AIIMS 25 May 2019 (Evening)

Ans. (a): As we know that, for an isochoric process

$$\Delta S = C_V \ln\frac{T_2}{T_1}$$

For diatomic process

$$C_V = \frac{5}{2}R$$

Therefore, $\Delta S = \frac{5}{2}R \times \ln\frac{500}{300}$

$$\Delta S = \frac{5}{2} \times 8.314 \times (\ln 5 - \ln 3) = 10.61$$

47. Assertion: Air that quickly leaks out of a balloon becomes cooler.

Reason: The leaking air undergoes adiabatic expansion.

(a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.

(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.

(c) If Assertion is correct but Reason is incorrect.

(d) If both the Assertion and Reason are incorrect.

AIIMS 26 May 2019 (Evening)

Ans. (a): When a system undergoes a change under the condition that no exchange of heat takes place between the system and surrounding, then such a process is called adiabatic process.

The leaking air of balloon undergoes adiabatic expansion. In this expansion, due to work done against external pressure.

Note : Adiabatic expansion such as bursting of tyre.

48. Assertion: U is state function.

Reason: T is an intensive property.

(a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.

(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.

(c) If Assertion is correct but Reason is incorrect.

(d) If both the Assertion and Reason are incorrect.

AIIMS 26 May 2019 (Evening)

Ans. (b): U is state function because it depends only on the state of system independent of the path followed T is intensive property because it does not depend on the mass of the substance or system.

So, both assertion and reason are true but reason is not the correct explanation of assertion.

49. The correct relation is:

(a) $\Delta G = -RT \ln K/Q$ (b) $\Delta G = +RT \ln K$

(c) $\Delta G = -RT \ln Q/K$ (d) $\Delta G = +RT \ln Q$

AIIMS 25 May 2019 (Morning)

Ans. (a): $\Delta G = \Delta G^o + RT \ln Q$

At Equilibrium

$\Delta G = 0$

And $Q = K$

K → Equilibrium constant

At Equilibrium

$$0 = \Delta G^o + R \ln K$$

$$\Delta G^o = -RT \ln K$$

Now,

$$\Delta G = -RT \ln K + RT \ln Q$$

$$\Delta G = RT \ln \frac{Q}{K}$$

$$\Delta G = -RT \ln \frac{K}{Q}$$

50. Which of the following statement regarding entropy is correct?

(a) at absolute zero temperature, the entropy of all crystalline substances is taken to be zero

(b) at 0^oC, the entropy of all crystalline substances is taken to be zero

(c) at absolute zero temperature, entropy of a perfect crystalline substance is taken to be zero

(d) at 0^oC, the entropy of a perfect crystalline substance is taken to be zero

AIIMS-1994

Ans. (c): Correct statement regarding entropy is at about zero temperature the entropy of a perfect crystalline substances is taken to be zero.

51. Which of the following is a characteristic of a reversible reaction?

(a) It never proceeds to completion

(b) It can be influenced by a catalyst

(c) It proceeds only in forward direction

(d) number of moles of reactants and products are equal.

AIIMS-1996

Ans. (b): Reversible reactions always attain equilibrium and never go for completion. Reversible reactions, however a static equilibrium is not being established. In these most of the reactions when carried out in closed vessels do not go completion, under a given set of conditions of temperature and pressure because reversible reaction are occurs in closed vessel's mostly.

52. Assertion: Addition of Q and W give ΔU

Reason: Addition of two path function cannot give state function.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.

@apna_pdf

(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS-27 May, 2018 (M)

Ans. (c): According to first law of Thermodynamics –
$\Delta U = Q + W$
Internal energy is a state function but Q and W are path functions.
- When the two path functions are combined to form state function.

53. Assertion: In Free expansion, $\Delta U = 0$
Reason: No work is done is free expansion.
(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS-27 May, 2018 (M)

Ans. (b): Both are true but unrelated. At constant volume work done is also-zero.

54. Assertion: When ideal gas expand from P_1,V_1,T_1 to P_2, V_2, T_2 in multiple steps, work done is high where number of steps are high.
Reason: Work is path function.
(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS-26 May, 2018 (M)

Ans. (b): When ideal gas expand from two steps, and work done is high in which number of steps are high.

$$\boxed{W = PdV}$$

55. Assertion: Entropy of ice is less than water.
Reason: Ice has cage like structure.
(a) If both Assertion and Reason are correct and the Reason is correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

AIIMS-2000

Ans. (b): Entropy of ice is less than water because water molecules in solid state lose kinetic energy and hence their tendency of movement is minimized. Hence, entropy decreases in solid state. The reason that ice have cage like structure is also correct but reason is not a correct explanation of the assertion.
Entropy – gas > liquid > solid

56. Assertion : During an adiabatic process, heat energy is not exchanged between system and its surroundings.
Reason: The temperature of a gas increases when it undergoes and adiabatic expansion.
(a) If both Assertion and Reason are correct and the Reason is correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

AIIMS-2002

Ans. (c): For an adiabatic process, Q = 0
$TV^{\gamma-1}$ = constant, for adiabatic process In an adiabatic expansion, temperature may increase or decrease depending upon the value of γ.

57. Assertion: Mass and volume are extensive properties.
Reason: Mass/ volume is also an extensive parameter.
(a) If both Assertion and Reason are correct and the Reason is correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

AIIMS-2002

Ans. (c): Mass and volume are extensive properties mass/volume is not an extensive parameter.
Because mass/volume are density. Density does not depend on mass.

58. Assertion: Absolute values of internal energy of substances cannot be determined.
Reason: It is impossible to determine exact values of constituent energies of the substances.
(a) If both Assertion and Reason are correct and the Reason is correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.

@apna_pdf

(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

AIIMS-2002

Ans. (a): It is impossible to determine the absolute values of energy therefore internal energy of substances is relatives and thus absolute value cannot be determined.

$$\boxed{\Delta E = C_v dT}$$

59. Assertion: The increase in internal energy (ΔE) for the vaporization of one mole of water at 1 atm and 373 K is zero.

Reason: For all isothermal processes, ΔE=0

(a) If both Assertion and Reason are correct and the Reason is correct explanation of the Assertion.
(b) If both Assertion and Reason are correct by Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

AIIMS-2003

Ans. (a): The increase in internal energy for the vaporization of one mole of water at 1atm and 373K is zero is true and for all isothermal process internal energy is zero.

At Isothermal → $\Delta H = 0$

$\Delta E = 0$

$\Delta T = 0$

60. Assertion: ΔH and ΔE are almost same for the reaction $N_2(g) + O_2(g) \rightleftharpoons 2NO(g)$

Reason: All reactants and products are gases.

(a) If both Assertion and Reason are correct and the Reason is correct explanation of the Assertion.
(b) If both Assertion and Reason are correct by Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

AIIMS-2003

Ans. (b): $\Delta H = \Delta E + \Delta nRT$

If there is no change in the moles of reactants (gaseous) and products (gaseous)

$\Delta n = 2 - (1 + 1) = 0$

$\therefore \Delta H = \Delta E$

All reactant and product are gases but this is not reason for $\Delta H = \Delta E$.

61. Assertion: Molar enthalpy of vaporization of water is different from ethanol.

Reason: Water is more polar than ethanol.

(a) If both Assertion and Reason are correct and the Reason is correct explanation of the Assertion.
(b) If both Assertion and Reason are correct by Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

AIIMS-2004

Ans. (b): Molar heat of vaporization of water is more than alcohol due to which large amount of energy is required to break H-bond in H_2O. It is also true that H_2O is more polar than alcohol.

Water have higher dielectric constant than ethanol that's why water is more polar.

62. Assertion: Water in liquid state is more stable than ice at room temperature

Reason: Water in liquid form has higher entropy than ice.

(a) If both Assertion and Reason are correct and the Reason is correct explanation of the Assertion.
(b) If both Assertion and Reason are correct by Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

AIIMS-2006

Ans. (a): At room temperature water is more stable and ice will tend to melt at room temp. $\Delta S = \frac{\Delta Q}{T} = \frac{mL}{T}$

which is positive entropy of an amount of ice at 0^oC is less than the entropy of the same amount (mass) of H_2O at 0^oC. At room temperature ice are melted this is the reason ice are unstable.

63. Assertion: When a salt such as NaCl dissolves, the Na^+ and Cl^- ions leaving the crystal lattice acquire far greater freedom.

Reason: In thermodynamic terms, the formation of solution occurs with a favorable change in free energy, i.e., ΔH has a high positive value and TΔS a low negative value.

(a) If both Assertion and Reason are correct and the Reason is correct explanation of the Assertion.
(b) If both Assertion and Reason are correct by Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.

@apna_pdf

(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

AIIMS-2007

Ans. (c): NaCl are strongly bonded due to electrostatic attraction. As it is dissolved in solvent in thermodynamics terms formation of solution occurs with a favourable change in ΔG, ΔG is negative for dissolution of salt. It $\Delta G < 0$ it is spontaneous process.

64. Assertion: Many endothermic reactions that are not spontaneous at room temperature become at high temperature.

Reason: Entropy of the system increase with increase in temperature.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS-2012

Ans. (c): $\Delta G = \Delta H - T\Delta S$

ΔH is +ve for endothermic process

For spontaneous process $\Delta G < 0$

$\therefore\ \Delta H - T\Delta S < 0$

i.e. $\Delta H < TS$

$\Delta G = 0$ At equilibrium

Entropy of the system also increases with increase in temperature but only slightly.

65. Assertion : For an isothermal reversible process $Q = -W$ i.e. work done by the system equals to the heat absorbed by the system.

Reason: Enthalpy change (ΔH) is zero for isothermal process.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS-2011,2013

Ans. (b): For an isothermal process change in internal energy (ΔE) is zero (as it is a function of temperature).

According to first law of thermodynamics

$$Q + W = \Delta E$$

Hence, $Q = -W$ (if $\Delta E = 0$)

If a system undergoes a change in which internal energy of the system remains constant (i.e. $\Delta E = 0$) then $-W = Q$.

This mean that work done by the system is equal to the heat absorbed by the system.

66. What is entropy change is 2 mol N_2, when its temperature is taken from 400 K to 800 K, adiabatically

(a) $30\frac{J}{K}$ (b) $60\frac{J}{K}$
(c) $40\frac{J}{K}$ (d) $20\frac{J}{K}$

AIIMS-27 May, 2018 (M)

Ans. (c): $\Delta S = nC_p \ln\frac{T_2}{T_1}$

C_v (for diatomic) $= \frac{5}{2}R$

$C_p = C_v + R$

$C_p = \frac{5}{2}R + R = \frac{7}{2}R$

$$\Delta S = 2\times\frac{7}{2}\times R\times\ln\frac{800}{400}$$

$$= 2\times\frac{7}{2}\times R\times\ln 2$$

$$= 7\times 8.314\times\ln 2$$

$$= 40.33$$

$$\simeq 40\ J/K$$

67. Which of following factor always increases for spontaneous process?

(a) ΔS (b) ΔH
(c) $\Delta H - T\Delta S$ (d) $\Delta S - \frac{\Delta H}{T}$

AIIMS-26 May, 2018 (M)

Ans. (d): For spontaneous process-

$\Delta G = -ve$

$\Delta G = \Delta H - T\Delta S$

Entropy of universe always increases

$$-\frac{\Delta G}{T} = \Delta S_{total} = \Delta S - \frac{\Delta H}{T}$$

68. Which of the following are extensive properties?

(a) V & E (b) V & T
(c) V & C_p (d) P and T

AIIMS-26 May, 2018 (M)

Ans. (a): The volume of any matter or substance depends on the mass or amount. Thus, volume is considered as an extensive property V & E are extensive in nature.

69. The ΔH_f° for CO_2 (g), CO(g) and H_2O(g) are–393.5, –110.5 and –241.8 kJ/mol respectively, the standard enthalpy change (in kJ) for the reaction

$CO_2(g) + H_2(g) \rightarrow CO(g) + H_2O(g)$ is

(a) 524.1 (b) 41.2
(c) –262.5 (d) –41.2

AIIMS-2013, 2017

@apna_pdf

Ans. (b): $\Delta H = \Sigma H_f^\circ$ (product) – ΣH_f° (reactants)

$=[\Delta H_f^\circ(CO) + \Delta H_f^\circ(H_2O)] - [\Delta H_f^\circ(CO_2) + \Delta H_f^\circ,(H_2)]$

$=[-110{\cdot}5-241{\cdot}8] - [-393{\cdot}5+0]$

$= -352{\cdot}3 + 393{\cdot}5$

$= +41{\cdot}3$ kJ/mol

70. Choose the reaction in which ΔH is not equal to ΔU?

(a) $C_{(graphite)} + O_2(g) \rightarrow CO_2(g)$

(b) $C_2H_4(g) + H_2(g) \rightarrow C_2H_6(g)$

(c) $2C_{(graphite)} + H_2(g) \rightarrow C_2H_2(g)$

(d) $H_2(g) + I_2(g) \rightarrow 2HI(g)$

AIIMS-2016

Ans. (b): We know that

$\Delta H = \Delta U + \Delta n_g RT$

If $\Delta n_g = 0$ then $\Delta H = \Delta U$

Where, $\Delta n_g = n_P - n_R$

n_P = no. of moles of gaseous products

n_R = no. of moles of gaseous reactants

So,

(a) $C_{(graphite)} + O_2(g) \rightarrow CO_2(g)$

$\Delta n_g = n_P - n_R = 1 - 1 = 0$

(b) $C_2H_4(g) + H_2(g) \rightarrow C_2H_6(g)$

$\Delta n_g = n_P - n_R = 1 - 2 = -1$

(c) $2C_{(graphite)} + H_2(g) \rightarrow C_2H_2(g)$

$\Delta n_g = n_P - n_R = 1 - 1 = 0$

(d) $H_2(g) + I_2(g) \rightarrow 2HI(g)$

$\Delta n_g = n_P - n_R = 2 - 2 = 0$

So, in option (b) $\Delta H \neq \Delta U$

71. Which of the following condition favour the reduction of a metal oxide to metal?

(a) $\Delta H = +ve, T\Delta S = +ve$ at low temperature

(b) $\Delta H = +ve, T\Delta S = -ve$ at low temperature

(c) $\Delta H = -ve, T\Delta S = -ve$ at low temperature

(d) $\Delta H = -ve, T\Delta S = +ve$ at any temperature

AIIMS-2012

Ans. (d): $\Delta G = \Delta H - T\Delta S$ ($\Delta G < 0$ – Spontaneous Process) for the reduction of a metal oxide, ΔG value must be negative and this can only achieved all possibilities of ΔH and TΔS values, when the ΔH = –ve and TΔS = +ve at any temperature.

72. What is the enthalpy change for, $2H_2O_2(l) \rightarrow 2H_2O(l) + O_2(g)$ if heat of formation of H_2O_2 (*l*) and $H_2O(l)$ are–188 and –286kJ/mol respectively?

(a) –196kJ/mol (b) +948kJ/mol

(c) +196kJ/mol (d) –948kJ/mol

AIIMS-2014

Ans. (a): Given, the reaction is–

$2H_2O_2(l) \rightarrow 2H_2O(l) + O_2(g)$

ΔH_f $H_2O_2(l) = -188$ kJ/mol

ΔH_f $H_2O(l) = -286$ kJ/mol

For 2 moles $H_2O_2 = 2 \times -188 = -376$ kJ/mol

For 2 moles of $H_2O = 2 \times -286 = -572$ kJ/mol

$\Delta H_r = -572 - (-376)$

$= -196$ kJ/mol

73. Enthalpy of formation of HF and HCl are –161kJ and –92kJ respectively. Which of the following statements is incorrect?

(a) HCl is more stable than HF.

(b) HF and HCl are exothermic compounds.

(c) The affinity of fluorine to hydrogen is greater than the affinity of chlorine to hydrogen.

(d) HF is more stable than HCl.

AIIMS-2010

Ans. (a): Enthalpy of formation of HF is more than the Enthalpy of formation of HCl. So, HF is more stable than HCl. Formation of HF and HCl are Exothermic.

74. Which of the following processes takes place with decrease of entropy?

(a) Solid →gas

(b) sugar + water → solution

(c) $NH_3(g)+HCl(g) \rightarrow NH_4\,Cl(s)$

(d) A(g)+ B(g) → mixture

AIIMS-2011

Ans. (c): The structure of a solid is generally organised and liquid are less organised and gas are random in nature.

$NH_3(g) + HCl(g) \rightarrow NH_4Cl(s)$

NH_4Cl are well organised

Thus, the entropy decreases.

75. For the reaction, $2Cl(g) \rightarrow Cl_2(g)$, the signs of ΔH and ΔS respectively, are:

(a) +,– (b) +,+

(c) –,– (d) –,+

AIIMS-2010

Ans. (c): $2\,Cl(g) \rightarrow Cl_2(g)$

For the given reaction, entropy is decreasing (–ve) in the reaction. Also the reaction is exothermic due to the bond formation so, ΔH is also –ve.

76. When a solid melts reversibly

(a) H decreases (b) G increase

(c) E decreases (d) S increase

AIIMS-2009

Ans. (d): When a solid melts, its entropy (S) increases because on change from solid to liquid, randomness increases.

77. ΔH_{fusion} of a substance is 'x' and ΔH_{vap} is 'y', then $\Delta H_{sublimation}$ will be

(a) x+y (b) x–y

(c) x/y (d) y/x

AIIMS-2007

Ans. (a):

$$\begin{tikzcd}
\text{Solid} \arrow[r, "\Delta H_{fusion}"] \arrow[rr, bend right, "\Delta H_{sub}"'] & \text{Liquid} \arrow[r, "\Delta H_{Vap}"] & \text{Vapour}
\end{tikzcd}$$

$\Delta H_{sub} = \Delta H_{fus} + \Delta H_{vap} = x + y$

@apna_pdf

78. **ΔS_{surr} for an exothermic reaction is**
(a) always positive
(b) always negative
(c) zero
(d) may be positive or negative

AIIMS-2007

Ans. (a): $\Delta S_{surrounding}$ for an exothermic reaction is always positive. In exothermic process, heat released by the reaction, increases the entropy of the surrounding. The overall entropy changes is certainly positive when the entropy of the system is positive. In some exothermic reactions, entropy of the system may decrease. If reaction is highly exothermic and increase in entropy of the surrounding is very high. The total entropy change will be positive.

79. **For a spontaneous process, the correct statement is :**
(a) Entropy of the system always increases.
(b) Free energy of the system always increases.
(c) Total entropy change is always negative.
(d) Total entropy change is always positive.

AIIMS-2006

Ans. (d): $\Delta S_{total} = \Delta S_{system} + \Delta S_{surroundings}$
For a spontaneous process, the ΔS_{total} must be positive i.e. $\Delta S_{total} > 0$ Total entropy change is always positive.

80. **For a phase change,**

$$\mathrm{H_2O}(l)\xrightleftharpoons{0^\circ\mathrm{C},\ 1\mathrm{bar}}\mathrm{H_2O}(s)$$

(a) $\Delta G = 0$ (b) $\Delta S = 0$
(c) $\Delta H = 0$ (d) $\Delta U = 0$

AIIMS-2006

Ans. (a): A system at equilibrium has ΔG equal to zero (the free energy change), ΔG is neither positive nor negative because process at equilibrium has a zero free energy change. At phase change ΔG are also zero.
$\Delta G = -RT\ln K$
ΔG = standard free energy
K = equation constant

81. **Which one of the following has ΔS^o greater than zero?**
(a) $\mathrm{CaO(s) + CO_2(g) \rightleftharpoons CaCO_3(s)}$
(b) $\mathrm{NaCl(aq) \rightleftharpoons NaCl(s)}$
(c) $\mathrm{NaNO_3(s) \rightleftharpoons Na^+(aq) + NO_3^-(aq)}$
(d) $\mathrm{N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)}$

AIIMS-2003

Ans. (c): We know that, in transition from solid state to liquid state, entropy increases. Hence, the value of ΔS will be greater than zero for the reaction.
$\mathrm{NaNO_3(s) \rightleftharpoons Na^+(aq) + NO_3^-(aq)}$
ΔS > 0 Mean's positive entropy.

82. **In the exothermic reaction, the enthalpy of reaction is always:**
(a) zero (b) positive
(c) negative (d) None of these

AIIMS-2001

Ans. (c) : Exothermic reactions are reactions or process that release energy, usually in the form of heat or light. In an exothermic reaction, energy is released because the total energy of the products is less than the total energy of the reactants. A system that releases heat to the environment, and chemical reaction, features a negative ΔH by convention, because the enthalpy of the products is less than the enthalpy of the reactants of the system.
Exothermic Reactions are energy liberating process. $\Delta H = \Sigma H_{product} - \Sigma H_{reactant}$ Mean's ΔH = Negative

83. **One mole of an ideal gas for which $C_v=(3/2)R$ is heated reversibly at a constant pressure of 1 atm from 25°C to 100° C. The ΔH is:**
(a) 3.75 cal (b) 37.5 cal
(c) 375 cal (d) 3725.0 cal

AIIMS-2000

Ans. (c): We know that,
$\Delta H = \Delta U + P\Delta V$ .....(i)
To find ΔU,
$\Delta U = C_v \times (T_2 - T_1)$ for 1 mole gas
$$\Delta U = \frac{3}{2}R \times (75)$$
Put this value in (i),
$$\Delta H = \left(\frac{3}{2} \times R \times 75\right) + (R \times 75)$$
$$\Delta H = \frac{5}{2} \times R \times 75$$
$\Delta H = 372.56$ cal (Take R = 1.987 cal)
$\Delta H \approx 375$ cal

84. **Enthalpy of neutralisation of CH_3COOH by NaOH is –50.6kJ/mol and the heat of neutralisation of a strong acid with NaOH is –55.9kJ/mol. The value of ΔH for the ionisation of CH_3COOH is:**
(a) 3.5kJ/mol (b) 4.6 kJ/mol
(c) 5.3 kJ/mol (d) 6.4 kJ/mol

AIIMS-2000

Ans. (c): Net ionic reaction for neutralization of strong acid and NaOH is
$\mathrm{H^+ + OH^- \rightarrow H_2O}$; -55.9 kJ/mol
For neutralization of acetic acid is
$\mathrm{CH_3COOH + OH^- \rightarrow CH_3COO^- + H_2O}$; –50.6 kJ/mol
Since the total reaction has an enthalpy change of –55.9 kJ/mol. The heat of ionisation must be equal to the difference between the value.
heat of ionisation = – 50.6 – (–55.9) kJ/mol
= 5.3 kJ/mol

85. **The internal energy of a substance:**
(a) increases with increase in temperature
(b) decreases with increase in temperature
(c) remains unaffected with temperature
(d) can be calculated by the equation, $E=mc^2$

AIIMS-2001

Ans. (a): Internal energy of a substance increase with increases in temperature due to increase in rotational, translational and vibrational energy of the molecule.
Internal energy is the function of temperature.
$\Delta U = nC_v\Delta T$

@apna_pdf

86. Combustion of glucose takes place according to the equation:

$$C_6H_{12}O_6 + 6O_2 \rightarrow 6CO_2 + 6H_2O, \Delta H = -72\,kcal$$

The energy required for production of 1.6 g of glucose is (molecular mass of glucose is 180g)

(a) 0.064 kcal (b) 0.64 kcal
(c) 6.4 kcal (d) 64 kcal

AIIMS-1998

Ans. (b): Molecular mass of $C_6H_{12}O_6$ = 180 g mol^{-1}

$\because$ 180 g of glucose require energy = 72 kcal

$\therefore$ 1.6 g of glucose required energy $= \frac{72 \times 1.6}{180}$

= 0.64 kcal.

87. For a spontaneous process, entropy:

(a) Increases (b) Decreases
(c) Unchanged (d) Not clear

AIIMS-1998

Ans. (a): $-\Delta G = -\Delta H + T\Delta S$ ($\Delta G = \Delta H - T\Delta S$)
The spontaneity of the process appears to be associated with a highly ordered system going to a less–ordered, uniform state. The more disordered a state, the larger its entropy. Therefore, entropy should be increases.

88. Internal energy does not include:

(a) Rotational energy
(b) Nuclear energy
(c) Vibrational energy
(d) Energy due to gravitational pull

AIIMS-1999

Ans. (d): Every substance is associated with definite amount of energy which depends upon chemical nature. The energy stored within a substance is called its internal energy. It is total energy of a substance depending upon its chemical nature, temperature, pressure, volume and amount of substances. Internal energy does not includes gravitational energy translational energy, rotational energy, vibrational energy and bond energy.
Because Internal Energy is the function of temperature only for ideal gas.

89. At a constant volume the specific heat of a gas is 0.075 and its molecular weight is 40. The gas is :

(a) Monoatomic (b) Diatomic
(c) Triatomic (d) None of these

AIIMS-1998

Ans. (a): Molar heat capacity at constant volume,
C_v = specific heat at constant volume × mol.wt.
= 0.075 × 40 = 3.0 cal (Monoatomic > Diatomic)

$\because C_p - C_v = R$

or $C_p = R + C_v = 2 + 3 = 5$

Now, $\frac{C_p}{C_v} = \gamma$

$\therefore \quad \gamma = \frac{5}{3} = 1.66$

This value shows that the gas is monoatomic.

90. The enthalpy change of a reaction does not depend on:

(a) initial and final enthalpy change of reaction.
(b) state of reactants and products.
(c) different intermediate reactions.
(d) nature of reactants and products.

AIIMS-1997

Ans. (c): Enthalpy change is a state function so it does not depend on the path taken by the reaction, it depends only on the difference of final and initial value of enthalpy change.
$\Delta H = 0$, $\Delta H = nC_p\Delta T$
State function only depend on initial and final State.

91. Calculate the entropy change in melting 1 mole of ice at 273K, $\Delta H_f^o = 6.025\,kJ/mole$ -

(a) 11.2 JK^{-1} mol^{-1} (b) 22.2 JK^{-1} mol^{-1}
(c) 15.1 JK^{-1} mol^{-1} (d) 5.1 JK^{-1} mol^{-1}

VITEEE-2019

Ans. (b) : Change entropy,

$$\Delta S_f = \frac{\Delta H_f}{T} = \frac{6025\,jmol^{-1}}{273K} = 22.04 \simeq 22.2\,J/mol\,K$$

92. For the reaction

$$H_2(g) + \frac{1}{2}O_2(g) \rightarrow H_2O(l), \Delta H = -285.8\,kJ\,mol^{-1}$$

$$\Delta S = -0.163\,kJ\,mol^{-1}K^{-1}$$

What is the value of free energy change at 27°C for the reaction ?

(a) –236.9 kJ mol^{-1} (b) –281.4 kJ mol^{-1}
(c) –334.7 kJ mol^{-1} (d) +334.7 kJ mol^{-1}

Ans. (a) : Given,

$$H_2(g) + \frac{1}{2}O_2(g) \rightarrow H_2O(l)$$

$\Delta H = -285.8$ kJ/mole

$\Delta S = -0.163$ kJ/mole

$\therefore \quad \Delta G = \Delta H - T\Delta S$

$\Delta G = -285.8 + 300 \times 0.163$

$\Delta G = -236.97$ kJ/mole

93. In a closed insulated container, a liquid is stirred with a paddle to increase its temperature. In this process, which of the following is true?

(a) $\Delta E = W = Q = 0$ (b) $\Delta E \neq 0, Q = W = 0$
(c) $\Delta E = W \neq 0, Q = 0$ (d) $\Delta E = Q \neq 0, W = 0$

VITEEE-2019

Ans. (c) : According to Ist Law of Thermodynamic

q = ΔE + W
E = change in internal energy
W = work done on system

Since system is closed and insulated, q = 0
Paddle work is done on system.
Hence internal energy of the system is increases.

$\therefore \quad \Delta E = W \neq 0$

94. The values of ΔH and ΔS for the reaction, C(graphite) +CO_2(g) → 2CO(g) are 170 kJ and 170 JK^{-1}, respectively. This reaction will be spontaneous at

@apna_pdf

(a) 910 K (b) 1000 K
(c) 510 K (d) 710 K

AIPMT-2009

Ans. (b) : Given–

$\Delta H = 170$ kJ

$\Delta S = 170\ JK^{-1}$

T = ?

Now, $\Delta G = \Delta H - T\Delta S$ (at equilibrium $\Delta G = 0$)

$\therefore$ $\Delta H = T\Delta S$

or $T = \frac{\Delta H}{\Delta S}$, $T = \frac{170}{170 \times 10^{-3}}$

T = 1000 K

Therefore, this reaction is spontaneous at this temperature.

95. Calculate enthalpy change for the change $8S(g) \rightarrow S_8(g)$, given that
$H_2S_2(g) \rightarrow 2H(g) + 2S(g)$, $\Delta H = 239.0$ k cal mol^{-1}
$H_2S_2(g) \rightarrow 2H(g) + S(g)$, $\Delta H = 175.0$ k cal mol^{-1}

(a) + 512.0 k cal (b) – 512.0 k cal
(c) 508.8 k cal (d) – 508.0 k cal

VITEEE-2018

Ans. (b) : Given that-

$$H_2S_2(g) \rightarrow 2H(g) + 2S(g) \quad \Delta H = 239.0\,k\,cal\,mol^{-1}$$

$$H_2S_2(g) \rightarrow 2H(g) + S(g) \quad \Delta H = 175.0\,k\,cal\,mol^{-1}$$

$\Delta H_{S-S} + 2\Delta H_{H-S} = 239$

And $2\Delta H_{H-S} = 175$

Hence, $2\Delta H_{S-S} = 239 - 175 = 64$ k cal mol^{-1}

Then, ΔH for $8S(g) \rightarrow S_8(g)$ is

$8 \times (-64) = -512$ k cal

96. For the process $H_2O(l)$ (1 bar, 373 K) $\rightarrow$ $H_2O(g)$ (1 bar, 373 K), the correct set of thermodynamic parameters is

(a) $\Delta G = 0, \Delta S = +ve$ (b) $\Delta G = 0, \Delta S = -ve$
(c) $\Delta G = +ve, \Delta S = 0$ (d) $\Delta G = -ve, \Delta S = +ve$

IIT JEE, 2007

Ans. (a) : For the process, water goes one state to another state. Due to equilibrium between liquid and gaseous state of H_2O on 373K, $\Delta G = 0$, and entropy also increases i.e. $\Delta S = +ve$

97. Consider the reaction: $N_2 + 3H_2 \rightarrow 2NH_3$ carried out at constant temperature and pressure. If ΔH and ΔU are the enthalpy and internal energy changes for the reaction, which of the following expressions is true ?

(a) $\Delta H > \Delta U$ (b) $\Delta H < \Delta U$
(c) $\Delta H = \Delta U$ (d) $\Delta H = 0$

AIEEE-2005

Ans. (b) : Given the reaction –

$$N_2 + 3H_2 \rightarrow 2NH_3$$

$\Delta n = 2 - (3+1) = -2$

$\therefore$ $\Delta H = \Delta U + \Delta nRT$

$\Delta H = \Delta U - 2RT$

So, $\boxed{\Delta U > \Delta H}$

98. Standard entropy of X_2, Y_2 and XY_3 are 60, 40 and 50 $JK^{-1}mol^{-1}$, respectively. For the reaction, $\frac{1}{2}X_2 + \frac{3}{2}Y_2 \rightleftharpoons XY_3, \Delta H = -30kJ$, to be at equilibrium, the temperature will be

(a) 1250 K (b) 500 K
(c) 750 K (d) 1000 K

NEET-2010, AIEEE-2008

Ans. (c) : For the reaction

$$\frac{1}{2}X_2 + \frac{3}{2}Y_2 \rightarrow XY_3; \quad \Delta H = -30kJ \ \ (\text{given})$$

Calculating the ΔS for the above reaction–

$$\Delta S = 50 - \left[\frac{1}{2} \times 60 + \frac{3}{2} \times 40\right] JK^{-1}$$

$$\Delta S = 50 - [30 + 60]$$

$$\Delta S = -40\,JK^{-1}$$

At equilibrium, $\Delta G = 0$, $\Delta G = \Delta H - \Delta ST$

$T\Delta S = \Delta H$

$$T = \frac{\Delta H}{\Delta S} = \frac{-30 \times 1000}{-40}$$

$T = 750\,K$.

99. One mole of an ideal gas at 300 K is expanded isothermally from an initial volume of 1 litre to 10 litres. Then ΔS (cal deg^{-1} mol^{-1}) for this process is: (R = 2 cal K^{-1} mol^{-1})

(a) 7.12 (b) 8.314
(c) 4.6 (d) 3.95

VITEEE-2016

Ans. (c) : Given that, T = 300K

$V_1 = 1$ litre, $V_2 = 10$ litres

R = 2 cal K^{-1} Mol^{-1}

For isothermal process,

$$\Delta S = 2.303\,nR\log\frac{V_2}{V_1}$$

$$\Delta S = 2.303 \times 1 \times 2 \log\frac{10}{1}$$

$\Delta S = 4.606 \log 10$

$\Delta S = 4.6$ cal deg^{-1} mol^{-1}

100. Match List I (Equations) with List II (Types of process) and select the correct option.

List - I (Equations)	List - II (Types of process)
A. $K_P > Q$	1. Non – spontaneous
B. $\Delta G^\circ < RT\ln Q$	2. Equilibrium
C. $K_P = Q$	3. Spontaneous and endothermic
D. $T > \frac{\Delta H}{\Delta S}$	4. Spontaneous

Codes :

	A	B	C	D
(a)	1	2	3	4
(b)	3	4	2	1
(c)	4	1	2	3
(d)	2	1	4	3

VITEEE- 2012

@apna_pdf

Ans. (c) : By option (A) If $K_p > Q$ and goes in forward direction then reaction is spontaneous

Option (B) Given, $\Delta G° < RT \ln Q$,

Thus, $\Delta G°$ = + ve and hence, the reaction is non-spontaneous.

Option (C) At equilibrium, $K_p = Q$

Option (D) $T > \dfrac{\Delta H}{\Delta S}$

or $\quad T\Delta S = \Delta H$

This is valid condition for spontaneous endothermic reactions (as $\Delta G \geq \Delta H - T\Delta S$)

101. For the reaction,

$$\mathbf{C_3H_8(g) + 5O_2(g) \longrightarrow 3CO_2(g) + 4H_2O(l)}$$

at constant temperature, $\Delta H - \Delta E$ is

(a) RT (b) –3RT

(c) 3RT (d) – RT

VITEEE- 2011

Ans.(b): For the reaction-

$$C_3H_8(g) + 5O_2(g) \rightarrow 3CO_2(g) + 4H_2O(l)$$

Given that, at constant temperature

Now, from the following equation-

$$\Delta H = \Delta E + P\Delta V \left(\because P\Delta V = \Delta n_g RT\right)$$

or $\quad \Delta H = \Delta E + \Delta n_g RT$

Where, $\Delta n_g = n_p - n_r = 3 - 6 = -3$

$\therefore \quad \Delta H - \Delta E = -3RT$

102. For which one of the following reactions will there be a positive ΔS?

(a) $H_2O(g) \longrightarrow H_2O(l)$

(b) $H_2(g) + I_2(g) \longrightarrow 2HI(g)$

(c) $CaCO_3(s) \longrightarrow CaO(s) + CO_2(g)$

(d) $N_2(g) + 3H_2(g) \longrightarrow 2NH_3(g)$

VITEEE- 2010

Ans. (c) : ΔS (entropy change) is the measure of randomness and thus in solid, liquid and gas, the order of entropy is gas > liquid > solid.

Thus, ΔS is positive for the reaction given in option (c) because solid $CaCO_3$ is forming gaseous CO_2.

103. Calculate ΔH° for the reaction,

$$\mathbf{Na_2O(s) + SO_3(g) \rightarrow NaSO_4(g)}$$

given the following :

(a) $\mathbf{Na(s) + H_2O(\mathit{l}) \rightarrow NaOH(s) + \frac{1}{2}H_2(g)}$

$\mathbf{\Delta H° = -146 kJ}$

(b) $\mathbf{Na_2SO_4(s) + H_2O(\mathit{l}) \rightarrow 2NaOH(s) + SO_3(g)}$

$\mathbf{\Delta H° = +418 kJ}$

(c) $\mathbf{2NaO(s) + 2H_2(g) \rightarrow 4Na(s) + 2H_2O(\mathit{l})}$

$\mathbf{\Delta H° = +259 kJ}$

(a) +823 kJ (b) –581 kJ

(c) –435 kJ (d) +531 kJ

VITEEE- 2009

Ans. (b) :

$Na(s) + H_2O(l) \rightarrow NaOH(s) + \frac{1}{2}H_2(g)$ .....(1)

$\Delta H° = -146$ kJ

$Na_2SO_4(s) + H_2O(l) \rightarrow 2NaOH(s) + SO_3(g)$ .....(2)

$\Delta H° = +418$ kJ

$2NaO(s) + 2H_2(g) \rightarrow 4Na(s) + 2H_2O(l)$ .....(3)

$\Delta H° = +259$ kJ

Given that enthalpies of reactions are –144 kJ, 418 kJ and 359 kJ.

Required reaction = (equation 3 ÷ 2) + (equation 1 × 2) – (equation 2)

$$Na_2O + SO_3 \longrightarrow Na_2SO_4;$$

$$\Delta H° = +\frac{259}{2} + (-146) \times 2 - (418)$$

$$\Rightarrow \Delta H = -580.5 \approx 581 \text{ kJ}$$

104. A spontaneous process is one in which the system suffers :

(a) no energy change

(b) a lowering of free energy

(c) a lowering of entropy

(d) an increase in internal energy

VITEEE- 2008

Ans. (b) : In any reaction, if the Gibbs free energy is negative then reaction will be spontaneous. ΔG = –ve for a spontaneous process.

105. If an endothermic reaction occurs spontaneously at constant temperature T and P, then which of the following is true?

(a) $\Delta G > 0$ (b) $\Delta H < 0$

(c) $\Delta S > 0$ (d) $\Delta S < 0$

VITEEE- 2008

Ans. (c) : For a reaction to take place spontaneously the value of ΔG must be negative i.e. ΔG<0.

Now, ΔG = ΔH– TΔS.

- As the reaction is endothermic, so value of ΔH must be positive, i.e. ΔH > 0.

Hence, to have a negative ΔG.

ΔH < TΔS. As T & P are constant.

- TΔS must be positive to give the total value a negative sign.

Hence, ΔS> 0.

106. Enthalpy is equal to

(a) $-T^2\left[\dfrac{\delta(\Delta G)}{\delta T}\right]_V$ (b) $-T^2\left[\dfrac{\delta(G/T)}{\delta T}\right]_P$

(c) $T^2\left[\dfrac{\delta(G/T)}{\delta T}\right]_V$ (d) $-T^2\left[\dfrac{\delta(\Delta G)}{\delta T}\right]_P$

VITEEE- 2007

Ans. (d) : Gibb's Helmholtz Equation–

$$\Delta G = \Delta H - T\Delta S \quad ....(1)$$

Differentiate this equation w.r.t. temperature at constant pressure,

$$\left(\frac{\partial \Delta G}{\partial T}\right)_P = \left(\frac{\partial G_y}{\partial T}\right)_P - \left(\frac{\partial G_x}{\partial T}\right)_P \quad ....(2)$$

@apna_pdf

$= -S_y - (-S_x)$

$= -(S_y - S_x) = -\Delta S$ ....(3)

Where, ΔS change in entropy

On combining equation (1) & (3), we get–

$$\Delta G = \Delta H + T\left(\frac{\partial(\Delta G)}{\partial T}\right)_P \qquad ....(4)$$

Equation (4) is an alternative form of Gibbs Helmholtz equation,

Dividing equation (4) by T^2, we get

$$\frac{\Delta G}{T^2} = \frac{\Delta H}{T^2} + \frac{1}{T}\left[\frac{\partial(\Delta G)}{\partial T}\right]_P$$

On rearrangement, we get

$$\left[\frac{\partial(\Delta G)}{\partial T}\right]_P = -\frac{\Delta H}{T^2}$$

$$\therefore \Delta H = -T^2\left[\frac{\partial(\Delta G)}{\partial T}\right]_P$$

107. Condition for spontaneity in an isothermal process is

(a) $\Delta A + W < 0$ (b) $\Delta G + U < 0$

(c) $\Delta A + U > 0$ (d) $\Delta G - U < 0$

VITEEE- 2007

Ans. (a) : Since $\Delta G = \Delta A + P.\ \Delta V$

For a spontaneous process ΔG should be negative which is possible only if $\Delta G < 0$

$\Delta A + W < 0$

108. The reaction,

$Zn(s) + CuSO_4(aq) \rightarrow ZnSO_4(aq) + Cu(s)$ is an example of a

(a) spontaneous process

(b) isobaric process

(c) non-spontaneous process

(d) reversible process

VITEEE- 2006

Ans. (a) : It is spontaneous process because zinc is more reactive than copper, hence can easily replace Cu from $CuSO_4$.

109. ΔS will be highest for

(a) $Ca_{(s)} + 1/2O_{2(g)} \rightarrow CaO_{(s)}$

(b) $CaCO_{3(s)} + CaO_{(s)} \rightarrow CO_{2(g)}$

(c) $C_{(s)} + O_{2(g)} \rightarrow CO_{2(g)}$

(d) $N_{2(g)} + O_{2(g)} \rightarrow 2NO_{(g)}$

SRMJEEE – 2014

Ans. (b) : The entropy of a system increases whenever its particles have more freedom of motion. Thus, the entropy increases whenever you have more moles of gaseous products than of reactants and whenever you have more product particles in solution than you have of reactant particles. Hence, among the given reaction, the entropy increases in –

$$CaCO_{3(s)} \longrightarrow CaO_{(s)} + CO_{2(g)}$$

Since, the reactant side has no gaseous particle while the product side has 1 gaseous particle. Hence, entropy increases and ΔS will be highest.

110. Which of the following conditions lead to a spontaneous process?

(a) ΔH is + ve ; TΔS is – ve

(b) TΔS = ΔH

(c) Both ΔH and TΔS are + ve but ΔH > TΔS

(d) Both ΔH and TΔS are + ve but TΔS > ΔH

SRMJEEE – 2013

Ans. (d) : We know that,

$\Delta G = \Delta H - T\Delta S$

Where, ΔG = Gibb's free energy change

ΔH = enthalpy change

ΔS = entropy change.

For the spontaneous process, ΔG should be negative which is possible in only option (d) because both ΔH and TΔS are positive and TΔS>ΔH due to which $\Delta G < 0$.

111. Enthalpy of neutralization of a strong acid by a strong base

1. has a constant value of – 57.32 kJ

2. is independent of the nature of strong acid and strong base

3. is heat change accompanying the reaction

$H^+_{(aq)} + HO^-_{(aq)} \rightarrow H_2O$

(a) 1 and 2 (b) 1 and 3

(c) 1 only (d) 1, 2 and 3

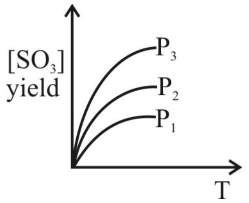
SRMJEEE – 2016

Ans. (d) : The enthalpy of neutralization of any strong acid with a strong base is always the same i.e. 57.1 kJ. The reason is that both the acid and base undergo complete ionisation. It is independent of the nature of the strong acid and strong base.

Enthalpy of neutralization is always constant for a strong acid and a strong base this is because all strong acids and strong base are completely ionized in dilute solution. Enthalpy change in neutralization are always negative.

$$H^+_{(aq)} + HO^-_{(aq)} \longrightarrow H_2O$$

112. For the reaction $SO_{2(g)} + \frac{1}{2}O_{2(g)} \rightleftharpoons SO_{3(g)}$ percentage yield of product at different pressure is shown in the figure. Then, which among the following is true?



$$SO_{2(g)} + \frac{1}{2}O_{2(g)} \rightleftharpoons SO_{3(g)}$$

(a) Pressure has no effect (b) $P_1 < P_2 < P_3$

(c) $P_1 > P_2 > P_3$ (d) $P_1 = P_2 = P_3 = 0$

AP- EAPCET- 07-09-2021, Shift-I

Ans. (c) : $SO_{2(g)} + \frac{1}{2}O_{2(g)} \rightleftharpoons SO_3(g)$

The percentage yield of product increases when $P_1 > P_2 > P_3$.

@apna_pdf

113. A gaseous mixture was prepared by taking equal number of moles of Helium and Neon. If the total pressure of the mixture was found to be 10 atm, the partial pressure of Helium in the mixture is _____

(a) 1 atm (b) 5 atm
(c) 10 atm (d) 0 atm

AP- EAPCET- 07-09-2021, Shift-I

Ans. (b) : Partial pressure = Mole fraction × Total pressure

$$X_{He} = \frac{n_{He}}{n_{He}+n_{Ne}} = \frac{n_{He}}{2n_{He}} = \frac{1}{2} \qquad (\because n_{He} = n_{Ne})$$

$P_{He} = (1 - X_{He}) \times P_T$

$P_{He} = 0.5 \times 10 = 5$ atm

114. For which one of the following reactions, the entropy change is positive?

(a) $H_2(g) + \frac{1}{2}O_2(g) \longrightarrow H_2O(l)$

(b) $Na^+(g) + Cl^-(g) \longrightarrow NaCl(s)$

(c) $NaCl(1) \longrightarrow NaCl(s)$

(d) $H_2O(1) \longrightarrow H_2O(g)$

AP-EAMCET (Engg.) 2013

Ans. (d) :

Entropy change is positive for vaporization of liquid water to water vapor. The entropy of a compound in gaseous state is higher than the entropy of compound in liquid state.

$H_2O(\ell) \longrightarrow H_2O(g)$; $\Delta H = +40.8\ kJmol^{-1}$

115. A chemical reaction cannot occur at all if its

(a) ΔH is (+)ve and ΔS is (–)ve
(b) ΔH is (–)ve and ΔS is (+)ve
(c) ΔH and ΔS are (+)ve but $\Delta H > T\Delta S$
(d) ΔH and ΔS are (–)ve but $\Delta H > T\Delta S$

AP - EAMCET(MEDICAL) - 2009

Ans. (c) : The mathematical expression of Gibb's Helmholtz equation is given as–

$$\Delta G = \Delta H - T\Delta S$$

Where, ΔG = Change in Gibb's energy
ΔH = Change in enthalpy
T = Temperature
ΔS = Change in entropy

If ΔG has the positive value then a chemical reaction cannot occur. This condition is true when ΔH and ΔS both are positive in such a way that $\Delta H > T\Delta S$.

116. Density of carbon monoxide is maximum at

(a) 2 atm and 600 K (b) 0.5 atm and 273 K
(c) 6 atm and 1092 K (d) 4 atm and 500 K

Karnataka-CET-2014

Ans. (d) : For ideal gas equation, P = dRT (d = Density)

$\therefore \quad d \propto \frac{P}{T}$

(a) $\frac{P}{T} = \frac{2}{600} = 0.0033$ (b) $\frac{P}{T} = \frac{0.5}{273} = 0.00183$

(c) $\frac{P}{T} = \frac{6}{1092} = 0.00549$ (d) $\frac{P}{T} = \frac{4}{500} = 0.0080$

∵ P/T ratio is highest at 4 atm and 500 K.

∴ Density is maximum at this condition.

117. The Gibbs free energy for the decomposition of Al_2O_3 at 500°C is 482.5 kJ/mol. The potential difference needed for electrolytic reduction of Al_2O_3 at 500°C is at least

(a) 2.5 V (b) 5.0 V
(c) 1.25 V (d) 4.5 V

AMU-2019

Ans. (c) : Reaction formed,

$$\frac{2}{3}Al_2O_3 \longrightarrow \frac{4}{3}Al + O_2$$

Where, $\Delta_r G = +482.5\ kJ\ mol^{-1}$

(i) $\underset{\text{(At anode)}}{2O^{2-} + 4e^- \longrightarrow O_2]\times 3}$

(ii) $\underset{\text{(At cathode)}}{Al^{3+} \longrightarrow Al + 3e^-]\times 4}$

Accurate reaction,

$$\frac{4}{3}Al + 2O^{2-} \longrightarrow O_2 + \frac{4}{3}Al$$

So, number of electron transferred $= \frac{12}{3} = 4$

From formula,

$\Delta G° = -nFE°$

$(482.5 \times 1000) J/mol = -4 \times 96500 \times E°$

$$E° = \frac{(482.5 \times 1000) J/mol}{4 \times 96500} = 1.25$$

118. The melting point of benzene is 5.5°C. What is the sign of ΔH, ΔS and ΔG for melting point of benzene at 0°C?

(a) ΔH>0, ΔS>0, ΔG>0 (b) ΔH<0, ΔS>0, ΔG<0
(c) ΔH>0, ΔS>0, ΔG<0 (d) ΔH>0, ΔS<0, ΔG>0

AMU-2019

Ans. (a) : The melting point of benzene is 5.5°C. The sign of ΔH, ΔS and ΔG for melting point of benzene at 0°C is–

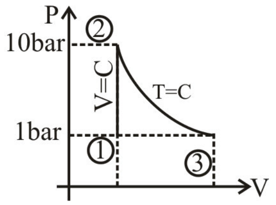
ΔH>0, ΔS>0, ΔG>0

119. An ideal gas initially at temperature, pressure and volume, 27°C, 1.00 bar and 10 L, respectively is heated at constant volume until pressure is 10.0 bar; it then undergoes a reversible isothermal expansion until pressure is 1.00 bar. What is the total work W, during this process?

(a) -23.02×10^3 J (b) -14.0×10^3 J
(c) 14.0×10^3 J (d) Zero

AMU-2018

Ans. (b) :



@apna_pdf

For process 1-2 : V = C

$W_1 = -P\Delta V$

$\because \quad \Delta V = 0$

$\therefore \quad W_1 = 0$

For process 2-3 : T = C

$$W_2 = -2.303 \text{ nRT} \log \frac{P_2}{P_3}$$

We know that, PV = nRT

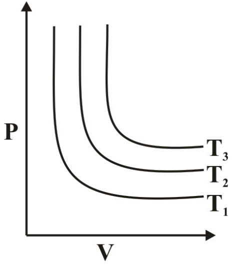
$$W_2 = -2.303 \times P \times V \times \log \frac{10}{1}$$

$= -2.303 \times 1 \times 10^5 \times 10^{-3} \log 10$

$= -2.303 \times 10^2$ J

$= -23.03 \times 10^3 \text{ J} \approx 23.02 \times 10^3$ J

120. For the given PV isotherms, which of the following is correct for T_1, T_2, T_3 ?

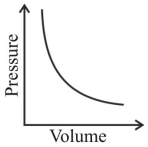


(a) $T_1 < T_2 < T_3$ (b) $T_3 < T_2 < T_1$

(c) $T_2 < T_3 < T_1$ (d) $T_1 > T_3 > T_2$

AMU-2018

Ans. (a) : According to Boyle's law, the product of volume and pressure of a given gas is constant at constant temperature. The curve between pressure and volume is plotted as



On increasing temperature the curve shifts to higher value.

121. A better criterion for ideality of a gas than $\left(\frac{\partial U}{\partial V}\right)_T = 0$ is

(a) $\left(\frac{\partial H}{\partial P}\right)_T < 0$ (b) $\left(\frac{\partial H}{\partial P}\right)_T > 0$

(c) $\left(\frac{\partial H}{\partial P}\right)_T = 0$ (d) $\left(\frac{\partial H}{\partial P}\right)_T \neq 0$

AMU-2017

Ans. (c) : $\left(\frac{\partial H}{\partial P}\right)_T = 0$

122. 30.4 kJ is required to melt one mole of NaCl. The entropy change during melting is 28.4 J mol^{-1} K^{-1}. What is the melting point of sodium chloride?

(a) 1070.4 K (b) 535.2 K

(c) 273.1 K (d) 1007.4 K

AMU-2016

Ans. (a) : $NaCl_{(s)} \longrightarrow NaCl_{(l)}$ (ΔG = 0, At phase)

$0 = \Delta H - T\Delta S$,

Entropy change, $\Delta S = \frac{\Delta H}{T}$

So, $T = \frac{\Delta H}{\Delta S} = \frac{30.4 \times 10^3}{28.4} = 1070.4\text{K}$

123. For an isolated system, ΔU = 0, then

(a) $\Delta S = 0$

(b) $\Delta S < 0$

(c) $\Delta S > 0$

(d) the value of ΔS cannot be predicted.

AMU-2012

Ans. (c) : ΔS is independent of ΔU

And for isolated system,

$\Delta S > 0 \rightarrow$ Always

124. An adiabatic process occurs in

(a) open system

(b) closed system

(c) isolated system

(d) in all the given systems

AMU – 2009

Ans. (c) : Adiabatic process is a process in which energy transfer take place in form of work only and heat transfer is zero. For that, system must be thermally insulated.

125. A reaction is spontaneous at high temperatures if

(a) ΔH and ΔS both are negative

(b) ΔH and ΔS both are positive

(c) ΔH is negative and ΔS is positive

(d) ΔH is positive and ΔS is negative.

AMU – 2007

Ans. (b) : A reaction is spontaneous at high temperature, if ΔH and ΔS are positive and it is an entropy driven process.

126. Calculate the entropy change for $CH_4(g)+H_2O(g) \rightarrow 3H_2(g)+CO(g)$ $JK^{-1}mole^{-1}$ are 186.2, 188.7, 130.6, 197.6 respectively. The entropy change is

(a) $-46\ JK^{-1}mole^{-1}$ (b) $+46\ JK^{-1}mole^{-1}$

(c) $-214.8\ JK^{-1}mole^{-1}$ (d) $+214.8\ JK^{-1}mole^{-1}$

AMU-2005

Ans. (d) : Given,

$CH_4(g) = 186.2\ JK^{-1}mol^{-1}$

$H_2O(g) = 188.7\ JK^{-1}mol^{-1}$

$H_2(g) = 130.6\ JK^{-1}mol^{-1}$

$CO(g) = 197.6\ JK^{-1}mol^{-1}$

The entropy change (ΔS°) for the reaction,

$CH_4(g)+H_2O(g) \rightarrow 3H_2(g)+CO(g)$

Entropy of a reaction = Entropy of products – Entropy of reactants

Entropy change (ΔS°) = (197.6 + 3×130.6) – (186.2 + 188.7)

$= 589.4 - 374.9$

$= 214.5\ JK^{-1}mole^{-1}$

@apna_pdf

127. A process is spontaneous at high temperature if

(a) $\Delta H > 0$ and $\Delta S > 0$ (b) $\Delta H < 0$ and $\Delta S < 0$

(c) $\Delta H > 0$ and $\Delta S < 0$ (d) $\Delta H = 0$ and $\Delta S < 0$

AMU-2004

Ans. (a) : $\Delta G = \Delta H - T\Delta S$

If ΔH is +ve and ΔS is +ve then . at high temperature ΔG is – ve, i.e the process is spontaneous.

128. ∆H and ∆E will have same value in

(a) $N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$

(b) $N_2O_4(g) \rightarrow 2NO_2(g)$

(c) $H_2(g) + I_2(g) \rightarrow 2HI(g)$

(d) $2H_2(g) + O_2(g) \rightarrow 2H_2O(l)$

AMU–2003

Ans. (c) : For $H_2(g) + I_2(g) \rightarrow 2HI(g)$

$\Delta H = \Delta E + P\Delta V$

$\Delta V = 0$

$\therefore \Delta H = \Delta E$

129. For the reversible process, the value of ∆S is given by the expression

(a) $q_{(rev)} \times T$ (b) $q_{(rev)} \div T$

(c) $\Delta H/\Delta T$ (d) $T \div q_{(rev)}$

AMU 2002

Ans. (b) : According to the second law of thermodynamics, the change in entropy for reversible reaction during a process is expressed as,

$$\Delta S = \frac{q_{rev}}{T}$$

130. For the precipitation reaction of Ag^+ ions with NaCl, which of the following statements is correct ?

(a) ΔG for the reaction is zero

(b) ΔG for the reaction is negative

(c) $[\Delta G] = [\Delta H]$

(d) none of these.

AMU–2001

Ans. (b) : For spontaneous reaction, the value of free energy is negative (i.e. $\Delta G < 0$).

Since, both ΔH and ΔS can be either positive or negative.

131. Enthalpy of formation of a compound

(a) is always positive

(b) is always negative

(c) can be either positive or negative

(d) can be either negative or zero

Assam CEE-2014

Ans. (c) : Enthalpy of formation of a compound can be positive or negative. It depends on standard form of elements that are taken into consideration.

132. For the gaseous reaction $N_2O_4(g) \rightarrow 2NO_2(g)$

(a) $\Delta H = 0$ (b) $\Delta H = \Delta U$

(c) $\Delta H < \Delta U$ (d) $\Delta H > \Delta U$

Assam CEE-2014

Ans. (d) : $\Delta H = \Delta U + \Delta n_g RT$

$\Delta n_g = n_p - n_R = 2 - 1 = 1$

Where, n_P = Mole of product

n_R = Mole of reactant

$\therefore \Delta H = \Delta U + (1)\,RT$

$\boxed{\therefore \Delta H > \Delta U}$

133. The temperature of a gas in a closed container is 27 °C. If the temperature is raised to 327 °C, the pressure exerted is

(a) reduced to half

(b) doubled

(c) reduced to one-third

(d) Cannot be calculated

Assam CEE-2014

Ans. (b) : Closed container mean volume is constant,

$$\frac{P_1}{T_1} = \frac{P_2}{T_2}$$

Given, $T_1 = 27 + 273 = 300$ K

$T_2 = 327 + 273 = 600$ K,

$$\frac{P_1}{300} = \frac{P_2}{600}$$

$$\therefore P_2 = \frac{600}{300} \times P_1 = 2P_1$$

So, Pressure become double.

134. For the reaction, $2Cl(g) \rightarrow Cl_2(g)$. the signs of ∆H and ∆S are

(a) ΔS is – Ve, ΔH is –Ve

(b) ΔS is + Ve, ΔH is –Ve

(c) ΔS is – Ve, ΔH is +Ve

(d) ΔS is + Ve, ΔH is +Ve

Assam CEE-2020

Ans. (a) : $2Cl(g) \rightarrow Cl_2(g)$

As we can see from the reaction, Entropy is decreasing in the reaction as no. of molecules are decreasing. It means the randomness at the system decreases and reaction is exothermic hence ΔH is also negative (–).

135. If temperature of a liquid is raised surface tension of the liquid

(a) Increases (b) decreases

(c) remains the same (d) decreases to 0^0C

Assam CEE-2019

Ans. (b) : Surface tension is defined as the resistance offered by the surface of the liquid to penetration. As the temperature increases, surface tension decreases.

136. An equilibrium mixture of ice and water is under constant pressure, where ice melts if heat is supplied. For this process

(a) Free energy increases

(b) Entropy increases

(c) Enthalpy increases

(d) Entropy decreases

Assam CEE-2018

Ans. (b) : As temperature increases, volume also increases due to increase in volume randomness of molecules also increases

Hence, entropy of system increases.

@apna_pdf

137. For a reaction, K = 100 the value of ΔG will be

(a) -2.303 RT (b) -4.606 RT
(c) $-$RT (d) RT

Assam CEE-2021

Ans. (b) : Given, K = 100
and

$$\Delta G = -2.303 \text{ RT} \log K$$
$$= -2.303 \text{ RT} \log(100)$$
$$= -2.303 \text{ RT} \times 2 \log 10$$
$$= -4.606 \text{ RT}$$

138. Highest entropy is in :

(a) hydrogen (b) water
(c) graphite (d) mercury

BCECE-2006

Ans. (a) : Entropy is defined as the degree of the randomness of molecules. It means, the molecules which have high randomness will have higher entropy.

So, Gas molecules have more entropy because it have more randomness motion.

Gas > Liquid > Solid.

From the above given option, Hydrogen is in gaseous state.

Hence, have more entropy.

139. Which of the following is always negative for exothermic reaction ?

(a) ΔH (b) ΔS
(c) ΔG (d) None of these

BCECE-2005

Ans. (a) : ΔH always negative for exothermic reactions, because exothermic process are energy librating process. i.e. $\Delta H = -ve$

140. What is ΔE for system that does 500 cal of work on surrounding and 300 cal of heat is absorbed by the system?

(a) -200 cal (b) -300 cal
(c) $+200$ cal (d) $+300$ cal

BCECE-2003

Ans. (a) : Given,

q = +300 cal (Heat is absorbed)
W= 500 cal (work done on surrounding)

From first law of thermodynamic

$\Delta E = q + W = 300 + (-500) = -200$ cal.

141. Which of the following will produce the highest rise in temperature ?

(a) 67 mL of 1 M NaOH + 33 mL of 0.5 M H_2SO_4
(b) 33 mL of 1 M NaOH + 67 mL of 0.5 M H_2SO_4
(c) 40 mL of 1 M NaOH + 60 mL of 0.5 M H_2SO_4
(d) 50 mL of 1 M NaOH + 50 mL of 0.5 M H_2SO_4

BCECE-2009

Ans. (d) : Here all the reaction are acid-base i.e neutralization.

Option (d) has highest heat evolved. So rise in temperature is maximum.

142. Unit of entropy is

(a) $JK^{-1}mol^{-1}$ (b) $J\ mol^{-1}$
(c) $J^{-1}K^{-1}mol^{-1}$ (d) $JK\ mol^{-1}$

BCECE-2012

Ans. (a) : Change in Entropy $(\Delta S) = \dfrac{q_{rev}}{T}$

Unit of,

$q_{rev.} \rightarrow J\ mol^{-1}$
$T \rightarrow K$
$\therefore \quad \Delta S \rightarrow JK^{-1}\ mol^{-1}$

143. Given that dE = TdS – pdV and H = E + pV. Which one of the following relations is true?

(a) dH = TdS + Vdp (b) dH = SdT + Vdp
(c) dH = –SdT – Vdp (d) dH = dE – pdV

BCECE-2014

Ans. (a) : dE = TdS – PdV ...(i)
H = E + PV ... (ii)
Differentiating Eq. (ii),
dH = dE + PdV + VdP ... (iii)
From equation (i) and (ii),
dH = TdS + Vdp

144. Which one of the following equations represents the variation of viscosity coefficient (η) with temperature (T)?

(a) $\eta = Ae^{-E/RT}$ (b) $\eta = Ae^{E/RT}$
(c) $\eta = Ae^{-E/KT}$ (d) $\eta = Ae^{-E/T}$

BCECE-2014

Ans. (b) : The variation of viscosity coefficient (η) with temperature (T) is given by,
$\eta = Ae^{E/RT}$
Viscosity are taken in Fluid medium

145. Which one of the following is an exothermic reaction?

(a) $N_2(g)+O_2(g)+180.8kJ \longrightarrow 2NO(g)$
(b) $C(\text{graphite})+2S(s) \longrightarrow CS_2(l)-91.9kJ$
(c) $N_2(g)+3H_2(g)-92kJ \longrightarrow 2NH_3(g)$
(d) $C(g)+H_2O(g) \longrightarrow CO(g)+H_2(g)-131.4kJ$

BCECE-2015

Ans. (c) : Reaction in which heat evolved from the system is known as Exothermic reaction.
$N_2(g) + 3H_2(g) \rightarrow 2\ NH_3(g) + 92\ kJ\downarrow$ heat is evolved
So, ΔH = Negative

146. Which of the following gases has maximum value of root mean square velocity (v_{rms}) at same temperature CO_2, H_2, NH_3?

(a) CO_2 (b) H_2
(c) NH_3 (d) All have same velocity

BCECE-2016

Ans. (b) : $v_{rms} = \sqrt{\dfrac{3RT}{M}}$

T = Constant

Its means, higher be the value of molecular mass, lower be the v_{rms} and vice-versa.

We have, $M_{CO_2} = 44,\ M_{H_2} = 2,\ M_{NH_3} = 17$

Hence, v_{rms} of H_2 will be maximum

@apna_pdf

147. Compounds with high heat of formation are less stable because

(a) It is difficult to synthesize them
(b) Energy rich state leads to instability
(c) High temperature is required to synthesize them
(d) Molecules of such compounds are distorted

BITSAT 2006

Ans. (b) : Higher values of heat of formation indicates a higher amount of energy released during the formation of a compound, which makes it more stable.
So, more the energy, lesser is the stability.

148. K for CH_3COOH at 25^0C is 1.754×10^{-5}. At 50^0C K is 1.633×10^{-5}. What are ΔH^0 and ΔS^0 for the ionization of CH_3COOH?

(a) $-1.55\,kJmol^{-1}, -96.44\,Jmol^{-1}K^{-1}$
(b) $-2.55\,kJmol^{-1}, -106.44\,Jmol^{-1}K^{-1}$
(c) $1.55\,kJmol^{-1}, 96.44\,Jmol^{-1}K^{-1}$
(d) $-1.55\,kJmol^{-1}, 96.44\,Jmol^{-1}K^{-1}$

BITSAT 2008

Ans. (a) : Given,
$T_1 = 25°C + 273 = 298K$, $T_2 = 50°C + 273 = 323K$

$$\left(K_{CH_3COOH}\right)_{25°C} = 1.754 \times 10^{-5}$$

$$\left(K_{CH_3COOH}\right)_{50°C} = 1.633 \times 10^{-5}$$

We know,

$$\Delta G^0 = -2.303\ RT \log K$$

$$\Delta G^0_{(323)} = -2.303 \times 8.314 \times 323 \log\left(1.633 \times 10^{-5}\right)$$
$$= 29605\,J$$

$$\Delta G^0_{(298)} = -2.303 \times 8.314 \times 298 \log\left(1.754 \times 10^{-5}\right)$$
$$= 27194\,J$$

$$\Delta G^0 = \Delta H^0 - T\Delta S^0$$

$$29605 = \Delta H^0 - 323\Delta S^0 \qquad .....(i)$$

$$27194 = \Delta H^0 - 298\Delta S^0 \qquad .....(ii)$$

From eqn. (i) & (ii) on calculation, We find

$$\Delta S^0 = -96.44\ J\,K^{-1}\,mol^{-1}$$

$$\therefore \Delta H^0 = -1.55\ kJ/mol$$

149. For the reaction

$$N_2 + 3H_2 \rightleftharpoons 2NH_3$$

Which one of the following is correct regarding ΔH :

(a) $\Delta H = \Delta E + 2RT$
(b) $\Delta H = \Delta E - 2RT$
(c) $\Delta H = \Delta E + RT$
(d) $\Delta H = \Delta E - RT$

BITSAT 2009

Ans. (b) : $N_2 + 3H_2 \rightleftharpoons 2NH_3$
According to 1st law of thermodynamics,
$\Delta H = \Delta E + nRT$
Where ΔH = enthalpy of reaction at constant pressure
ΔE = heat of reaction at constant volume
R = molar gas constant
T = temperature of the reaction
n = (no. of moles of product) – (no. of moles of reactant.)
From reaction, $n = n_P - n_R = 2 - 4 = -2$
Hence, $\Delta H = \Delta E - 2RT$

150. One mole of an ideal gas at 300 K is expanded isothermally from an initial volume of 1 litre to 10 litres. The ΔE for this process is ($R = 2$ cal $mol^{-1}K^{-1}$)

(a) 163.7 cal
(b) zero
(c) 1381.1 cal
(d) 9 lit atom

BITSAT 2009

Ans. (b) : For isothermal process, ΔE = 0 because for ideal gas, internal energy is a function of temperature only.

151. A spontaneous reaction is impossible if

(a) both ΔH and ΔS are negative
(b) both ΔH and ΔS are positive
(c) ΔH is negative and ΔS is positive
(d) ΔH is positive and ΔS is negative

BITSAT 2015

Ans. (d) : For non spontaneous reaction,
ΔH is positive and ΔS is negative.

152. For a particular reversible reaction at temperature T, ΔH and ΔS were found to be both +ve. If T_e is the temperature at equilibrium, the reaction would be spontaneous when

(a) $T_e > T$
(b) $T > T_e$
(c) T_e is 5 times T
(d) $T = T_e$

BITSAT 2016
AIEEE-2010

Ans. (b) : At equilibrium, ΔG = 0
Hence, $\Delta G = \Delta H - T_e\Delta S$
$0 = \Delta H - T_e\Delta S$
$\Delta H = T_e\Delta S$
For a spontaneous reaction
ΔG must be negative which is possible only if $\Delta H - T\Delta S < 0$
$\therefore \Delta H < T\Delta S$
or $T > \dfrac{\Delta H}{\Delta S}$; $T_e < T$

153. For the reaction $CO(g) + \frac{1}{2}O_2(g) \rightarrow CO_2(g)$

Which one of the statement is correct at constant T and P?

(a) ΔH = ΔE
(b) ΔH < ΔE
(c) ΔH > ΔE
(d) ΔH is independent of physical state of the reactants.

BITSAT 2017

@apna_pdf

Ans. (b) : $CO(g)+\frac{1}{2}O_2(g)\rightarrow CO_2(g)$

Δn = [1 mol of CO_2] – [1 mol of CO + 0.5 mol of O_2]
= –0.5

$\Delta H=\Delta E-\frac{1}{2}RT$

$\therefore\ \Delta E>\Delta H$

154. For the chemical reaction,
$N_2+3H_2\rightarrow 2NH_3$, if
$\frac{d[NH_3]}{dt}=2\times10^{-4}$ mol L^{-1} s^{-1}, the value of
$\frac{-d[H_2]}{dt}$ is

(a) $1\times10^{-4}\,mol\,L^{-1}s^{-1}$ (b) $3\times10^{-4}\,mol\,L^{-1}s^{-1}$
(c) $4\times10^{-4}\,mol\,L^{-1}s^{-1}$ (d) $6\times10^{-4}\,mol\,L^{-1}s^{-1}$

CG PET -2008

Ans. (b) : $N_2+3H_2\rightarrow 2NH_3$ (Haber's Process)

Given that $\frac{d[NH_3]}{dt}=2\times10^{-4}\,mol\,L^{-1}s^{-1}$

Using above reaction,

$$\frac{-d[H_2]}{dt}=\frac{3d[NH_3]}{2dt}$$

$$\frac{-d[H_2]}{dt}=\frac{3}{2}\times2\times10^{-4}\,mol\,L^{-1}s^{-1}$$

$$\therefore\quad \frac{-d[H_2]}{dt}=\frac{3}{2}\times2\times10^{-4}\,mol\,L^{-1}s^{-1}$$

$$=3\times10^{-4}\,mol\,L^{-1}s^{-1}$$

155. Which of the following units of energy, represents maximum amount of energy?

(a) Calorie (b) Joule
(c) Erg (d) Electron volt

CG PET -2008

Ans. (a) : 1 eV energy = 1.6×10^{-19} J

- 1 erg energy = 10^{-7} J
- 1 calorie energy = 4.18 J

Hence, maximum amount of energy represented by calorie.

156. 1.0L of 1.0 M solution of sodium hydroxide is neutralised by 1.0 L of 1.0 M of methanoic acid. If the heat of formation of water is X, the neutralisation energy of above reaction is

(a) less than X (b) more than X
(c) equal to X (d) None of the above

CG PET -2008

Ans. (a) : Heat of Neutralization of a strong acid with strong base is constant and equal to 13.7 kcal. Here, constant value represents the heat of formation of one mole of H_2O.

$H^++OH^-\rightarrow H_2O$,

ΔH = 13.7 kcal.

But the heat of neutralization of weak acid and strong base is less than 13.7 kcal (X) because some heat is utilized to dissociate the molecule of weak acid into ions.

Heat of Neutralization are taken strong Acid with strong base.

157. Match List I with List II and select the correct answer using the codes.

List I	List II
A. Spontaneous process	1. $\Delta H<0$
B. Exothermic process	2. Heat of reaction
C. Enthalpy at constant Pressure	3. $\Delta G<0$
D. Cyclic process	4. $\Delta U=0,\Delta H=0$

Codes

	A	B	C	D
(a)	4	2	1	3
(b)	3	1	2	4
(c)	1	3	4	2
(d)	1	2	3	4

CG PET- 2016

Ans. (b) : By option –

A – spontaneous process

$\Delta G<0$

B – Exothermic process

$\Delta H<0$

C – Enthalpy at constant Pressure

ΔH (Heat of reaction)

D – In cyclic process

All state function are zero

$\Delta u=0$, $\Delta H=0$

158. In an adiabatic process which of the following is true

(a) q=+W (b) q=0
(c) $\Delta E=q$ (d) $p\Delta V=0$

CG PET -2006

Ans. (b) : In an adiabatic process, q = 0 as no heat is exchanged between system and surrounding.

Adiabatic expansion → cooling effect and vice versa .

159. The decomposition of dinitrogen tetroxide at 300 K and 1.0 atm pressure is 20%. At equilibrium, the partial pressure (in atm) of nitrogen peroxide is

(a) 0.2 (b) 0.67
(c) 0.33 (d) 0.8

CG PET -2017

Ans. (c) : $\because N_2O_4 \rightleftharpoons 2NO_2$

Molar ratio= 1:2

Also, only 20% of N_2O_4 gets decomposed means.

Thus, Total number of moles at equilibrium = 0.4 + 0.8 = 1.2 moles

$\because$ Total pressure (P_t) =1 atm (given)

According to Daltons law of partial pressure,

$$P_{N_2O_4}=X_{(N_2O_4)}\times P_t$$

$$P_{NO_2}=X_{(NO_2)}\times P_t$$

$$P_{NO_2}=\frac{0.4}{1.2}\times1=0.33$$

@apna_pdf

160. In a reversible isothermal process, the change in internal energy is

(a) zero (b) positive

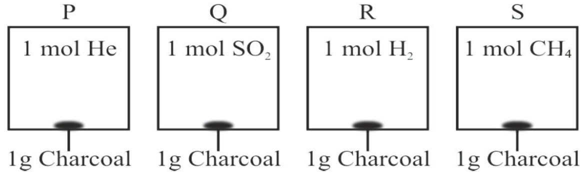
(c) negative (d) None of these

CG PET- 2010

Ans. (a) : $\Delta E = 0$ for reversible isothermal process (T = constant)

- Internal energy is function of temperature only for ideal gas.

161. From the figure, in which of the following vessel, the pressure of the gas is the highest, (Temperature and volume of the gases are the same in each vessel).



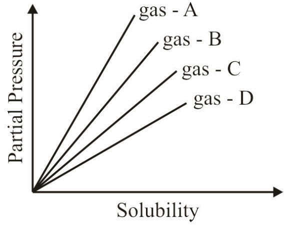
(a) Q (b) P

(c) R (d) S

GUJCET-2020

Ans. (b) : Helium has the highest moles So, it has the highest pressure. As He gas will not absorbed so the pressure of the gas will be highest in P.

162. From the given graph at constant, temperature, which gas has the least solubility?



(a) gas-D (b) gas-B

(c) gas-A (d) gas-C

GUJCET-2014

Ans. (c) : Henry's law is gas law which states "at the amount of gas that is dissolved in a liquid is directly proportional to the partial pressure of that gas above the liquid when the temperature is kept constant".

$P = K_H X$

The constant of proportionality for this relationship is called Henry's law constant.

$$\text{Solubility} \propto \frac{1}{\text{Henry's constant}}$$

It means, Less value of Henry Constant, more the solubility.

163. At the equilibrium position in the process of adsorption :

(a) $\Delta H > 0$ (b) $\Delta H = T\Delta S$

(c) $\Delta H > T\Delta S$ (d) $\Delta H < T\Delta S$

HP CET-2018

Ans. (b) : At equilibrium position during adsorption, $\Delta G = \Delta H - T\Delta S$ [ΔG=0, at equilibrium]

So, that

$\Delta H = T\Delta S$

164. In conversion of limestone to lime,

$CaCO_3(s) \longrightarrow CaO(s) + CO_2(g)$ the values of $\Delta H°$ and $\Delta S°$ are +179.1 kJ mol^{-1} and 160.2 J/K, respectively at 298 K and 1 bar. Assuming that $\Delta H°$ and $\Delta S°$ do not change with temperature, temperature above which conversion of limestone to lime will be spontaneous is

(a) 1008 K (b) 1200 K

(c) 845 K (d) 1118 K

AIEEE-2007

Ans. (d) : $CaCO_3(s) \rightarrow CaO(s) + CO_2(g)$

Given that,

$\Delta H^o = +179.1$ kJ/mol

$\Delta S^o = 160.2$ J/mol

$\Delta G^o = \Delta H^o - T\Delta S^o$

For spontaneous process, $\Delta G^o < 0$

$\therefore \Delta H^o - T\Delta S^o < 0$

$\therefore 179.1\times10^3 < 160.2 \times T$

$$\therefore T > \frac{179.1\times10^3}{160.2}$$

$\therefore \boxed{T > 1118 \text{ K}}$

Therefore, above 1118 K, the reaction will be spontaneous.

165. The entropy change involved in the isothermal reversible expansion of 2 moles of an ideal gas from a volume of 10 dm^3 to a volume of 100 dm^3 at 27°C is

(a) 38.3 J mol^{-1} K^{-1} (b) 35.8 J mol^{-1} K^{-1}

(c) 32.3 J mol^{-1} K^{-1} (d) 42.3 J mol^{-1} K^{-1}

AIEEE-2011

Ans. (a) : Given, n = 2 mole

$V_1 = 10\ dm^3$

$V_2 = 100\ dm^3$

$T = 27°C + 273 = 300$ K

$$\Delta S = 2.303 nR \log\left(\frac{V_2}{V_1}\right)$$

$$= (2.303)\,(2)(8.314)\log\left(\frac{100}{10}\right)$$

$= 38.3$ J $mol^{-1}K^{-1}$

Thus, entropy change of reaction is 38.3J $mol^{-1}K^{-1}$.

166. Two blocks of the same metal having same mass and at temperature T_1 and T_2 respectively, are brought in contact with each other and allowed to attain thermal equilibrium at constant pressure. The change in entropy, ΔS for this process is

(a) $2C_p k \ln\left[\frac{(T_1+T_2)^{\frac{1}{2}}}{T_1T_2}\right]$ (b) $2C_p \ln\left[\frac{(T_1+T_2)}{4T_1T_2}\right]$

(c) $C_p \ln\left[\frac{(T_1+T_2)^2}{4T_1T_2}\right]$ (d) $2C_p \ln\left[\frac{T_1+T_2}{2T_1T_2}\right]$

JEE Main-2019 Shift-I

@apna_pdf

Ans. (c) At the thermal equilibrium,

$$\text{Final Temperature } T_f = \frac{T_1 + T_2}{2}$$

For the 1st block, $\Delta S_I = C_P \ln\frac{T_f}{T_1}$

For the 2nd block, $\Delta S_{II} = C_P \ln\frac{T_f}{T_2}$

When brought in contact with each other,

$$\Delta S = \Delta S_I + \Delta S_{II} = C_P \ln\frac{T_f}{T_1} + C_P \ln\frac{T_f}{T_2}$$

$$= C_P \ln\left(\frac{T_f}{T_1}\times\frac{T_f}{T_2}\right) = C_P \ln\left[\frac{T_f^2}{T_1T_2}\right]$$

$$= C_P \ln\left[\frac{\left(\frac{T_1+T_2}{2}\right)^2}{T_1T_2}\right] = C_P \ln\left[\frac{(T_1+T_2)^2}{4T_1T_2}\right]$$

167. The reaction,
$MgO(s) + C(s) \rightarrow Mg(s) + CO(g)$, for which $\Delta_r H° = +491.1$ kJ mol^{-1} and $\Delta_r S° = 198.0$ JK^{-1} mol^{-1}, is not feasible at 298 K. Temperature above which reaction will be feasible is

(a) 2040.5 K (b) 1890.0 K
(c) 2380.5 K (d) 2480.3 K

JEE Main-2019, Shift-II

Ans. (d) : At equilibrium $T = \frac{\Delta H}{\Delta S} = \frac{491.1\times1000}{198}$

$= 2480.3$ K

It is the temperature above which reaction is not possible.

168. The entropy change associated with the conversion of 1 kg of ice at 273 K to water vapours at 383 K is (Specific heat of water liquid and water vapour are 4.2 kJK^{-1} kg^{-1} and 2.0 kJK^{-1} kg^{-1}; heat of liquid fusion and vapourisation of water are 334 kJ kg^{-1} and 2491kJkg^{-1} respectively).
(log273 = 2.436, log 373 = 2.572, log383 = 2.583)

(a) 9.25 kJ kg^{-1} K^{-1} (b) 8.49 kJ kg^{-1} K^{-1}
(c) 7.90 kJ kg^{-1} K^{-1} (d) 2.64 kJ kg^{-1} K^{-1}

JEE Main-2019 Shift-II

Ans. (a) : The conversion of 1kg of ice at 273 K into water vapours at 383 K takes place as follow–

$$\underset{273K}{H_2O(s)} \xrightarrow{\Delta S_1} \underset{273K}{H_2O(l)} \xrightarrow{\Delta S_2} \underset{373K}{H_2O(l)} \xrightarrow{\Delta S_3} \underset{373K}{H_2O(g)} \xrightarrow{\Delta S_4} \underset{383K}{H_2O(g)}$$

$$\Delta S_1 = \frac{\Delta H_{Fusion}}{\Delta T_{Fusion}} = \frac{334}{273} = 1.22\,kJ\,kg^{-1}K^{-1}$$

$$\Delta S_2 = C\log\frac{T_2}{T_1} = 4.2\log\left(\frac{373}{273}\right)$$

$= 4.2 \times 2.303(\log373 - \log273)$ kJ K^{-1} kg^{-1}
$= 4.2 \times 2.303(2.572 - 2.436)$
$= 1.31$ kJ K^{-1} kg^{-1}

$$\Delta S_3 = \frac{\Delta H_{vap.}}{\Delta T_{vap.}} = \frac{2491}{373} = 6.67\,kJ\,kg^{-1}K^{-1}$$

$$\Delta S_4 = C\log\frac{T_2}{T_1} = 2\log\left(\frac{383}{273}\right)$$

$= 2\times2.303(\log383 - \log373)$
$= 2\times2.303(2.583 - 2.572)$
$= 0.05$ kJ K^{-1} kg^{-1}

$\Delta S_{Total} = \Delta S_1 + \Delta S_2 + \Delta S_3 + \Delta S_4$
$= 1.22+1.31+6.67+0.05$
$= 9.26$ kJ kg^{-1} K^{-1}

169. A process has $\Delta H = 200$ J mol^{-1} and $\Delta S = 40$ JK^{-1} mol^{-1}. Out of the values given below, choose the minimum temperature above which the process will be spontaneous

(a) 20 K (b) 4 K
(c) 5 K (d) 12 K

JEE Main-2019, Shift-II

Ans. (c) : $\Delta G = \Delta H - T\Delta S < 0$ $(\Delta G = \Delta H - T\Delta S)$

$$T = \frac{\Delta H}{\Delta S} = \frac{200}{40} = 5K$$

170. The process with negative entropy change is

(a) Synthesis of ammonia from N_2 and H_2
(b) Dissociation of $CaSO_4(s)$ to $CaO(s)$ and $SO_3(g)$
(c) Dissolution of iodine in water
(d) Sublimation of dry ice

JEE Main-2019, Shift-II

Ans. (a) : Four moles of gas ($N_2 + 3H_2 \rightarrow 2NH_3$) reacts to give two mole of gas
Hence, Entropy decreases.
$\Delta n_g < 0$, it mean's entropy = Negative

171. The true statement amongst the following is-

(a) S is not a function of temperature but ΔS is a function of temperature.
(b) Both ΔS and S are functions of temperature.
(c) Both S and ΔS are not functions of temperature
(d) S is a function of temperature but ΔS is not a function of temperature.

JEE Main-2020, Shift-II

Ans. (b) : By definition of entropy

$$ds = \frac{dQ}{T} \text{ and } \Delta s = \int\frac{dQ}{T}$$

So, ΔS, S both are the function of temperature.

172. Data given for the following reaction is as follows. $FeO(s) + C_{(graphite)} \longrightarrow Fe(s) + CO(g)$

Substance	**ΔH° (kJ mol^{-1})**	**ΔS° (J mol^{-1} K^{-1})**
FeO(s)	–266.3	57.49
$C_{(graphite)}$	0	5.74
Fe(s)	0	27.28
CO(g)	–110.5	197.6

@apna_pdf

The minimum temperature in K at which the reaction becomes spontaneous is .... (Integer answer)

JEE Main-2021, Shift-II

Ans. (964): $FeO_{(s)} + C_{(graphile)} \longrightarrow Fe_{(s)} + CO_{(g)}$

$$\Delta H^o_{reaction} = \Delta H^o_{f(product)} - \Delta H^o_{f(reactants)}$$
$$= [\Delta H^o_{f(Fe)} + \Delta^o_{f(CO)}] - [\Delta^o_{f(FeO)} - \Delta^o_{f(C)}]$$
$$= [0 + (-110.5)] - [266.3 - 0]$$
$$= 156\,kJ\,mol^{-1}$$
$$\Delta S^o_{reaction} = \Delta S^o_{product} - \Delta S^o_{reactant}$$
$$= [\Delta S^o_{(Fe)} + \Delta S^o_{(CO)}] - [\Delta S^o_{(FeO)} - \Delta S^o_{(C)}]$$
$$= [27.28 + 197.6] - [57.49 + 5.79]$$
$$= 161\,JK^{-1}\,mol^{-1}$$

According to Gibb's equation,

$$\Delta G^o = \Delta H^o - T\Delta S^o$$
$$T\Delta S^o = \Delta H^o$$
$$\Rightarrow \quad T = \frac{\Delta H^o}{\Delta S^o} = \frac{156}{161}$$
$$= \frac{156000}{161} = 964\,K$$

The temperature at which reaction becomes spontaneous is 964 K.

173. For the reaction,

$$\mathbf{2NO_2(g) \rightleftharpoons N_2O_4(g)}\ \textbf{when}$$

$\Delta S = -176.0\ JK^{-1}$ and $\Delta H = -57.8\ kJ\ mol^{-1}$, the magnitude of ΔG at 298 K for the reactions is .... $kJ\ mol^{-1}$. (Nearest integer)

JEE Main-2021 Shift-II

Ans. (5) : Given that,

$\Delta S = -176.0\ JK^{-1}$

$\Delta H = -57.8\ kJ\ mol^{-1}$

$\Delta G = \Delta H - T\Delta S$

$$\Delta G = 57.8 - \frac{298(-176)}{1000}$$

$\Delta G = -5.352$ kJ/mole

174. ($\Delta H - \Delta E$) for the formation of carbon monoxide (CO) from its elements at 298 K is ($R = 8.314\ JK^{-1}\ mol^{-1}$)

(a) $-1238.78\ J\ mol^{-1}$ (b) $1238.78\ J\ mol^{-1}$

(c) $-2477.57\ J\ mol^{-1}$ (d) $2477.57\ J\ mol^{-1}$

AIEEE-2006

Ans. (b) : $C_{(s)} + \frac{1}{2}O_{2(g)} \longrightarrow CO_{(g)}$

$\Delta ng = 1 - \frac{1}{2} = 0.5$ ($\Delta nq \to Gaseous_P - Gaseous_R$)

$\Delta H = \Delta U + \Delta ng\ RT$

$\therefore \quad \Delta H - \Delta U = \Delta ng \times R \times T$

$= 0.5 \times 8.314 \times 298$

$\Delta H - \Delta U = 1238.78$J/mol.

175. The enthalpy changes for the following processes are listed below

Cl_2 (g) = 2Cl(g), 242.3 $kJ\ mol^{-1}$

I_2 (g) = 2I (g), 151.0 $kJ\ mol^{-1}$

ICl(g) = I(g) + Cl(g), 211.3 $kJ\ mol^{-1}$

I_2 (s) = I_2 (g), 62.76 $kJ\ mol^{-1}$

Given that the standard states for iodine and chlorine are I_2 (s) and Cl_2 (g), the standard enthalpy of formation of ICl is

(a) $-14.6\ kJ\ mol^{-1}$ (b) $-16.8\ kJ\ mol^{-1}$

(c) $+16.8\ kJ\ mol^{-1}$ (d) $+244.8\ kJ\ mol^{-1}$

AIEEE-2006, AIIMS-2015

Ans. (c) : Here correct option is (b) Not (c).

$$\frac{1}{2}I_2(s) \to \frac{1}{2}Cl_2(g) \to ICl(g)$$
$$\Delta H = \left[\frac{1}{2}\Delta H_{s\to g} + \frac{1}{2}\Delta H_{diss}(Cl_2) + \frac{1}{2}\Delta H_{diss}(l)\right] - \Delta H_{ICl}$$
$$= \left(\frac{1}{2}\times 62.76 + \frac{1}{2}\times 242.3 + \frac{1}{2}\times 151.0\right) - 211.3$$
$$= 228.03 - 211.3$$
$$\Delta H = 16.73\ kJ\,mol^{-1}$$

176. The value of enthalpy change (ΔH) for the reaction

$$\mathbf{C_2H_5OH(\mathit{l}) + 3O_2(g) \to 2CO_2(g) + 3H_2O(\mathit{l})}\ \textbf{at}$$

27^oC is – 1366.5 $kJ\ mol^{-1}$. The value of internal energy change for the above reaction at this temperature will be

(a) –1371.5 kJ (b) –1369.0 kJ

(c) –1364.0 kJ (d) –1361.5 kJ

AIEEE-2011

Ans. (c) : $\Delta H = \Delta E + \Delta n_gRT$

$\Delta E = -1366.5 + 1 \times 8.314 \times 10^{-3} \times 300$

$= -1363.6$ kJ

177. Consider the reaction,

$$\mathbf{4NO_2(g) + O_2(g) \to 2N_2O_5(g)\ \Delta_rH = -111kJ}$$

If N_2O_5 (s) is formed instead of N_2O_5(g) in the above reaction, the Δ_rH value will be

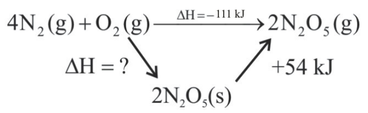
(Given, ΔH of sublimation for N_2O_5 is 54 kJ mol^{-1})

(a) –165 kJ (b) +54 kJ

(c) +219 kJ (d) –219 kJ

AIEEE-2011

Ans. (a) :



$4N_2(g) + O_2(g) \xrightarrow{\Delta H = -111\,kJ} 2N_2O_5(g)$
ΔH = ?
+54 kJ
$2N_2O_5(s)$

From Hess's law,

$\Delta H_f + \Delta H_{sub} = \Delta H_{reaction}$

$\Delta H_f = \Delta H_{reaction} - \Delta H_{sub}$

$= -111kJ - (54\ kJ)$

$= -111 - 54\ kJ = -165$ kJ

178. Given, $C_{(graphite)} + O_2(g) \to CO_2(g)$;

$$\mathbf{\Delta_rH^o = -393.5\,kJ\ mol^{-1}}$$

$$\mathbf{H_2(g) + \frac{1}{2}O_2(g) \to H_2O(\mathit{l});}$$

$$\mathbf{\Delta_rH^o = -285.8\,kJ\ mol^{-1}}$$

@apna_pdf

$CO_2(g) + 2H_2O(l) \rightarrow CH_4(g) + 2O_2(g)$;

$\Delta_r H^o$ = +890.3 kJ mol^{-1} Based on the above thermochemical equations, the value of $\Delta_r H^o$ at 298 K for the reaction,

$C_{(graphite)} + 2H_2(g) \rightarrow CH_4(g)$ will be

(a) + 78.8 kJ mol^{-1} (b) + 144.0 kJ mol^{-1}
(c) –74.8 kJ mol^{-1} (d) –144.0 kJ mol^{-1}

[JEE Main 2017]

Ans. (c) :

$C_{graphite} + O_{2(g)} \rightarrow CO_{2(g)}$; ΔrH^o = – 393.5 ... (1)

$H_2(g) + \frac{1}{2}O_2(g) \rightarrow H_2O(1)$; $\Delta rH^o = -285.8$ ...(2)

$CO_2(g) + 2H_2O(I) \rightarrow CH_4 + 2O_2(g)$; ΔrH^o = + 890.3 ... (3)

Add reactions (1) and (3)

$C_{(graphite)} + 2H_2O(I) \rightarrow CH_4(g) + O_2(g)$ ... (4)

Multiply reaction (2) with 2

$2H_2(g) + O_2(g) \rightarrow 2H_2O(1)$ ...(5)

ΔH = – 285.8 × 2 = –571.6 kJ/mol

Add reaction (4) and (5)

$C_{(graphites)} + 2H_2(g) \rightarrow CH_4(g)$

ΔH = 496.8 – 571.6

= –74.8 kJ/mol

179. For silver, $C_p(JK^{-1}mol^{-1})$ 23 + 0.01T. If the temperature (T) of 3 moles of silver is raised from 300 K to 1000 K at 1 atm pressure, the value of ΔH will be close to

(a) 62 kJ (b) 16 kJ
(c) 21 kJ (d) 13 kJ

[JEE Main 2019, 8 April Shift-I]

Ans. (a) : $\Delta H = n\int_{T_1}^{T_2} C_P dT = 3 \times \int_{300}^{1000}(23 + 0.01T)dT$

$= 3\left[23(1000-300) + \frac{0.01}{2}(1000^2 - 300^2)\right]$

= 61950J ≈ 62 kJ.

180. The difference between ΔH and ΔU ($\Delta H - \Delta U$), when the combustion of one mole of heptane (*l*) is carried out at a temperature T, is equal to

(a) –4 RT (b) 3 RT
(c) 4 RT (d) –3 RT

[JEE Main 2019, to April Shift-II]

Ans. (a) : $C_7H_{16}(l) + 11HO_2(g) \rightarrow 7CO_2(g) + 8H_2O(l)$

Now,

$\Delta n_g = n_p - n_r = 7 - 11 = -4$

$\because \Delta H = \Delta U + \Delta n_g RT$

$\therefore \Delta H - \Delta U = -4RT$

181. At 298.2 K the relationship between enthalpy of bond dissociation (in kJ mol^{-1}) for hydrogen (E_H) and its isotope, deuterium E_D), is best described by

(a) $E_H = \frac{1}{2}E_D$ (b) $E_H = E_D$
(c) $E_H = E_D - 7.5$ (d) $E_H = 2E_D$

[JEE Main 2021, 25 July Shift-I]

Ans. (c) : Enthalpy of bond dissociation (kJ/mole) at 298.2 K.

For, Hydrogen = 435.88

For, Deuterium = 443.35

$E_H = E_D - 7.5$

182. When 400 mL of 0.2 M H_2SO_4 solution is mixed with 600 mL of 0.1 M NaOH solution, the increase in temperature of the final solution is .... × 10^{-2} K. (Round off to the nearest integer).

[Use : $H^+(aq) + OH^+(aq) \rightarrow H_2O$; ΔH = –57.1kJ mol^{-1}]

Specific heat of H_2O = 4.18 J $K^{-1}g^{-1}$, density of H_2O = 1.0 g cm^{-3}. Assume no change in volume of solution on mixing.

[JEE Main 2021, 27 July Shift-II]

Ans. (82) :

$nH^+ = \frac{400 \times 0.2}{1000} \times 2 = 0.16$

$nOH^- = \frac{600 \times 0.1}{1000} = 0.06$ (L.R.)

Now, heat liberated from reaction = heat gained by solutions.

0.06 × 57.1 × 10^3 = (1000 × 1.0) × 4.18 × ΔT

ΔT = 0.8196 K

= 81.96 × 10^{-2} K = 82 × 10^{-2} K

183. For water at 100°C and 1 bar, $\Delta_{vap}H - \Delta_{vap}U$= ....×$10^2$ J mol^{-1}.

(Round off to the nearest integer)

[Use : R = 8.31J $mol^{-1}K^{-1}$]

[Assume volume of $H_2O(l)$ is much smaller than volume of $H_2O(g)$. Assume $H_2O(g)$ treated as an ideal gas]

[JEE Main 2021, 27 July Shift-I]

Ans. (31) : $\Delta H - \Delta U = \Delta n_g RT$

$\Delta n_g = 1 - 0 = 1$

$\Delta H - \Delta U$ = 1 × 8.31 × 3.73

$\Delta H - \Delta U$ = 30.99 × 10^2 J mol^{-1}

$\Delta H - \Delta U$ ≈ 31 × 10^2 J mol^{-1}

= 31

184. The Born-Haber cycle for KCl is evaluated with the following data :

$\Delta_f H^o$ for KCl = –436.7 kJ mol^{-1}

$\Delta_{sub}H^o$ for K = 89.2 kJ mol^{-1}.

$\Delta_{ionisation}$ H^o for K = 419.0 kJ mol^{-1}

$\Delta_{electron\ gain}$ H^o for Cl(g) = –348.6 kJ mol^{-1}, $\Delta_{bond}H^o$ for Cl_2 = 243.0 kJ mol^{-1}

The magnitude of lattice enthalpy of KCI in kJ mol^{-1} is ....

(Nearest integer)

[JEE Main 2021, 26 Aug Shift-I]

@apna_pdf

Ans. (718) :

$$\begin{tikzcd}
K(s) \arrow[d, "\Delta H_{sublimation}"'] & +\frac{1}{2}Cl_2(g) \arrow[r] \arrow[d, "\Delta H_{dissociation}"] & KCl(s);\Delta H_f^0 \\
K(g) \arrow[d, "IE_1"'] & Cl(g) \arrow[d, "EA"] & \\
K^+(g) & +\frac{1}{2}Cl^-{}_2(g) \arrow[r] & KCl(s);\Delta H^0_{lattice}
\end{tikzcd}$$

$$\therefore \Delta_f^0 = \Delta H_{sublimation} + \frac{1}{2}\Delta H_{dissociation} + IE_1 + EA + \Delta H^0_{lattice}$$

$$-436.7\,kJ/mol = 89.2\,kJ/mol + \frac{1}{2}\times(243\,kJ/mol)$$

$$+419\,kJ/mol + (-348.6\,kJ/mol) + \Delta H^0_{lattice}$$

$$\Delta H^0_{lattice} = -717.8\,kJ/mol$$

$\therefore$ Magnitude of lattice enthalpy of KCl in kJ/mol is 718 (nearest).

185. Heat required to raise the temperature of 1 mole of a substance by 1^o is called

(a) specific heat (b) molar heat capacity

(c) water equivalent (d) specific gravity

AIEEE-2002

Ans. (b) : Heat required to raise the temperature of 1 mole of a substance by 1^{o}C is called molar heat capacity.

186. An ideal gas is allowed to expand both reversibly and irreversibly in an isolated system. If T_i is the initial temperature and T_f is the final temperature, then which of the following statements is correct?

(a) $(T_f)_{irrev} > (T_f)_{rev}$

(b) $T_f > T_i$ for reversible process but $t_f = t_i$ for irreversible process

(c) $(T_f)_{rev} = (T_f)_{irrev}$

(d) $T_f = T_i$ for both reversible and irreversible processes

AIEEE-2006

Ans. (a) : According to law of thermodynamics,

$\Delta E = \Delta q + \Delta W$

Since, the system is isolated, therefore the change takes place adiabatically. Thus,

$\Delta q = 0$

So, $\Delta E = \Delta W$

We know, $\Delta W_{irreversible} > \Delta W_{reversible}$

This implies $\Delta E_{irreversible} > \Delta E_{reversible}$

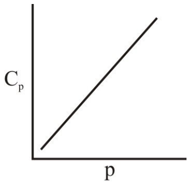
$\Delta E = nR\Delta T$

As a result, $\Delta T_{irrev} > \Delta T_{rev.}$

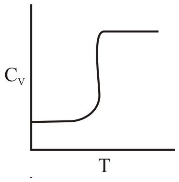
Thus, $(T_f)_{irrev} > (T_f)_{rev.}$

187. For a diatomic ideal gas in a closed system, which of the following plots does not correctly describe the relation between various thermodynamic quantities?

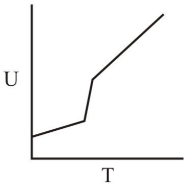
(a)



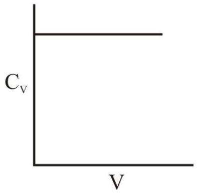
(b)



(c)



(d)



JEE Main-2019

Ans. (a) : At higher temperature the rotational degree of freedom become active

$$C_P = \frac{7}{2}R \text{ (Independent of P)}$$

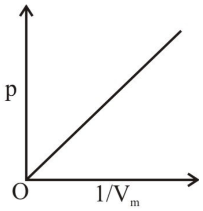
$$C_V = \frac{5}{2}R \text{ (Independent of V)}$$

C_V depends on T and independent of V.

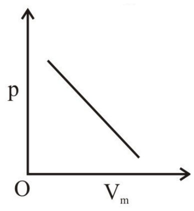
C_P depends on T and independent of P.

188. The combination of plots which does not represent isothermal expansion of an ideal gas is

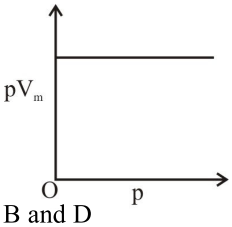
(a)



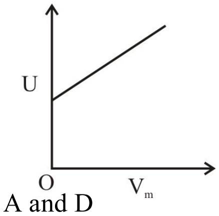
(b)



(c)



(d)



(a) B and D (b) A and D

(c) B and C (d) A and C

[JEE Main 2019, 12 Jan Shift-II]

Ans. (a) :

From graph B

Here, $P \propto \frac{1}{V_m}$

For Isothermal expansion,

$PV_m = K$ (Where K = Constant)

So, if graph is parabolic in nature then it will represent Isothermal expansion of an ideal gas.

From Graph D :

here, U = Constant and it shows straight line.

So, option (b) and (d) does not represent isothermal expansion of an ideal gas.

189. ΔU is equal to

(a) isochoric work (b) isobaric work

(c) adiabatic work (d) isothermal work

[JEE Main-2017]

@apna_pdf

Ans. (c) : $\Delta U = Q + \Delta W$

For adiabatic work, heat value is zero (Q = 0). So change in energy is equal to the work.

$\Delta U = 0 + \Delta W$

$\Delta U = \Delta W_{adiabatic}$

Thus, ΔU is equal to adiabatic work.

190. 5 moles of an ideal gas at 100 K are allowed to undergo reversible compression till its temperature becomes 200 K. If $C_v = 28\ JK^{-1}\ mol^{-1}$, calculate ΔU and ΔPV for this process. ($R = 8.0\ JK^{-1}\ mol^{-1}$)

(a) ΔU=2.8kJ; Δ(pV)=0.8kJ

(b) ΔU=14 J; Δ(pV) = 0.8 J

(c) ΔU=14 kJ; Δ(pV) = 4 kJ

(d) ΔU=14 kJ; Δ(pV) = 18 kJ

[JEE Main 2019, 8 april Shift-II]

Ans. (c) : Given that,

Number of moles of an ideal gas (n) = 5 mol

Temperature, $T_2 = 200$ K

$T_1 = 100$ K

Specific heat at constant pressure $(C_v) = 28\,J/mol\,K$

$$\Delta U = nC_v\Delta T$$

$$= 5mol \times 28J/mol\,K \times (200-100)K$$

$$= 14000J = 14k\,J$$

$$C_p = C_v + R = (28+8)J/mol\,K$$

$$= 36J/mol\,K$$

$$\Delta H = nC_p\Delta T = 5mol \times 36J/mol\,K \times 100K$$

$$= 18000J = 18kJ$$

$$\Delta H = \Delta U + \Delta PV$$

$$\Delta PV = \Delta H - \Delta U = (18-14)kJ = 4kJ$$

191. Among the following the set of parameters that represents path function, is

(A) q + W (B) q

(C) W (D) H–TS

(a) (A) and (D) (b) (A), (B) and (C)

(c) (B), (C) and (D) (d) (B) and (C)

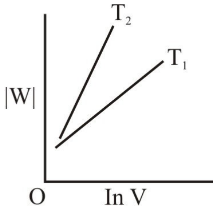
[JEE Main 2009, 9 April Shift-I]

Ans. (d) : A property whose value does not depend on the path taken to reach that specific value is known to as state function or point functions. In contrast, those function which do depend on the path from two points are known as path function.

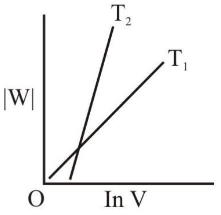
Hence, we know that heat and work are not state function but Q + W = ΔU (Definite quantity) is state function. H – TS (i.e., G) is also a state function. In essence, heat and work changes in every step of the process hence they are path function.

192. Consider the reversible isothermal expansion of an ideal gas in a closed system at two different temp. T_1 and T_2 ($T_1 < T_2$). The correct graphical depiction of the dependence of work done (W) on the final volume (V) is

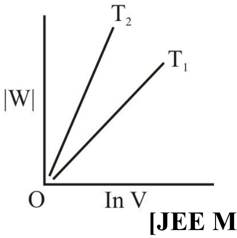
(a)



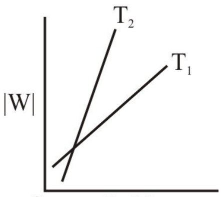
(b)



(c)



(d)



[JEE Main 2019, 9 Jan Shift-I]

Ans. (b) : For isothermal expansion–

$$w_{rev.} = -nRT\ln\frac{V_f}{V_i}$$

$$|w_{rev.}| = nRT\ln\frac{V_f}{V_i}$$

$|w_{rev.}| = nRT \ln V_f - nRT \ln V_i$

Comparing it with straight line equation, y = mx + c

Therefore, slope of curve (a) is more than curve (d) and intercept of curve (b) is more negative than curve (d).

193. For water $\Delta_{vap}H = 41kJ\ mol^{-1}$ at 373 K and 1 bar pressure. Assuming that water vapour is an ideal gas that occupies a much larger volume than liquid water, the internal energy change during evaporation of water is ....kJ mol^{-1}.

[User $R = 8.3\ J\ mol^{-1}\ K^{-1}$]

[JEE Main 2021, 26 Aug Shift-II]

Ans. 38 : $H_2O(l) \rightleftharpoons H_2O(g)\ \Delta H_{vap.} = 41\ kJ\ mol^{-1}$

For the reaction–

$\Delta H = \Delta E + \Delta n_g RT$

Given that,

$\Delta H = 41\ kJ\ mol^{-1}$

Gas constant (R) = 8.314 J/K mol

Temperature (T) = 373 K

ΔE is internal energy charge

Δn_g is change in gaseous mole = 1 – 0 = 1

Means $\Delta n_q > 0$

$41 \times 10^{-3} = \Delta E + 1 \times 8.3 \times 373$

$\Delta E \approx (41 - 3.0959) = 38\ kJ\ mol^{-1}$

194. A system does 200 J of work and at the same time absorbs 150 J of heat. The magnitude of the change in internal energy is ....J. (Nearest integer)

[JEE Main 2021, 25 July Shift-II]

Ans. 50 : Given that–

W = –200 J, Q = +150

According to first law of thermodynamics–

$\Delta U = Q + W$

$\Delta U = 150 - 200 = -50J$

Hence, internal energy –50 J

@apna_pdf

195. At 300 K and 1 atm, 15 mL of a gaseous hydrocarbon requires 375 mL air containing 20% O_2 by volume for complete combustion. After combustion, the gases occupy 330 mL. Assuming that the water formed is in liquid form and the volumes were measured at the same temperature and pressure, the formula of the hydrocarbon is

(a) C_3H_8 (b) C_4H_8
(c) C_4H_{10} (d) C_3H_6

[JEE Main 2016]

Ans. (a) : Combustion of hydrocarbon C_xH_y is given as,

$$C_xH_y(g)+\left(x+\frac{y}{4}\right)O_2(g)\rightarrow xCO_2(g)+\frac{y}{2}H_2O(l)$$

15 mL hydrocarbon requires $15\left(x+\frac{y}{4}\right)$mL oxygen

Volume of O_2 = 20% of 375

$$=\frac{200}{100}\times 375$$

$$\therefore \quad 15\left(x+\frac{y}{4}\right)=75$$

$$x+\frac{y}{4}=5 \qquad .....(i)$$

Final volume = 330 mL

Initial volume = 375 + 15 = 390 mL

H_2O formed = 390 – 330 = 60 mL

$$\Rightarrow \quad 15\times\frac{y}{2}=60$$

$$y = 8$$

Putting the value of y in equation (i), we get–

$$x = 3$$

∴ Hydrocarbon will be C_3H_8.

196. A gaseous hydrocarbon gives upon combustion, 0.72 g of water and 3.08 g of CO_2 The empirical formula of the hydrocarbon is

(a) C_2H_4 (b) C_3H_4
(c) C_6H_5 (d) C_7H_8

[JEE Main 2013]

Ans. (d) : $C_AH_B+\left(A+\frac{B}{4}\right)O_2\rightarrow ACO_2+\frac{B}{2}H_2O$

Moles of H_2O $=\frac{0.72}{18}=0.04$

Moles of CO_2 $=\frac{3.08}{44}=0.07$

$$\therefore \quad \frac{A}{\frac{B}{2}}=\frac{0.07}{0.08}$$

$$\Rightarrow \quad \frac{A}{B}=\frac{7}{8}$$

So, A = 7, B = 8

Empirical formula is C_7H_8

197. During spontaneous discharge of an electrochemical cell, Gibb's free energy will

(a) increase (b) decrease
(c) not change (d) be infinity

J & K CET-(2012)

Ans. (b) : During spontaneous discharge for electrochemical cell, Gibbs free energy will decreases.

$\Delta G^o = -nFE^o_{Cell}$ ($\Delta G < 0$)

$\Delta G^o < 0 \rightarrow$ –ve decreases

$E^o_{cell} > 0 \rightarrow$ +ve increases

198. The thermochemical property which always takes up negative values is

(a) Enthalpy of formation
(b) Lattice enthalpy
(c) Enthalpy of atomisation
(d) Enthalpy of combustion.

J & K CET-(2016)

Ans. (d) : Enthalpy of combustion is defined as the heat change (usually the heat evolved) when one mole of substance is completely burnt in oxygen with all the reactants and product in their standard state under standard conditions (298 K and 1 bar pressure).

Enthalpy of combustion is an exothermic reaction.

199. The enthalpy change accompanying a reaction is called

(a) reaction enthalpy
(b) standard enthalpy
(c) thermochemical equation
(d) enthalpy of atomization.

J & K CET-(2014)

Ans. (a) : Enthalpy of reaction is also known as the heat of reaction. It is the change in the enthalpy of a chemical reaction that occurs at a constant pressure. It is thermodynamic unit of measurement useful of calculating the amount of energy per mole either released or produced in a reaction.

The heat change during a chemical reaction is called enthalpy and the enthalpy change accompanying a reaction is called enthalpy or enthalpy of reaction.

200. Which one of the following options is correct for the spontaneity of the reaction?

(a) ΔG = Positive (+ ve); ΔH = positive (+ ve)
(b) ΔH = Positive (+ ve); ΔS = negative (– ve)
(c) ΔG = negative (– ve); ΔS = negative (– ve)
(d) ΔG = negative (– ve); ΔS = positive (+ ve)

J & K CET-(2017)

Ans. (d) : $\Delta G = \Delta H - T\Delta S$

Where, ΔG = Gibbs free energy change
ΔH = Enthalpy change
ΔS = Entropy change

$\Delta G < 0$, it means ΔG is always negative in spontaneous reaction and entropy change (ΔS) is always positive in spontaneous reaction.

So, option (d) are correct.

201. Thermodynamic properties are divided into two broad types: intensive properties and extensive properties. Which of the following is not an intensive property?

(a) Pressure (b) Volume
(c) Temperature (d) Density

J & K CET-(2017)

@apna_pdf

Ans. (b) : Volume is extensive property because volume are dependent on mass. So, intensive property do not depends on the mass.

Example–Intensive property examples density temperature pressure.

202. What condition will facilitate the spontaneity of a reaction if ΔH and ΔS both are negative?

(a) Low temperature (b) High temperature
(c) Low pressure (d) High pressure

J & K CET-(2018)

Ans. (a) : Given that–

$\Delta H = -ve$ and $\Delta S = -ve$

$\Delta G = \Delta H - T\Delta S$ (If phase change, then $\Delta G = 0$)

For a spontaneous reaction we know that–

$\Delta G = -ve$

$\Delta G = -ve \Rightarrow (T = -ve)$

So, the reaction becomes spontaneous only when the temperature is very less.

203. Which of the following options is an intensive property of a system?

(a) Mass (b) Volume
(c) Potential energy (d) Temperature

J & K CET-(2019)

Ans. (d) : Temperature is an intensive property as it does not depend upon the quantity of matter present in the system.

Intensive → Independent of mass

204. PV value decreases with increases in P at constant temperature when

(a) There is no attractive or repulsive forces between molecules
(b) attractive and repulsive forces between molecules are equal
(c) attractive forces between molecules are predominant
(d) repulsive forces between molecules are predominant.

J & K CET-(2015)

Ans. (c) : It can be seen easily that at constant temperature, PV vs P plot for real gases is not a straight line. There is a significant deviation from ideal behaviour. Two types of curves are seen. In the curves for hydrogen and Helium, as the pressure increases the value of PV also increases. The second type of plot is seen in the case of other gas like carbon mono oxide and methane. In these plots, first there is a negative deviation from ideal behavior then, PV value decreases.

205. Among the following pairs, which one has both variables as intensive variable?

(a) T, V (b) m, P
(c) d, V (d) P, T

J & K CET-(2015)

Ans. (d) : The properties which do not depend upon the quantity or size of matter are called intensive properties e.g. pressure, temperature, density, concentration, surface tension, viscosity etc. and extensive are dependent on mass or quantity of matter.

206. For the process to occur under adiabatic condition, the correct condition is

(a) $\Delta T = 0$ (b) $\Delta U = 0$
(c) $\Delta P = 0$ (d) $\Delta q = 0$

J & K CET-(2015)

Ans. (d) : A system is said to be under adiabatic condition if there is no exchange of heat between the system and its surroundings. It means ($\Delta q = 0$).

Hence, under adiabatic condition, $\Delta q = 0$

207. In thermodynamics, a quantity whose value simply depends upon the initial and final states of the system is called

(a) a thermodynamic quantity
(b) a state function
(c) an adiabatic quantity
(d) a path function

J & K CET-(2013)

Ans. (b) : State Function–The properties which depends only on initial and final state, not on path or reaction intermediate are called state function.

e.g. Entropy, Gibb's free energy, etc.

208. If ΔH and ΔS are positive for a reaction, the reaction will be spontaneous only when

(a) $T\Delta S = \Delta H$ (b) $T\Delta S > \Delta H$
(c) $T\Delta S < \Delta H$ (d) $T\Delta S$ is negative

J & K CET-(2013)

Ans. (b) : $\Delta G = \Delta H - T\Delta S$

For spontaneous $\Delta G° < 0$

It means $\Delta H - T\Delta S$ is also negative–

So, $T\Delta S > \Delta H$

209. Which one among the following pairs does not represent example for intensive property?

(a) Temperature and density
(b) pressure and molar volume
(c) Molar heat capacity and density
(d) Heat capacity and enthalpy

J & K CET-(2011)

Ans. (d) : Pressure, temperature, density, specific heat surface tension, molar volume etc are intensive properties (independent of mass). Heat capacity and enthalpy are extensive properties since they depend upon the quantity of matter in the system.

210. We believe in the laws of thermodynamics because they are

(a) Theoretical
(b) Derived based on mathematical analysis
(c) Empirical and nobody disproved
(d) Mere statements

J & K CET-(2008)

Ans. (d): Only the laws of thermodynamics are mere statements, so they are believed. Many mathematical expression are divided on the basic of these laws.

211. All naturally occurring process proceed spontaneously in a direction, which leads to

(a) increases of enthalpy
(b) increase of free energy
(c) decrease of free energy
(d) decrease of entropy

J & K CET-(2013, 2007)

@apna_pdf

Ans. (c): Conditions for spontaneity:-

Enthalpy : ΔH = negative
Entropy : ΔS = positive
$\Delta G = \Delta H - T\Delta S$
(–ve) (-ve) (+ve)

Therefore, all naturally occurring process proceed spontaneously in a direction, which leads to decrease of free energy.

212. For a chemical reaction, the free energy change (ΔG) is negative. The reaction is

(a) a spontaneous reaction
(b) an equilibrium reaction
(c) an equilibrium reaction
(d) characterised by $r_f = r_b$ (where r_f and r_b are rates of forward and backward and backward reactions respectively)

J & K CET-(2006)

Ans. (a) : ΔG is negative for spontaneous reaction Gibbs free energy relates enthalpy, entropy & temperature.

A spontaneous reaction will always occur when ΔH is negative & ΔS is positive.

$\Delta G = \Delta H - T\Delta S$.

When $\Delta H - T\Delta S$ is negative so ΔG is also negative.

213. ΔG for a spontaneous reaction is

(a) zero
(b) negative
(c) positive
(d) could be positive or negative

J & K CET-(2005)

Ans. (b) : ΔG gives a criteria for spontaneous at constant pressure and temperature.

(i) If ΔG is negative (< 0), the process is spontaneous.

Because, $\Delta G = \Delta H - T\Delta S$

Here, $\Delta H < 0$ and $\Delta S > 0$

So, $\Delta G < 0$

(ii) If ΔG is positive (> 0), the process is non-spontaneous.

(iii) If ΔG is zero then reaction is equilibrium.

214. Which of the following is not an endothermic reaction?

(a) dehydrogenation
(b) ethane to ethene
(c) combustion of propane
(d) change of chlorine molecule into chlorine atoms

J & K CET-(2005)

Ans. (c) : Propane releases its chemical energy by undergoing hydrocarbon combustion. Below is a hydrocarbon combustion animation showing the net reaction that occurs when propane combines with oxygen.

$C_3H_8 + 5O_2 \rightarrow 3CO_2 + 4H_2O + \text{Heat energy}$

The hydrogen combustion reaction releases heat energy and it is an example of an exothermic reaction. The reaction also has a negative enthalpy change (ΔH) value.

215. A process in which the system does not exchange heat with the surroundings is known as

(a) isothermal (b) isobaric
(c) isochoric (d) adiabatic

JIPMER-2013
J & K CET-(2005)

Ans. (d) Adiabatic Process–When a thermodynamic system undergoes a change in such a way that no exchange of heat takes place between systems and surroundings, the process is known as an adiabatic process. During the adiabatic process, there is no exchange of heat that takes place between the system and surroundings.

i.e. $\Delta Q = 0$

216. In a reversible process, $\Delta S_{sys} + \Delta_{Surr}$ is

(a) > 0 (b) < 0
(c) ≥ 0 (d) $= 0$

J & K CET-(2004)

Ans. (d): Entropy of the system and surrounding remains constant in a reversible equilibrium process.

i.e., $\Delta S_{total} = \Delta S_{system} + \Delta_{Surrounding} = 0$

217. For the reaction, $N_2 + 3H_2 \rightleftharpoons 2NH_3$; ΔH =?

(a) $\Delta E + 2RT$ (b) $\Delta E - 2RT$
(c) $\Delta E + RT$ (d) $\Delta E - RT$

J & K CET-(2004)

Ans. (b) : $N_2 + 3H_2 \longrightarrow 2NH_3$

$\Delta H = \Delta E + \Delta n_g RT$
$\Delta n_g = 2 - (3 + 1) = -2,$
$\boxed{\Delta H = \Delta E - 2RT}$

218. For the process $H_2O_{(l)} \rightleftharpoons H_2O_{(g)}$ at 100^0C, 1 atm pressure,

(a) $\Delta H = T\Delta S$ (b) $\Delta H = 0$
(c) $\Delta H = \Delta E$ (d) $\Delta E = 0$

J & K CET-(2002)

Ans. (a) : $H_2O\ (l) \rightleftharpoons H_2O\ (g)$

At this condition $H_2O(l)$ are converted in to H_2O (g)

$\therefore$ state change, $\Delta G = \Delta H - T\Delta S$

Phase state change,

$\therefore$ $\Delta G = 0$ (the process in equilibrium)

$0 = \Delta H - T\Delta S$

$\boxed{\Delta H = T\Delta S}$

219. A tightly closed dessicator in action is an example of

(a) open system (b) isolated system
(c) closed system (d) none of these

J & K CET-(2002)

Ans. (c) : If a system can exchange only energy with the surrounding but not matter, it is called a closed system.

220. In the reaction milk $\rightarrow$ cheese, ΔS is

(a) 0 (b) negative
(c) positive (d) none of these

J & K CET-(2001)

@apna_pdf

Ans. (b): In this conversion of milk (liquid) is converted into cheese (solid) entropy decreases.
Therefore, ΔS is negative
$\Delta S = S_{final} - S_{initial}$
Thus, $\Delta S = -ve$

221. For the process : $CO_2(s) \to CO_2(g)$
(a) both ΔH and ΔS are +ve
(b) ΔH is –ve and ΔS is +ve
(c) ΔH is –ve and ΔS is –ve
(d) Both ΔH and ΔS are –ve

J & K CET-(2000)

Ans. (a) : $CO_2(s) \to CO_2(g)$
The reaction involves conversion of $CO_2(s)$ to $CO_2(g)$ i.e. randomness increases and hence entropy increases. i.e. ΔS = +ve. Further heat is absorbed in this reaction thus, ΔH = +ve.

222. The enthalpy of atomization of carbon and hydrogen are q_1 and q_2 respectively. If q_3 is the bond energy of C – H bond, then ΔH of the following reaction is
$C(s) + 2H_2(g) \to CH_4(g)$
(a) $4q_3 - q_1 - 2q_2$
(b) $q_1 + q_2 - q_3$
(c) $q_1 + 2q_2 - 4q_3$
(d) $q_1 + 4q_2 - 4q_3$

J & K CET-(1998)

Ans. (d) : $C(s) + 2H_2(s) \to CH_4(s) \quad \Delta H = ?$
$C(s) \to C(g); \quad \Delta H_1 = q_1$
$H_2(g) \to 2H(g); \quad \Delta H_2 = 2q_2$
$\Delta H = q_1 + 4q_2 - 4q_3$

223. In which of the following reactions would ΔE be equal to ΔH ?
(a) $2SO_2(g) + O_2(g) \rightleftharpoons 2SO_3(g)$
(b) $H_2(g) + 1/2O_2 \rightleftharpoons H_2O(l)$
(c) $H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$
(d) $NO(g) \rightleftharpoons 2NO(g)$

J & K CET-(1999)

Ans. (c): $H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$
$\Delta n_g = (1+1) - 2 = 0$
$\Delta H = \Delta E + \Delta n_g RT$
$\Delta H = \Delta E$

224. Which one of the following is a non-spontaneous reaction?
(a) dissolution of a salt in water
(b) expansion of a gas into vacuum
(c) melting of ice
(d) passage of a gas from a lower pressure to a higher pressure

J & K CET-(1999)

Ans. (d): A physical or chemical process which don't occurs its own are called non- spontaneous process.
Flow of heat from higher to lower (spontaneous).
∴ Passage of a gas from a lower pressure to a higher pressure (Non-spontaneous)

225. For which of the following reactions ΔH is not equal to ΔE ?
(a) $H_2(g) + I_2(g) = 2HI(g)$
(b) $HCl(aq) = NaOH(aq) = NaCl(aq) + H_2O$
(c) $C(s) + O_2(g) = CO_2(g)$
(d) $N_2(g) + 3H_2(g) = 2NH_3(g)$

J & K CET-(1998)

Ans. (d) : In this reaction Δn = 2 – 4 = –2
If $\quad \Delta n_g < 0$
Since $\quad \Delta H = \Delta E + \Delta n_g RT$

226. Which of the following is not a state function?
(a) q
(b) q + w
(c) E
(d) PΔV

J & K CET-(1997)

Ans. (d) (i) q→ Heat contains by any body at constant pressure is called enthalpy (H) and H are state function
(ii) q + w = U → state function
(iii) E→ state function
(iv) PdV = W → It is a path function

227. In an isothermal expansion of an ideal gas:
(a) W= 0
(b) △E = 0
(c) q = 0
(d) △V = 0

JCECE - 2003

Ans. (b): For isothermal process– T = Constant
or $\quad \Delta T = 0$
Here, $\quad \Delta E = 0$

228. Human body is an example of:
(a) open system
(b) closed system
(c) isolated system
(d) none of these

JCECE - 2004

Ans. (a) : Human body can exchange energy and matter with surrounding. This is an example of open system.

229. For a reaction to be spontaneous at all temperatures
(a) ΔG and ΔH should be negative
(b) ΔG and ΔH should be positive
(c) ΔG = ΔS = 0
(d) ΔH < ΔG

JCECE - 2009

Ans. (a) : For a reaction to be spontaneous ΔG should be negative
$\Delta G = \Delta H - T\Delta S$
For a reaction to be spontaneous at all temperature ΔG and ΔH should be negative.

230. Which one of the following is correct?
(a) $-\Delta G = \Delta H - T\Delta S$
(b) $\Delta H = \Delta G - T\Delta S$
(c) $\Delta S = \frac{1}{T}[\Delta G - \Delta H]$
(d) $\Delta S = \frac{1}{T}[\Delta H - \Delta G]$

JCECE - 2010

Ans. (d) : We know that,
Gibbs free energy is, $\Delta G = \Delta H - T\Delta S$
$T\Delta S = \Delta H - \Delta G$
$\Delta S = \frac{1}{T}[\Delta H - \Delta G)$

231. Which of the following conditions will always lead to a non-spontaneous change?
(a) +ve ΔH and +ve ΔS
(b) –ve ΔH and –ve ΔS
(c) +ve ΔH and –ve ΔS
(d) –ve ΔH and +ve ΔS

JCECE - 2011, J & K CET-(1997)

@apna_pdf

Ans. (c) : For a process to be spontaneous, ΔG will be negative.

We know that,

$$\Delta G = \Delta H - T\Delta S$$

If $\Delta H = +$ ve and $\Delta S = -$ ve, ΔG will be positive at all temperatures. Thus, the process is non-spontaneous.

232. Which of the following pairs of a chemical reaction is certain to result in a spontaneous reaction?

(a) Exothermic and decreasing disorder
(b) Endothermic and increasing disorder
(c) Exothermic and increasing disorder
(d) Endothermic and decreasing disorder

JCECE - 2012, CG PET -2007
JIPMER-2007, NEET-2005

Ans. (c) : For a spontaneous reaction, $\Delta G = -$ve.

From Gibb's-Helmholtz equation–

$$\Delta G = \Delta H - T\Delta S$$

$\Delta G = -$ve, when $\Delta H = -$ve and $\Delta S = +$ve

For $\Delta H = -$ve, reaction should be exothermic and $\Delta S = +$ve for increase in disorder.

233. The value of compression factor, Z for critical constants is

(a) $\frac{1}{2}$ (b) $\frac{3}{4}$
(c) $\frac{2}{3}$ (d) $\frac{3}{8}$

JCECE - 2014

Ans. (d) : We know, $P_c = \frac{a}{27b^2}$, $V_c = 3b$

And, $T_c = \frac{8a}{27Rb}$

$$\frac{P_cV_c}{T_c} = \frac{a\times 3b\times 27Rb}{27b^2\times 8a} = \frac{3}{8}R$$

$$\frac{P_cV_c}{RT_c} = \frac{3}{8}$$

Compression factor, $Z = \frac{PV}{RT} = \frac{P_cV_c}{RT_c} = \frac{3}{8}$

234. The enthalpy change for a reaction does not depend upon the

(a) physical state of reactants and products
(b) use of different reactants for the same product
(c) nature of intermediate reaction steps
(d) difference in initial or final temperature of involved substances

JCECE - 2015
AIEEE-2003

Ans. (c) : Enthalpy change (ΔH) is a state function so, it does not depend on the path taken by the reaction, it depend only on the difference of final and initial values of enthalpy change.

235. ΔH and ΔS for the reaction,

$$\mathbf{Ag_2O(s) \rightarrow 2Ag(s) + \frac{1}{2}O_2(g), are\ 30.56\,kJ\,mol^{-1}}$$

and 66.00 JK^{-1} mol^{-1} respectively. The temperature at which the free energy change for the reaction will be zero, is

(a) 3528 K (b) 463 K
(c) 73 K (d) 144 K

JIPMER-2015

Ans. (b) : From the Gibb's – Helmholtz equation

$$\Delta G = \Delta H - T\Delta S$$

At equilibrium, $\Delta G = 0$

Hence, $\Delta H - T\Delta S = 0$ or $\Delta H = T\Delta S$

$$T = \frac{\Delta H}{\Delta S}$$

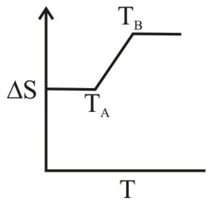
Given that, $\Delta H = 30.560$ kJ mol^{-1}

$= 30560 J\ mol^{-1}$

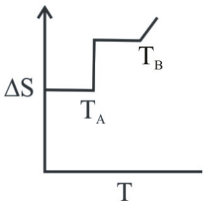
$$T = \frac{30560}{66.0} = 463\,K$$

236. If for a given substance, melting point is T_B and freezing point is T_A then correct variation of entropy by graph between entropy change and temperature is

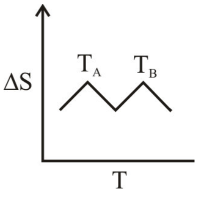
(a)



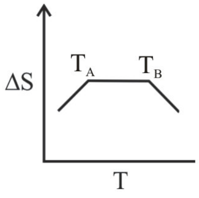
(b)



(c)

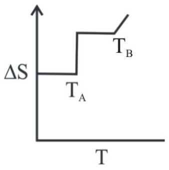


(d)



JIPMER-2015

Ans. (b) : For a pure substance T_A and T_B represent the same temperature.



237. 0.40 g of helium in a bulb at a temperature of T K had a pressure of p atm. When the bulb was immersed in water bath at temperature 50 K more than the first one, 0.08 g of gas had to be removed to restore the original pressure. T is.

(a) 500 K (b) 400 K
(c) 600 K (d) 200 K

JIPMER-2015

Ans. (d) : Since P and V is constant

$$n_iT_i = n_fT_f$$

$$\frac{0.4}{4}\times(T) = \frac{(0.4-0.08)}{4}\times(T+50)$$

$$5T = 4(T+50)$$

$$T = 200\ K$$

@apna_pdf

238. If the E^o_{cell} for a given reaction has a negative value then which of the following gives the correct relationships for the values of ΔG^0 and K_{eq} ?

(a) $\Delta G^0<0, K_{eq}>1$ (b) $\Delta G^0<0, K_{eq}<1$

(c) $\Delta G^0>0, K_{eq}<1$ (d) $\Delta G^0>0, K_{eq}>1$

JIPMER-2014

Ans. (c) : $\Delta G°$ = work done by cell

$E°_{cell} < 0$

$\Delta G° = -n \times F \times E°_{cell}$

$\Delta G° > 0$

$\Delta G° = -RT \ln K_{eq}$

$\ln K_{eq} < 0$

$\boxed{K_{eq} < 1}$

239. If a gas expands at constant temperature indicates that

(a) Kinetic energy of molecules decreases

(b) Pressure of the gas increases

(c) Kinetic energy of molecules remains as same

(d) number of the molecules of gas increase

JIPMER-2014

Ans. (c) : Kinetic energy of gas molecules is a function of temperature only gas expands at constant temperature kinetic energy of molecules remain the same.

240. Which of the following statement is correct?

(a) E_{cell} and Δ_rG of cell reaction both are extensive properties

(b) E_{cell} and Δ_rG of cell reaction both are intensive properties

(c) E_{cell} is the intensive property while Δ_rG of cell reaction is an extensive property

(d) E_{cell} is an extensive property while Δ_rG of cell reaction is an intensive property

JIPMER-2013

Ans. (c) : Extensive properties are the properties which depend upon the quantity of the matter contained in the system, e.g., mass, volume, Gibb's free energy, etc. Intensive properties are the properties which depend only upon the nature of the substance and are independent of the amount of the substance present in the system, e.g., heat, boiling point, emf of a cell, etc.

241. For the reaction,

$$H_2O(l) \rightleftharpoons H_2O(g)$$

at 373 K and 1 atm pressure

(a) $\Delta H=0$ (b) $\Delta E=0$

(c) $\Delta H=T\Delta S$ (d) $\Delta H=\Delta E$

JIPMER-2011

Ans. (c) : As in the given reaction, liquid water is in equilibrium with water vapor at 373K and 1 atm pressure

So, $\Delta G=0$

$\Delta G = \Delta H - T\Delta S$

$\Delta H = T\Delta S$

242. The change in entropy for the fusion of 1 mole of ice is [melting point of ice = 273 K, molar enthalpy of fusion for ice = 6.0 kJ mol^{-1}]

(a) 11.73 JK^{-1} mol^{-1} (b) 18.84 JK^{-1} mol^{-1}

(c) 21.97 JK^{-1} mol^{-1} (d) 24.47 JK^{-1} mol^{-1}

JIPMER-2008

Ans. (c) : Entropy change of fusion

$$\Delta S_f = \frac{\Delta H_f}{T}$$

$\Delta H_f = 6\times10^3$ J, mol^{-1} T=273K

$$\Delta S_f = \frac{6\times10^3}{273}$$

$=21.97\ JK^{-1}\ mol^{-1}$

243. A reaction occurs spontaneously if

(a) $T\Delta S < \Delta H$ and both ΔH and ΔS are + ve

(b) $T\Delta S > \Delta H$ and both ΔH and ΔS are + ve

(c) $T\Delta S = \Delta H$ and both ΔH and ΔS are + ve

(d) $T\Delta S > \Delta H$ and ΔH is + ve and ΔS is – ve

JIPMER-2007
NEET-2005

Ans. (b) : Gibb's energy equation is,

$\Delta G = \Delta H - T\Delta S$

ΔG = –ve for spontaneous reaction

Where, ΔS = + ve, ΔH = + ve,

and $T\Delta S > \Delta H$

244. The entropy values (in $JK^{-1}\ mol^{-1}$) of $H_2(g)$ = 130. 6, $Cl_2(g)$ = 223.0 and HCl(g) = 186.7 at 298 K and 1 atm pressure. The entropy change for the reaction:

$H_2(g)+Cl_2(g) \longrightarrow 2HCl(g)$ is:

(a) + 540.3 (b) +727.3

(c) –166.9 (d) +19.8

JIPMER-2006

Ans. (d) : $\Delta S° = 2S^\circ_{HCl} - (S^\circ_{H_2} + S^\circ_{Cl_2})$

$= 2\times186.7 - (130.6\ 0+223.0)$

$=19.8 JK^{-1}\ mol^{-1}$

245. In an isothermal process

(a) $\Delta H=\Delta E + P\Delta V$ (b) $\Delta H = W$

(c) $\Delta H =\Delta E$ (d) $\Delta H = S\Delta T$

JIPMER-2005

Ans. (b) : An isothermal process

T = constant or $\Delta T = 0$

According to Ist law of thermodynamics –

$T\Delta S = \Delta H - W$

$\Delta Q = \Delta H - W$

We know that, $\Delta Q = nC_p\Delta T$

$\Delta Q = 0$

So, $\boxed{\Delta H = W}$

246. The internal energy of a substance

(a) Decrease with increase in temperature

(b) Increase with increase in temperature

(c) Remains unaffected with change in temperature

(d) Calculated by $E = mc^2$

JIPMER-2005

@apna_pdf

Ans. (b) : The internal energy of a substance always increases with increase in temperature, because internal energy is a function of temperature only.

247. The enthalpies of all elements in their standard states are

(a) Zero (b) > 0
(c) < 0 (d) unity

JIPMER-2004

Ans. (a) : The enthalpies of formation is the heat released or consumed during the formation of a compound from its substituent elements in standard state.

Example–

$C + O_2(g) \rightarrow CO_2(g)$

No contribution
to the enthalpy
of reaction

248. Conversion of oxygen into ozone is non-spontaneous at

(a) Low temperature (b) all temperature
(c) High temperature (d) room temperature

JIPMER-2018
Karnataka-CET-2014

Ans. (b) : $3O_2(g) \rightleftharpoons 2O_3(g)$; $\Delta H = +ve$;

$\Delta S = -ve$

Equation, $\Delta G = \Delta H - T\Delta S = +ve - (-ve)$

$\Delta G = +ve$:

Non – spontaneous at all temperature

So, conversion of oxygen into ozone is non-spontaneous process.

249. A hypothetical reaction $A \longrightarrow 2B$ proceeds through the following sequence of steps

I. $A \longrightarrow C$; $\Delta_r H = q_1$

II. $C \longrightarrow D$; $\Delta_r H = q_2$

III. $\frac{1}{2}D \longrightarrow B$; $\Delta_r H = q_3$

The heat of hypothetical reaction is

(a) $q_1 + q_2 - 2q_3$ (b) $q_1 + q_2 + 2q_3$
(c) $q_1 + 2q_2 - 2q_3$ (d) $q_1 - q_2 + 2q_3$

JIPMER-2016

Ans. (b) : Given,

$A \longrightarrow C, \Delta H = q_1$ .....(i)

$C \longrightarrow D, \Delta H = q_2$ .....(ii)

$\frac{1}{2}D \longrightarrow B, \Delta H = q_3$ .....(iii)

From equation (iii)–

$D \longrightarrow 2B, \Delta H = 2q_3$

According to Hess's law, the total heat changes occurring during a chemical reaction are independent of path.

So, adding equation (i) + (ii) + (iii)

$\Delta H = q_1 + q_2 + 2q_3$

250. The reaction in which $\Delta H > \Delta U$ is

(a) $N_2(g) + O_2(g) \rightarrow 2NO(g)$
(b) $CaCO_3(s) \rightarrow CaO(s) + CO_2(g)$
(c) $N_2(g) + 3H_2(g) \rightarrow 2NH_3(g)$
(d) $CH_4(g) + 2O_2(g) \rightarrow CO_2(g) + 2H_2O(l)$

Karnataka-CET-2019

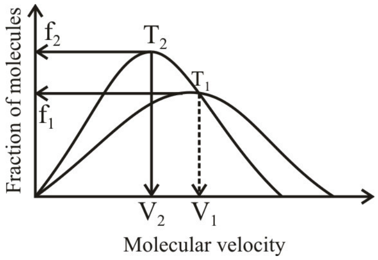
Ans. (b) : As $\Delta H = \Delta U + \Delta n_g RT$

For the reaction $CaCO_3(s) \rightarrow CaO(s) + CO_2(g)$

$\Delta n_g = 1$

$\therefore \Delta H > \Delta U$

251. Plot of Maxwell's distribution of velocities is given below.



Which of the following is correct about this plot?

(a) $T_1 < T_2$ (b) $f_1 > f_2$
(c) $T_1 > T_2$ (d) $V_1 < V_2$

Karnataka-CET-2015

Ans. (c) : $v = \sqrt{\frac{3RT}{M}}$

$V \propto \sqrt{T}, V \propto \frac{1}{\sqrt{M}}$

$V\uparrow, T\uparrow$, $V\uparrow$ no.of moleculer $\downarrow$

In increasing temperature, the molecule velocity increasing but fraction of molecules processing that velocity decreeing.

since, $V_1 > V_2$,

$T_1 > T_2$

252. For an ideal binary liquid mixture

(a) $\Delta S_{(mix)} = 0; \Delta G_{(mix)} = 0$
(b) $\Delta H_{(mix)} = 0; \Delta S_{(mix)} < 0$
(c) $\Delta V_{(mix)} = 0; \Delta G_{(mix)} > 0$
(d) $\Delta S_{(mix)} > 0; \Delta G_{(mix)} < 0$

Karnataka-CET-2014

Ans. (d): Entropy of universe always increases therefore, for an ideal binary liquid solution.

$\Delta H = 0$ & $\Delta V = 0$ from,

$\Delta G = \Delta H - T\Delta S$

$\Delta G = -ve$ Hence, $\Delta G < 0$ and $\Delta S > 0$

253. The value of entropy of solar system is

(a) increasing (b) decreasing
(c) constant (d) zero

Karnataka-CET-2013

Ans. (a) : All naturally occurring processes are spontaneous and are accompanied by a net increase of entropy.

254. The process is spontaneous at the given temperature, if

(a) ΔH is +ve and ΔS is –ve
(b) ΔH is –ve and ΔS is +ve

@apna_pdf

(c) ΔH is +ve and ΔS is +ve
(d) ΔH is +ve and ΔS is equal to zero

Manipal-2017
NEET-I 2016, 2014
Karnataka-CET-2013

Ans. (b) : $\Delta G = \Delta H - T\Delta S$ (Gibbs energy equation)
A reaction is spontaneous when, $\Delta G = -ve$, $\Delta H = -ve$, $\Delta S = +ve$ and $T\Delta S = +ve$

255. Which of the following gases has the highest value of RMS velocity at 298 K?

(a) CH_4 (b) CO
(c) Cl_2 (d) CO_2

Karnataka-CET-2013

Ans. (a) : RMS-velocity of a gas $v_{rms} = \sqrt{\dfrac{3RT}{M}}$

Here, higher the molecular weight of a gas, lower will be its v_{rms}.

$$v_{rms} \propto \sqrt{\frac{1}{M}}$$

$\therefore$ CH_4(mol. weight = 16) has highest v_{rms}.

256. 2 moles of N_2O_4(g) is kept in a closed container at 298 K and under 1 atm pressure. It is heated to 596 K when 20% by mass of N_2O_4(g) decomposes to NO_2. The resulting pressure is

(a) 1.2 atm (b) 4.8 atm
(c) 2.8 atm (d) 2.4 atm

Karnataka-CET-2012

Ans. (d): Given,
Initialy,

$$n = 2, \quad T = 298K, \quad P = latm$$

$$V = \frac{nRT}{P} = \frac{2 \times 0.084 \times 298}{1} = 48.9L$$

Finally $T = 596K, P = ?, V = 48.9L$

$$N_2O_4(g) \rightleftharpoons 2NO_2(g)$$

	$N_2O_4(g)$	$2NO_2(g)$
T = 298 K	2	0
T = 596 K	$2 - \dfrac{20}{100} \times 2$ = 1.6 moles	0.8

Total moles = 1.6 + 0.8 = 2.4 moles

$$P = \frac{nRT}{V} = \frac{2.4 \times 0.084 \times 596}{48.9} = 2.4 \text{ atm}$$

257. Which of the following statements is true?

(a) The total entropy of the universe is continuously decreasing
(b) The total energy of the universe is continuously decreasing
(c) The total energy of the universe remains constant
(d) The total entropy of the universe remains constant

Karnataka-CET-2012

Ans. (c) : According to the first law of thermodynamics, the total energy of the universe remains constant.

258. For the reversible reaction, A (s) + B (g) $\rightleftharpoons$ C (g) + D (g), $\Delta G^o = -350$ kJ, which one of the following statements is true?

(a) The reaction is thermodynamically non-feasible
(b) The entropy change is negative
(c) Equilibrium constant is greater than one
(d) The reaction should be instantaneous

Karnataka-CET-2011

Ans. (c): $A(s) + B(g) \rightleftharpoons C(g) + D(g), \Delta G^o = -350 \text{ kJ}$

Relationship between ΔG^o and equilibrium constant is
$\Delta G^o = -RT \ln K_c$
Since, $\Delta G^o = -350kJ$
$\ln K_c > 0, K_c > 1$

259. 5 moles of SO_2 and 5 moles of O_2 are allowed to react. At equilibrium, it was found that 60% of SO_2 is used up. If the partial pressure of the equilibrium mixture is one atmosphere, the partial pressure of O_2 is

(a) 0.82 atm (b) 0.52 atm
(c) 0.21 atm (d) 0.41 atm

Karnataka-CET, 2009

Ans. (d) : $2SO_2(g) + O_2(g) \rightleftharpoons 2SO_3(g)$

	$2SO_2(g)$	$O_2(g)$	$2SO_3(g)$
Initially	5	5	0
At equilibrium	(5 – 3) = 2	(5 – 1.5) = 3.5	3

$$\therefore \; P_{O_2} = \frac{3.5 \times 1}{8.5} = 0.41 \text{atm}$$

260. For the reaction $H_2O(l) \rightleftharpoons H_2O(g)$ at 373 K and 1 atm pressure

(a) $\Delta H = 0$ (b) $\Delta E = 0$
(c) $\Delta H = T\Delta S$ (d) $\Delta H = \Delta E$

Karnataka-CET, 2009

Ans. (c) : $\Delta G = \Delta H - T.\,\Delta S$
For the reaction,

$$H_2O(l) \rightleftharpoons H_2O(g)$$

$\Delta G = 0$ (at equilibrium)

$\therefore$ $\Delta H = T.\,\Delta S$

261. For the reaction,
$A(g) + B(g) \rightleftharpoons C(g) + D(g); \Delta H = QkJ$
The equilibrium constant cannot be disturbed by

(a) addition of A
(b) addition of D
(c) increasing of pressure
(d) increasing of temperature

Karnataka-CET-2021

Ans.(c): For the given hypothetical reaction, $\Delta n = 0$, because no. of molecules of gaseous molecule on both side are equal. Thus, the equilibrium constant can not be disturbed by increasing of pressure.

262. Considering the reaction C(s) + O_2(g) $\longrightarrow CO_2(g) + 393.5$ kJ, the signs of ΔH, ΔS and ΔG respectively are

@apna_pdf

(a) +, –, – (b) –, +, +
(c) –, –, – (d) –, +, –

Karnataka-CET-2007

Ans. (a) : ΔH = + ve (combustion reaction)
ΔS = – ve (spontaneous at all temperature)
ΔG = – ve (because reaction is spontaneous)

263. The relation between ΔH and ΔU is

(a) $\Delta H = \Delta U + RT$ (b) $\Delta H = \Delta U - \Delta nRT$
(c) $\Delta H = \Delta U + \Delta nRT$ (d) $\Delta U = \Delta H + \Delta nRT$

Karnataka-CET-2007

Ans. (c) : The relationship between ΔH and ΔU is
$\Delta H = \Delta U + \Delta nRT$

264. Entropy of the universe is

(a) constant
(b) zero
(c) continuously decreasing
(d) continuously increasing

Karnataka-CET-2007

Ans. (d) : According to second law of thermodynamics, the entropy of the universe always increases in the course of every spontaneous (natural) change.

265. Which of the following is an intensive property?

(a) temperature (b) viscosity
(c) surface tension (d) all of these

Karnataka-CET-2007

Ans. (d) : The properties of the system whose value is independent of the amount of substance present in the system are called intensive properties, e.g. viscosity, surface tension, temperature, pressure etc.

266. 56 g of nitrogen and 96 g of oxygen are mixed isothermally and at a total pressure of 10 atm. The partial pressures of oxygen and nitrogen (in atm) are respectively

(a) 4, 6 (b) 5, 5
(c) 2, 8 (d) 8, 2
(e) 6, 4

Kerala-CEE-2010

Ans. (e) : Partial pressure of component = Mole fraction × Total pressure

Given, mass of N_2 = 56g, mass of O_2 = 96g
Total pressure = 10 atm

$$n_{N_2} = \frac{56}{28} = 2, \qquad n_{O_2} = \frac{96}{32} = 3$$

$$x_{N_2} = \frac{2}{2+3} = 0.4, \qquad x_{O_2} = \frac{3}{2+3} = 0.6$$

$P_{N_2} = 0.4 \times 10 = 4$ atm

$P_{O_2} = 0.6 \times 10 = 6$ atm

267. Given that dE= Tds – pdV and H = E + pV. Which one of the following relations is true?

(a) $dH = TdS + Vdp$ (b) $dH = SdT + Vdp$
(c) $dH = -SdT + Vdp$ (d) $dH = dE + pdV$
(e) $dH = dE - TdS$

Kerala-CEE-2009

Ans. (a) : We know that,
$H = E + pV$

Differentiating both side, we get
$dH = dE + pdV + Vdp$
$dH = TdS - pdV + pdV + Vdp$
$dH = TdS + Vdp$

268. The lattice enthalpy and hydration enthalpy of four compounds are given below

Compound	**Lattice enthalpy (in kJ mol^{-1})**	**Hydration enthalpy (in kJ mol^{-1})**
P	**+780**	**– 920**
Q	**+ 1012**	**– 812**
R	**+ 828**	**– 878**
S	**+ 632**	**– 600**

The pair of compounds which is soluble in water is

(a) P and Q (b) Q and R
(c) R and S (d) Q and S
(e) P and R

Kerala-CEE-2008

Ans. (e): $NH_3(g) + HCl(g) \longrightarrow NH_4Cl(g)$
$\Delta n_g = -1, \qquad \Delta H = \Delta U + \Delta n_g RT$
Δn_g is – ve, $\qquad \Delta H < \Delta U$
A compound is soluble in water when its hydration enthalpy is greater than its lattice enthalpy.

269. Which of the following is true in respect of adsorption?

(a) $\Delta G < 0; \Delta S > 0; \Delta H < 0$
(b) $\Delta G < 0; \Delta S < 0; \Delta H < 0$
(c) $\Delta G > 0; \Delta S > 0; \Delta H < 0$
(d) $\Delta G < 0; \Delta S < 0; \Delta H > 0$
(e) $\Delta G > 0; \Delta S > 0; \Delta H > 0$

Kerala-CEE-2006

Ans. (b) : For adsorption process,
$\Delta G < 0, \Delta H < 0$ & $\Delta S < 0$
Note-Adsorption of gases on the solid surface is generally exothermic because entropy decreases. Adhering of gas molecules to the surface lower randomness.

270. For the reaction $CO(g) + \frac{1}{2}O_2(g) \longrightarrow CO_2(g)$, ΔH and ΔS are –283 kJ and –87 JK^{-1}, respectively. It was intended to carry out this reaction at 1000, 1500, 3000 and 3500 K. At which of these temperatures would this reaction be thermodynamically spontaneous?

(a) 1500 and 3500 K
(b) 3000 and 3500 K
(c) 1000, 1500 and 3000 K
(d) 1500, 3000 and 3500 K
(e) At all these temperatures

Kerala-CEE-2006

Ans. (c) : Given, ΔH = –283 kJ, ΔS = –87 JK^{-1}
By using the equation,
$\Delta G = \Delta H - T\Delta S$
At 1000K, $\Delta G = -283 - (1000 \times -0.087)$
$= -196$ kJ (spontaneous)

@apna_pdf

At 1500 K, $\Delta G = -283 - (1500 \times -0.087)$
$= -152.5$ kJ (spontaneous)
At 3000 K, $\Delta G = -283 - (3000 \times -0.0987)$
$= -22$ kJ (spontaneous)
At 3500 K, $\Delta G = -283 - (3500 \times -0.087)$
$= +21.5$ kJ (Non-spontaneous)

271. ΔH and ΔS for a reaction are $+30.558$ kJ mol^{-1} and 0.066 kJ mol^{-1} at 1 atm pressure. The temperature at which free energy change is equal to zero and the nature of the reaction below this temperature are:

(a) 483 K, spontaneous
(b) 443 K, non-spontaneous
(c) 443 K, spontaneous
(d) 463 K, non-spontaneous
(e) 463 K, spontaneous

Kerala-CEE-2005

Ans. (d) : $\Delta G = \Delta H - T\Delta S$
Where, $\Delta H = +30.558$ kJ mol^{-1}
$\Delta G = 0$
$\Delta S = 0.066$ kJ mol^{-1}
$0 = \Delta H - T\Delta S$
$\Delta H = T\Delta S$
$30.558 = T \times 0.066$
$T = \dfrac{30.558}{0.066}$
$T = 463K$

272. The enthalpy of a monoatomic gas at T Kelvin is:

(a) $\frac{7}{2}$ RT
(b) $\frac{3}{2}$ RT
(c) $\frac{1}{2}$ RT
(d) $\frac{1}{2}$ mv^2
(e) $\frac{5}{2}$ RT

Kerala-CEE-2004

Ans. (e) For Mono atomic gas, $E = \frac{3}{2}RT$

$$H = E + PV = E + RT$$
$$H = \frac{3}{2}RT + RT = \frac{5}{2}RT$$

273. Choose the reaction in which ΔH is not equal to ΔU.

(a) $C(graphite) + O_2(g) \rightarrow CO_2(g)$
(b) $C_2H_4(g) + H_2(g) \longrightarrow C_2H_6(g)$
(c) $2C(graphite) + H_2(g) \longrightarrow C_2H_2(g)$
(d) $H_2(g) + I_2(g) \longrightarrow 2HI(g)$
(e) $N_2(g) + O_2(g) \rightarrow 2NO(g)$

Kerala-CEE-2012

Ans. (b) : $\Delta H = \Delta U + \Delta n_g RT$
If, $\Delta n_g = 0$ then, $\Delta H = \Delta U$
By option–
For (a): $\Delta n_g = 0$; (b) $\Delta n_g = 1 - 2 = -1$
(c) $\Delta n_g = 0$ (d) $\Delta n_g = 2 - 2 = 0$
(e) $\Delta n_g = 2 - 2 = 0$

274. A certain reaction has ΔH of 12 kJ and a ΔS of 40 JK^{-1}. The temperature above which the reaction becomes spontaneous is

(a) 27 °C
(b) 27 K
(c) 300 °C
(d) 30 °C
(e) 30 K

Kerala-CEE-2013

Ans. (a) : $\Delta G = \Delta H - T\Delta S$
For the reaction to be spontaneous,
$\Delta G < 0$
$\Delta H - T\Delta S < 0$
$T < \dfrac{\Delta H}{\Delta S}$
Now, $T = \dfrac{\Delta H}{\Delta S} = \dfrac{12 \times 10^3}{40} = 300K$
$= 300 - 273 = 27°C$
Above 27°C, the reaction becomes spontaneous.

275. The enthalpy change for a reaction at equilibrium is -20.5kJ mol^{-1}. Then the entropy change for this equilibrium at 410 K is

(a) + 50 JK^{-1} mol^{-1}
(b) + 55 JK^{-1} mol^{-1}
(c) + 75 JK^{-1} mol^{-1}
(d) – 50 JK^{-1} mol^{-1}
(e) – 55 JK^{-1} mol^{-1}

Kerala-CEE-2015

Ans. (d) : At equilibrium, $\Delta S = \dfrac{\Delta H}{T}$
$\Delta H = -20.5$ kJ/mol
$\Delta H = -20500$ J/mol
$T = 410K$
$\Delta S = \dfrac{-20500}{410} = -50JK^{-1}mol^{-1}$

276. Critical density of a gas having molecular weight 39 g mol^{-1} is 0.1×10^3 g cm^{-3}. Its critical volume in L mol^{-1} is

(a) 0.390
(b) 3.90
(c) 0.039
(d) 39.0
(e) 390

Kerala-CEE-2016

Ans. (a) : The density of a substance at its thermodynamic critical point is called critical density.
Critical density = 0.1×10^3 g cm^{-3} = $100gL^{-1}$
Critical mass = Molecular weight = 39 g
Critical volume = $\dfrac{\text{Molecular weight}}{\text{Critical density}}$
$= \dfrac{39}{100} = 0.390\,Lmol^{-1}$

277. Thermal decomposition of ammonium dichromate gives

(a) N_2, H_2O and Cr_2O_3
(b) N_2, NH_3 and CrO
(c) $(NH_4)_2$ CrO_4 and H_2O
(d) N_2, H_2O and CrO_3
(e) N_2, H_2O and CrO

Kerala-CEE-2016

@apna_pdf

Ans. (a) : Ammonium dichromate is a flammable inorganic compound with the chemical formula $(NH_4)_2Cr_2O_7$.

Thermal decomposition of ammonium dichromate $(NH_4)_2\ Cr_2O_7$ on heating gives N_2, Cr_2O_3 and H_2O as follows–

$$(NH_4)Cr_2O_7 \xrightarrow{\Delta} N_2 + Cr_2O_3 + 4H_2O$$

$(NH_4)_2Cr_2O_7$ has been used as a source of pure nitrogen in the laboratory and also as a catalyst in pyrotechniques.

278. The correct descending order of the heat liberated (in kJ) during the neutralisation of the acids CH_3COOH (*W*), HF(*X*), HCOOH (*Y*) and HCN (*Z*) under indentical conditions (K_a of $CH_3COOH = 1.8 \times 10^{-5}$, $HCOOH = 1.8\times10^{-4}$, $HCN = 4.9 \times 10^{-10}$ and $HF = 3.2 \times 10^{-4}$) is

(a) Y > X > Z > W (b) X > Y > W > Z
(c) W > X > Y > Z (d) Z > W > Y > X
(e) Z >Y > X > W

Kerala-CEE-2016

Ans. (b) : K_a for $CH_3COOH = 1.8 \times 10^{-5}$ (W)
K_a for $HCOOH = 1.8 \times 10^{-4}$ (Y)
K_a for $HCN = 4.9 \times 10^{-10}$ (Z)
K_a for $HF = 3.2 \times 10^{-4}$ (X)

Now, $K_a \propto$ Strength of acid or, $K_a \propto$ Heat liberated during neutralisation.

Thus, order of heat liberated during neutralisation is–

HF > HCOOH > CH_3COOH > HCN

i.e. X > Y > W > Z.

279. For the process A(*l*) (0.05 atm, 32°C) → A (g) (0.05 atm, 32°C).
The correct set of thermodynamic parameters is

(a) $\Delta G = 0$ and $\Delta S = -$ ve
(b) $\Delta G = 0$ and $\Delta S = +$ ve
(c) $\Delta G = +$ ve and $\Delta S = 0$
(d) $\Delta G = -$ ve and $\Delta S = 0$
(e) $\Delta G = 0$ and $\Delta S = 0$

Kerala-CEE-2017

Ans. (b) : A(*l*) (0.05 atm, 32°C) → A(g) (0.05 atm, 32°C)

Liquid A is changing into gaseous A, thus, randomness is increasing i.e. entropy change (ΔS) is positive.

$$K_p = \frac{P_{A_{(g)}}}{P_{A_{(l)}}} = \frac{0.05}{0.05} = 1$$

$$\Delta G = -RT\ lnK_p = -RT\ ln(1) = 0$$

Thus, the system is in equilibrium.

280. A gas will approach ideal behavior at

(a) Low temperature and low pressure
(b) Low temperature and high pressure
(c) High temperature and low pressure
(d) High temperature and high pressure
(e) low volume and high pressure

Kerala-CEE-2017

Ans. (c) : For ideal behavior, the gaseous molecules should be far apart this is possible by high temperature and low pressure.

281. In which one of the following reactions, entropy decreases?

(a) Sodium chloride is dissolved in water
(b) Water is heated from 303K to 353K
(c) Sodium bicarbonate is decomposed to $Na_2CO_3(s)$, $CO_2(g)$ and $H_2O(g)$
(d) Water crystallizes into ice
(e) Dihydrogen molecule is decomposed into hydrogen atoms

Kerala-CEE-2020

Ans. (d) : Entropy simply defines that it is nothing but disorderness or randomness of the system. Here, water crystallizes into ice. In this case phase converts into liquid to solid. So, entropy decreases.

282. In which of the following $\Delta E = \Delta H$?

(a) $N_2O_4(g) \rightleftharpoons 2NO_2(g)$
(b) $2SO_2(g) + O_2(g) \rightleftharpoons 2SO_3(g)$
(c) $H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$
(d) $H_2(g) + \frac{1}{2}O_2(g) \rightleftharpoons H_2O(\ell)$

Manipal-2020

Ans. (c) : $H_2(g) + I_2(g) \longrightarrow 2HI(g)$

Δn_g = Gaseous moles of product – Gaseous moles of reactants

$\Delta n_g = 2 - 2 = 0$
$\Delta n_g = 0\ \ \Delta H = \Delta E$
$\Delta n_g > 0\ \ \Delta H > \Delta E$
$\Delta n_g < 0\ \ \Delta H < \Delta E$

283. The Electrophile involved in the Sulphonation of benzene is :

(a) SO_3^+ (b) SO_3^{2-}
(c) H_3^+O (d) SO_3

Manipal-2019

Ans. (d) : Sulphonation of benzene involves the formation of the electrophile SO_3 in the first step which subsequently attacks benzene ring and causes sulphonation.

$$2H_2SO_4 \rightleftharpoons H_3O^+ + HSO_4^- + \underset{\text{(eletrophile)}}{SO_3}$$

284. For a process to be spontaneous :

(a) ΔG must be –ve (b) ΔG should be +ve
(c) ΔH must be –ve (d) ΔS must be –ve

Manipal-2018

Ans. (a) : $\Delta G = \Delta H - T\Delta S$ (Gibbs energy equation)

A reaction is spontaneous when, ΔG = –ve, ΔH = –ve, ΔS = +ve and $T\Delta S$ = +ve

- ΔG = –ve for spontaneous reaction.
- ΔG = +ve for non-spontaneous reaction.
- ΔG = 0 for equilibrium reaction.

@apna_pdf

285. C_p/C_v for noble gases is :

(a) 1.66 (b) 1.43

(c) 1.80 (d) 1.33

Manipal-2017

Ans. (a) : Inert gas exist as mono atomic molecules for there

$$C_p = \frac{5}{2}R$$

$$C_v = \frac{3}{2}R$$

$$\gamma = \frac{C_p}{C_v}$$

$$\gamma = \frac{\frac{5}{2}R}{\frac{3}{2}R}$$

$$\gamma = \frac{5}{3}$$

$$\gamma = 1.66$$

286. During the adsorption of krypton on activated charcoal at low temperature:

(a) $\Delta H < 0$ and $\Delta S > 0$ (b) $\Delta H > 0$ and $\Delta S > 0$

(c) $\Delta H < 0$ and $\Delta S < 0$ (d) $\Delta H > 0$ and $\Delta S < 0$

Manipal-2016

Ans. (c) : During adsorption, there is always a decrease in residual forces of the surface i.e. there is decreases in surface energy which appears as heat adsorption. Therefore, is invariably accompanied by evolution of heat.

So, during the adsorption of krypton on activated charcoal at low temperature. $\Delta H < 0, \Delta S < 0$.

287. A reaction is spontaneous at low temperature, but non-spontaneous at high temperature. Which of the following condition is true for the chemical reaction?

(a) $\Delta H > 0, \Delta S = 0$ (b) $\Delta H < 0, \Delta S < 0$

(c) $\Delta H < 0, \Delta S > 0$ (d) $\Delta H > 0, \Delta S > 0$

Manipal-2016

Ans. (b) : $\Delta G = \Delta H - T\Delta S$

When $\Delta H < 0$ and $\Delta S < 0$ then ΔG will be negative at low temperatures (positive at high temperature) and the reaction will be spontaneous.

288. Identify the invalid equation

(a) $\Delta H = \sum H_{products} - \sum H_{reactants}$

(b) $\Delta H = \Delta U + P\Delta V$

(c) $\Delta H^o_{reaction} = \Sigma H^o_{product\ bonds} - \Sigma H^o_{reactant\ bonds}$

(d) $\Delta H = \Delta U + \Delta nRT$

MHT CET-2017

Ans. (c) : Option (c) is invalid equation.

The correct equation is–

$$\Delta H^o_{(reaction)} = \Sigma H^o_{(reactant\ bond)} - \Sigma H^o_{(product\ bond)}$$

289. Identify an extensive property amongst the following.

(a) Viscosity (b) Heat capacity

(c) Density (d) Surface tension

MHT CET-2016

Ans. (b) : Extensive property–Volume, Internal energy, Entropy, Mass etc.

Intensive property– Viscosity, Density, Temperature, Pressure etc.

- Intensive property: Do not depend on amount of matter.
- Extensive property: Depend on amount of matter.

290. Mathematical equation of first law of thermodynamics for isochoric process is

(a) $\Delta U = q_v$ (b) $-\Delta U = q_v$

(c) $q = -W$ (d) $\Delta U = W$

MHT CET-2016

Ans. (a) : The first law of thermodynamics says,

$$\Delta U = q + w$$

In an isochoric process the work done is zero.

Since there is no change in Volume.

So, $\Delta U = q_v + 0 \Rightarrow \Delta U = q_v$

291. The relation between solubility of a gas in liquid at constant temperature and external pressure is stated by which law?

(a) Raoult's law

(b) Van't Hoff- Boyle's law

(c) Van't Hoff-Charles' law

(d) Henry's law

MHT CET-2016

Ans. (d) : Henry's law states that at a constant temperature, the solubility of a gas is directly proportional to the pressure of the gas.

The partial pressure of the gas in vapor phase (P) is proportional to the mole fraction of the gas (x) in the solution.

$$P = K_H x$$

K_H is the Henry's law constant,

More the value of K_H, lower is the solubility of gas.

292. The equation that represents general Van't Hoff equation is

(a) $\pi = \frac{n}{V}RT$ (b) $\pi = nRT$

(c) $\pi = \frac{V}{n}RT$ (d) $\pi = nVRT$

MHT CET-2016

Ans. (a) : Van't Hoff general equation is

$$\pi = \frac{n}{V}RT$$

Where, π is pressure

T is temperature

R is gas constant

N is number of moles

V is Volume

$$\therefore \quad \pi = \frac{n}{V}RT$$

@apna_pdf

293. Which among the following is a feature of adiabatic expansion?

(a) $\Delta V < 0$ (b) $\Delta U < 0$
(c) $\Delta U > 0$ (d) $\Delta T = 0$

MHT CET-2015

Ans. (d) : For adiabatic expansion, there is no change in heat which means no change in temperature also.

$dq = 0, T = \text{Constant}$

$\therefore \quad dT = 0 \Rightarrow \Delta T = 0$

294. For which among the following reactions, change in entropy is less than zero?

(a) Sublimation of iodine
(b) Dissociation of hydrogen
(c) Formation of water
(d) Thermal decomposition of calcium carbonate

MHT CET-2015

Ans. (b) : For a non-spontaneous process, change in entropy is less than zero. Here, dissociation of hydrogen is a non-spontaneous process. Hence it has entropy less than zero. Therefore option (b) is correct.

295. If average velocity of a sample of gas molecules at 300 K is 5 cm s^{-1}, what is RMS velocity of same sample of gas molecules at the same temperature? (Given, α:u:v = 1:1.224:1.127)

(a) 6.112 cm/s (b) 4.605 cm/s
(c) 4.085 cm/s (d) 5.430 cm/s

MHT CET-2014

Ans. (d) : Given, that α (most probable velocity)
u(RMS velocity) : v (average velocity)
= 1: 1.224:1.127

$$v_{average} = \sqrt{\frac{8RT}{\pi M}}, \; v_{rms} = \sqrt{\frac{3RT}{M}}$$

$$v_{rms} = \sqrt{\frac{3\pi}{8}} \times v_{average}$$

$$\frac{u}{v} = \frac{1.224}{1.127}, \qquad \frac{u}{5} = \frac{1.224}{1.127}$$

$$u = \frac{1.224 \times 5}{1.127}$$

$u = 5.430$ cm/s

296. According to Hess's law, the heat of reaction depends upon

(a) initial condition of reactants
(b) initial and final conditions of reactants
(c) intermediate path of the reaction
(d) end conditions of reactants

MHT CET-2011

Ans. (b) : According to Hess's law of constant heat summation, the heat of a process does not depend on the path followed to obtain final state but it depends upon the initial and final states of reactant.

297. Find the correct equation

(a) $E_2–E_1–H_2+H_1 = n_2RT–n_1RT$
(b) $E_2–E_1–H_2–H_1 = n_2RT–n_1RT$
(c) $H_2–H_1– E_2+E_1 = n_2RT–n_1RT$
(d) $H_2+H_1– E_2+E_1 = n_2RT–n_1RT$

MHT CET-2010

Ans. (c) : We know that,

$\Delta H = \Delta E + \Delta n_g RT$

$H_2\text{-}H_1 = E_2 – E_1 + (n_2RT\text{-}n_1RT)$

298. Kirchhoff's equation is

(a) $\log\frac{k_2}{k_1} = \frac{E_a}{2.303R}\left[\frac{1}{T_1} - \frac{1}{T_2}\right]$

(b) $\log\frac{p_2}{p_1} = \frac{\Delta H_V}{2.303R}\left[\frac{T_2 - T_1}{T_1 \times T_2}\right]$

(c) $\Delta C_p = \frac{\Delta H_2 - \Delta H_1}{T_2 - T_1}$

(d) $\log\frac{k_2}{k_1} = \frac{\Delta H}{2.303R}\left[\frac{1}{T_1} - \frac{1}{T_2}\right]$

MHT CET-2009

Ans. (c) : Kirchhoff's equation–

$$\boxed{\frac{\Delta H_2 - \Delta H_1}{T_2 - T_1}} = \Delta C_p$$

$$\boxed{\Delta C_p = (\Sigma C_p)_{products} - (\Sigma C_p)_{reactants}}$$

299. In .... process, work is done at the expense of internal energy.

(a) Isothermal (b) Isochoric
(c) Adiabatic (d) Isobaric

MHT CET-2009

Ans. (c) : We know that,
An adiabatic process is a type of thermodynamic process that occurs without transferring heat or mass between the thermodynamic system and its environment.

$\Delta E = Q + W$

If heat supplied from the surrounding,

$Q = 0$

$\Delta E = W$

So, work is done at the expense of only internal Energy Q = 0 for adiabatic process.

300. Hess's law is based on

(a) Law of conservation of mass
(b) Law of conservation of energy
(c) First law of thermodynamics
(d) None of the above

MHT CET-2007

Ans. (b) : Hess' law states that, if a reaction can take place by more than one route and the initial and final conditions are the same. The total enthalpy change is the same.
Hess's law is based upon law of conservation of energy i.e. first law of thermodynamics.

301. Which of the following is a path function?

(a) Internal energy (b) Enthalpy
(c) Work (d) Entropy

MHT CET-2007

Ans. (c) : Internal energy, entropy and enthalpy are point functions but work and heat are path functions.

@apna_pdf

302. 2 moles of ideal gas at 27°C temperature is expanded reversely from 2 lit. to 20 lit. Find entropy change. (R = 2 cal/mol K)

(a) 92.1 (b) 0

(c) 4 (d) 9.2

NEET-2002

Ans. (d) : Given, n = 2, R = 2 cal/mol K

$V_1 = 2$ lit., $V_2 = 20$ lit.

As we know that, $\Delta S = 2.303 n R \log \frac{V_2}{V_1}$

$$\Delta S = 2.303 \times 2 \times 2 \times \log \frac{20}{2} = 9.2 \text{ cal K}^{-1} \text{ mol}^{-1}$$

303. What is the entropy change (in J K^{-1} mol^{-1}) when one mole of ice is converted into water at 0°C? (The enthalpy change for the conversion of ice to liquid water is 6.0 kJ mol^{-1} at 0°C.)

(a) 20.13 (b) 2.013

(c) 2.198 (d) 21.98

NEET-2003

Ans. (d) : $\Delta S = \frac{\Delta H}{T} = \frac{6.0}{273} = 0.02198 \text{kJK}^{-1}\text{mol}^{-1}$

($\because$ T = 0°C = 0 + 273 K = 273 K)

$\Delta S = 0.02198 \times 1000 \text{ JK}^{-1}\text{mol}^{-1}$

$\Delta S = 21.98 \text{JK}^{-1}\text{mol}^{-1}$

304. The enthalpy and entropy change for the reaction:

$Br_2(l) + Cl_2(g) \rightarrow 2\,BrCl(g)$

are 30 kJ mol^{-1} and 105 JK^{-1} mol^{-1} respectively. The temperature at which the reaction will be in equilibrium is

(a) 300 K (b) 285.7 K

(c) 273 K (d) 450 K

NEET-2006

Ans. (b) : $Br_2(l) + Cl_2(g) \rightarrow 2\,BrCl(g)$

Given, $\Delta H = 30 \times 10^3 \text{ J mol}^{-1}$

$\Delta S = 105 \text{ JK}^{-1} \text{ mol}^{-1}$, T = ?

According to second law,

$$T = \frac{\Delta H}{\Delta S} = \frac{30 \times 10^3}{105} = 285.7\text{K}$$

305. For the gas phase reaction,

$PCl_5(g) \rightleftharpoons PCl_3(g) + Cl_2(g)$

which of the following conditions are correct?

(a) $\Delta H < 0$ and $\Delta S < 0$ (b) $\Delta H > 0$ and $\Delta S < 0$

(c) $\Delta H = 0$ and $\Delta S < 0$ (d) $\Delta H > 0$ and $\Delta S > 0$

NEET-2008

Ans. (d) : From enthalpy equation,

$\Delta H = \Delta E + n_g RT$

Δn_g = Product mole – Reactant mole

$\Delta n_g = 2 - 1 = 1$

Thus, the value of ΔH is +ve or > 0

$\Delta G = \Delta H - T\Delta S$

For a spontaneous reaction, ΔG must be –ve. Since in this reaction ΔH is +ve. So for the negative value of ΔG, ΔS must be positive or > 0.

Hence, $\Delta H > 0, \Delta S > 0$

306. The enthalpy of fusion of water is 1.435 kcal/mol. The molar entropy change for the melting of ice at 0°C is

(a) 10.52 cal/(mol K) (b) 21.04 cal/(mol K)

(c) 5.260 cal/(mol K) (d) 0.526 cal/(mol K)

NEET-2012

Ans. (c) : $\Delta S = \frac{\Delta H}{T}$ ($\because \Delta G = \Delta H - T\Delta S$)

At phase change ΔG = 0

The molar entropy change for the melting of ice

$$\Delta S = \frac{1.435}{273} = 5.26 \text{ cal/mol K}$$

307. If the enthalpy change for the transition of liquid water to steam is 30 kJ mol^{-1} at 27°C, the entropy change for the process would be

(a) 10 J mol^{-1} K^{-1} (b) 1.0 J mol^{-1} K^{-1}

(c) 0.1 J mol^{-1} K^{-1} (d) 100 J mol^{-1} K^{-1}

NEET-2011

Ans. (d) The transition under consideration is :

$H_2O(\ell) \rightarrow H_2O\,(g)$

We know that, $\Delta S_{vapour} = \frac{\Delta H_{vapour}}{T}$

Given, $\Delta H_{vapour} = 30 \text{ kJ mol}^{-1}$

$\Delta H_{vapour} = 30 \times 1000 \text{ J mol}^{-1}$

T = 27 + 273 = 300K

Thus, $\Delta S_{vapour} = \frac{\Delta H_{vapour}}{T} = \frac{30 \times 10^3}{300}$

$$\boxed{\Delta S_{vapour} = 100 \text{Jmol}^{-1}\text{K}^{-1}}$$

308. Standard entropies of X_2, Y_2 and XY_3 are 60, 40 and 50 J K^{-1} mol^{-1} respectively. For the reaction $1/2X_2 + 3/2\,Y_2 \rightleftharpoons XY_3$, ΔH= –30 kJ, to be at equilibrium, the temperature should be

(a) 750 K (b) 1000 K

(c) 1250 K (d) 500 K

NEET-2010

AIEEE-2008

Ans. (a) : $\frac{1}{2}X_2 + \frac{3}{2}Y_2 \rightarrow XY_3$, $\Delta H = -30\text{kJ} = -30 \times 10^3\text{J}$

$\Delta S_{reaction} = \sum \Delta S_{product} - \sum \Delta S_{reactant}$

$\Delta S = 50 - \left[\frac{1}{2} \times 60 + \frac{3}{2} \times 40\right]$

$= 50 - 90 = -40 \text{ JK}^{-1}$

$$T = \frac{\Delta H}{\Delta S} = \frac{-30 \times 10^3}{-40} = 750\text{K}$$

309. For a given reaction, ΔH = 35.5 kJ mol^{-1} and ΔS = 83.6 J K^{-1} mol^{-1}. The reaction is spontaneous at (Assume that ΔH and ΔS do not vary with temperature)

(a) T > 425 K (b) all temperature

(c) T > 298 K (d) T < 425 K

NEET-2017

@apna_pdf

Ans. (a) : $\Delta H = 35.5 \text{ kJ mol}^{-1} = 35.5 \times 10^3 \text{ J mol}^{-1}$

$\Delta S = 83.6 \text{ JK}^{-1} \text{ mol}^{-1}$

According to Gibbs-Helmholtz equation,

$\Delta G = \Delta H - T\Delta S$

For a reaction to be spontaneous,

$\Delta G < 0$

$\therefore \quad \Delta G = \Delta H - T\Delta S < 0$

$$\Delta H < T\Delta S \Rightarrow T > \frac{\Delta H}{\Delta S} = \frac{35.5\times10^3}{83.6} = 425\text{K}$$

$$\boxed{T > 425\text{K}}$$

310. For a sample of perfect gas when its pressure is changed isothermally from p_i to p_f, the entropy change is given by

(a) $\Delta S = nR\ln\left(\frac{P_f}{P_i}\right)$ (b) $\Delta S = nR\ln\left(\frac{P_i}{P_f}\right)$

(c) $\Delta S = nRT\ln\left(\frac{P_f}{P_i}\right)$ (d) $\Delta S = RT\ln\left(\frac{P_i}{P_f}\right)$

NEET-II 2016

Ans. (b) : For measurable change between two states. i.e initial (i) and final (f)

$$\Rightarrow \quad \Delta S = \int_i^f \frac{dq}{T}$$

As the temperature is constant

$$\therefore \ \Delta S = \frac{1}{T}\int_i^f dq \text{ rev}$$

As we know that

$$dq_{rev} = -dw_{rev} = nRT\left(\frac{dV}{V}\right)$$

$$\therefore \ \Delta S = \frac{1}{T}\int_i^f nRT\left(\frac{dV}{V}\right)$$

$$\Rightarrow \Delta S = \frac{nRT}{T}\int_i^f \left(\frac{dV}{V}\right)$$

$$\Rightarrow \Delta S = nR \ln \frac{V_f}{V_i}$$

From Charle's law,

$P_f V_f = P_i V_i$

$$\frac{V_f}{V_i} = \frac{P_i}{P_f}$$

$$\therefore \quad \Delta S = nR \ln\left(\frac{P_i}{P_f}\right)$$

311. Consider the following liquid vapour equilibrium Liquid $\rightleftharpoons$ vapour

Which of the following relations is correct?

(a) $\frac{d \ln P}{dT^2} = \frac{-\Delta H_v}{T^2}$ (b) $\frac{d \ln P}{dT} = \frac{\Delta H_v}{RT^2}$

(c) $\frac{d \ln G}{dT^2} = \frac{\Delta H_v}{RT^2}$ (d) $\frac{d \ln P}{dT} = \frac{-\Delta H_v}{RT}$

NEET-I 2016

Ans. (b) : According to Clausius Clapeyron equation–

$$P = Ae^{\frac{-\Delta H}{RT}}$$

$$\ln P = \ln A + \ln e^{\frac{-\Delta H}{RT}} \Rightarrow \ln p = \ln A - \frac{\Delta H}{RT}\ln e$$

$$\text{or } \ln p = \ln A - \frac{\Delta H}{RT}$$

$$\frac{d}{dT}(\ln P) = 0 + \frac{-\Delta H}{R}\frac{d}{dT}(T^{-1})$$

$$\frac{d}{dT}(\ln P) = \frac{\Delta H_v}{RT^2}$$

312. For irreversible expansion of an ideal gas under isothermal condition, the correct option is

(a) $\Delta U \neq 0, \ \Delta S_{total} = 0$ (b) $\Delta U = 0, \ \Delta S_{total} = 0$

(c) $\Delta U \neq 0, \ \Delta S_{total} \neq 0$ (d) $\Delta U = 0, \ \Delta S_{total} \neq 0$

NEET-2021

Ans. (d) : For, isothermal

We know,

$\Delta U = nC_v\Delta T$

Here, $\Delta U = 0, \Delta T = 0$

$$\boxed{\Delta S_{total} = nR\ln\frac{V_1}{V_2} \Rightarrow \Delta S_{total} \neq 0}$$

313. For the reaction $2Cl_{(g)} \rightarrow Cl_{2(g)}$, the correct option is

(a) $\Delta_rH > 0$ and $\Delta_rS > 0$ (b) $\Delta_rH > 0$ and $\Delta_rS < 0$

(c) $\Delta_rH < 0$ and $\Delta_rS > 0$ (d) $\Delta_rH < 0$ and $\Delta_rS < 0$

NEET-2020

Ans. (d) : $2Cl(g) \rightarrow Cl_2(g)$

- Bond formation is exothermic process

$$\boxed{\Delta_rH < 0}$$

- 2 atoms gives one molecules,

– Randomness decreases, $\boxed{\Delta_rS < 0}$

314. Consider the following processes :

	ΔH (kJ/mol)
$1/2A \rightarrow B$	**+150**
$3B \rightarrow 2C + D$	**+125**
$E + A \rightarrow 2D$	**+350**

For $B + D \rightarrow E + 2C$, ΔH will be

(a) 525 kJ/mol (b) -175 kJ/mol

(c) -325 kJ/mol (d) 325 kJ/mol

NEET-2011

Ans. (b) : $1/2A \rightarrow B, \Delta H = +150$ kJ/mol .....(i)

$3B \rightarrow 2C + D, \Delta H = +125$ kJ/mol .....(ii)

$E + A \rightarrow 2D, \Delta H = +350$ kJ/mol .....(iii)

According to Hess's law.

From, 2(i)-(iii)+(ii)

$\Delta H = 2(150) - 350 - 125$

$= -175\text{kJ/mol}$

315. Three thermo chemical equations are given below :

(i) $C_{(graphite)} + O_2(g) \rightarrow CO_2(g); \Delta_rH^0 = x \text{ kJ mol}^{-1}$

@apna_pdf

(ii) $C_{(graphite)}+\frac{1}{2}O_2(g)\rightarrow CO(g);\Delta_rH^0 = y\,kJ\,mol^{-1}$

(iii) $CO(g)+\frac{1}{2}O_2(g)\rightarrow CO_2(g);\Delta_rH^0 = z\,kJ\,mol^{-1}$

Based on the above equations, find out which of the relationship given below is correct.

(a) z = x + y (b) x = y + z

(c) y = 2z - x (d) x = y - z

Karnataka NEET-2013

Ans. (b) :

$C_{(graphite)}+O_2(g)\rightarrow CO_2(g);\Delta_rH^0 = x\,kJ\,mol^{-1}$ .....(i)

$C_{(graphite)}+\frac{1}{2}O_2(g)\rightarrow CO(g);\Delta_rH^0 = y\,kJ\,mol^{-1}$ .....(ii)

$CO(g)+\frac{1}{2}O_2(g)\rightarrow CO_2(g);\Delta_rH^0 = z\,kJ\,mol^{-1}$ .....(iii)

From equation (i) – (ii),

$$\frac{1}{2}O_2 \rightarrow CO_2 - CO;(x-y) \qquad .....(iv)$$

$$CO+\frac{1}{2}O_2 \rightarrow CO_2;(z)$$

From equation (iii),

$$z = x - y \Rightarrow \boxed{x = y + z}$$

316. For the reaction,
$C_2H_5OH(l) + 3O_2(g) \rightarrow 2CO_2(g) + 3H_2O(l)$
which one is true?

(a) $\Delta H = \Delta E + RT$ (b) $\Delta H = \Delta E - RT$

(c) $\Delta H = \Delta E - 2RT$ (d) $\Delta H = \Delta E - 2RT$

NEET-2000

Ans. (b) : $\Delta H = \Delta E + P\Delta V$

Also PV = nRT (ideal gas equation)

or $P\Delta V = \Delta n_gRT$

Δn_g = change in number of gaseous moles

∴ $\Delta H = \Delta E + \Delta n_gRT$

$\Delta n_g = 2 - 3 = -1$

$\boxed{\Delta H = \Delta E - RT}$

317. In an endothermic reaction, the value of ΔH is

(a) negative (b) positive

(c) zero (d) constant

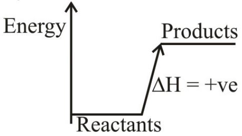
NEET-1999

Ans. (b) : Endothermic Reaction–

- In their reactions the value of ΔH is always positive

$\boxed{\Delta H > 0}$

- Is a reaction that absorb heat from the surrounding.
- Temperature of the surrounding decrease.
- Energy level diagram.



318. One mole of an ideal gas at 300 K is expanded isothermally from an initial volume of 1 litre to 10 litres. The ΔE for this process is (R = 2 cal mol^{-1} K^{-1})

(a) 138.1 cal (b) zero

(c) 163.7 cal (d) 9 L atm

NEET-1998

Ans. (b) : For isothermal process, ΔT = 0

$\Delta E = nC_v\Delta T \Rightarrow \Delta E = 0$

Hence, change in internal energy is zero during isothermal expansion of gas.

319. For the reaction, $N_2 + 3H_2 \rightleftharpoons 2NH_3, \Delta H = ?$

(a) ΔE + 2RT (b) ΔE – 2RT

(c) ΔH = RT (d) ΔE – RT

NEET-1991

Ans. (b) : $N_2 + 3H_2 \rightarrow 2NH_3$

$\Delta n_g = 2 - 4 = -2$

Δn_g = Negative

$\Delta H = \Delta E + \Delta n_gRT$

$\boxed{\Delta H = \Delta E - 2RT}$

320. For the reaction,
$C_3H_8(g) + 5O_2(g) \rightarrow 3CO_2(g) + 4H_2O(l)$
at constant temperature, ΔH – ΔE is

(a) + RT (b) –3RT

(c) +3RT (d) –RT

NEET-2003

Ans. (b) : $C_3H_8(g) + 5O_2(g) \rightarrow 3CO_2(g) + 4H_2O(l)$

$\Delta n_g = 3 - 6 = -3 \quad \because \Delta n_g > 0$

$\Delta H = \Delta E + \Delta n_gRT$

$\Delta H = \Delta E - 3RT$

$\Delta H - \Delta E = -3RT$

321. Assume each reaction is carried out in an open container. For which reaction will ΔH = ΔE?

(a) $2CO(g) + O_2(g) \rightarrow 2CO_2(g)$

(b) $H_2(g) + Br_2(g) \rightarrow 2HBr(g)$

(c) $C(s) + 2H_2O(g) \rightarrow 2H_2(g) + CO_2(g)$

(d) $PCl_5(g) \rightarrow PCl_3(g) + Cl_2(g)$

NEET-2004

Ans. (b) : $\Delta H = P\Delta V + \Delta U$

But for a physical or chemical change.

$\Delta H = \Delta U + \Delta n_g\,RT$

Where Δn_g = No. of gaseous moles of product reactant

So, for ΔH = ΔU or ΔH = ΔE

Δn_g has to 0

In (b) option, $\Delta n_g = 2 - 2 = 0$. Therefore, ΔH = ΔE.

322. Equal volumes of two monatomic gases, A and B at same temperature and pressure are mixed. The ratio of specific heats (C_P/C_V) of the mixture will be

(a) 0.83 (b) 1.50

(c) 3.3 (d) 1.67

NEET-2012

Ans. (d) : For monatomic gases

$$\gamma = \frac{C_p}{C_v} = \frac{5/2R}{3/2R} = 1.67$$

$\gamma_{diatomic} = 1.40$

$\gamma_{triatomic} = 1.33$

@apna_pdf

323. Which one among the following is the correct option for right relationship between C_p and C_v for one mole of ideal gas?

(a) $C_v = RC_P$
(b) $C_p + C_v = R$
(c) $C_p - C_v = R$
(d) $C_p = RC_V$

NEET-2021

Ans. (c) : $\Delta U = q - W$

Where, $q = nC_p\Delta T$ & $\Delta U = nC_v\Delta T$

$nC_v\Delta T = nC_p\Delta T - nR\Delta T \quad [\because W = PdV = nR\Delta T]$

$C_v = C_p - R$

$\boxed{R = C_p - C_v}$

Hence, $C_p - C_v = R$ is correct option.

324. The correct option for free expansion of an ideal gas under adiabatic condition is

(a) $q = 0, \Delta T = 0$ and $w = 0$
(b) $q = 0, \Delta T < 0$ and $w > 0$
(c) $q < 0, \Delta T = 0$ and $w = 0$
(d) $q > 0, \Delta T = 0$ and $w > 0$

NEET-2020, 2011

Ans. (a) : For free expansion of ideal gas

$q = 0, w = 0$

$\Delta E = q + w$

$\Delta E = 0$

$\Delta E = nC_v\Delta T = 0$

$q = 0, \Delta T = 0, w = 0$

325. Which of the following are not state functions?

(I) q + w **(II) q**
(III) w **(IV) H – TS**

(a) I and IV
(b) II, III and IV
(c) I, II and III
(d) II and III

NEET-2008

Ans. (d) : State function or state variable depends only on the state of the system

$\left.\begin{array}{l} w = \text{work} \\ q = \text{Heat} \end{array}\right\}$ Both are not state functions

And $\Delta U = q + w$, $\Delta G = H - T\Delta S$ are state function.

326. In a closed insulated container a liquid is stirred with a paddle to increase the temperature, which of the following is true?

(a) $\Delta E = W \neq 0, q = 0$
(b) $\Delta E = W = q \neq 0$
(c) $\Delta E = 0, W = q \neq 0$
(d) $W = 0, \Delta E = q \neq 0$

NEET-2008, UP CPMT-2006

Ans. (a) : $\Delta E = q + W$

Closed, insulated $\boxed{q = 0}$

Paddle → Work done on the system $\boxed{W \neq 0}$

$T\uparrow, \Delta E\uparrow, \Delta E \neq 0$

$q = 0, \Delta E = W$

$\boxed{\Delta E \neq 0, W \neq 0, q = 0}$

Hence option (a) is correct.

327. 5 moles of nitrogen gas at 5 atm pressure shows 100 lit volume. The same gas assumes 200 lit volume upon absorbing 30.26 kJ heat against an external pressure of 2 atm. Calculate the internal energy changes of this process. [Given 1 lit-atm =101.32J]

(a) 50.52 kJ
(b) 60.66 kJ
(c) 0.14 kJ
(d) 10 kJ

Tripura JEE-2021

Ans. (d) : Temperature in both the states can be obtained using the ideal gas relation temperature in the first state $T_1 = \frac{P_1V_1}{nR}$, $T_1 = \frac{5 \times 100}{5 \times 0.082} = 1218\text{K}$

Temperature in the second state = $T_2 = \frac{P_2V_2}{nR}$

$T_2 = \frac{2 \times 200}{5 \times 0.082} = 974.42\text{K}$

$\Delta U = q - w = q - nR\Delta T$

$\Delta U = 30.26 - 5 \times 0.0821 \times (1218 - 974.42)$

$\Delta U = 30.26 - 20.26 = 10$ kJ.

328. The occurrence of reaction is impossible if

(a) ΔH is +ve, ΔS is also +ve
(b) ΔH is –ve, ΔS is also –ve
(c) ΔH is –ve, ΔS is +ve
(d) ΔH is +ve, ΔS is –ve

UP CPMT-2011
J & K CET-(2003)

Ans. (d) : ΔH = +ve and ΔS = –ve both oppose the reaction.

329. During isothermal expansion of ideal gas its

(a) internal energy increases
(b) enthalpy increase
(c) enthalpy reduces to zero
(d) enthalpy remains unchanged

UP CPMT-2007
NEET-1994, 1991

Ans. (d) : Isothermal process is done at constant temperature, $dT=0, \Delta E=0$

$\therefore \quad \Delta H = \Delta E + P\Delta V$

Here, ΔH = enthalpy change

ΔE = internal energy change

P = pressure

ΔV = change in volume during expansion of ideal gas

For isothermal expansion

$\Delta H = 0$

Hence, during isothermal expansion of ideal gas, its enthalpy remains unchanged.

330. Internal energy is sum of

(a) kinetic energy and potential energy
(b) all types of energy of the system
(c) energy of internal system
(d) None of the above

UP CPMT-2007

Ans. (b) : Every system having some quantity of matter is associated with a definite amount of energy. This energy is known as internal energy. It is sum of many type of energies, such as translation energy, rotational energy, vibrational energy, electronic energy and bonding energy of the molecule.

$E = E_{trans} + E_{rot} + E_{vib} + E_{bonding} + E_{electronic}$

@apna_pdf

331. In exothermic reaction, heat is
(a) given out
(b) absorbed
(c) not involved
(d) given out or absorbed

UP CPMT-2005

Ans. (a) : In exothermic reaction heat is always given
ΔH = $\Sigma H_P - \Sigma H_R$ and for exothermic reaction $\Sigma H_R > \Sigma H_P$.
Energy release in burning 1 litre of gasoline is 30 MJ.

332. Difference in the melting and boiling point of inert gases is
(a) large (b) small
(c) no difference (d) None of these

UP CPMT-2005

Ans. (b) :	He	Ne	Ar	Kr	Xe	Rn
Melting point /K	0.95	24.6	83.8	115.9	161.3	202
Boiling point /K	4.2	27.1	87.2	119.7	165.0	211

∴ there is small difference in melting and boiling point of inert gases.

333. Suitable conditions for melting of ice
(a) high temperature and high pressure
(b) high temperature and low pressure
(c) low temperature and low pressure
(d) low temperature and high pressure

UP CPMT-2005

Ans. (a) : Use Le-Chatelier principle to find favourable conditions for melting of ice.

$$\text{ice} \rightleftharpoons \text{water}$$

According to Le-Chatelier principle at equilibrium if we change temperature or pressure of a reaction it will shift in such a way so as to undo the change.
∵ melting of ice is endotherimic process.
∴ supply of heat shifts equilibrium in forward direction
∵ volume of ice is more than volume of water.
∴ increase in pressure shifts equilibrium to right.
∴ high temperature and high pressure are favourable conditions of melting of ice.

334. Which is correct for an endothermic reaction?
(a) Δ H is positive (b) Δ H is negative
(c) Δ E is negative (d) Δ H= zero

UP CPMT-2003

Ans. (a) : In endothermic reaction heat is always absorbed

$$A + B \rightleftharpoons C + D \quad \Delta H = +ve$$

$\therefore \quad H_p > H_R$
$\therefore \quad \Delta H = H_p - H_R$
$\therefore \quad \Delta H$ is always positive.

335. $NH_4Cl(s) \rightarrow NH_3(g) + HCl(g)$. When the above reaction occurs, the entropy
(a) remains same (b) decreases
(c) increases (d) None of these

UP CPMT-2002

Ans. (c) : $NH_4Cl \rightarrow NH_3(g) + HCl(g)$
After dissociation of ammonium chloride two mole are formed. No. of mole of product is greater than reactant. So, entropy of above reaction increases.

336. The relation of ΔH and ΔE is represented as
(a) $\Delta H = \Delta E - P\Delta V$ (b) $\Delta E = \Delta H - P\Delta V$
(c) $\Delta H = \Delta E + \Delta nRT$ (d) $\Delta E = \Delta V + \Delta H$

UP CPMT-2002

Ans. (c) : The relation between ΔH (Heat of reaction at constant pressure) is significant, where gases are involved in a chemical reaction.

$$\Delta H = \Delta E + P.\Delta V$$

or $$\Delta H = \Delta E + \Delta n_g RT$$

Δn_g = No. of gaseous mole of product – No. of gaseous mole of reactant.

337. Which law states entropy of all pure crystalline solids is zero at absolute zero?
(a) First law of thermodynamics
(b) Second law of thermodynamics
(c) Third law of thermodynamics
(d) Hess's law

UP CPMT-2001

Ans. (c)
(a) **The first law of thermodynamics** states that energy can neither be created nor destroyed.
(b) **The second law of thermodynamics** states that entropy of universe is continuously increasing.
(c) **The third law of thermodynamics** states that entropy of all crystalline solids is zero at absolute zero temperature.
(d) **Hess's law** this law states that total amount of heat evolved or absorbed in a reaction is independent of path.

338. Consider the reaction $N_2 + 3H_2 \longrightarrow 2NH_3$ carried out at constant temperature and pressure. If ΔH and ΔU are the enthalpy and internal energy changes for the reaction, which of the following expressions is true?
(a) $\Delta H > \Delta U$ (b) $\Delta H < \Delta U$
(c) $\Delta H = \Delta U$ (d) $\Delta H = 0$

UPTU/UPSEE-2007

Ans. (b): $\Delta H = \Delta U + \Delta n_g RT$

$N_2 + 3H_2 \rightarrow 2NH_3$
∵ $\Delta n_g < 0$
$\Delta n_g = -ve$
ΔH = enthalpy change
(at constant pressure)
ΔU = internal energy change
(at constant volume)

$$\boxed{\Delta H < \Delta U}$$

Δn_g = moles of [Gaseous products – Gaseous reactions]

339. In an isochoric process, ΔH for a system is equal to:
(a) $P \cdot \Delta V$ (b) PV
(c) $E + P \cdot \Delta V$ (d) ΔE

UPTU/UPSEE-2006

@apna_pdf

Ans. (d) : For an isochoric process (V is constant)

i.e. $\Delta V = 0$

Work done (W) = P.ΔV

$W = P.0 = 0$

We know, $\Delta H = \Delta E + W$

$\Delta H = \Delta E + 0$

$\Rightarrow \Delta H = \Delta E$

340. Considering entropy (s) as a thermodynamic parameter, the criterion for the spontaneity of any process, the change in entropy is

(a) $\Delta S_{system} > 0$ only

(b) $\Delta S_{surrounding} > 0$

(c) $(\Delta S_{system} + \Delta S_{surrounding}) > 0$

(d) $(\Delta S_{system} - \Delta S_{surrounding}) > 0$

UPTU/UPSEE-2017
NEET-2004

Ans. (c) : Entropy (S) is the measure of randomness or disorder of the molecules, it is an extensive property and a state function. A process is spontaneous if and only if the entropy of the universe increase. Therefore

$\Delta S_{Universe} > 0$

$\Delta S_{universe} = \Delta S_{system} + \Delta S_{surrounding}$

341. The densities of graphite and diamond at 298 K are 2.25 and 3.31 g cm^{-3} respectively. If the standard free energy difference is 1895 J mol^{-1}, the pressure at which graphite will be transformed into diamond is

(a) 9.92×10^8 Pa

(b) 9.92×10^7 Pa

(c) 9.92×10^6 Pa

(d) None of these

UPTU/UPSEE-2012

Ans. (d) : Volume of graphite $= \frac{\text{Mass}}{\text{Denisty}} = \frac{12}{2.25}$

Volume of diamond $= \frac{12}{3.31}$

Change in volume,

$$\Delta V = \left(\frac{12}{3.31} - \frac{12}{2.25}\right) \times 10^{-6} m^3 = -1.71 \times 10^{-6}$$

$\Delta G = W_{compress} = p\Delta V$

$$p = \frac{1895}{1.71 \times 10^{-6}} Pa$$

$= 1108 \times 10^6$ Pa

$= 11.08 \times 10^8$ Pa

342. For which reaction change of entropy will be positive?

(a) $H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$

(b) $HCl(g) + NH_3(g) \rightleftharpoons NH_4Cl(s)$

(c) $NH_4NO_3(s) \rightleftharpoons N_2O(g) + 2H_2O(g)$

(d) $MgO(s) + H_2(g) \rightleftharpoons Mg(s) + H_2O(l)$

WB-JEE-2008

Ans. (c) Entropy of gas is greater than that of liquid and solid.

In option (c), solid is converted into gaseous phase.

Entropy of gas > liquid > solid.

343. Under which of the following conditions is the relation ΔH =ΔE+pΔV valid for a closed system?

(a) Constant pressure

(b) Constant temperature

(c) Constant temperature and pressure

(d) Constant temperature, pressure and composition.

WB-JEE-2009

Ans. (a) : $H = E + PV$

$\therefore \Delta H = \Delta E + P\Delta V + V\Delta P$

At constant P, $\Delta H = \Delta E + P\Delta V$

344. Which of the following thermodynamic relation is correct?

(a) $dG = VdP - SdT$

(b) $dE = PdV + TdS$

(c) $dH = -VdP + TdS$

(d) $dG = VdP + SdT$

WB-JEE-2010
TS-EAMCET (Engg.), 06.08.2021

Ans. (a) : We know that,

$G = H - TS$

Where,

G = Gibbs free energy

H = enthalpy

T = temperature

S = entropy

$\because H = U + PV$

$\therefore G = U + PV - TS$

On differentiation,

$dG = dU + PdV + VdP - TdS - SdT$ …(i)

$dQ = dU - dW$

If the work done is only due to expansion,

Then, $-dW = PdV$

$dQ = dU + PdV$

For a reversible process,

$dS = \frac{dQ}{T}$ or $TdS = dQ$ ….(ii)

and $dQ = dU + PdV$ ….(iii)

From equation (i), (ii) and (iii), we have

$dG = VdP - SdT$

345. Identify the correct statement from the following is a chemical reaction.

(a) The entropy always increases

(b) The change in entropy along with suitable change in enthalpy decides the rate of reaction

(c) The enthalpy always decreases

(d) Both the enthalpy and the entropy remain constant

WB-JEE-2012

Ans. (b) : The change in entropy along with suitable change in enthalpy decides the rate of reaction is correct statement because

$\Delta G_{(T,P)} = \Delta H - T\Delta S$, gives the free energy of system.

When $\Delta G_{(T,P)} < 0$, the reaction is spontaneous.

When $\Delta G_{(T,P)} > 0$, the reaction is non-spontaneous.

Hence, option (b) is correct.

@apna_pdf

346. The standard Gibbs free energy change (ΔG^o) at 25°C for the dissociation of N_2O_4 (g) to NO_2 (g) is (given, equilibrium constant = 0.15, R = 8.314 J/mol K)

(a) 1.1 kJ (b) 4.7 kJ
(c) 8.1 kJ (d) 38.2 kJ

WB-JEE-2013

Ans. (b) : $\Delta G^o = - 2.303RT \log_{10}K$

$\because \Delta G \rightarrow$ Standard Gibbs free energy

$= - 2.303 \times 8.314 \times 298 \times \log 0.15$

$= - 2.303 \times 8.314 \times 298 \times (-0.8239)$

$= 4701.04 \text{ J} = 4.7\text{kJ}$

347. The condition of spontaneity of a process is

(a) lowering of entropy at constant temperature and pressure
(b) lowering of Gibbs free energy of system at constant temperature and pressure
(c) increase of entropy of system at constant temperature and pressure
(d) increase of Gibbs free energy of the universe at constant temperature and pressure

WB-JEE-2013

Ans. (b) : From Gibbs – Helmholtz equation,

$\Delta G = \Delta H - T\Delta S$

A process will be spontaneous if $\Delta G = -ve$

$\Delta H = -ve, \Delta S = +ve$

348. For isothermal expansion of an ideal gas, the correct combination of the thermodynamic parameters will be

(a) $\Delta U = 0, Q = 0, W \neq 0 \text{ and } \Delta H \neq 0$
(b) $\Delta U \neq 0, Q \neq 0, W \neq 0 \text{ and } \Delta H = 0$
(c) $\Delta U = 0, Q \neq 0, W = 0 \text{ and } \Delta H \neq 0$
(d) $\Delta U = 0, Q \neq 0, W \neq 0 \text{ and } \Delta H = 0$

WB-JEE-2013

Ans. (d) : For isothermal process, $\Delta T = 0$

From first law of thermodynamics,

$\Delta U = Q + W$

$\therefore \quad \Delta U = nC_v\Delta T = 0$

$\Delta H = nC_p\Delta T = 0$

As $\quad \Delta U = 0 \Rightarrow Q \neq 0$ and $W \neq 0$

Parameter are,

$\Delta U = 0 \Rightarrow Q \neq 0, W \neq 0$ and $\Delta H = 0$

349. For a spontaneous process, the correct statement(s) is (are)

(a) $(\Delta G_{system})_{T, p} > 0$
(b) $(\Delta G_{system}) + (\Delta S_{surroundings}) > 0$
(c) $(\Delta G_{system})_{T, p} < 0$
(d) $(\Delta U_{system})_{T, v} > 0$

WB-JEE-2014

Ans. (c): From second law of thermodynamics.

For a spontaneous process,

(i) $(\Delta G_{system})_{T,P} < 0, \; (\Delta G_{system})_{T,V} < 0$

(ii) $\Delta S_{total} = \Delta S_{univ} = \Delta S_{sys} + \Delta S_{surr} > 0$

This is kind of the mathematical expression of the second law of thermodynamics.

Hence, option (b,c) is correct.

350. The values of ΔH and ΔS of a certain reaction are –400 kJ mol^{-1} and –20 kJ mol^{-1} k^{-1} respectively. The temperature below which the reaction is spontaneous, is

(a) 100 K (b) 20°C
(c) 20 K (d) 120°C

WB-JEE-2014

Ans. (c) : Given, $\Delta H = -400 \text{ kJ mol}^{-1}$

$\Delta S = -20\text{kJ mol}^{-1}\text{K}^{-1}$

Gibbs Helmholtz equation is–

$\Delta G = \Delta H - T\Delta S$

For a reaction to be spontaneous, ΔG must be less than 0, i.e negative

$\because \quad \Delta H - T\Delta S < 0$

$T\Delta S < \Delta H$

The temperature below which the reaction is spontaneous is at phase change.

$$T < \frac{\Delta H}{\Delta S} < \frac{-400}{-20} < 20\text{K}$$

351. For the reaction, $X_2Y_4(l) \rightarrow 2XY_2(g)$ at 300 K, the values of ΔU and ΔS are 2 kcal and 20 cal K^{-1} respectively. The value of ΔG for the reaction is

(a) -3400 cal (b) 3400 cal
(c) -2800 cal (d) 2000 cal

WB-JEE-2015

Ans. (c) : Given, ΔU = 2kcal = 2000 cal

Entropy change, $\Delta S = 20 \text{ cal K}^{-1}$

Temperature (T) = 300 K

From the given reaction–

$\Delta n_g = n_g \text{ (product)} - n_g \text{ (reactant)}$

$= 2 - 0 = 2$

$R = 2 \text{ cal K}^{-1} \text{ mol}^{-1}$

$\Delta H = 2000 + (2 \times 2 \times 300)$

$\Delta H = \Delta U + \Delta n_gRT$

$= 3200$ cal

Now, We know Gibbs free energy change is,

$\Delta G = \Delta H - T\Delta S$

$\Delta G = 3200 - (300 \times 20)$

$\Delta G = - 2800$ cal

352. The condition for a reaction to occur spontaneously is

(a) ΔH must be negative
(b) ΔS must be negative
(c) $(\Delta H - T\Delta S)$ must be negative
(d) $(\Delta H + T\Delta S)$ must be negative

WB-JEE-2016

Ans. (c) : For a reaction to occur spontaneously,

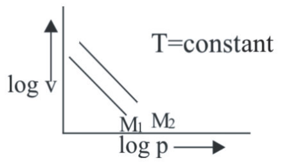
ΔG must be negative or $\Delta G < 0$

We know that, $\Delta G = \Delta H - T\Delta S$

$\therefore$ For a spontaneous reaction,

$\Delta H - T\Delta S$ must be negative

353.



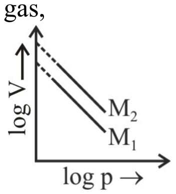
@apna_pdf

For same mass of two different ideal gases of molecular weights M_1 and M_2 plots of log V vs log p at a given constant temperature are shown. Identify the correct option.

(a) $M_1 > M_2$
(b) $M_1 = M_2$
(c) $M_1 < M_2$
(d) can be predicted only if temperature is known

WB-JEE-2017

Ans. (a) : For ideal gas,



$$\because \quad PV = \frac{w}{M}RT$$

$$PV = \frac{k}{M} \quad \text{.....(i)}$$

Let, wRT = k

Taking log on both the sides of equation (i)

$$\log P + \log V = \log\frac{k}{M}$$

$$\text{or} \quad \log V = -\log P + \log\frac{k}{M} \quad \text{.....(ii)}$$

On comparing equation (ii) with y = mx + C,

Intercept, $C = \log\dfrac{k}{M}$

$$\log\frac{k}{M_2} > \log\frac{k}{M_1}$$

or $M_1 > M_2$

354. At constant pressure, the heat of formation of a compound is not dependent on temperature, when

(a) $\Delta C_p = 0$ (b) $\Delta C_v = 0$
(c) $\Delta C_p > 0$ (d) $\Delta C_p < 0$

WB-JEE-2019

Ans. (a) : At constant pressure, the enthalpy of element or compound changes with temperature according to the Kirchhoff's equation–

$$\Delta H = C_p\Delta T \qquad (\because \Delta H = nC_p\Delta T)$$

So, If $\Delta C_p = 0$ then $\Delta H = 0$

Thus, the heat of formation of the compound becomes independent of temperature.

355. For the equilibrium, $H_2O(l) \rightleftharpoons H_2O(v)$, which of the following is correct?

(a) $\Delta G = 0, \Delta H < 0, \Delta S < 0$
(b) $\Delta G < 0, \Delta H > 0, \Delta S > 0$
(c) $\Delta G > 0, \Delta H = 0, \Delta S > 0$
(d) $\Delta G = 0, \Delta H > 0, \Delta S > 0$

WB-JEE-2019

Ans. (d) : We have $\Delta G = \Delta H - T\Delta S$

$$H_2O(l) \rightleftharpoons H_2O(v)$$

As the process is in equilibrium, $\Delta G = 0$

$\Delta H > 0$ (as the process is endothermic)

$\Delta S > 0$ (as entropy is increase from liquid to gas)

This process is spontaneous at temperature above 0°C so G is negative. Thus free energy changes (ΔG) will be less than zero at 1 atm and 298 K.

356. For spontaneous polymerization, which of the following is (are) not correct?

(a) ΔG is negative (b) ΔH is positive
(c) ΔS is positive (d) ΔS is negative

WB-JEE-2020

Ans. (d) : For spontaneous process,

$$\Delta G = \Delta H - T\Delta S$$
$$\Delta H < 0$$
$$\Delta S < 0$$
$$\Delta G < 0$$

2. First Law of Thermodynamics and Application

357. The work done when 2 moles of an ideal gas expands reversibly and isothermally from a volume of 1L to 10L at 300K is

$(R = 0.0083 \text{ kJ K}^{-1}\text{mol}^{-1})$

(a) 0.115 kJ (b) 58.5 kJ
(c) 11.5 kJ (d) 5.8 kJ

Karnataka CET-17.06.2022, Shift-II

Ans. (c) : Given, $n = 2\text{moles}, V_1 = 1L, \quad V_2 = 10L$

$$T = 300K, \; R = 0.0083 kJ\,K^{-1}mol^{-1}$$

For isothermally,

$$W = -2.303 \text{ nRT } \log\left(\frac{V_2}{V_1}\right)$$

$$= -2.303 \times 2 \times 0.0083 \times 300 \log\left(\frac{10}{1}\right)$$

$$= -2.303 \times 2 \times 0.0083 \times 300 \times 1$$

$$= -11.4689kJ \quad \approx -11.5kJ$$

358. Which one of the following is the correct relation between C_P and C_V for one mole of an ideal gas? (R is molar gas constant)

(a) $C_P = C_V - R$ (b) $C_P = C_V + R$
(c) $C_P = R - C_V$ (d) $C_P = C_V \times R$
(e) $C_P = C_V / R$

Kerala CEE -03.07.2022

Ans. (b) : According to first law of thermodynamics,

$$\Delta U = q - W$$
$$nC_v\Delta T = nC_p\Delta T - nR\Delta T$$
$$C_p - C_v = R$$
$$C_p = R + C_v$$

359. When 5 moles of He gas expand isothermally and reversibly at 300 K from 10 litre to 20 litre, the magnitude of the maximum work obtained is_____ J. [nearest integer] Given : $R = 8.3 \text{ JK}^{-1} \text{ mol}^{-1}$ and log 2 = 0.3010)

JEE Main-27.06.2022, Shift-II

@apna_pdf

Ans. (8630) : Given,

n = 5 moles, R = 8.3 $JK^{-1}mol^{-1}$, V_1 = 10 L, V_2 = 202

T = 300 K

For isothermally,

$$W = -2.303\ nRT\ \log\left(\frac{V_2}{V_1}\right)$$

$$= -2.303 \times 5 \times 8.3 \times 300\ \log\left(\frac{20}{10}\right)$$

$$= -2.303 \times 5 \times 8.3 \times 300 \times 0.301$$

$$= -8630.377\ J \approx -8630\ J$$

360. Consider following statements:

(a) The absolute value of internal energy cannot be evaluated.

(b) Entropy is a state function and extensive property

(c) Temperature is an extensive property

(d) The standard enthalpy of formation of an element (ΔH_f) is always considered to be zero

(e) For an adiabatic process $\Delta S > 0$

wrong statements are :

(a) (a) and (b) (b) (a) and (d)

(c) (c) and (e) (d) (b) and (d)

CG PET-22.05.2022

Ans. (c) : The temperature T is an intensive property, independent of the size of system. (i.e. mass)

In adiabatic process q=0

$$\because \quad \Delta S = \frac{q}{T}$$

$$\Delta S = 0$$

The change is the entropy for an adiabatic process equal to zero. So, from the given option (c) and (e) are wrong statement.

361. 4.0 L of an ideal gas is allowed to expand isothermally into vacuum until the total volume is 20 L. The amount of heat absorbed in this expansion is ——— L atm.

JEE Main-28.06.2022, Shift-I

Ans. (0) : In case of free expansion,

$$W = -P_{ext} \times \Delta V \quad (\because P_{ext} = 0)$$

$$\boxed{W = 0}$$

First law of thermodynamics,

$$\Delta U = q - W$$

For isothermally $\Delta U = 0$

$$0 = q - W$$

$$q = W = 0$$

Amount of heat absorbed = 0

362. Consider the following statements:

1. One kind of energy can be converted into an exactly equivalent amount of other kind of energy.

2. Continuous production of mechanical work is possible without the supply of equivalent quantity of heat.

Which of the statements given above is/are contrary to first law of thermodynamics?

(a) 1 only (b) 2 only

(c) Both 1 and 2 (d) Neither 1 nor 2

SCRA-2010

Ans. (a) : From first law of thermodynamics, also known as Law of conservation of energy, states that "Energy can neither be created nor destroyed, energy can only be transferred into one form to another".

The second law of the thermodynamics states that, "It is impossible in any system for heat transfer from a reservoir to completely convert into work in a cyclic process".

363. Work done by an ideal gas at a constant volume is ....

(a) $-\frac{\Delta p}{p}$ (b) $-V\Delta p$

(c) 0 (d) $\frac{nR}{p}$

AP EAMCET (Engg.) 21.09.2020, Shift-I

WB-JEE-2013

Ans. (c) : The first law of thermodynamics,

$$\Delta E = q + W$$

Where,

Work done (W) = $-p\Delta V$

$$W = -p \times \Delta V (\because \Delta V = 0)$$

The volume is constant,

$$W = 0$$

364. A system undergoes a process in which ΔU=+300J while absorbing 400 J of heat energy and undergoing an expansion against 0.5 bar. What is the change in volume (in L) ?

(a) 4 (b) 5

(c) 2 (d) 3

AP EAPCET-6 Sep. 2021, Shift-II

Ans. (c) : From first law of thermodynamics,

$$dU = Q+W$$

Since, expansion occurs and we know that in the case of expansion occurs and we know that in the case of expansion work done having negative sign. So,

$$\Delta U = \Delta Q + \Delta W \text{ or } dU = dq + dW$$

Here dq = 400 Joule, ΔU = 300 Joule

$$dq = dU + dW$$

$$400 = 300 + dW$$

$$dW = 100\ J$$

We know that, dW = PdV

$$dV = \frac{dW}{P}$$

$$= \frac{100}{0.5\times10^5} \quad (\because 1\ \text{bar} = 10^5\ \text{pascals})$$

$$= 20\times10^{-4}$$

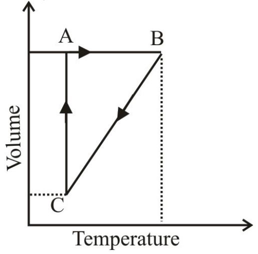
$$= 2\times10^{-3}$$

$$= \frac{2}{1000} \quad (\because 1000\ m^3 = 1\ \text{litre})$$

$$= 2\ \text{litre}$$

@apna_pdf

365. Five moles of a gas are put through a series of changes as shown graphically in a cyclic process. The processes A → B, B → C and C → A respectively are



(a) isochoric, isobaric, isothermal
(b) isobaric, isochoric, isothermal
(c) isothermal, isobaric, isochoric
(d) isochoric, isothermal, isobaric

COMEDK-2018

Ans. (a) : Process $A \rightarrow B$ is isochoric, i.e., volume remains constant.
Process $B \rightarrow C$ is isobaric, i.e., pressure remains constant. ($\because$ at constant $P, V \propto T$)
Process $C \rightarrow A$ is isothermal, i.e., temperature remains constant.

366. One mole of a perfect gas expands isothermally and reversibly from 10 dm^3 to 20 dm^3 at 300 K. Δu, q and work done in the process are [R= 8.3×10^{-3} kJ K^{-1} mol^{-1}]

(a) 0, 1.726 kJ, –1.726 kJ
(b) 0, 17.48 J, 1.726 J
(c) 0, 21.84 kJ, 21.84 kJ
(d) none of these.

COMEDK-2020

Ans. (a) : Given that : n=1, V_1=10 dm^3,
V_2= 20 dm^3, T=300 K, R=8.3×10^{-3} kJ K^{-1} mol^{-1}
Formula for maximum work,

$$W_{max} = -2.303nRT\log\frac{V_2}{V_1}$$

$$= -2.303\times1\times8.3\times10^{-3}\times300\times\log\frac{20}{10}$$

$=–2.303 \times 2.49 \times 0.3010=–1.726$kJ
According to first law,
$\Delta U = q + W$
Now, 0 = q + W
$\therefore +q = -W$ or $q = 1.726$kJ
For an isothermal expansion of a perfect gas at constant temperature, $\Delta U = 0$
$\Delta U = 0; W_{max} = -1.726$kJ and $q = 1.726$kJ

367. Based on the first law of thermodynamics, which one of the following is correct?

(a) For an isochoric process, $\Delta u = -q$
(b) For an adiabatic process, $\Delta u = -W$
(c) For an isothermal process, q=+ W
(d) For an cyclic process, q = – W

COMEDK-2019
Karnataka CET-2011

Ans. (d) : (a) For an isochoric process,
Work done by the gas= $-P\Delta V$
$\Delta U = q + W$
$\Delta U = q - P\Delta V$
When, $\Delta V = 0, \Delta U = q$ or qv
(b) For an adiabatic process, q=0, $\Delta U = W$
(c) For an isothermal process, $\Delta U = 0, q = -W$
(d) For a cyclic process, $\Delta U = 0$
$\therefore$ $\Delta U = 0 = q + W$ or $q = -W$

368. Assertion: In a process, if work = 0 then ΔU = q.
Reason: q is difference between initial state and final state of a system.

(a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS 26 May 2019 (Evening)

Ans. (c) At in a process
At W = 0
From thermodynamics Ist Law
$\Delta U = q + w$
At W = 0
$\Delta U = q$
$\because$ So, Assertion is correct
q → path function does not depend on initial and final state at is a path dependent

369. 1 mole of an ideal gas expands isothermally and reversibly from 2 lit to 4 lit and 3 moles of same gas expand from 2 lit to x lit and doing same work, what is 'x'?

(a) $(8)^{\frac{1}{3}}$	(b) $(4)^{\frac{2}{3}}$
(c) 2	(d) 4 lit

AIIMS-26 May, 2018 (M)

Ans. (b): $W = -nRT \ \ln\frac{V_2}{V_1}$

$$-\ RT\ln\frac{4}{2} = -3RT\ln\frac{x}{2}$$

$$\ln2 = \ln\left(\frac{x}{2}\right)^3$$

$x^3 = 16$
$x = (16)^{1/3} = (4)^{2/3}$

370. One mono-atomic gas is expanded adiabatically from 2L to 10L at 1 atm external pressure, find ΔU (in atm L)?

(a) –8	(b) 0
(c) –66.7	(d) 58.2

AIIMS-26 May, 2018 (M)

@apna_pdf

Ans. (a): Given that, $V_1 = 2$ L, $V_2 = 10$ L, P = 1 atm
At adiabatic process Q = constant
Process is adiabatic $\therefore \Delta Q = 0$

$$\therefore \quad \Delta U = W = -P_{ext.}\Delta V$$
$$= -1\ (10-2)\ \text{atm L}$$
$$= -8\ \text{atm L}$$

371. One mole of an ideal gas is allowed to expand reversibly and adiabatically from a temperature of 27ºC. If the work done during the process is 3 kJ, then final temperature of the gas is (C_v=20J/K)

(a) 100K (b) 150K
(c) 195K (d) 255K

AIIMS-2010

Ans. (b): Given number of moles = 1
Work done by the system = 3000J
Work done is negative because it is done by the system.
Initial temperature = 27°C = 300K
Heat capacity (c_v) = 20 J/K
We know that work done

$$W = -nc_v\ (T_2 - T_1)$$
$$3000 = -1 \times 20\ (T_2 - 300)$$
$$3000 = -20T_2 + 6000$$
$$20T_2 = 3000$$
$$T_2 = 150\text{K}$$

372. One mole of an ideal gas at 300 K is expanded isothermally from an initial volume of 1 litre to 10 litres. The value of ΔE for this process is (R=2 cal mol^{-1} K^{-1})

(a) 163.7 cal (b) zero
(c) 138.1 cal (d) 9 litre atm

AIIMS-2010

Ans. (b): $\Delta E = nC_v\Delta T$
For isothermal process, $\Delta T = 0$, $\Delta E = 0$
Hence, change in internal energy (ΔE) is zero during isothermal expansion of a gas.

373. 6 moles of an ideal gas expand isothermally and reversibly from a volume of 1 litre to a volume of 10 litres at 27ºC. What is the maximum work done?

(a) 47kJ (b) 100kJ
(c) 0 (d) 34.465 kJ

AIIMS-2009, VITEEE- 2006

Ans. (d): For isothermal change,

$$W = -2.303\ nRT\ \log\frac{V_2}{V_1}$$

Given, n =6, T = 27°C = 273+27 = 300K

$V_1 = 1$ L, $V_2 = 10$ L

$$W = -2.303 \times 6 \times 8.314 \times 300\ \log\frac{10}{1} = 34464.86\text{J}$$

= 34.465 kJ.

374. Calculate change in internal energy if $\Delta H = -92.2\text{kJ}, P = 40\,\text{atm and}\ \Delta V = -1\text{L}$

(a) –42kJ (b) –88kJ
(c) +88kJ (d) +42kJ

AIIMS-2007

Ans. (b): $\Delta H = 92.2$kJ
P = 40 atm
$\Delta V = -1$ L

Or
$$\Delta H = \Delta E + \Delta nRT$$
$$\Delta H = \Delta E + PdV$$
$$-92.2\text{kJ} = \Delta E + 40 \times -1$$
$$-92.2\text{kJ} = \Delta E - 40\text{atm L}$$
$$-92200\text{J} = \Delta E - 40 \times 101.325\ \text{J}$$
[$\because$ 1 atm L = 101.325J]
$$\Delta E = -92200\text{J} + 4053\ \text{J}$$
$$\Delta E = -88147\ \text{J} \approx -88\ \text{kJ}$$

375. The enthalpy change (ΔH) for the reaction, $N_2(g) + 3H_2(g) \rightarrow 2NH_3(g)$ is –92.38kJ at 298K. The internal energy change ΔU at 298 K is

(a) –92.38 kJ (b) –87.42 kJ
(c) –97.34 kJ (d) –89.9 kJ

AIIMS-2006

Ans. (b): We know that $N_{2(g)} + 3H_{2(g)} \Rightarrow NH_{3(g)}$
$$\Delta E = \Delta H - \Delta nRT$$
Here Δn = number of molecules of products –number of molecules of reactants
= 2 – 4 = –2
$$= -92.38 - \left(\frac{-2 \times 8.31 \times 298}{1000}\right) \because \Delta n_g < 0$$
$$= -92.38 + 4.95 = -87.42\ \text{kJ}$$

376. For the reaction of one mole of zinc dust with one mole of sulphuric acid in a bomb calorimeter , ΔU and W corresponds to

(a) ΔU <0, W=0 (b) ΔU <0, W<0
(c) ΔU >0, W=0 (d) ΔU >0, W>0

AIIMS-2005

Ans. (a): $Zn + H_2SO_4 \rightarrow ZnSO_4 + H_2$
$$\Delta n_{gas} = 0$$
$$\therefore \quad W = \Delta\ n_{gas}\ RT = 0$$
$$\Delta U = W + Q$$
In bomb calorimeter, there is no expansion in volume, so work done will be zero. This reaction is exothermic. So, some heat will evolved which will result in lowering of internal energy (Internal energy are the function of temperature).
Hence, ΔU < 0 and W = 0

377. Two moles of an ideal gas are compressed isothermally (100ºC) and reversibly from a pressure of 10 atm to 25 atm. Then the free energy change is:

(a) +15.482 kJ (b) +10.462 kJ
(c) +5.684 kJ (d) +3.3642 kJ

AIIMS-2001

Ans. (c): For isothermal reversible process:

$$W_{rev} = -2.303\ \ nRT\ \log\left(\frac{P_1}{P_2}\right) = -2.303nRT\log\frac{V_1}{V_2}$$

$$= -\ 2.303 \times 2 \times 8.314 \times 373 \times \log\left(\frac{10}{25}\right) = +\ 5684.08\text{J}$$

@apna_pdf

$W_{rev} = +5.684\text{kJ}$

Since, it is a measure of free energy

$\therefore \quad \Delta G = W_{rev} = W_{max}$

$\therefore \quad \Delta G = +5.684 \text{ kJ}$

378. A gas expands isothermally against a constant external pressure of 1 atm from a volume of 10 dm^3 to a volume of 20 dm^3. It absorbs 800 J of thermal energy from its surrounding. The ΔU is:

(a) -312J (b) $+123$J

(c) -213J (d) $+231$J

BCECE-2007, AIIMS-1999

Ans. (c): In general

$$W = -\int_{V_1}^{V_2} PdV = -P(V_2 - V_1)$$

$$W = -(1\text{atm})(20-10) = -10\,\text{dm}^3\text{ atm}$$

$$\left[\begin{array}{l}\because 1\text{dm}^3 = 1\text{L} \\ 1\text{atm L} = 101.325\text{J}\end{array}\right]$$

$= -10 \times 101.325 = -1013.25 \text{ J} \approx -1013 \text{ J}$

According to 1st law of thermodynamics,

$\Delta U = q + W = 800\text{J} + (-1013\text{J}) = -213\text{J}$

379. During isothermal expansion of one mole of an ideal gas from 10 atm to 1atm at 273 K, the work done is (gas constant=2):

(a) -895.8cal (b) -1172.6cal

(c) -1257.43cal (d) -1499.6cal

AIIMS-2000

Ans. (c): Work done in expansion of gas during Isothermal process,

$$W = -2.303 nRT \log\frac{P_1}{P_2}$$

$$W = -2.303 \times 1 \times 2 \times 273 \log\frac{10}{1}$$

$$W = -1257.43 \text{ cal.}$$

380. When the temperature of 2 moles of an ideal gas is increased by 20ºC at constant pressure. Find the work involved in the process.

(a) 5R (b) 40R

(c) 15R (d) 20R

AP EAPCET 19-08-2021, Shift-II

Ans. (b) : Given, n = 2 mole

T = 20ºC

P = Constant

$\Delta W = ?$

From ideal gas equation -

$\Delta W = P\Delta V = nR\Delta T$

$\therefore \ \Delta W = 2 \times R \times 20$

$\Delta W = 40R$

381. The work done in ergs for the reversible expansion of one mole of an ideal gas from a volume of 10 litres to 20 litres at 25°C is

(a) $2.303 \times 298 \times 0.082 \log 2$

(b) $298 \times 10^7 \times 8.31 \times 2.303 \log 2$

(c) $2.303 \times 298 \times 0.082 \log 0.5$

(d) $8.31 \times 10^7 \times 298 - 2.303 \log 0.5$

VITEEE-2019

Ans. (b) : Given that,

$V_1 = 10$ litre

$V_2 = 20$ litre

$T = 25° = 273 + 25 = 298$ K

1 Joule = 10^7 erg

Workdone, $W = -2.303 \text{ nRT} \log \dfrac{V_2}{V_1}$

$$= -2.303 \times 1 \times 8.314 \times 298 \times 10^7 \times \log\frac{20}{10}$$

$$= -2.303 \times 10^7 \times 8.314 \times 298 \log 2$$

$$= -298 \times 10^7 \times 8.31 \times 2.303 \log 2$$

382. Calculate the work done when a gas is compressed by an average pressure of 0.50 atm so as to decrease its volume from 400 cm^3 to 200 cm^3.

(a) 1.013J (b) 10.13J

(c) 101.3J (d) None of these

SRMJEEE – 2016

Ans. (b) : Given data :

P = 0. 50 atm

$V_1 = 400 \text{ cm}^3 = 0.4 \text{ L} \quad (\because 1\text{L} = 1000\,\text{cm}^3)$

$V_2 = 200 \text{ cm}^3 = 0.2$ L

W = ?

Now, $W = -P\Delta V$

$W = -P(V_2 - V_1)$

$W = -0.50\,(0.2 - 0.4)$

$W = 0.1 \text{ atm} \quad (\because 1\text{atm L} = 101.325\text{J})$

$\therefore \quad W = 0.1 \times 101.325$

W = 10.13 Joule

383. A system is provided with 50 J of heat and the work done on the system is 10 J. What is the change in internal energy of the system in joules?

(a) 60 (b) 40

(c) 50 (d) 10

AP-EAMCET- (Engg.) - 2010

Ans. (a) : Given,

q = 50 J

W = 10J

We know that,

The law of conservation of energy that the total is constant, energy con be transformed from one from to another, but can be neither created or destroyed.

$\Delta U = q + W$

$\Delta U = 50 + 10 = 60$J.

384. Calculate the maximum work done in expanding 16 g of oxygen at 300 K and occupying a volume of 5 dm^3 isothermally until volume becomes 25 dm^3.

(a) -2.01×10^3J (b) $+2.01 \times 10^3$J

(c) 2.01 J (d) 2.01×10^3 kJ

AMU-2017

Ans. (a) : Maximum work is obtained in isothermal reversible process.

The expansion for the maximum work is as Follow,

@apna_pdf

$$W = -2.303nRT\log\frac{V_2}{V_1}, W = -2.303nRT\log\frac{P_1}{P_2}$$

The number of moles of oxygen (n) =

$$\frac{\text{Weight}}{\text{Molecular Weight}} = \frac{16}{32} = 0.5$$

The temperature is T = 300K

The initial volume is $V_1 = 5dm^3$

The final volume is $V_2 = 25dm^3$

Substituting values in the above reaction we get,

$$W = -2.303\times0.5\times8.314\times300\times\log\frac{25}{5} = -2.01\times10^3 J$$

385. A sample of liquid in a thermally insulated container is stirred for 1 hr by a mechanical attachment to a motor in the surroundings, which of the following thermodynamic quantity for the system is zero?

(a) Work (W)

(b) Change in internal energy (ΔE)

(c) Change in enthalpy (ΔH)

(d) None of these

AMU-2012

Ans. (d) : For a thermally insulated container, $\Delta q = 0$.
But work (w), change in internal energy (ΔE) and change in enthalpy are non zero.
∵ So, this is the adiabatic process.

386. The incorrect statement of the first law of thermodynamics is

(a) $W = \Delta E - q$ (b) $q = \Delta E - W$

(c) $\Delta E = q + W$ (d) $q = \Delta E + W$

AMU-2004

Ans. (d) : Mathematically the first law of thermodynamics may be stated as –

$\Delta E = q + W$

Where, ΔE = Change in internal energy of system
q = Heat supplied to the system
W = Work done on the system

387. 1 g ice absorbs 335J of heat to melt at 0°C. The entropy change will be

(a) $1.2\ JK^{-1}\ mol^{-1}$ (b) $335\ JK^{-1}\ mol^{-1}$

(c) $22.1\ JK^{-1}\ mol^{-1}$ (d) $0.8\ JK^{-1}\ mol^{-1}$

BCECE-2010

Ans. (c) : $\Delta G = \Delta H - T\Delta S$

At phase / state change, $\Delta G = 0$

$$\Delta S_f = \frac{\Delta H_f}{T_f} = \left(\frac{335\times18}{273}\right) = 22.1 JK\,mol^{-1}$$

388. When 1 mole gas is heated at constant volume, temperature is raised from 298K to 308K. Heat supplied to the gas is 500J.Then which statement is correct?

(a) $q = W = 500J, \Delta U = 0$

(b) $q = \Delta U = 500J, W = 0$

(c) $q = W = 500J, \Delta U = 0$

(d) $\Delta U = 0, q = W = -500J$

BCECE-2012

Ans. (b) : From first law of thermodynamics

$\Delta U = q + W$

Given, q = 500J

$W = P\Delta V = 0, \Delta V = 0$

(At constant volume)

So, $\Delta U = q = 500J$ $\Delta V = 0$ then $W = 0$

389. In photoelectric effect, if the energy required to overcome the attractive forces on the electron, (work function) of Li, Na and Rb are 2.41 eV, 2.30 eV and 2.09 eV respectively, the work function of 'K' could approximately be in eV.

(a) 2.52 (b) 2.20

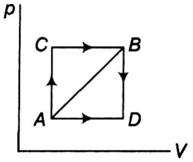
(c) 2.35 (d) 2.01

BCECE-2014

Ans. (b) : As the size of the atom (element) increases the energy required to overcome the attractive force on outer most electron decreases Li, Na, K, and Rb have the following order of size Li < Na < K < Rb
Thus, the energy in case of K is intermediate of Rb and Na i.e

2.30 > K >2.09 or the energy for K is 2.20eV.

390. A system is allowed to move from state A to B following path ACB by absorbing 80J of heat energy. The work done by the system is 30 J. The work done by the system in reaching state B from A is 10J through path ADB. Which statements are correct?



I. Increase in internal energy from state A to state B is 50 J.

II. If path ADB is followed to reach state B, $\Delta E = 50J$.

III. If work done by the system in path AB is 20J, the heat absorbed during path AB = 70J.

IV. The value $E_C - E_A$ is equal to $E_D - E_B$.

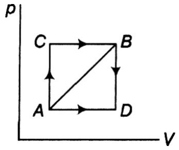
V. Heat absorbed by the system to reach B from A through path ADB is 60J.

(a) I, V (b) I, III, V

(c) I, II, III, V (d) I, IV, V

BCECE-2014

Ans. (c)



Given, Statement-(I) : ACB,

q = 80 J, W = –30 J

According to first law of thermodynamics,

$\Delta E = q + W = 80 - 30 = 50$ J

Statement-(III) : $A \rightarrow B$

W = –20 J, $\Delta E = 50$ J

Similarly, $\Delta E = q + W \Rightarrow q = \Delta E - W$

= 50 – (–20) J = 70 J

@apna_pdf

Statement-(V) : ADB,

$W = -10$ J, $\Delta E = 50$ J

Similarly, $q = \Delta E - W = 50 - (-10) = 60$ J

In statement (IV) No. the value of $E_C - E_A$ is equal to $E_D - E_B$ are not possible internal energy (E) in cyclic process are zero.

Hence, correct statement is I, II, III and V.

391. Temperature of 5 moles of a gas is decreased by 2K at constant pressure. Indicate the correct statement

(a) Work done by gas is = 5 R
(b) Work done over the gas is = 10 R
(c) Work done by the gas = 10 R
(d) Work done = 0

BITSAT-2007

Ans. (b) : For 5 moles of gas at temperature T,

$PV_1 = 5RT$ .....(i)

For 5 moles of gas at temperature (T – 2),

$PV_2 = 5R(T-2)$ .....(ii)

$\therefore P(V_2 - V_1) = 5R(T-2-T);$

$P\Delta V = -10R, -P\Delta V = 10R$

When ΔV is negative, W is +ve.

392. Which of the following represents the first law of thermodynamics

(a) $\Delta U = q + W$
(b) $\Delta U = p\Delta V$
(c) $\Delta U = \Delta H + p\Delta V$
(d) $\Delta H = q + W$

CG PET-2012

Ans. (a) : The first law of thermodynamics state that the energy converted can be from one form to another with the interaction of heat, but it cannot be created or destroyed, under any circumstances.

It relates to change in energy with work and heat transfer.

$\Delta U = q + W$

393. Which of the following is a first order reaction?

(a) $NH_4NO_2 \rightarrow N_2 + 2H_2O$
(b) $2HI \rightarrow H_2 + I_2$
(c) $2NO_2 \rightarrow 2NO + O_2$
(d) $2NO + O_2 \rightarrow 2NO_2$

CG PET-2010

Ans. (a) : Order of Reaction–No. of reactant molecules taking part in the reaction/no. of reactant molecules that effects the rate of reaction.

$NH_4NO_2 \rightarrow N_2 + 2H_2O$

Rate of equation

$K[NH_4NO_2]^1$

∴ Order of this reaction is (1)

Hence, option (a) is correct.

394. Identify the correct statement regarding a spontaneous process.

(a) For a spontaneous process in an isolated system, the change in entropy is positive
(b) Endothermic processes are never spontaneous
(c) Exothermic processes are always spontaneous
(d) Lowering of energy in the reaction process is the only criterion for spontaneity

AIEEE-2007

Ans. (a) For a spontaneous process, $\Delta G < 0$

$\Delta G = \Delta H - T\Delta S < 0$

For isolated system, change in enthalpy is zero.

Hence, ΔS must be positive for spontaneous process.

Hence, option (a) is correct.

395. During which of the following processes, does entropy decrease?

A. Freezing of water to ice at 0°C.

B. Freezing of water to ice at –10°C.

C. $N_2(g) + 3H_2(g) \longrightarrow 2NH_3(g)$

D. Adsorption of CO(g) and lead surface.

E. Dissolution of NaCl in water.

(a) A, B, C and D
(b) B and C
(c) A and E
(d) A, C and E

JEE Main-2021, Shift-II

Ans. (a) : A,B→ freezing of H_2O will decreases entropy as particles more closer and forces of attraction will increases. Thus leads to decreases in randomness so entropy decreases.

C → No of molecule decreasing, so entropy decreases.

D→ Adsorption will lead to a decreases in the randomness of gaseous particles.

At the adsorption $\Delta H < 0$, $\Delta g < 0$, $\Delta S < 0$

396. The incorrect expression among the following is

(a) $\dfrac{\Delta G_{System}}{\Delta S_{Total}} = -T(\text{at constant P})$

(b) $\ln k = \dfrac{\Delta H° - T\Delta S°}{RT}$

(c) $k = e^{-\frac{\Delta G°}{RT}}$

(d) For isothermal process,

$W_{reversible} = -nRT \ln\dfrac{V_f}{V_i}$

JEE Main-2021, Shift-II

Ans. (b) : We know that,

$\Delta G^o = \Delta H° - T\Delta S°$

Where ΔG^o is standard Gibbs free energy change

ΔH° is standard Enthalpy change,

TΔS° is standard Entropy change,

T is temperature.

$\Delta G^o = -RT \times \ln(K)$, where K is the equilibrium constant

$-RT \times \ln(K) = \Delta H^o - T\Delta S°$

$\text{In}(K) = -\left[\dfrac{\Delta H° - T\Delta S°}{RT}\right]$

397. Given :

(a) $C_{graphite} + O_2(g) \rightarrow CO_2(g);$

$\Delta_r H^\ominus = x$ kJ mol^{-1}

(b) $C_{graphite} + \dfrac{1}{2}O_2(g) \rightarrow CO_2(g);$

$\Delta_r H^\ominus = y$ kJ mol^{-1}

@apna_pdf

(c) $CO(g)+\frac{1}{2}O_2(g)\rightarrow CO_2(g)$;

$\Delta_rH^{\ominus} = z$ kJ mol^{-1}

Based on the above thermochemical equations, find out which one of the following algebraic relationships is correct?

(a) $y = 2z - x$ (b) $x = y - z$

(c) $z = x + y$ (d) $x = y + z$

[JEE Main-2019, 12 Jan Shift-II]

Ans. (d) : Given–

$C_{graphite} + O_2(g) \rightarrow CO_2(g)$; $\Delta_rH^o = x$ kJ/mol .....(i)

$C_{graphite} + \frac{1}{2}O_2(g) \rightarrow CO_2(g)$; $\Delta_rH^o = y$ kJ/mol .....(ii)

$CO(g) + \frac{1}{2}O_2(g) \rightarrow CO_2(g)$; $\Delta_rH^o = z$ kJ/mol .....(iii)

From reaction (i), (ii) and (iii)

(i) = (ii) + (iii)

$\boxed{x = y + z}$

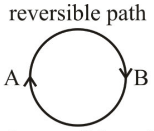
398. The internal energy change when a system goes from state A to B is 40 kJ/mol. If the system goes from A to B by a reversible path and returns to state A by an irreversible path, what would be the net change in internal energy?

(a) 40 kJ (b) > 40 kJ

(c) <40 kJ (d) zero

AIEEE-2003

Ans. (d) :



For a cyclic process the net change in the internal energy is zero because the change in internal energy does not depend on the path.

$\because$ $\Delta U = U_f - U_i$

$U_f = U_i$

When system returns to its initial state,

$\therefore$ $\Delta U = 0$

399. A piston filled with 0.04 mole of an ideal gas expands reversibly from 50.0 mL to 375 mL at a constant temperature of 37.0°C. As it does so, it absorbs 208 J of heat. The values of q and W for the process will be (R = 8.314 J/mol K. In 7.5 = 2.01)

(a) q = +208 J, W = –208 J

(b) q = –208, J, W = –208 J

(c) q = –208 J, W = +208 J

(d) q = +208 J, W = +208 J

[JEE Main-2013]

Ans. (a) : The process is isothermal expansion,

$\boxed{T = \text{Constant}}$

$\Delta U = 0$

$\Delta U = q + W \Rightarrow W = -q$

$\boxed{q = +208\,J}$

$\boxed{W = -280\,J}$

Here negative sign shows that system expand.

400. At constant volume, 4 mol of an ideal gas when heated from 300 K to 500 K changes its internal energy by 5000 J. The molar heat capacity at constant volume is

[JEE Main-2020, 8 Jan Shift-II]

Ans. (6.25 J/mol K) :

Given, n = 4, $\Delta T = (500 - 300) = 200$ K

$\Delta U = 5000$ J

We know that,

$$\Delta U = nC_v\Delta T \Rightarrow C_v = \frac{\Delta U}{n\Delta T} = \frac{5000}{4\times 200} = 6.25\,J/mol\,K$$

401. Which one of the following equations does not correctly represent the first law of thermodynamics for the given processes involving an ideal gas?

(Assume non-expansion work is zero)

(a) Cyclic process : $q = -W$

(b) Adiabatic process : $\Delta U = -W$

(c) Isochoric process : $\Delta U = q$

(d) Isothermal process : $q = -W$

[JEE Main 2019, 8 April Shift-I]

Ans. (b) : According to first law of thermodynamic,

$\Delta U = q + W$

Cyclic process: $\Delta U = 0 \Rightarrow q = -W$

Isothermal process : $\Delta U = 0 \Rightarrow q = -W$

Adiabatic process: $q = 0 \Rightarrow \Delta U = W$

Isochoric process : $W = 0 \Rightarrow \Delta U = q$

402. Five moles of an ideal gas at 1 bar and 298 K is expanded into vacuum to double the volume. The work done is

(a) $-RT\ In\ (V_2/V_1)$ (b) $-RT(V_2-V_1)$

(c) $C_v(T_2-T_1)$ (d) zero

[JEE Main 2020, 4 Sep Shift-II]

Ans. (d) : Expansion of a gas in vacuum ($P_{ext} = 0$) is called free expansion. No work is done during free expansion, since as the expansion is done in vacuum that is in absence of external pressure hence work will be,

$W = -P_{ext}\Delta V \Rightarrow W = 0$

Here, ($P_{ext} = 0$) because expansion takes place in vacuum.

403. At 25°C, 50g of iron reacts with HCI to form $FeCl_2$. The evolved hydrogen gas expands against a constant pressure of 1 bar. The work done by the gas during this expansion is .... J. (Round off to the nearest integer)

[Given, R = 8.314J mol^{-1}K^{-1}.

Assume, hydrogen is an ideal gas]

[Atomic mass off Fe is 55.85 u]

[JEE Main 2021, 16 March Shift-II]

Ans. (–2218 J) :

Given,

T = 298 K

R = 8.314 J/mol K

Chemical reaction is,

$Fe + 2HCl \longrightarrow FeCl_2 + H_2(g)$

50g P = 1 bar

@apna_pdf

$$= \frac{50}{55.85} \text{mol}$$

Work done for 1 mol gas $= -P \times \Delta V = \Delta n_g RT$

$= -1 \times 8.314 \times 298$

Work done for $\frac{50}{55.85}$ mol of gas

$$= -1 \times 8.314 \times 298 \times \frac{50}{55.85} \text{J}$$

$= -2218.059 \text{J} \approx -2218 \text{ J}$

404. Five moles of an ideal gas at 293K is expanded isothermally from an initial pressure of 2.1 MPa to 1.3 MPa against at constant external pressure 4.3 MPa. The heat transferred in this process is ....kJ mol^{-1}. (Rounded off to the nearest integer)
[$R = 8.314 \ Jmol^{-1}K^{-1}$]

[JEE Main 2021, 25 Feb Shift-II]

Ans. (3) : Given, $n = 5$, $T = 293$ K, $\Delta U = 0$,
$P_1 = 2.1$MPa, $P_2 = 1.3$ MPa, $P_{ext} = 4.3$ MPa
Isothermal irreversible (T = Constant),
We know that,

$$W = -P_{ext}(V_2 - V_1) = -P_{ext} nRT\left(\frac{1}{P_2} - \frac{1}{P_1}\right)$$

$$= -4.3 \times 5 \times 8.314 \times 293\left(\frac{1}{1.3} - \frac{1}{2.1}\right)$$

$= -15347.7$ J
Now from equation,
$\Delta U = q + W$
$\therefore \ q = -W$ (For isothermal process)
$q = -(-15347.7) = 15347.7$ J $= 15.35$ kJ (For 5 moles)

$$\therefore \ q/\text{mol} = \frac{15.35}{5} = 3 \text{kJ mol}^{-1}$$

405. One mole of an ideal gas expands isothermally and reversible from 2 lit. to 20 lit. at 300 K. If the final pressure of the gas is l bar, the work done by the gas is

(a) –300R ln10	(b) 300R ln10
(c) 18	(d) –18

J & K CET-(2015)

Ans. (a) : Given,
$V_1 = 2L$, $V_2 = 20L$
$T = 300K$, $P_2 = 1$ bar
Work done in isothermal process,

$$= -nRT \ln\frac{V_2}{V_1}$$

$$= -1 \times R \times 300 \ln\frac{20}{2}$$

$W = -300R \ln 10$

406. The compressibility factor for an ideal gas is:

(a) <1	(b) =1
(c) >1	(d) always 2

JCECE - 2003

Ans. (b): Compressibility factor (Z) $= \frac{PV}{nRT}$
For ideal gas,
$PV = nRT$
So, $Z = \frac{nRT}{nRT} = 1$
For ideal gas $\boxed{Z = 1}$
For real gas, $\boxed{Z < 1 \text{ or } Z > 1}$

407. In adiabatic conditions, 2 mole of CO_2 gas at 300 K is expanded such that its volume becomes 27 times. Then, the work done is
($C_v = 6$ cal mol^{-1} and $\gamma = 1.33$)

(a) 1400 cal	(b) 1000 cal
(c) 900 cal	(d) 1200 cal

JIPMER-2018

Ans. (d) : In adiabatic condition $\frac{T_2}{T_1} = \left(\frac{V_1}{V_2}\right)^{\gamma-1}$

$$\frac{T_2}{T_1} = \left(\frac{1}{27}\right)^{1.33-1} = \left(\frac{1}{27}\right)^{0.33} = \frac{1}{3}$$

$T_2 = 300 \times \frac{1}{3} = 100K$
Thus $T_2 < T_1$ hence cooling takes place due to expansion under adiabatic condition (q = 0).
$q = \Delta U + W$
$W = -\Delta U = U_1 - U_2 = C_v(T_1 - T_2)$
$= 6(300 - 100) = 1200$ cal/mol

408. The correct statement regarding entropy is
(a) at absolute zero temperature, entropy of a perfectly crystalline solid in zero
(b) at absolute zero temperature, the entropy of a perfectly crystalline substance is positive
(c) at absolute zero temperature, the entropy of all crystalline substances is zero
(d) at 0^oC, the entropy of a perfect crystalline solid in zero

Karnataka-CET-2016
NEET-1998

Ans. (a) : Entropy of perfectly crystalline solids will be zero at absolute zero. It is predicted in the third law of thermodynamics.

409. A gas expands from the volume of $1m^3$ to a volume of $2m^3$ against an external pressure of 10^5Nm^{-2}. The work done by the gas will be

(a) 10^2 kJ	(b) 10^2 J
(c) 10^3 J	(d) 10^5 kJ

Karnataka-CET-2012

Ans. (a) : Given,
$V_1 = 1 \ m^3, \ V_2 = 2m^3, \ P = 10^5 \ Nm^{-2}$
Since work done (W) $= P\Delta V$
$= P(V_2 - V_1)$

$$= 10^5 \frac{N}{m^2} \times (2-1) m^3$$

$W = 10^5 \ J = 10^2$ kJ

@apna_pdf

410. Based on the first law of thermodynamics, which one of the following is correct?

(a) For an isochoric process = $\Delta E = -q$

(b) For an adiabatic process = $\Delta E = -w$

(c) For an isothermal process = $q = +w$

(d) For a cyclic process $q = -w$

Karnataka-CET, 2011, 2010

Ans. (d) : First law of Thermodynamics is

$$\Delta E = q + W$$

(a) For isochoric process, $\Delta V = 0$

$$W = P\Delta V = 0$$

$$\therefore \quad \Delta E = q$$

(b) For adiabatic process, $q = 0$

$$\Delta E = W$$

(c) For isothermal process, $\Delta T = 0$ & $\Delta E = 0$

$$\therefore \quad q = -W$$

(d) For cyclic process, state functions like

$$\Delta E = 0$$

$$q = -W$$

411. According to the first law of thermodynamics which of the following quantities represents the change in a state function?

(a) q_{rev}

(b) q_{rev}/W_{rev}

(c) W_{rev}

(d) W_{rev}

(e) $q_{rev} + W_{rev}$

JIPMER-2011
Kerala-CEE-2010

Ans. (e) : State Function– Those quantities which is depend upon the initial and final states not of path followed.

According to the first law of thermodynamics (q_{rev} + W_{rev}), represents the change in a state function.

$$\Delta E = q_{rev} + W_{rev}.$$

412. The first law of thermodynamic is expressed as:

(a) $q - W = \Delta E$

(b) $\Delta E = q - W$

(c) $q = \Delta E - W$

(d) $W = q + \Delta E$

(e) none of the these

Kerala-CEE-2006

Ans. (c) : The first law of thermodynamics can be expressed as –

$$\Delta E = q + W$$

$$q = \Delta E - W$$

413. If P, T, ρ and R represents pressure, temperature, density and universal gas constant respectively, then the molar mass of the ideal ga is given by :

(a) $\frac{\rho RT}{P}$

(b) $\frac{\rho T}{PR}$

(c) $\frac{P}{\rho RT}$

(d) $\frac{RT}{\rho P}$

Manipal-2019

Ans. (a) : If P, T, ρ and R represents pressure, temperature, density and universal gas constant then ideal gas equation.

$PV = nRT$ for n mole of gas

$PV = RT$ for 1 mole of gas

We know that,

$$M = V \times \rho \Rightarrow V = \frac{M}{\rho}$$

Put the value of V in gas equation,

$$P \times \frac{M}{\rho} = RT$$

Then molar mass of gas,

$$M = \frac{\rho RT}{P}$$

414. Deviation from the ideal gas behaviour of a gas can be expressed as :

(a) $Z = \frac{P}{VRT}$

(b) $Z = \frac{PV}{nRT}$

(c) $Z = \frac{nRT}{PV}$

(d) $Z = \frac{VR}{PT}$

Manipal-2018

Ans. (b) : According to ideal gas equation,

$PV = nRT$

n = number of mole of gas

Therefore compressibility factor $Z = \frac{PV}{nRT}$

For an ideal gas Z = 1 and for real gas, Z may be either greater than one or less than one.

415. Three moles of an ideal gas are expanded isothermally from a volume of 300 cm^3 to 2.5 L at 300 K against a pressure of 1.9 atm. The work done in joules is

(a) – 423.56 J

(b) + 423.56 J

(c) – 4.18 J

(d) + 4.8 J

MHT CET-02.05.2019, SHIFT-III

Ans. (a) : Given,

$$V_1 = 300 \text{ cm}^3 = 3\times10^{-4} \text{ m}^3$$

$$V_2 = 2.5 \text{ L} = 25\times10^{-4} \text{ m}^3$$

$$T = 300 \text{ K}$$

$$P = 1.9 \text{ atm} = 1.9\times1.01325\times10^5 \text{ N/m}^2$$

Now, work done during change in volume against constant pressure is

$$W = -P(V_2 - V_1)$$

$$= -1.9\times1.01325\times10^5 (25\times10^{-4} - 3\times10^{-4})$$

$$= -1.925\times10^5(22\times10^{-4}) \text{ Nm}$$

$$= -423.56 \text{ Nm}$$

$$W = -423.56 \text{ J}$$

416. A gas performs 0.320 kJ work on surrounding and absorbs 120 J of heat from the surrounding. Hence, change in internal energy is

(a) 200 J

(b) 120.32 J

(c) –200 J

(d) 440 J

MHT CET-03.05.2019, Shift-I

Ans. (c) : According to first law of thermodynamics,

$$\Delta U = q + W$$

Since, work is done on the surrounding

So, $\quad W = -0.320 \text{ kJ} = -320 \text{ J}$

$$q = 120 \text{ J}$$

$$\therefore \quad \Delta U = 120 - 320 = -200 \text{ J}$$

@apna_pdf

417. "The mass and energy both are conserved in an isolated system" is the statement of

(a) second law of thermodynamics
(b) third law of thermodynamics
(c) modified first law of thermodynamics
(d) first law of thermodynamics

MHT CET-03.05.2019, Shift-I

Ans. (c) : Modified first law of thermodynamics– According to this law, if a certain amount of one kind of energy is produced, an equal amount of some other kind of energy is consumed so that the total energy in the universe remains constant.

The modified first law of thermodynamics states that "In an isolated system, both mass and energy are conserved".

418. Calculate the work done during combustion of 0.138 kg of ethanol, $C_2H_5OH(l)$ at 300 K. Given: R = 8.314 JK^{-1} mol^{-1}, molar mass of ethanol = 46 g mol^{-1}.

(a) – 7482 J (b) 7482 J
(c) – 2494 J (d) 2494 J

MHT CET-2018

Ans. (b) :

$$C_2H_5OH(l)+3O_2(g)\longrightarrow 2CO_2(g)+3H_2O(l)$$

$$\text{No. of moles of ethanol}=\frac{\text{Mass of ethanol}}{\text{Molar mass of ethanol}}$$

$$=\frac{138}{46}=3$$

$$3C_2H_5OH+9O_2\longrightarrow 6CO_2+9H_2O$$

$\Delta n = 6 - 9 = -3$

Work (W) = $-\Delta nRT$

W = $-(-3) \times 8.314 \times 300$

W = 7482 J

419. Which among the following equations represents the first law of thermodynamics under isobaric conditions?

(a) $\Delta U = q_p - P_{ex}.\Delta V$ (b) $q_v = \Delta U$
(c) $\Delta U = W$ (d) $W = -q$

MHT CET-2018

Ans. (a) : The internal energy change $\Delta U = q_p + W$

At constant pressure (i.e. isobaric condition)

$\Delta U = q_p + (-P_{ex}.\ \Delta V)$ $(\because W = -P_{ex}.\ \Delta V)$

$\Delta U = q_p - P_{ex}.\ \Delta V$

420. The first law of thermodynamics for isothermal process is

(a) $q = -W$ (b) $\Delta U = W$
(c) $\Delta U = q_v$ (d) $\Delta U = -q_v$

MHT CET-2017

Ans. (a) : According to the first law of thermodynamics

$\Delta U = q + W$

For an isothermal process, $\Delta U = 0$

Hence, $q + W = 0$ or

$q = -W$

421. The work done during combustion of 9 × 10^{-2} kg of ethane, C_2H_6 (g) at 300 K is (Given R = 8.314 J deg^{-1} mol^{-1}, atomic mass C = 12, H = 1)

(a) 6.236 kJ (b) –6.236 kJ
(c) 18.71 kJ (d) –18.71 kJ

MHT CET-2017

Ans. (c) :

$$2C_2H_6(g)+7O_2(g)\longrightarrow CO_2(g)+6H_2O(l)$$

$\Delta n = 2 - (1 + 3.5) = -2.5$

Molar mass of ethane = 2 (12) + 6 (1) = 30 g/mol

9 × 10^{-2} kg ethane = 9 × 10^{-2} kg × 1000 g/kg = 90 g

$$90\text{ g ethane}=\frac{90\text{g}}{30\text{g/mol}}=3\text{ mol ethane}$$

For 1 mole of ethane, $\Delta n = -2.5$

For 3 mole of ethane, $\Delta n = -2.5 \times 3 = -7.5$

Work done, W = $-\Delta nRT$

W = $-(-7.5) \times 8.314 \times 300$

W = 18707 J

W = 18. 71 kJ

422. What is the amount of work done when 0.5 mole of methane, $CH_4(g)$, is subjected to combustion at 300 K? (Given R = 8.314 JK^{-1} mol^{-1})

(a) –2494 J (b) –4988 J
(c) +4988 J (d) +2494 J

MHT CET-2016

Ans. (d) : The balanced chemical equation for combustion reaction is,

$$CH_4(g)+2O_2(g)\longrightarrow CO_2(g)+2H_2O(1)$$

When 1 mole of methane undergoes combustion

$\Delta n = 1 - (1 + 2) = -2$ $\therefore \Delta n$ = Negative

When 0.5 mole of methane undergo combustion

$\Delta n = -2 \times 0.5 = -1$

At STP (1 atm and 273 K) 1 mole of a gas occupies a volume of 22.4 L.

$$\text{The Volume change }(\Delta V) = 22.4\text{ L}\times \Delta n \times \frac{300\text{K}}{273\text{K}}$$

$\Delta V = -24.62$ L

Work done (W) = $-P\Delta V$

W = –1atm × (–24.62 L)

W = + 24.6 L atm

1 L atm = 101.3 J

W = 24.62 atm × 101.3 J

Hence, the amount of work done is + 2494 J.

423. Given: R = 8.314 JK^{-1} mol^{-1}, the work done during combustion of 0.090 kg of ethane (molar mass = 30) at 300 K is

(a) – 18.7 kJ (b) 18.7 kJ
(c) 6.234 kJ (d) – 6.234 kJ

MHT CET-2015

Ans. (b) : The combustion of C_2H_6 is as,

$$C_2H_6+7/2O_2\longrightarrow 2CO_2+3H_2O$$

$$\text{No of moles of } C_2H_6=\frac{\text{Mass}}{\text{Molar mass}}$$

$= (0.090\text{ kg}) (.30 \times 10^{-3}\text{ kg mol}^{-1})$

Change in number of moles of gas is,

$\Delta n = \Sigma n_{g\,(produced)} - \Sigma n_{g\,(reactant)}$

$\Delta n = 2-(1+ 7/2) = -2.5$ $\therefore \Delta n$ = Negative

@apna_pdf

Now, work done (W) = – P Δ V = ΔnRT

$W = -(-2.5 \times 8.314 \times 300)$

$= 6235.5$ J

For one mole combustion,

$W = 6235.5$ J

For 3 moles,

$W = 3 \times 6235.5$ J

$= 18706.5$ J = 18.7 kJ

424. The work done when two mole of an ideal gas is compressed form a volume of 5 m^3 to 1 dm^3 at 300 K, under a pressure of 100 kPa is

(a) 499.9 kJ
(b) –499.9 kJ
(c) –99.5 kJ
(d) 42495 kJ

MHT CET-2014

Ans. (a) : Work done,

$W = -P(V_2 - V_1)$

$P = 100\text{kPa}$

$V_1 = 5\text{m}^3$

$V_2 = 1\text{dm}^3 = 1 \times 10^{-3}\text{m}^3$

$W = -100 \times (10^{-3} - 5) = 100(0.001 - 5)$

$= 499.9$ kJ

425. The pressure of a gas is 100 kPa. If it is compressed from 1 m^3 to 10 dm^3 , find the work done.

(a) 990 J
(b) 9990 J
(c) 9900 J
(d) 99000 J

MHT CET-2010

Ans. (d) : Given, P = 100 kPa

$V_1 = 1\ m^3$

$V_2 = 10 \times 10^{-3} m^3 = 10^{-2} m^3$

Workdone, $W = -P\,dV = P(V_1 - V_2)$

$= 100 \times 10^3 (1 - 10^{-2})$

$= 100 \times 10^3 \times 0.99 = 99000$ J

426. At the same conditions of pressure, volume and temperature, work done is maximum for which gas if all gases have equal masses?

(a) NH_3
(b) N_2
(c) Cl_2
(d) H_2S

MHT CET-2009

Ans. (a) : When P, V and T are same and mass is also small work done depends only on molecular mass.

$W \propto \frac{1}{M}$ (Where, M = molecular mass)

$NH_3 \rightarrow 14 + 3 = 17$ g/mole

$N_2 \rightarrow 14 \times 2 = 28$ g/mole

$Cl_2 \rightarrow 35.5 \times 2 = 71$ g/mole

$H_2S \rightarrow 2 + 32 = 34$ g/mole

Among the given gases, NH_3 has lowest molecular mass. So work done is maximum.

427. 16 g of oxygen gas expands isothermally and reversible at 300K from 10 dm^3 to 100 dm^3 the work done is (in J)

(a) zero
(b) – 2875 J
(c) + 2875 J
(d) infinite

MHT CET-2009

Ans. (b) : $W = -2.303\ nRT \log \frac{V_2}{V_1}$

As we know that, work done in an isothermal reversible expansion is given as –

$$W = -2.303 \times \frac{16}{32} \times 8.314 \times 300 \log \frac{100}{10}$$

$= -2872\ J \approx -2875$ J

428. The work done during the expansion of a gas from a volume of 4 dm^3 to 6 dm^3 against a constant external pressure of 3 atm is (1 L atm = 101.32 J)

(a) –6 J
(b) –608 J
(c) +304 J
(d) –304 J

UPTU/UPSEE-2007
NEET-2004

Ans. (b) : Work done during expansion of a gas is ,

$W = -P\Delta V$

$W = -P(V_{\text{Final}} - V_{\text{initial}})$

$W = -3(6 - 4) \times 101.32$ ($\because$ 1 dm^3 = 1L)

$W = -6 \times 101.32 \approx -608$ J

429. Three moles of an ideal gas expanded spontaneously into vacuum. The work done will be

(a) infinite
(b) 3 Joules
(c) 9 Joules
(d) zero

NEET-2010

Ans. (d) : The work done is the product of pressure and change in volume.

$W = -P_{ext}\Delta V$

Since the ideal gas expands spontaneously into vacuum,

Free expansion $\boxed{P_{ext} = 0}$.

$W = -0 \times \Delta V = 0$

Hence work done is also zero in vacuum.

430. An ideal gas expands isothermally from 10^{-3} m^3 to 10^{-2} m^3 at 300 K against a constant pressure of 10^5 Nm^2. The work done on the gas is

(a) +270 kJ
(b) –900 J
(c) +900 kJ
(d) –900 kJ

NEET-Odisha 2019

Ans. (b) : For an isothermal irreversible expansion

Work done (W) = $-P(V_2 - V_1)$

V_1 = initial value

V_2 = final value

Given, P = 100000 Nm^{-2}

$V_1 = 10^{-3}\ m^3$

$V_2 = 10^{-2}\ m^3$

Then , $W = -100000(10^{-2} - 10^{-3})$

$= -100000 \times \frac{9}{1000}$

$= -900$J

431. A gas is allowed expand in a well insulated container against a constant external pressure of 2.5 atm from an initial volume of 2.50 L to a final volume of 4.50 L. The change in internal energy ΔU of the gas in joules will be

@apna_pdf

(a) –500 J (b) –505 J
(c) +505 J (d) 1136.25 J

NEET-2017

Ans. (b) : Given, $P = 2.5$ atm, $V_1 = 2.5$ L, $V_2 = 4.5$ L
$\Delta V = 4.50 - 2.5$
$\Delta V = 2L$
For adiabatic process,
$q = 0$
The first law of thermodynamics $\Delta U = q + W$
When $q = 0$, then $\Delta U = W$
Now $W = -P\Delta V$
$\Delta U = -2.5 \times 2L$ atm
$\Delta U = -5L$ atm
We know that 1 L atm = 101.3 J
$\Delta U = -5 \times 101.3J = -506.5J \approx -505J.$

432. Under isothermal conditions, a gas at 300 K expands from 0.1 L to 0.25 L against a constant external pressure of 2 bar. The work done by the gas is [Given that 1 L bar = 100 J]
(a) 30 J (b) –30 J
(c) 5 kJ (d) 25 J

NEET-2019

Ans. (b) : Given,
$V_1 = 0.1$ L
$V_2 = 0.25$ L
$P = 2$ bar
$\therefore$ 1 L bar = 100 J
$W = -P_{ext}\,\Delta V$
$= -2 \text{ bar} \times (0.25 - 0.1)$ L
$= -2 \times 0.15$ L bar
$= -0.30$ L bar
$= -0.30 \times 100$ J
$= -30$ J

433. Which of the following is the correct equation?
(a) $\Delta U = \Delta W + \Delta Q$ (b) $\Delta U = \Delta Q - W$
(c) $\Delta W = \Delta U + \Delta Q$ (d) None of these

NEET-1996

Ans. (a) : First law of thermodynamics,
$\Delta U = \Delta Q + \Delta W$
Where, ΔU = Change in internal energy
ΔQ = Heat absorbed by the system
ΔW = Workdone by the system

434. Work done by 1 mole of an ideal gas for its adiabatic reversible change when temperature attains T_2 from T_1 is'
(a) $(C_P - C_V)(T_2 - T_1)$ (b) $C_P(T_1 - T_2)$
(c) $C_V(T_2 - T_1)$ (d) $(C_P - C_V)(T_1 + T_2)$

Tripura JEE-2022

Ans. (c): For Adiabatic Process,
$q = 0$
$\Delta U = q + W$
$\Delta U = w$
$nC_VdT = W$
$1 \times C_V(T_2 - T_1) = W$
$\boxed{C_v(T_2 - T_1) = W}$

435. In which of the following changes entropy decreases ?
(a) Crystallization of sucrose from solution
(b) Dissolving sucrose in water
(c) Melting of ice
(d) Vapourisation of camphor

UPTU/UPSEE-2018

Ans. (a) : During the crystallization of sucrose solution liquid state is changing into solid state hence entropy decreases.

$\boxed{\text{Gas} > \text{Liquid} > \text{Solid}}_{\text{Entropy}}$

436. 1 mole of gas occupying 3L volume is expanded against a constant external pressure of 1 atm to a volume of 15L. The work done by a system is equal to
(a) -1.215×10^3J (b) -12.15×10^3J
(c) $+1.215 \times 10^3$J (d) $+12.15 \times 10^3$J

UPTU/UPSEE-2015

Ans. (a) :
$W = -P_{ext}\,\Delta V$
$W = -1\,(15 - 3)$
$W = -12$ L atm
$= -12 \times 101.27J$ ($\because$ 1L atm = 101.270J)
$= -1215.24$ J
$W = -1.215 \times 10^3$ J

437. When 1 mole of a gas is heated at constant volume, temperature is raised form 298 K to 308K. Heat supplied to the gas is 500J. Then, which statement is correct?
(a) $q = -W = 500$ J, $\Delta E = 0$
(b) $q = W = 500$J, $\Delta E = 0$
(c) $q = \Delta E = 500$ J, $W = 0$
(d) $\Delta E = 0$; $q = W = -500$ J

UPTU/UPSEE-2014

Ans. (c) : We know that,
$\Delta H = \Delta E + P\Delta V$
From the first law of thermodynamics,
$\Delta U = q + W$
$W = -P\Delta V$
$\Delta V = 0$ {Given in question}
$W = -P \times 0 = 0$
$q = 500J$
So, $\Delta U = q = 500$ J

438. Pressure-volume (PV) work done by an ideal gaseous system at constant volume is (where E is internal energy of the system)
(a) $-\Delta P/P$ (b) zero
(c) $-V\Delta P$ (d) $-\Delta E$

WB-JEE-2013

Ans. (b) : From the first law of thermodynamics
$\Delta E = q + W$
$W = -P\Delta V$
$\therefore \Delta V = 0$ since the volume is constant
$W = 0$

@apna_pdf

3. Second Law of Thermodynamics and Entropy

439. Among the following for spontaneity of chemical reaction there should be:
(a) decrease in entropy and increase in free energy
(b) decrease in entropy and free energy both
(c) increase in entropy and decrease in free energy
(d) increase in entropy and free energy both

MPPET - 2012

Ans. (c) : From Gibbs – Helmholtz equation,
$\Delta G = \Delta H - T\Delta S$
For a spontaneous reaction at any temperature. ΔG = –ve and it is possible when ΔH = –ve and ΔS = +ve
Thus, for a spontaneous reaction, there must be increase in entropy and decrease in free energy.

440. The enthalpy of vaporization of a compound is 840 J/mole and its boiling point is 170 K. Its entropy of vaporization is

(a) 4.94 J/mol/K	(b) 12 J/mol/K
(c) 200 J/mol/K	(d) 49 J/mol/K

TS EAMCET 10.08.2021, Shift-I

Ans. (a) : Given that $\Delta H_{vap.}$ = 840 J/mol, $T_{B.P}$ = 170K

We know that, $\Delta S_{vap.} = \frac{\Delta H_{vap.}}{T_{B.P}} = \frac{840}{170} = 4.94$ J/mol/K

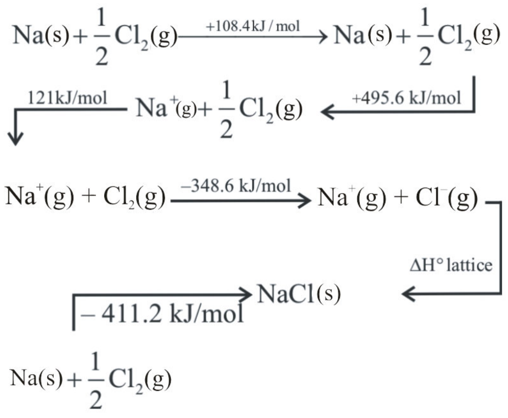
441. For an adiabatic change in a system, the condition which is applicable will be

(a) $w = 0$	(b) $q = -w$
(c) $q = w$	(d) $q = 0$

COMEDK-2015

Ans. (d) : In adiabatic system there is neither heat exchange nor leaves the system (i.e. heat remains constant)
$\Delta Q = \Delta U + \Delta W$
ΔQ = Constant or $\Delta Q = 0$

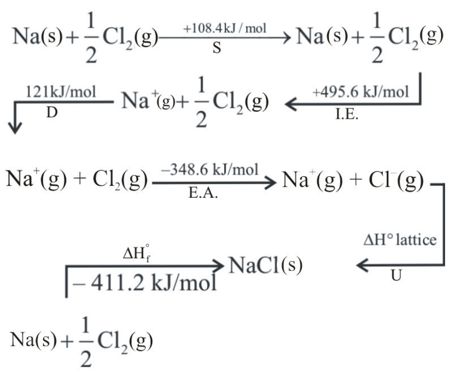
442. For one mole of NaCl(s) the lattice enthalpy is



(a) –788 kJ/mol	(b) +878 kJ/mol
(c) +788 kJ/mol	(d) –878 kJ/mol

COMEDK-2015

Ans. (a) :



$\Delta_f H^\circ = S + D + I.E. + E.A + U$
$-411.2 = 108.4 + 121 + 495.6 - 348.6 + U$
$U = -787.6 \text{kJ/mol} \approx -788 \text{kJ/mol}$

443. A process is spontaneous at a given temperature if

(a) $\Delta H = 0, \Delta S < 0$	(b) $\Delta H > 0, \Delta S < 0$
(c) $\Delta H < 0, \Delta S > 0$	(d) $\Delta H > 0, \Delta S = 0$

COMEDK-2017, 2016

Ans. (c) : $\Delta G = \Delta H - T\Delta S$
A process is spontaneous if ΔG is –ve, ΔH is –ve and ΔS is positive.

444. For the gas phase reaction,
$PCl_5(g) \rightleftharpoons PCl_3(g) + Cl_2(g)$
Which of the following condition are correct?

(a) $\Delta H < 0$ and $\Delta S < 0$	(b) $\Delta H > 0$ and $\Delta S < 0$
(c) $\Delta H = 0$ and $\Delta S < 0$	(d) $\Delta H > 0$ and $\Delta S > 0$

COMEDK-2018

Ans. (d) : $PCl_5(g) \rightleftharpoons PCl_3(g) + Cl_2(g)$
One mole of PCl_5 is dissociated into two moles of PCl_3 and Cl_2 in the same phase hence, the process is endothermic i.e., $\Delta H > 0$. Also ΔS > 0 as one mole of gaseous reactant gives two moles of gaseous products and randomness increases.

445. A piece of ice kept at room temperature melts of its own. This reaction is governed by which law?
(a) Zeroth law of Thermodynamics
(b) Third law of Thermodynamics
(c) First law of Thermodynamics
(d) Second law of Thermodynamics

GUJCET-2008

Ans. (d) : When ice changes into water spontaneously at room temperature, the randomness increases, so entropy increases which is in accordance with the second law of thermodynamics.
- The zeroth law of thermodynamics states that if two bodies are each in thermal equilibrium with some third body, then they are also in equilibrium with each other.
- The third law of thermodynamics state that the entropy of a system become constant at absolute zero temperature.

@apna_pdf

446. Which of the following is not an intensive property?

(a) Entropy (b) Melting point
(c) Specific gravity (d) Refractive index

TS EAMCET 05.08.2021, Shift-I

Ans. (a) : Intensive property – An intensive property is one that does not depend on the mass of the substance or system.

Example– Temperature, pressure, density etc.

Extensive property – An extensive property is a property that depends on the amount of matter or mass in a sample.

Example– Enthalpy, entropy, internal energy etc.

447. Calculate the change of entropy for the process, water (liquid) to water (vapour) involving $\Delta H_{vap} = 40850$ J mol^{-1} at 373 K.

(a) $\Delta S_{vap} = 98.5$ J K^{-1} mol^{-1}
(b) $\Delta S_{vap} = 109.52$ J K^{-1} mol^{-1}
(c) $\Delta S_{vap} = 89$ J K^{-1} mol^{-1}
(d) $\Delta S_{vap} = 72$ J K^{-1} mol^{-1}

SRMJEEE – 2015

Ans. (b) :

Given : $\Delta H_{vap} = 40850\ \text{Jmol}^{-1}$

$\Delta T_b = 373$ K

Now, $$\Delta S_{vap} = \frac{\Delta H_{vap}}{T_b}$$

$$\Delta S_{vap} = \frac{40850\,\text{Jmol}^{-1}}{373\text{K}}$$

$$\Delta S_{vap} = 109.52\ \text{JK}^{-1}\ \text{mol}^{-1}$$

448. The temperature of K at which ΔG = 0, for a given reaction with ΔH = –20.5 kJ mol^{-1} and ΔS = –50.0 JK^{-1}mol^{-1} is

(a) –410 (b) 410
(c) 2.44 (d) – 2.44

AP-EAMCET (Engg.) - 2014

Ans. (b) : Given, ΔG = 0, ΔH = –20.5 kJ mol^{-1}

ΔS = –50JK^{-1} mol^{-1}

According to Gibb's equation–

$$\Delta G = \Delta H - T\Delta S$$

$$0 = -20.5\times10^3 - T\times(-50)$$

$$T = \frac{-20.5\times10^3}{-50}$$

T = 410 K

449. What is the entropy change in JK^{-1} during the melting of 27.3 g of ice at 0°C? (Latent heat of fusion of ice = 330 Jg^{-1})

(a) 330 (b) 12.1
(c) 3.3 (d) 33

AP-EAMCET- (Engg.)-2011

Ans. (d : We know that,

$$\Delta S_f = \frac{\Delta H_f}{T_f}$$

Given that, Latent heat of fusion of ice = 330 Jg^{-1}

T = 0°C = 273K

So,

$$\Delta S_f = \frac{330\times27.3}{273}$$

$$= 33\ \text{JK}^{-1}$$

450. If S^0 CH$_4$(g) = 186.2JK^{-1}mol^{-1}, S^0 H$_2$O(g) = 188.7JK^{-1}mol^{-1}, S^0 H$_2$(g) = 130.6 JK^{-1}mol^{-1} and S^0 CO(g) = 197.91 JK^{-1}mol^{-1}, then entropy change for $CH_4(g) + H_2O(g) \rightarrow 3H_2(g) + CO(g)$ will be :

(a) –214.8 JK^{-1}mol^{-1} (b) 214.8 JK^{-1}mol^{-1}
(c) –218.4 JK^{-1}mol^{-1} (d) 218.4 JK^{-1}mol^{-1}

AMU–2006

Ans. (b) : $CH_4(g) + H_2O(g) \rightarrow 3H_2(g) + CO(g)$

Change entropy, $\Delta S = \Delta S_{(product)} - \Delta S_{(reactant)}$

$$\Delta S^0 = (3\times130.6+197.91) - (186.2+188.7)$$

$$= 214.81\ \text{JK}^{-1}\text{mol}^{-1}$$

451. The enthalpy of vaporization of a liquid is 35.2 kJ mol^{-1} at 110.6°C. The entropy change for the process will be

(a) 9.18 JK^{-1}mol^{-1} (b) 31.83 JK^{-1}mol^{-1}
(c) 91.76 JK^{-1}mol^{-1} (d) 318.3 JK^{-1}mol^{-1}

AMU–2006

Ans. (d) : We know that,

$$\text{Entropy of vaporisation} = \frac{\text{Enthalpy of vaporisation}}{\text{Boiling point}}$$

$$(\Delta S)_{vap} = \frac{(\Delta H)_{vap}}{T_{b.p}}$$

$$\text{or, Entropy of vaporisation}(\Delta S) = \frac{35.2}{110.6}\,\text{J mol}^{-1}\text{K}^{-1}$$

$= 0.3183$ J mol^{-1}K^{-1} = 318.3 J mol^{-1}K^{-1}

452. Enthalpy change when 1g water is frozen at 0°C is :

$(\Delta H_{fus} = 1.435\ \text{kcal mol}^{-1})$

(a) 0.0797 kcal (b) –0.0797 kcal
(c) 1.435 kcal (d) –1.435 kcal

BCECE-2003

Ans. (b) : Given that, $(\Delta H)_{fusion} = 1.435$ kcal/mol

- For 1 mole heat given 1.435 kcal
- For water $\frac{1}{18}$ mole $= 1.435\times\frac{1}{18}$ kcal heat

$= 0.07972$ kcal

Since heat will be released ⇒ ΔH = –0.07972 kcal

453. For which of the process, ΔS is negative?

(a) $H_2(g) \rightarrow 2H(g)$
(b) $N_2(g)(1\text{atm}) \rightarrow N_2(g)(8\text{atm})$
(c) $2SO_3(g) \rightarrow 2SO_2(g) + O_2(g)$
(d) $C_{(diamond)} \rightarrow C_{(graphite)}$

BITSAT 2008

Ans. (b) : The higher is the pressure lower become entropy. When the pressure increase on the gases molecule kinetic energy of the particle decrease with respect to the pressure. This is due to the particle comes closer and intermolecular distance decreases the entropy.

@apna_pdf

Entropy is a state function that is often referred to as the state of disorder of a system.

- $H_2(g) \rightarrow 2H(g)$ entropy increases because no. of atoms increases.
- $N_2(g, 1\ atm) \rightarrow N_2(g, 8\ atm)$ entropy decreases as pressure increase and randomness decreases.
- $2SO_3(g) \rightarrow 2SO_2(g) + O_2(g)$ entropy increases because no. of atoms increases.
- $C_{(diamond)} \rightarrow C_{(graphite)}$ entropy increases as the compactness of system decreases and randomness increases.

454. For a given reaction, $\Delta H = 35.5$ kJ mol^{-1} and $\Delta S = 83.6$ JK^{-1} mol^{-1}. The reaction is spontaneous at : (Assume that ΔH and ΔS do not vary with temperature)

(a) T>425 K (b) All temperature
(c) T>298 K (d) T<425 K

BITSAT 2017

Ans. (a) : Given that

$\Delta H = 35.5$ kJ/mol = 35500 J/mol

$\Delta S = 83.6$ J/K/mol

We know that,

$\Delta G = \Delta H - T\Delta S$

For spontaneous $\Delta G < 0$

$\Delta H - T\Delta S < 0$

$$T > \frac{\Delta H}{\Delta S}$$

$$T > \frac{35500}{83.6}$$

$T > 425$ K

So, the given reaction will be spontaneous at T > 425 K.

455. Identify the correct statement for change of Gibbs energy for a system $\left(\Delta G_{system}\right)$ at constant temperature and pressure

(a) If ΔG_{system} =0, the system has attained equilibrium
(b) If ΔG_{system} =0, the system is still moving in a particular direction
(c) If ΔG_{system} =0, the process is not spontaneous
(d) if ΔG_{system} =0, the process is spontaneous

CG PET -2007

Ans. (a) : We know that,

$\Delta G = \Delta S - T\Delta S$

If $(\Delta G)_{system} < 0$ the process is spontaneous

If $(\Delta G)_{system} > 0$ the process is non-spontaneous

If $(\Delta G)_{system} = 0$ the process is in equilibrium.

456. At 27ºC latent heat of fusion of a compound is 2930 J/mol, then entropy change is

(a) 9.77 J/mol-K (b) 10.77 J/mol-K
(c) 9.07 J/mol-K (d) 0.977 J/mol-K

CG PET -2007

Ans. (a) : $\Delta S_{\ system} = \frac{Q_{rev}}{T} = \frac{2930}{300}$

$= 9.77$ J / mol-K

457. Which of the following does not result in an increase in entropy?

(a) Crystallisation of sucrose from a solution
(b) Rusting of iron
(c) Conversion of ice of water
(d) Vaporisation of camphor

CG PET -2005

Ans. (a) : In crystallization of sucrose from solution, the liquid is converted into solid. As result in decrease in randomness because of which the entropy will decrease.

458. Entropy of a perfectly crystalline solid at 0 K is

(a) positive (b) negative
(c) zero (d) either positive or negative

J & K CET-(2012)

Ans. (c) : Entropy of a perfect crystalline solid at absolute zero temperature is zero. This is the statement of third law of thermodynamics.

459. Entropy change in a process where 1 litre of liquid. He is poured into ice cold water is

(a) finite and positive (b) finite and negative
(c) zero (d) infinity.

J & K CET-(2012)

Ans. (a) : Entropy change in a process where 1L of liquid is poured into ice cold water is finite and negative because randomness decreases.

Entropy = gas > liquid > solid

460. What will be the entropy change of the system when expansion of 1 mole of a gas takes place from 3 L to 6 L under isothermal conditions? Consider, R=2 cal K^{-1} mol^{-1} and log 2=0.301.

(a) 2.84 cal K^{-1} (b) 1.386 cal K^{-1}
(c) 0.37 cal K^{-1} (d) 5.26 cal K^{-1}

J & K CET-(2018)

Ans. (b) $\Delta S = 2.303\ n\ R\ \log_{10}\left(\frac{V_f}{V_i}\right)$

$$\Delta S = 2.303 \times 1 \times 2 \log_{10}\left(\frac{6}{3}\right)$$

$= 2.\ 303 \times 2 \times 0.301$

$=1.386$ cal K^{-1}

461. Pick out the wrong statement.

(a) The standard free energy of formation of elements is zero.
(b) A process that leads to increase in free energy will be spontaneous.
(c) A process accompanied by decreases in entropy will be non-spontaneous under normal conditions.
(d) Enthalpy of combustion is always negative.

J & K CET-(2011)

Ans. (b) : ΔG gives a criteria for spontaneity at constant temperature and pressure.

If $\Delta G < 0$ = Negative

Then the process are spontaneous

If $\Delta G > 0$ = Positive

Then the process are non–spontaneous

@apna_pdf

462. The values of ΔH and ΔS for a reaction are respectively 30 kJ mol^{-1} and 100 JK^{-1} mol^{-1}. Then the temperature above which the reaction will become spontaneous is

(a) 300 K (b) 30 K
(c) 100 K (d) 300^0C

J & K CET-(2011)

Ans. (a): Given that $\Delta H = 30$ kJ $mol^{-1} = 30\times10^3$ $Jmol^{-1}$

$\Delta S = 100\ JK^{-1}$

$\Delta G = \Delta H - T\Delta S$

For spontaneous reaction, $\Delta G < 0$

$\Delta H - T\Delta S < 0$

$(30 \times 10^3) - T \times (100) < 0$

$30000 < 100\ T$

$300 < T$

$T > 300$ K

463. When water is cooled to its entropy

(a) increases (b) decreases
(c) remains same (d) becomes zero

J & K CET-(2010)

Ans. (b) : When water is cooled to ice randomness or disorderness decreases i.e. entropy decrease.

464. The incorrect statement among the following is

(a) the entropy of the universe remains constant.
(b) heat cannot be completely converted into work.
(c) the absolute entropy of a perfectly crystalline solid at absolute zero temperature is zero.
(d) the total energy of an isolated system remains constant.

J & K CET-(2009)

Ans. (a) : The Entropy of Universe are increasing spontaneously, $\Delta S_{universe} > 0$

465. What are the units of entropy?

(a) cal.K (b) $cal.K^{-1}$
(c) $cm.\ K^{-1}$ (d) cm. K

J & K CET-(2006)

Ans. (b) : Entropy, $\Delta S = \dfrac{q_{rev}}{T}$

$\because$ unit of Entropy is cal K^{-1}

466. One mole of a perfect gas expands isothermally to ten times its original volume. The change in entropy is

(a) 0.1 R (b) 2.303 R
(c) 10.0 R (d) 100. O R

J & K CET-(2004)

Ans. (b) : Given, n = 1 mole, $V_i = V$, $V_f = 10$ V

For reversible isothermal process,

$$\Delta S = nR\ln\left(\frac{V_f}{V_i}\right) = 2.303\ nR\ \log_{10}\left(\frac{V_f}{V_i}\right)$$

$$\Delta S = 2.303 \times R \times \log_{10}\left(\frac{10V}{V}\right)$$

$\Delta S = 2.303$ R $\qquad [\because \log_{10}10 = 1]$

467. The entropy of crystalline substances at absolute zero going by the third law of thermodynamics should be taken as

(a) 100
(b) 50
(c) Zero
(d) different for different substances

J & K CET-(2005)

Ans. (c) : Third law of thermodynamics states that the entropy of a perfectly crystalline substance at absolute zero K temperature is zero.

468. When the same quantity of heat is absorbed by a system at two different temperatures T_1 and T_2, such that $T_1 > T_2$, change in entropies are ΔS_1 and ΔS_2 respectively. Then

(a) $\Delta S_1 < \Delta S_2$ (b) $\Delta S_1 = \Delta S_2$
(c) $S_1 > S_2$ (d) $\Delta S_2 < \Delta S_1$

Karnataka-CET-2020

Ans. (a) : Entropy change occur due to transfer of heat.

$\Delta S = q / T \qquad [q = \text{constant}]$

So, $\Delta S \propto \dfrac{1}{T}$

Given , $T_1 > T_2$

So, actual relation between the entropies will be

$(\Delta S_2 > \Delta S_1)$

469. The enthalpy of vaporization of benzene is +35.3 kJ/mol at its boiling point of 80^oC. The entropy change in the transition of vapour to liquid at its boiling point is..... in $Jmol^{-1}K^{-1}$

(a) – 100 (b) + 100
(c) + 342 (d) – 342

Karnataka-CET-2011

Ans. (a): Given that,

$\Delta H_{vap.} = +35.3$ kJ/mol

$T = 80^oC = 80 + 273 = 353$ K

$$\text{Entropy, } \Delta S_{vap.} = \frac{\Delta H_{vap.}}{T} = \frac{+35.3}{353} = 0.1 kJ/mol/K$$

$\Delta S_{vap.} = 0.1 \times 10^3 = 100$ J/mol/K

Entropy change in the transition of vapour to liquid is negative, $\Delta S_{vap.} = -100$ J mol^{-1} K^{-1}

470. If one mole of ammonia and one mole of hydrogen chloride are mixed in a closed container to form ammonium chloride gas, then

(a) $\Delta H > \Delta U$ (zb) $\Delta H = \Delta U$
(c) $\Delta H < \Delta U$ (d) there is no relationship

KARNATAKA-CET, 2008

Ans. (c): We can write the given reaction is-

$$\underset{1\,mol}{NH_3(g)} + \underset{1\,mol}{HCl(g)} \rightarrow \underset{1\,mol}{NH_4Cl(g)}$$

$\Delta H = \Delta U + \Delta n_gRT$

Δn_g = Number of moles of product – number of moles of reactant

$= 1 - 2 = -1$

$\Delta H = \Delta U - RT$

$\therefore \quad \Delta H < \Delta U$

471. In the reaction; $A_2(g) + 3B_2(g) \longrightarrow 2AB_3(g)$ the standard entropies in (JK^{-1} mol^{-1}) of $A_2(g)$, $B_2(g)$ and $AB_3(g)$ are respectively 190, 130 and 195 and the enthalpy change for the reaction is

@apna_pdf

-95 kJ mol^{-1}. The temperature (in K) at which the reaction attains equilibrium is (assuming both the standard entropy change and standard enthalpy change for this reaction are constant over a wide range of temperature)

(a) 500 (b) 400
(c) 300 (d) 600
(e) 700

Kerala-CEE-2012

Ans. (a): In the reaction-

$A_2(g) + 3B_2(g) \longrightarrow 2AB_3(g)$

Entropy change $\Delta S^0 = \Sigma S_{(product)} - \Sigma S_{(reactant)}$

$\Delta S^0 = 2 \times S_{AB_3} - [S_{A_2} + 3S_{B_2}]$

$= 2 \times 195 - [190 + 3 \times 130]$

$= 390 - [190 + 390]$

$= -190 \text{ J K}^{-1}\text{ mol}^{-1}$

Given, $\Delta H^0 = -95 \text{ kJ mol}^{-1}$

At equilibrium, $\Delta G^0 = 0$

$\Delta G^0 = \Delta H^0 - T\Delta S^0$

$0 = \Delta H^0 - T\Delta S^0$

$T\Delta S^0 = \Delta H^0$

$$T = \frac{\Delta H^0}{\Delta S^0} = \frac{-95 \times 10^3 \text{ Jmol}^{-1}}{-190 \text{JK}^{-1}\text{mol}^{-1}} = \frac{95000 \text{Jmol}^{-1}}{190 \text{JK}^{-1}\text{mol}^{-1}}$$

$T = 500\text{K}$

472. For a process, entropy change of a system is expressed as

(a) H – TS (b) $\frac{q_{rev}}{T}$
(c) $\frac{T}{q_{rev}}$ (d) $q_{rev} \times T$

MHT CET-02.05.2019, SHIFT-III
WB-JEE-2013

Ans. (b): Entropy is a function of the state of the system , so the change in entropy of a system is determined by its initial and final states.

$$\Delta S_{system} = \frac{q_{rev}}{T}$$

Here, the system absorbs q amount of heat from surrounding at temperature T.

473. The second law of thermodynamics says that in a cyclic process

(a) work cannot be converted into heat
(b) heat cannot be converted into work
(c) work cannot be completely converted into heat
(d) heat cannot be completely converted into work

WB-JEE-2009

Ans. (d): According to second law of thermodynamics–

- No cyclic process that converts heat entirely into work is possible.
- Work can never be equal to Q.
- Some energy must always be transferred as heat to the system's surrounding.

474. The enthalpy of vaporization of a certain liquid at its boiling point of 35°C is 24.64 kJ mol^{-1}. The value of change in entropy for the process is

(a) 704 JK^{-1} mol^{-1} (b) 80 JK^{-1} mol^{-1}
(c) 24.64 JK^{-1} mol^{-1} (d) 7.04 JK^{-1} mol^{-1}

WB-JEE-2014

Ans. (b): ΔS = ? (change in entropy)

Boiling point (T) = 35°C = 35 + 273 = 308K

Enthalpy of vaporization $(\Delta H_v) = 24.64 \text{ kJ mol}^{-1}$

$= 24.64 \times 10^3 \text{J mol}^{-1}$

$$\text{Entropy of vaporization} = \frac{\text{Enthalpy of vap}(\Delta H_v)}{\text{Boiling point }(T)}$$

$$\therefore \quad \Delta S = \frac{24.64 \times 10^3 \text{ J mol}^{-1}}{308 \text{ K}}$$

$= 80 \text{ JK}^{-1}\text{ mol}^{-1}$

4. Heat of Reaction

475. 2.2 g of nitrous oxide (N_2O)gas is cooled at a constant pressure of 1 atm from 310 K to 270 K causing the compression of the gas from 217.1mL to 167.75 mL. The change in internal energy of the process, ΔU is '-x' J. The value of 'x' is ____.
[Nearest integer]
(Given : atomic mass of N = 14 g mol^{-1} and of O = 16 g mol^{-1} Molar heat capacity of N_2O is 100 JK^{-1} mol^{-1})

JEE Main-29.06.2022, Shift-II

Ans. (195) : Given that, $T_1 = 310$ K, $T_2 = 270$ K

$\Delta T = T_2 - T_1 = 270 - 310 = -40\text{K}$

$P = 1 \text{ atm} = 1 \times 101.3 \text{ kPa}$

$V_1 = 217.\ 1\text{mL} = 217.1 \times 10^{-6} \text{ m}^3$

$V_2 = 167.75 \text{ mL} = 167.75 \times 10^{-6} \text{ m}^3$

$\Delta V = V_2 - V_1 = 16.7.75 \times 10^{-6} - 217.1 \times 10^{-6}$

$= -49.35 \times 10^{-6} \text{ m}^3$

$C_p = 100 \text{ J K}^{-1}\text{mol}^{-1}$

$$(n)_{N_2O} = \frac{2.2}{44} = \frac{1}{2} = 0.5$$

$\Delta H = nC_p\Delta T = 0.5 \times 100 \times (-40) = -200 \text{ J}$

$\Delta H = \Delta U + W = \Delta U + (P\ \Delta V)$

$\Delta V = \Delta H - P\Delta V$

$= -200 - 101.3 \times 10^3 \times (-49.35 \times 10^{-6})$

$= -200 + 4.999$

$= -197.00 \text{ J}$

476. The dissociation energy of CH_4 is 360 kcal mol^{-1} and that of ethane is 620 kcal mol^{-1}. The bond energy of C – C bond is :

(a) 260 kcal (b) 980 kcal
(c) 90 kcal (d) 80 kcal

CG PET-22.05.2022

Ans. (d) :

$CH_4(g) \longrightarrow C(g) + 2H_2(g)\ ;\ \Delta H = 360 \text{ kcal mol}^{-1}$

So, bond dissociation energy of one C –H bond

$$= \frac{360}{4} = 90 \text{ kcal/mol}$$

@apna_pdf

$C_2H_6\,(g) \longrightarrow 2C\,(g) + 3H_2(g)$; $\Delta H = 320$ kcal/mol
$\Delta H = \Sigma\,(\text{Bond energy})_R - \Sigma\,(\text{Bond energy})_P$
$620 = [6 \times (B.E)_{C-H} + 1 \times (B.E)_{C-C}]$
$620 = 6 \times 90 + (B.E)_{C-C}$
$(B.E)_{C-C} = 620 - 540 = 80$ kcal /mol

477. What is the amount of heat liberated (in kcal). When one mole of aqueous NaOH reacted with one mole of aqueous HCl solution?

(a) 22.4 (b) 13.7
(c) 2.303 (d) 0.693

AP-EAMCET (Med.)-1999

Ans. (b) : When one mole of strong acid reacts with one mole of strong base, a fixed amount 13.7 kcal/mol heat is liberated.

$HCl + NaOH \rightarrow NaCl + H_2O, \quad \Delta Q = 13.7$ kcal/mole

478. What is the amount of heat is released when 8.17 g of Al (s) is converted to Al_2O_3(s) at 25°C and 1 atm via the reaction $4\,Al(s) + 3\,O_2\,(g) \rightarrow 2\,Al_2O_3(s)$?
[For the reaction, $\Delta H = -\ 1676$ kJ/mol, atomic mass of Al = 27]

(a) 134 kJ (b) 254 kJ
(c) 268 kJ (d) 1.01×10^3 kJ

SCRA 2012

Ans. (b) : $\Delta H_f^o = -1676$kJ mol

Note that the minus sign is used here to illustrate that the heat is being given off.

This value tells us that when 1 mole of aluminium oxide is formed at standard conditions from its constituent elements in their most stable form, 1676 kJ of heat are being given off.

In other words, we know that standard enthalpy change for this reaction

$$2Al(s) + \frac{3}{2}O_2(g) \rightarrow Al_2O_3(s)$$

is equal to

$$\Delta H_f^o = -1676\text{kJ}$$

This implies that this reaction

$$4Al(s) + 3O_2(g) \rightarrow 2Al_2O_3(s)$$

will have

$$\Delta H^o_{rxn} = 2.\Delta H_f^o\,,\quad \Delta H^o_{rxn} = 3352\text{ kJ}$$

So, when 2 moles of aluminium oxide are formed under standard conditions, the reaction given off 3352 kJ of heat.

Use the molar mass of aluminium to calculate the number of moles present in sample

$$8.17\text{ g } \cdot \frac{1\text{ mol Al}}{26.98\text{ g}} = 0.30282\text{ moles Al}$$

According to the balanced chemical equation, the reaction will produce

$$0.30282\text{ moles Al } \cdot \frac{1\text{ mol }Al_2O_3}{4\text{ moles Al}} = 0.15141\text{ moles }Al_2O_3$$

We can say that when 8.17 g of aluminium undergo complete combustion, the reaction will give off

$$0.15141\text{ moles }Al_2O_3 \cdot \frac{3352\text{kJ}}{2\text{ moles }Al_2O_3} = 254\text{ kJ}$$

479. The enthalpy change of a reaction does not depend on

(a) Initial and final state of the reaction
(b) State of the reactants and products
(c) Nature of the reactants
(d) Different intermediate states

SCRA-2015

Ans. (d): The enthalpy change of the reaction depend upon the initial and final state of the reaction, state of reactant and products and nature of the reactants. It is not depend upon the different intermediates states.

480. The bond enthalpy of H–H, Cl – Cl and H – Cl are 435, 243 and 431 kJ mol^{-1} respectively. The enthalpy of formation of HCl(g) would be:

(a) 92 kJ mol^{-1} (b) –92 kJ mol^{-1}
(c) 184 kJ mol^{-1} (d) –184 kJ mol^{-1}

MPPET - 2012

Ans. (b): For the reaction,

$$\frac{1}{2}H_2(g) + \frac{1}{2}Cl_2(g) \rightarrow HCl(g)$$

For reactants–

Bond Energy of H–H bond = 435 kJ mol^{-1}

Bond Energy of Cl–Cl bond = 243 kJ mol^{-1}

For products–

Energy of formation of H–Cl bond = 431kJ mol^{-1}

Thus, ΔH of the above reaction is–

$$\Delta H = \frac{1}{2}\left(\Delta H_{H_2} + \Delta H_{Cl_2}\right) - \Delta H_{HCl}$$
$$= \frac{1}{2}(435 + 243) - 431$$
$$= \frac{1}{2}(678) - 431$$
$$= 339 - 431$$
$$= -92\text{ kJ mol}^{-1}$$

481. Consider the following reactions:

$$\mathbf{C + O_2 \rightarrow CO_2;\quad \Delta H = -400\,kJ\,mol^{-1}}$$
$$\mathbf{2H_2 + O_2 \rightarrow 2H_2O;\quad \Delta H = -570\,kJ\,mol^{-1}}$$
$$\mathbf{CO_2 + 2H_2O \rightarrow CH_4 + 2O_2 \Delta H = 890\,kJ\,mol^{-1}}$$

The heat of formation of methane is

(a) –180 kJ mol^{-1} (b) –1060 kJ mol^{-1}
(c) –720 kJ mol^{-1} (d) –80 kJ mol^{-1}

(A.P.EAMCET-1994)

Ans. (d) : Given that,

$C + O_2 \longrightarrow CO_2; \Delta H = -400\text{kJ/mole}$ ....(i)
$2H_2 + O_2 \longrightarrow 2H_2O$; $\Delta H = -570$ kJ/mole ....(ii)
$CO_2 + 2H_2O \longrightarrow CH_4 + 2\,O_2$; $\Delta H = 890$ kJ/mole .(iii)

Adding equation (i), (ii) and (iii) we get,

$C + 2H_2 \rightarrow CH_4$; $\Delta H = -400 + (-570) + 890$
$\Delta H = -80\text{kJ/mole}$.

482. Given that,

$$\textbf{(i)}\ \mathbf{CH_3CHO + \frac{5}{2}O_2 \rightarrow 2CO_2 + 2H_2O;}$$
$$\mathbf{\Delta H = -1168\,kJ\,mol^{-1}}$$

@apna_pdf

(ii) $CH_3COOH + 2O_2 \rightarrow 2CO_2 + 2H_2O$

$\Delta H = -876\ kJ\ mol^{-1}$

ΔH for the reaction,

$CH_3CHO + \frac{1}{2}O_2 \rightarrow CH_3COOH$, is

(a) $-292\ kJ\ mol^{-1}$ (b) $378\ kJ\ mol^{-1}$
(c) $195\ kJ\ mol^{-1}$ (d) $-2044\ kJ\ mol^{-1}$

(A.P.EAMCET-1994)

Ans. (a) : Given that,

$CH_3CHO + \frac{5}{2}O_2 \longrightarrow 2CO_2 + 2H_2O$;

$\Delta H = -1168$ kJ/mole .....(i)

$CH_3COOH + 2O_2 \longrightarrow 2CO_2 + 2H_2O$; $\Delta H = -876$ kJ/mol

or reverse the reaction:-

$2CO_2 + 2H_2O \rightarrow CH_3COOH + 2O_2$; $\Delta H = 876$ kJ/mole .....(ii)

Adding both equation (i) + (ii) we get–

$CH_3CHO + \frac{1}{2}O_2 \longrightarrow CH_3COOH$

$\therefore \Delta H = -1168 + 876$

$\Delta H = -292 kJ / mole$

483. Calculate the heat of formation (ΔH) of CO (in kcal) from the following data.

I. $C_{(graphite)} + O_2(g) \longrightarrow CO_2(g)$;

$\Delta H = -94\ kcal$

II. $CO(g) + \frac{1}{2}O_2(g) \longrightarrow CO_2(g)$;

$\Delta H = -68\ kcal$

(a) –1.3 (b) –26
(c) –162 (d) –82

(A.P.EAMCET-2000)

Ans. (b): Given that,

$C(s) + O_2(g) \longrightarrow CO_2(g)$; $\Delta H = -94$ kcal ....(i)

$CO(g) + \frac{1}{2}O_2(g) \longrightarrow CO_2(g)$; $\Delta H = -68$ kcal

Reverse of the reaction is:-

$CO_2 \longrightarrow CO + \frac{1}{2}O_2$; $\Delta H = 68$ kcal ....(ii)

Adding the equation (i) and (ii) we get –

$C + \frac{1}{2}O_2 \longrightarrow CO$;

$\Delta H = -94 + 68$

$\Delta H = -26$ kcal

484. In which of the following reactions heat liberated is known as standard heat of formation of CO_2?

(a) $2CO(g) + O_2(g) \rightarrow 2CO_2(g) + 135.5$ kcal

(b) $C_{(diamond)} + O_2(g) \rightarrow 2CO_2(g) + 19.5$ kcal

(c) $C_{(graphite)} + O_2(g) \rightarrow CO_2(g) + 94.05$ kcal

(d) $CH_4(g) + 2O_2(g) \rightarrow CO_2(g) + 2H_2O(\ell)$ +212.8 kcal

(A.P.EAMCET-1999)

Ans. (c) : $C_{graphite} + O_2(g) \longrightarrow CO_2(g) + 94.05$ kcal

The standard enthalpy of formation or standard heat of formation of a compound is the change of enthalpy during the formation of 1 mole of the substance from its constituent elements, with all substances in their standard states.

485. The heat of combustion of CH_4, C(graphite) and $H_2(g)$ are respectively 20 kcal, – 40 kcal and –10 kcal. The heat of formation of CH_4 is

(a) –40 kcal (b) + 40 kcal
(c) 80 kcal (d) None of these

(A.P.EAMCET-1998)

Ans. (a) : Given,

Heat of combustion,

$CH_4(g) + 2O_2 \longrightarrow CO_2 + 2H_2O$; $\Delta H = -20$ kcal .....(1)

$C_{(graphite)} + O_2 \longrightarrow CO_2$; $\Delta H = -40$ kcal .....(2)

$H_2(g) + \frac{1}{2}O_2 \longrightarrow H_2O$; $\Delta H = -10$ kcal .....(3)

From equation (2) + (3) – (1), we get–

$C + 2H_2 \rightarrow CH_4$

$\Delta H = -40 + 2(-10) - (-20)$

$= -40$ kcal

486. Calculate the heat of combustion (in kJ) of methane from the following data.

(I) $C_{(graphite)} + 2H_2(g) \longrightarrow CH_4(g)$;

$\Delta H = -74.8\ kJmol^{-1}$

(II) $C_{(graphite)} + O_2(g) \longrightarrow CO_2(g)$;

$\Delta H = -393.5\ kJmol^{-1}$

(III) $H_2(g) + \frac{1}{2}O_2(g) \longrightarrow H_2O(\ell)$

$\Delta H = -286.2\ kJmol^{-1}$

(a) –891.1 (b) –816.3
(c) –965.9 (d) –1040.7

(A.P.EAMCET-2002)

Ans. (a) : Given that,

$C_{(graphite)} + 2H_2(g) \longrightarrow CH_4(g)$; $\Delta H = -74.8 kJ\ mol^{-1}$

or $CH_4(g) \longrightarrow C + 2H_2$; $\Delta H = 74.8\ kJmol^{-1}$ .... (i)

$C + O_2(g) \longrightarrow CO_2(g)$; $\Delta H = -393.5\ kJmol^{-1}$ ...... (ii)

$H_2(g) + \frac{1}{2}O_2(g) \rightarrow H_2O(\ell)$; $\Delta H = -286.2\ kJmol^{-1}$ .....(iii)

Multiply by 2 in equation (iii) we get

$2H_2(g) + O_2(g) \longrightarrow 2H_2O(\ell)$; $\Delta H = -572.4$ kJ ....(iv)

Adding equation (i), (ii) and (iv), we get

$CH_4 + 2O_2 \longrightarrow CO_2 + 2H_2O$;

$\Delta H = 74.8 + (-393.5) + (-572.4)$

$\Delta H = -891.1$ kJ

487. When 10 g of methane is completely burnt in oxygen, the heat evolved is 560 kJ. What is the heat of combustion (in kJ mol^{-1}) of methane?

@apna_pdf

(a) –1120 (b) – 968
(c) – 896 (d) – 560

(A.P.EAMCET-2003)

Ans. (c) :

$$\underset{10g}{CH_4} + 2O_2 \longrightarrow CO_2 + 2H_2O,\ \Delta H = -560\text{ kJ}$$

$\therefore$ Heat of combustion of 10 g $CH_4 = \dfrac{-560\text{ kJ}}{10}$

So, the heat of combustion of 16 gm $CH_4 = \dfrac{-560}{10} \times 16$

$= -896$ kJ/mole

$\therefore$ Heat of combustion = – 896 kJ/mole

488. Which of the following is not correct?

(a) Dissolution of NH_4Cl in excess of water is an endothermic process
(b) Neutralisation process is always exothermic
(c) The absolute value of enthalpy (H) can be determined experimentally
(d) The heat of reaction at constant volume is denoted by ΔE

(A.P.EAMCET-2005)

Ans. (c) : The absolute value of enthalpy (H) cannot be determined. Only the change in enthalpy (ΔH) during a process can be determined. Hence, statement is false.

For other options,

(a) Dissolution of NH_4Cl in excess of water is an endothermic process because when NH_4Cl dissolves in water, the absorption of heat occurs shows the reaction is an endothermic reaction. Hence, statement is true.

(b) Neutralization reaction is always exothermic because the formation of two very strong covalent bonds between hydrogen and hydroxide ion is responsible for the neutralization reaction's exothermic character. Hence, statement is true.

(d) The heat of reaction at constant volume is denoted by ΔE because difference between the sum of internal energies of products and the sum of internal energies of reactants at a given temperature and constant volume is called the heat of reaction.

489. Calculate ΔH in kJ for the following reaction

$$C(g) + O_2(g) \longrightarrow CO_2(g)$$

Given that,

$$H_2O(g) + C(g) \longrightarrow CO(g) + H_2(g);\quad \Delta H = +131\text{ kJ}$$

$$CO(g) + \frac{1}{2}O_2(g) \longrightarrow CO_2(g)\quad \Delta H = -282\text{ kJ}$$

$$H_2(g) + \frac{1}{2}O_2(g) \longrightarrow H_2O(g)\ \ \Delta H = -242\text{ kJ}$$

(a) – 393 (b) + 393
(c) + 655 (d) – 655

(A.P.EAMCET-2008)

Ans. (a) : Given that,

$H_2O(g) + C(g) \rightarrow CO(g) + H_2(g)$, $\Delta H = +131$ kJ .....(i)

$CO(g) + \frac{1}{2}O_2(g) \longrightarrow CO_2(g)$, $\Delta H = -282$ kJ ....(ii)

$H_2(g) + \frac{1}{2}O_2(g) \longrightarrow H_2O(g)$, $\Delta H = -242$kJ ....(iii)

Adding equation (i), (ii) and (iii) we get

$C(g) + O_2(g) \longrightarrow CO_2(g)$

$\therefore \Delta H = (131 - 282 - 242)$ kJ

$\Delta H = -393$ kJ

490. Calculate enthalpy for formation of ethylene from the following data.

(I) $C_{(graphite)} + O_2(g) \longrightarrow CO_2(g);$

$\Delta H = -393.5\text{ kJmol}^{-1}$

(II) $H_2(g) + \frac{1}{2}O_2(g) \longrightarrow H_2O(l);$

$\Delta H = -286.2\text{ kJmol}^{-1}$

(III) $C_2H_4(g) + 3O_2(g) \rightarrow 2CO_2(g) + 2H_2O(l);$

$\Delta H = -1410.8\text{ kJmol}^{-1}$

(a) 54.1 kJ (b) 44.8 kJ
(c) 51.4 kJ (d) 48.4 kJ

(A.P.EAMCET-2007)

Ans. (c): Given that,

$C(graphite) + O_2(g) \rightarrow CO_2(g);\ \Delta H = -393.5\text{ kJmol}^{-1}$

Multiply the above equation by 2, we get,

$2C(graphite) + 2O_2 \rightarrow 2CO_2;\ \Delta H = -787.0\text{ kJmol}^{-1}$ ..(i)

$H_2(g) + \frac{1}{2}O_2(g) \longrightarrow H_2O(l);\ \Delta H = -286.2\text{ kJmol}^{-1}$

Multiply the above equation by 2, we get

$2H_2(g) + O_2(g) \rightarrow 2H_2O(l);$

$\Delta H = -572.4\text{ kJmol}^{-1}$ …...(ii)

and $C_2H_4(g) + 3O_2(g) \rightarrow 2CO_2(g) + 2H_2O(l)$

$\Delta H = -1410.8\text{ kJmol}^{-1}$ ....(iii)

Adding equation (i) and (ii) then subtracted by equation (iii) we get–

$2C(graphite) + 2H_2 \longrightarrow C_2H_4(g)$;

$\Delta H_f = -787.0 - 572.4 - (-1410.8)$

$\Delta H_f = -1359.4 + 1410.8$

$\Delta H_f = 51.4\text{ kJmol}^{-1}$

491. The enthalpies of combustion of carbon and carbon monoxide are –393.5 kJ and –283 kJ mole^{-1} respectively. The enthalpy of formation of carbon monoxide is :

(a) 110.5 kJ mole^{-1} (b) 676.5 kJ mole^{-1}
(c) –676.5 kJ mole^{-1} (d) –110.5 kJ mole^{-1}

MPPET-2013

Ans. (d): The balanced chemical equations for the combustion of carbon and carbon mono oxide are as given below.

$C + O_2 \rightarrow CO_2;\ \Delta H = -393.5$kJ …..(i)

$CO + \frac{1}{2}O_2 \rightarrow CO_2;\ \Delta H = -283$kJ …..(ii)

Subtract equation (ii) from equation (i).

@apna_pdf

$$C+\frac{1}{2}O_2 \rightarrow CO;\ \Delta H=-110.5\,kJ$$

Thus, the enthalpy of formation of carbon monoxide per mole is –110 kJ.

Hence, the correct option is (a).

492. Given that $N_2(g) + 3H_2(g) \rightarrow 2NH_3(g)$; $\Delta_rH° = -92$ kJ, the standard molar enthalpy of formation in kJ mol^{-1} of $NH_3(g)$ is

(a) –92 (b) +46

(c) +92 (d) –46

TS-EAMCET-2016

Ans. (d) : Given that,

$$N_2(g) + 3H_2(g) \rightarrow 2NH_3(g);\quad (\Delta_rH°) = -92\ kJ$$

∴ The standard molar enthalpy of formation of NH_3 is

$$=\frac{1}{2}\Delta_rH°$$

$$\frac{1}{2}N_2(g)+\frac{3}{2}H_2(g)\rightarrow NH_3(g);$$

$$\Rightarrow \Delta_rH°=\left(-\frac{92}{2}\right)=\Delta_rH°=-46\,kJ/mole$$

493. The enthalpy of formation (ΔH_f) of methanol, formaldehyde and water are –239, – 116 and – 286 kJ mol^{-1} respectively. The enthalpy change for the oxidation of methanol to formaldehyde and water in kJ is

(a) –136 (b) –173

(c) 163 (d) –163

AP EAMCET-2017

Ans. (d): Given that

$\Delta H_{f(CH_3OH)} = -239$ kJ/mol …….(i)

$\Delta H_{f(HCHO)} = -116$ kJ/mol …….(ii)

$\Delta H_{f(H_2O)} = -286$ kJ/mol …….(iii)

$$2CH_3OH + O_2 \longrightarrow 2HCHO + 2H_2O$$

$$\Delta H_R = \frac{1}{2}[2\times eq^n.(ii) + 2\times eq^n.(iii) - 2\times eq^n.(i)]$$

$$\therefore \Delta H_R = \frac{1}{2}[2\times(-116) + 2\times(-286) - 2\times(-239)]$$

$$= \frac{1}{2}[-232-572+478]$$

$$= \frac{1}{2}[-804+478]$$

$$\Delta H_R = -163\ kJ$$

494. Standard enthalpy (heat) of formation of liquid water at 25^0C is around

$$H_2(g)+\frac{1}{2}O_2(g)\rightarrow H_2O(l)$$

(a) –237 kJ/mol (b) 237 kJ/mol

(c) –286 kJ/mol (d) 286 kJ/mol

TS EAMCET-2017

Ans. (c): The standard enthalpy of formation of liquid water at 25^0C is around –286 kJ/mole.

$$\left(\Delta H_f^\circ\right)_{water} = \left[\Delta H^\circ_{H_2O(l)} - \left(\Delta H^\circ_{H_2(g)} + 0.5\Delta H^\circ_{O_2(g)}\right)\right]$$

$$= -286 - [0 + 0.5\times 0]$$

$$= -286\ kJ/mole$$

495. The heat liberated when 1.89 g of benzoic acid is burnt in a bomb calorimeter at 25^oC increases the temperature of 18.94 kg of water by 0.632°C. If g the specific heat of water at 25^oC is 0.998 cal / (g^oC). then find the heat of combustion of benzoic acid.

(a) 881.1 kJ mol^{-1} (b) 771.2 kJ mol^{-1}

(c) 981.1 kJ mol^{-1} (d) 871.2 kJ mol^{-1}

AP EAPCET 24.08.2021 Shift-II

AIIMS-1994

Ans. (b): Given that:-

Weight of benzoic acid = 1.89gm

Temperature of bomb colorimeter = 25°C

= 25 + 273

= 298K

Mass of water (m) = 18.94 kg = 18940 gm

Increase in temperature (ΔT) = 0.632°C

Specific heat of water (c_w) = 0.998 cal/g°C

Heat gained by water (Q) = $mc_w\Delta T$

= 18940 × 0.998 × 0.632

= 11946.14 cal

Since,

1.89 gm of acid liberates 11946.14 cal of heat.

Therefore, heat liberated by 122gm of acid (molecular weight of benzoic acid)

$$=\frac{11946.14\times 122}{1.89}$$

= 771126.5 cal

= 771.12 kcal

496. The enthalpy of formation of two compounds X and Y are –36 kJ and –72 kJ respectively, which one of the following statement is correct?

(a) Compound X is more stable than compound Y.

(b) Compound Y is more stable than compound X.

(c) Both compound X and Y are endothermic compounds.

(d) Both X and y are unstable.

COMEDK-2011

Ans. (b) : X→ $\Delta H_t^\circ = -36kJ$

Y→ $\Delta H_t^\circ = -72kJ$

Here, –ve sign are indicate that energy release.

∵ Less the energy more the stability.

∵ Y releases more energy (y > x).

So, compound Y are more stable.

497. The enthalpy change for reaction $H_2(g)$ $+Cl_2 \rightarrow 2HCl(g)$ is –194 kJ. The heat of formation of HCl is

(a) –194 (b) +194 kJ

(c) –97 kJ (d) +97 kJ

COMEDK-2011

Ans. (c): $H_{2(g)} + Cl_{2(g)} \rightarrow 2HCl_{(g)};\Delta H_r = -194\,kJ$

Heat of formation for 1 mole of HCl

$$\Delta H_r = \frac{-194}{2} = -97kJ$$

@apna_pdf

498. The enthalpy of neutralization of HCl and NaOH is x kJ. The heat evolved when 500 mL of 2 N HCl is mixed with 250 mL of 4 N NaOH will be

(a) x
(b) x/2
(c) x/4
(d) 2x/3

COMEDK-2012

Ans. (a) : The enthalpy of neutralization of any strong acid with a strong base or vice-versa is always the same.

No. of gram equivalents HCl =

$$\frac{500\times2}{1000}=1$$

No. of gram equivalents NaOH =

$$\frac{250\times4}{1000}=1$$

499. Standard molar enthalpies of formation of $CaCO_3$(s), CaO(s) and CO_2(g) are –1206.92 kJ mol^{-1} ’-635.09 kJ mol^{-1} and –393.51 kJ mol^{-1} respectively. The ΔH_r for decomposition of $CaCO_{3(s)}$ is

(a) 178.3 kJ mol^{-1}
(b) –178.3 kJ mol^{-1}
(c) 1448.5 kJ mol^{-1}
(d) –1448.5 kJ mol^{-1}

COMEDK-2014

Ans. (a) : $CaCO_3(s)\rightarrow CaO(s)+CO_2(g)$

$$\Delta H_r^o=\left[\Delta H^o_{f(CaO)}+\Delta H^o_{f(CO_2)}\right]-\left[\Delta H^o_{f(CaCO_3)}\right]$$

$$=\left[(-635.09)+(-393.51)\right]-(-1206.92)$$

$$=178.32 \text{ kJ mol}^{-1}$$

500. When 5 liters of a gas mixture of methane and propane is perfectly combusted at 0°C and 1 atmosphere, 16 liters of oxygen at the same temperature and pressure is consumed. The amount of heat released from this combustion is ($\Delta H_{comb.}CH_4$ = 890 kJ mol^{-1}, $\Delta H_{comb.}(C_3H_8)$ = 2220 kJ mol^{-1})

(a) 38
(b) 317
(c) 477
(d) 32

KARNATAKA NEET-2013

Ans. (b) : The balanced equations of combustion reactions are:

$$CH_4(g)+2O_2(g)\rightarrow CO_2(g)+$$
$$2H_2O(l),\ \Delta H_{CH_4(g)}=890 \text{ kJ/mol}$$

$$C_3H_8(g)+5O_2(g)\rightarrow 3CO_2(g)+$$
$$4H_2O(l),\ \Delta H_{C_3H_8(g)}=2220 \text{ kJ/mol}$$

Let here xL CH_4 and (5 – x)L C_3H_8 in 5L gas mixture at STP

So total volume of oxygen consumed as per stoichiometry of the reaction involved will be

$$\Rightarrow 2x+5(5-x)=16$$
$$\Rightarrow 2x+25-5x=16$$
$$\Rightarrow 3x=9$$
$$\Rightarrow x=3L$$

So volume of CH_4(g) = 3L

And volume of C_3H_8(g) = 2L at STP

$$n_{CH_4(g)}=\frac{3}{22.4}\text{mol}$$

$$n_{C_3H_8(g)}=\frac{2}{22.4}\text{mol}$$

So

$$\Delta H_{mixture}=\frac{3}{22.4}\Delta H_{CH_4(g)}+\frac{2}{22.4}\Delta H_{C_3H_8(g)}$$

$$\Delta H_{mixture}=\frac{3\times890+2\times2220}{22.4}\approx317\,\text{kJ}$$

501. 100 cm^3 of 0.1 M HCl and 100 cm^3 of 0.1 M NaOH solutions are mixed in a calorimeter. If the heat liberated is "Q" kcal, the heat of neutralization (ΔH) (in kcal) of HCl (aq) and NaOH(aq) is

(a) –10Q
(b) –100Q
(c) –1000Q
(d) –Q

AP-EAMCET (Medical), 2008

Ans. (b) : During the process, following reaction occur-

$$NaOH+HCl\longrightarrow NaCl+H_2O$$

$\therefore$ When 1 mole of NaOH is neutralised by 1 mole of HCl then the heat liberated is Q kcal.

Or ΔH = Q kcal

$\therefore$ 10 moles of NaOH are neutralised by 10 moles of HCl.

Heat liberated = $-10\times10\times$ Q kcal = –100 Q kcal.

502. The average S-F bond energy in kJ mol^{-1} of SF_6 is _____ (Rounded off to the nearest integer) [Given: The values of standard enthalpy of formation of SF_6(g), S(g) and F(g) are-1100, 275 and 80 kJ mol^{-1} respectively.]

JEE Main 26.02.2021,Shift-II

Ans.: Given,

$$SF_6(g)\rightarrow S(g)+6F(g)$$

$$\Delta H^\circ_{SF_6}=-1100\text{kJ/mole}$$

$$\Delta H^\circ_S(g)=275\text{kJ/mole}$$

$$\Delta H^\circ_F=80\text{kJ/mole}$$

$$\Delta H^\circ_{reaction}=6\times E_{S-F}=\Delta H^\circ_S(g)+6\times\Delta H^\circ_F(g)-\Delta H^\circ_{SF_6}(g)$$

$$E_{S-F}=\frac{275+6\times80+1100}{6}$$

$$E_{S-F}=\frac{1855}{6}=309.167\,\text{kJ/mole}$$

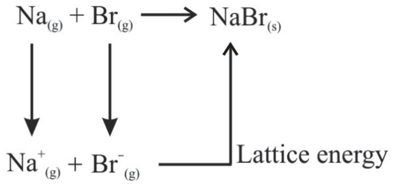
$$E_{S-F}\approx309\ \text{kJ/mole}$$

503. The ionization enthalpy of Na$^+$ formation from $Na_{(g)}$ is 495.8 kJ mol^{-1} , while the electron gain enthalpy of Br –325.0 kJ mol^{-1}. Given the lattice enthalpy of NaBr is –728.4 kJ mol^{-1} . The energy for the formation of NaBr ionic solid is (-) ____ × 10^{-1} kJ mol^{-1}.

JEE Main 25-02-2021, Shift-I

@apna_pdf

Ans. : 5576



$Na_{(g)} + Br_{(g)} \longrightarrow NaBr_{(s)}$
$Na^+_{(g)} + Br^-_{(g)}$
Lattice energy

Given : Ionisation energy of $Na^+ = 495.8\ kJmol^{-1}$

Electron gain enthalpy for Br = $-325\ kJmol^{-1}$

Lattice enthalpy of NaBr = $-728.4\ kJmol^{-1}$

ΔH for of NaBr ionic solid = $IE_1 + \Delta H_{eg} + L.E$

$= 495.8 + (-325) + (-728.4)$

$= 495.8 - 1053.4$

$= -557.6\ kJmol^{-1}$

$= -5576 \times 10^{-1}\ kJmol^{-1}$

504. Which of the following compounds has the highest hydration energy?

(a) $BeSO_4$ (b) $CaSO_4$

(c) $SrSO_4$ (d) $BaSO_4$

TS-EAMCET 09.08.2021, Shift-I

Ans. (a) : Hydration energy is the energy released when one mole of ions undergo hydration and lattice energy is the energy released when the ions make bonds between them.

In second group metal sulphate, $BeSO_4$ is most water soluble compound among all of them because hydration energy is higher than the lattice energy.

Note-The hydration enthalpies of $BeSO_4$ and $MgSO_4$ are quite high because of small size of Be^{2+} and Mg^{2+} ions. These hydration enthalpy values are higher than their corresponding lattice enthalpies and therefore, $BeSO_4$ and $MgSO_4$ are highly soluble in water.

505. Assertion: The enthalpy of formation of gaseous oxygen molecules at 298 K under a pressure of one atm is zero.

Reason: The entropy of formation of gaseous oxygen molecules under the same conditions is zero.

(a) If both Assertion and Reason are true and the Reason is a correct explanation of the Assertion

(b) If both Assertion and Reason are true but Reason is not a correct explanation of the Assertion

(c) If Assertion is true but the Reason is false

(d) If both Assertion and Reason are false

AIIMS-1996

Ans. (c): The standard state of oxygen element is gaseous diatomic molecule (O_2). Thus, the standard enthalpy of formation for an element in its standard state is zero. Entropy of formation of given elementary substances at 298 K and one atmosphere is not zero. Thus, Assertion is true Reason is false.

506. $C+O_2(g) \rightarrow CO_2$.......(i) $\Delta H = -393\ kJ\ mol^{-1}$

$H_2 + 1/2\ O_2 \rightarrow H_2O$,..... (ii) $\Delta H = -287.3\ kJ\ mol^{-1}$

$2CO_2+3H_2O \rightarrow C_2H_5OH + 3O_2$....(iii) $\Delta H = 1366.8\ kJ\ mol^{-1}$

Find the standard enthalpy of formation of $C_2H_5OH(l)$

(a) $281.1\ kJ\ mol^{-1}$ (b) $-281.1\ kJ\ mol^{-1}$

(c) $562.2\ kJmol^{-1}$ (d) $-562.2\ kJ\ mol^{-1}$

AIIMS 26 May 2019 (Morning)

Ans. (b): We have:-

$C+O_2(g) \rightarrow CO_2$.......(i) $\Delta H = -393\ kJ\ mol^{-1}$

$H_2 + 1/2\ O_2 \rightarrow H_2O$,..... (ii) $\Delta H = -287.3\ kJ\ mol^{-1}$

$2CO_2+3H_2O \rightarrow C_2H_5OH + 3O_2$....(iii) $\Delta H = 1366.8\ kJ\ mol^{-1}$

Now,

$\Delta H_r = \sum \Delta H_f(\text{product}) - \sum \Delta H_f(\text{reactant})$

$= \Delta H_{f(C_2H_5OH)} + \Delta H_{f(O_2)} - 2\Delta H_{f(CO_2)} - 3\Delta H_{f(H_2O)}$

(∵ from (iii))

$\Rightarrow 1366.8 = \Delta H_{f(C_2H_5OH)} + 0 - 2(-393) - 3(-287.3)$

$\Delta H_{f(C_2H_5OH)} = 1366.8 + 2(-393) + 3(-287.3)$

$= 1366.8 + (-786) - 861.9$

$= 1366.8 - 1647.9$

$= -281.1\ kJ\ mol^{-1}$

507. $C_3H_6 + H_2 \rightarrow C_3H_8\ \Delta H_1 = -124kJ$

$C_3H_8 + 5O_2 \rightarrow 3CO_2 + 4H_2O\ \Delta H_2 = -2027kJ$

$H_2 + \frac{1}{2}O_2 \rightarrow H_2O\ \ \Delta H_3 = -286kJ$

Calculate enthalpy of combustion of propene?

(a) −1020kJ (b) −2085kJ

(c) −2020kJ (d) None

AIIMS-27 May, 2018 (M)

Ans. (d): We have,

$C_3H_6 + H_2 \rightarrow C_3H_8\ \Delta H_1 = -124kJ$

$C_3H_8 + 5O_2 \rightarrow 3CO_2 + 4H_2O\ \Delta H_2 = -2027kJ$

$H_2 + \frac{1}{2}O_2 \rightarrow H_2O\ \ \Delta H_3 = -286kJ$

Now, adding (i) and (ii) and subtracting with (iii) :- we get

$$C_3H_6 + \frac{9}{2}O_2 \longrightarrow 3CO_2 + 3H_2O$$

$$\Delta H = [\Delta H_1 + \Delta H_2 - \Delta H_3]$$

$$= -124 + (-2027) - (-286)$$

$$= -2151 + 286$$

$$= -1865kJ$$

508. The standard enthalpies of combustion of C_6H_6 (*l*), $C_{(graphite)}$ and H_2 (g) are respectively –3270 kJ mol^{-1}, –394kJ^{-1} and – 286 kJ mol^{-1} . What is the standard enthalpy of formation of C_6H_6 (l) in kJ mol^{-1}?

(a) –48 (b) +48

(c) –480 (d) +480

AIIMS-2016

Ans. (b): Given

(I) $C_6H_6 + \frac{15}{2}O_2 \longrightarrow 6CO_2 + 3H_2O, \Delta H = -3270\,kJ\ mol^{-1}$

(II) C (graphite) $O_2 \longrightarrow CO_2 . \Delta H = -394\,kg\,mol^{-1}$

@apna_pdf

(III) $H_2+\frac{1}{2}O_2 \longrightarrow H_2O, \Delta H=-286\,kJ\,mol^{-1}$

Multiplication eq^n. (II) by 6 and eq^n. (III) by 3 gives

(IV) $6C(s)+6O_2 \longrightarrow 6CO_2,\ \Delta=-394\times 6\,kJ\,mol^{-1}$

$= -2364\ kJ\ mol^{-1}$

(V) $3H_2+\frac{3}{2}O_2 \longrightarrow 3H_2O,\ \Delta H=-286\times 3\,kJ\,mol^{-1}$

$= -858\ kJ\ mol^{-1}$

reverse equation (I) we get:-

(VI)

$6CO+3H_2O \longrightarrow C_6H_6+\frac{15}{2}O_2,\ \Delta H=+3270\,kJ\ mol^{-1}$

Addition of (IV), (V) & (VI) Equation:-

$6C+3H_2 \longrightarrow C_6H_6$,

$\Delta H = +3270 + (-2364 - 858) = +48\ kJ\ mol^{-1}$

509. The molar heat capacity of water at constant pressure is 75 J K mol^{-1}. When 1kJ of heat is supplied to 100 g of water, which is free to expand, the increase in temperature of water is

(a) 6.6 K (b) 1.2 K

(c) 2.4 K (d) 4.8 K

AIIMS-2017

Ans. (c): Relation between heat supplied, molar heat capacity at constant volume and temperature change is

$q = n\,C_p\Delta T$, $q = 1\ kJ = 1000\ J$

$= \text{No . of moles} = n = \frac{\text{mass}}{\text{molecular weight}} = \frac{100}{18}$

Put this value in $q = n\,C_p\,\Delta T$

$$1000 = \frac{100}{18}\times 75\times\Delta T$$

$\Delta T = 2.4\ K$

510. Enthalpy of combustion of CH_4, C_2H_6 and C_3H_8 are–210.8, –368.4 and –526.2 k cal mol^{-1} respectively. Enthalpy of combustion of hexane can be predicted as

(a) -840 k cal mol^{-1} (b) -684 k cal mol^{-1}

(c) -1000 k cal mol^{-1} (d) none of these

AIIMS-2011

Ans. (c): (ΔH_c = Reactant – Product)

Enthalpy of combustion of $CH_4 = -210.8$ kJ

Enthalpy of combustion of $C_2H_6 = -368.4$ kJ

Enthalpy of combustion of $C_3H_8 = -526.2$ kJ

∵ For 3 Carbon, – 526.5 kJ

For 6 Carbon, $2\times -526.2 = -1052.4$ kJ

For hexane, enthalpy of combustion can be approximated to –1000 kJ

511. The standard enthalpy of combustion at 25ºC of hydrogen, cyclohexene (C_6H_{10}) and cyclohexane (C_6H_{12}) are –241, –3800 and –3920kJ/mol respectively. Calculate the heat of hydro-genation of cyclohexene.

(a) –111 kJ/mol (b) –121 kJ/mol

(c) –118 kJ/mol (d) –128 kJ/mol

AIIMS-2009

Ans. (b) : The required reaction is

$C_6H_{10}+H_2 \rightarrow C_6H_{12},\quad \Delta H_1 = ?$ …..(i)

Let us write the given facts

$H_2+\frac{1}{2}O_2 \rightarrow H_2O$

$\Delta H_2 = -241$ kJ/mole …….(ii)

$C_6H_{10}+\frac{17}{2}O_2 \rightarrow 6CO_2+5H_2O,$

$\Delta H_3 = -3800$ kJ/mole …….(iii)

$C_6H_{12}+9O_2 \rightarrow 6CO_2+6H_2O,$

$\Delta H_4 = -3920$ kJ/mole …….(iv)

The-required-reaction (i) can be obtained by adding equations (ii) and (iii), and subtracting (iv) from the sum of (ii) and (iii).

$C_6H_{10}+H_2 \rightarrow C_6O_{12}$

$\Delta H_1 = (\Delta H_2+\Delta H_3)-\Delta H_4$

$= [-241 + (-3800)] - (-3920)$

$= (-241 - 3800) - (-3920)$

$= -4041 + 3920 = -121$ kJ/mole

512. What will be the heat of formation of methane, if the heat of combustion of carbon is '–x' kJ, heat of formation of water is '–y'kJ and heat of combustion of methane is 'z' kJ?

(a) $(-x-y+z)$kJ (b) $(-z-x+2y)$kJ

(c) $(-x-2y-z)$kJ (d) $(-x-2y+z)$kJ

AIIMS-2008

Ans. (d): For given data, we have

$C+O_2 \longrightarrow CO_2 - x\,kJ$ ——(i)

$H_2+\frac{1}{2}O_2 \longrightarrow H_2O - y\,kJ$ ——(ii)

$CH_4+2O_2 \longrightarrow CO_2+2H_2O+z\,kJ$ ——(iii)

The required equation is,

$C+2H_2 \longrightarrow CH_4+Q$ (Q = Heat formation of the CH_4)

By multiplying equation

(i) + 2 × (ii)——(iii) we get

$C + 2H_2 \rightarrow CH_4 + (-x -2y +z)$kJ

Thus, heat of formation of methane is (–x –2y +z) kJ

513. Which of the following is arranged in the increasing order of enthalpy of vaporisation?

(a) NH_3, PH_3, AsH_3 (b) AsH_3, PH_3, NH_3

(c) NH_3, Ash_3, PH_3 (d) PH_3, AsH_3, NH_3

AIIMS-2004

Ans. (d): As Molecular mass increase , enthalpy of vaporization increases, However NH_3 has exceptionally high enthalpy of vaporization due to inter molecular hydrogen bonding,

$PH_3 < AsH_3 < NH_3$

→In hydrogen bonded molecule enthalpy of vaporization increases Ex :- HF, H_2O, NH_3

514. How much energy is released when 6 moles of octane is burnt in air ? Given ΔH_f^o for $CO_2(g)$, H_2O (g) and $C_8H_{18}(l)$ respectively are –490, –240 and +160 J/mol.

@apna_pdf

(a) −6.2kJ (b) −37.4kJ
(c) −35.5kJ (d) −20.0kJ

AIIMS-2004

Ans. (c): Given-

$C + O_2 = CO_2, \Delta H = -490$ J/mol ——(i)

$H_2 + \frac{1}{2}O_2 = H_2O, \Delta H = -240\,J/mol$ ———(ii)

$8C + 9H_2 = C_8H_{18}, \Delta H = +160\,J/mol$ ———(iii)

The given reaction of the burning of octane can be obtained by

⇒2 × (iii) – 16 (i) – 18 (ii)

$16C + 18H_2 - 16C - 16O_2 - 18H_2 - 9O_2$

$\rightarrow 2C_8H_{18} - 16CO_2 - 18H_2O$

$2C_8H_{18} + 25O_2 \rightarrow 16CO_2 + 18H_2O$

$\Delta H = [2\times160 - 16\times(-490) - 18\times(-240)]$

$\Delta H = -11840$ J = – 11.840 kJ For 2 mole of octane

∴ Energy released for 6 moles of octane.

$= -11.840 \times 3 = -35.5$ kJ

515. ΔH_f^o (298K) of methanol is given by the chemical equation:

(a) $CH_4(g) + \frac{1}{2}O_2(g) \rightarrow CH_3OH(g)$

(b) $C(\text{graphite}) + \frac{1}{2}O_2(g) + 2H_2(g) \rightarrow CH_3OH(l)$

(c) $C(\text{diamond}) + \frac{1}{2}O_2(g) + 2H_2(g) \rightarrow CH_3OH(l)$

(d) $CO(g) + 2H_2(g) \rightarrow CH_3OH(l)$

AIIMS-2005

Ans. (b): Heat of formation is defined as the heat exchange when one mole of a compound is formed from its constituent elements at STP.

In Case of allotropes, most stable allotrope is taken into account. Among graphite and diamond, graphite is stable.

Hence, heat of formation of CH_3OH is represented by

$C\text{ (graphite)} + \frac{1}{2}O_2(g) + 2H_2(g) \longrightarrow CH_3OH(l)$

516. The heat of neutralisation of a strong base and a strong acid is 57 kJ. The heat released when 0.5 moles of HNO_3 solution is added to 0.20 moles of NaOH solution, is

(a) 11.4kJ (b) 34.7kJ
(c) 23.5kJ (d) 58.8kJ

AIIMS-2002

Ans. (a):

One mole of H^+ and one mole of OH^- give 57 kJ.

$$H^+ + OH^- \rightarrow H_2O + \text{Heat}$$

When 0.5 moles of H^+ react with 0.2 mole of OH^-

0.2 mole of OH^+ is neutralized by 0.2 mole of OH^- and 0.3 mole of H^+ remain unreached.

$$\underset{0.2\text{mole}}{H^+} + \underset{0.2\text{mole}}{OH^-} \rightarrow H_2O$$

So, Heat evolved = $\frac{57\times0.2}{1} = 11.4\,kJ$

517. One gram sample of NH_4NO_3 is decomposed in a bomb calorimeter, the temperature of the calorimeter increases by 6.12 K. The heat capacity of the system is 1.23 kJ/g-deg. What is the molar heat of decomposition for NH_4NO_3?

(a) −7.53 kJ/mol (b) −398.1 kJ/mol
(c) −16.1 kJ/mol (d) −602 kJ/mol

AIIMS-2003

Ans. (d): We know that,

$q = ms\Delta T$

When 1g of ammonium nitrate decomposes, heat evolved q = 1×1.23×6.12

When 1 mole of NH_4NO_3 decomposes, heat evolved is

q = 1×1.23×6.12×80

= 602. 21 kJ/mol.

518. The heat of reaction for:

$$C_{10}H_8(s) + 12O_2(g) \rightarrow 10CO_2(g) + 4H_2O(l)$$

at constant volume is –1228.2k cal at 25°C. The heat of reaction at constant pressure and same temperature is :

(a) −1228.2 k cal (b) −1229.3 k cal
(c) −1232.9 k cal (d) −1242.6 k cal

AIIMS-2001

Ans. (b): $C_{10}H_8(s)+12O_2(g) \rightarrow 10CO_2(g)+4H_2O(l)$

$\Delta n_g = n_p - n_R$

$\Delta n_q = 10-12 = -2\ (\Delta n_q<0)$

We known that $\Delta H = \Delta E + \Delta n_q RT$

$\Delta E = -1228.2$ kcal

$\Delta H = -1228.8 - 2\times2\times10^{-3}\times298$

$= -1229.3$ kcal

519. The heat of combustion of yellow phosphorous is –9.91kJ and of red phosphorous is –8.7kJ. The heat of transition of yellow phosphorus to red phosphorus is:

(a) −9.91kJ (b) −8.78kJ
(c) −9.34kJ (d) −1.13kJ

AIIMS-1998

Ans. (d):

$P(\text{red}) + \frac{5}{2}O_2 \rightarrow P_2O_5; \Delta H = -8.78$

$P(\text{yellow}) + \frac{5}{2}O_2 \rightarrow P_2O_5; \Delta H = -9.91$

Subtracting eq^n. (i) and (ii)

$P(\text{red}) + \frac{5}{2}O_2 - P(\text{yellow}) - \frac{5}{2}O_2 \rightarrow P_2O_5 - P_2O_5$

P (Red) – P (yellow) = O

$\Delta H = -8.78 + 9.91 = +1.13$

P (Red)→P (yellow), $\Delta H = +1.13$

P (yellow) → P (Red), $\Delta H = -1.13$ kJ

520. $S + O_2 \rightarrow SO_2 + x$ **kcal ......(1)**

$SO_2 + \frac{1}{2}O_2 \rightarrow SO_3 + y$ **kcal ....(2)**

The heat of formation of SO_3 in the above reaction is

@apna_pdf

(a) $(x+y)$ (b) $(x-y)$
(c) $(2x-y)$ (d) $(2x+y)$

AIIMS-1997

Ans. (a): $S + O_2 \rightarrow SO_2$, $\Delta H_1 = x$ k cal ......(i)

$SO_2 + \frac{1}{2} O_2 \rightarrow SO_3$, $\Delta H_2 = y$ k cal ......(ii)

Adding eq^n. (i) & (ii),

$S + \frac{3}{2}O_2 \rightarrow SO_3$

∴ From Hess's law,

$\Delta H_1 + \Delta H_2 = \Delta H_3$

$\therefore \Delta H_3 = x + y$

521. The enthalpy change for a given reaction at 298 K is – x J mol^{-1}. For the reaction to be spontaneous at 298 K, the entropy change at that temperature

(a) Can be negative, but numerically greater than $\frac{x}{298}Jk^{-1}$
(b) Can be negative, but numerically smaller than $\frac{x}{298}Jk^{-1}$
(c) Can not be negative
(d) Can not be positive

JEE Main, 2019

Ans. (b) : We know that,

$\Delta G = \Delta H - T\Delta S$

For spontaneity $\Delta G < 0$

so, $\Delta H - T\Delta S < 0$

Given, $\Delta H = -$ x cal/mol (i.e.→ – ve)

Therefore, For $\Delta G < O$,

ΔS can be negative but the numerical value must be less than $\frac{x}{298}kJ^{-1}$.

522. The standard molar heat of formation of ethane, CO$_2$ and water (l) are respectively –21.1, –94.1 and –68.3 kcal. The standard molar heat of combustion of ethane will be

(a) –372 kcal (b) 162 kcal
(c) –240 kcal (d) 183.5 kcal

VITEEE-2014

Ans. (a) : Given,

(i) $2C + 3H_2 \rightarrow C_2H_6; \Delta H = -21.1$ kcal

(ii) $C + O_2 \rightarrow CO_2; \Delta H = -94.1$ kcal

(iii) $H_2 + \frac{1}{2}O_2 \rightarrow H_2O; \Delta H = -68.3$ kcal

Now, eq^n 2 × (ii) + 3 × (iii) – (i),

we get ⇒ $C_2H_6 + \frac{3}{2}O_2 \rightarrow 2CO_2 + 3H_2O$

Heat of combustion of ethane

= 2(–94.1) + 3 (–68.3) – (–21.1)

= –188.2–204.9 + 21.1

= – 372 kcal.

523. Consider the following processes
ΔH (kJ/mol)

$$\frac{1}{2}A \longrightarrow B + 150$$
$$3B \longrightarrow 2C + D - 125$$
$$E + A \longrightarrow 2D + 350$$

For $B + D \longrightarrow E + 2C, \Delta H$ will be

(a) 525 kJ/mol (b) –175 kJ/mol
(c) –325 kJ/mol (d) 325 kJ/mol

VITEEE-2012

Ans. (b): For B+D → E + 2C

We have to multiply in eq^n (i) by (2) we get:–

$\frac{1}{2}A \rightarrow B,\ \Delta H = 150\ \ kJmol^{-1}$

$2\times\frac{1}{2}A \rightarrow 2B,\ \ \Delta H = +300\ \ kJmol^{-1}$

$A \rightarrow 2B$ …….(i), $\Delta H = +300\ \ kJmol^{-1}$

$3B + \rightarrow 2C + D$ …….(ii), $\Delta H = -\ 125\ kJmol^{-1}$

$E + A \rightarrow 2D$ …….(iii), $\Delta H = +\ 350\ kJmol^{-1}$

Adding eq^n. (i) and (ii) and the subtracting by (iii)

(i) + (ii) - (iii), we have

$\therefore \Delta H = [+300 - 125 - 350)]$

$= -175\ kJ/mol^{-1}$

524. Heat of formation, ΔH_f° of an explosive compound like NCl$_3$ is

(a) Positive (b) Negative
(c) Zero (d) Positive or negative

VITEEE- 2011

Ans. (a) : Formation of NCl$_3$ is endothermic process. In endothermic reaction, heat is absorbed. Hence the sign of the ΔH will be positive.

525. Enthalpy of a compound is equal to its

(a) Heat of combustion (b) Heat of formation
(c) Heat of reaction (d) Heat of solution

VITEEE- 2010

Ans. (b) : Heat of formation is equal to enthalpy of a compound.

526. Given: 2C(s) + 2O$_2$ (g) → 2CO$_2$ (g); ΔH = –787 kJ

$$H_2(g) + \frac{1}{2}O_2(g) \rightarrow H_2O(l);\ \Delta H = -286\ kJ$$

$$C_2H_2(g) + 2\frac{1}{2}O_2(g) \rightarrow 2CO_2(g) + H_2O(l)\ ;\Delta H = -1310\ kJ$$

The heat of formation of acetylene is

(a) –1802 kJ (b) +1802 kJ
(c) +237 kJ (d) –800 kJ

VITEEE- 2007

Ans. (c) : We have to find

$$2C(s) + 2H_2(g) \longrightarrow C_2H_2(g),\ \ \Delta H = ?$$

This is the equation for formation of acelytene

$2C(s) + 2O_2(g) \longrightarrow 2CO_2(g);\ \ \Delta H = -787\,kJ$ …..(1)

$H_2(g) + \frac{1}{2}O_2(g) \longrightarrow H_2O(l); \Delta H = -286\,kJ$ …..(2)

@apna_pdf

$$C_2H_2(g)+2\frac{1}{2}O_2(g)\longrightarrow 2CO_2(g)+H_2O(l);$$

$\Delta H=-1310\,kJ$ ….(3)

Add eq. (1) and (2), we get –

$$2C(s)+H_2(g)+2\frac{1}{2}O_2(g)\longrightarrow 2CO_2(g)+H_2O(l);$$

$\Delta H=-1073\,kJ$ ….(4)

Subtract eq. (3) form eq. (4), we get –

$$2C(s)+H_2(g)\longrightarrow C_2H_2(g);$$

$\Delta H=+237$ kJ

527. Calculate ΔH (in joules) for
$C_{(graphite)} \rightarrow C_{(diamond)}$ from the following data,
$C_{(graphite)} + O_2(g) \rightarrow CO_2(g)$; $\Delta H = -393.5$ kJ
$C_{(diamond)} + O_2(g) \rightarrow CO_2(g)$; $\Delta H = -395.4$ kJ

(a) 1900 J (b) -788.9×10^3 J
(c) 190000 J (d) $+788.9 \times 10^3$ J

SRMJEEE – 2014

Ans. (a) :
$C_{(graphite)} + O_2(g) \rightarrow CO_2(g)$ $\Delta H° = -393.5$ kJ …..(i)
$C_{(diamond)} + O_2(g) \rightarrow CO_2(g)$ $\Delta H° = -395.4$ kJ ….. (ii)
We find –
$C_{graphite} \rightarrow C_{diamond}$
Subtracting the equation (i) by (ii), we get –
$\Delta H° = -393.5 - (-395.4)$
$\Delta H° = 1.9$ kJ
or $\Delta H° = 1900$ J

528. Enthalpy of formation of $C_2H_4(g)$, $CO_2(g)$ and $H_2O(l)$ at 25°C and 1 atm pressure are 52, –394 and –286 kJ/mol respectively. Enthalpy of combustion of $C_2H_4(g)$ is

(a) +1412 kJ/mol (b) –1412 kJ/mol
(c) +141.25 kJ/mol (d) –141.2 kJ/mol

SRMJEEE – 2012

Ans. (b) : Given that, $\Delta H°_{(C_2H_4)} = 52$ kJ/mol
$\Delta H°_{(CO_2)} = -394$ kJ/mol, $\Delta H°_{(H_2O)} = -286$ kJ/mol
Now, following reaction occur:-
$C_2H_4(g) + 3O_2(g) \longrightarrow 2CO_2(g) + 2H_2O(g)$

$$\Delta_r H° = \Delta H°_{Product} - \Delta H°_{reactant}$$

$$\Delta_r H° = \left(2\Delta H^o_{CO_2} + 2\Delta H^o_{H_2O}\right) - \left(\Delta H^o_{C_2H_4} - 3\Delta H^o_{O_2}\right)$$

$$\Delta_r H° = \left[2\times(-394)+2\times(-286)\right]-\left[52-3\times 0\right]$$

$$\Delta_r H° = -788-572-52$$

$$\Delta_r H° = -1412\,kJ/mol$$

529. Which of the following equations correctly represents the standard heat of formation $\left(\Delta H^o_f\right)$ of methane?

(a) $C_{(diamond)} + 2H_2(g) = CH_4(g)$
(b) $C_{(diamond)} + 2H_2(g) = CH_4(g)$
(c) $C_{(graphite)} + 2H_2(g) = CH_4(g)$
(d) $C_{(graphite)} + 4H_2(g) = CH_4(g)$

SRMJEEE – 2007

Ans. (c) : The heat of a formation of a substance is the enthalpy associated with one mole of a substance from its elements in their standard states under standard conditions. $C_{graphite} + 2H_2(g) \longrightarrow CH_4(g)$

530. Given that,
$C(s) + O_2(g) \rightarrow CO_2(g)$; $\Delta H° = -x$ kJ mol^{-1}
$2CO(g) + O_2(g) \rightarrow 2CO_2(g)$; $\Delta H° = -y$ kJ mol^{-1}
The enthalpy of formation of CO will be

(a) $\frac{y-2x}{3}$ (b) $\frac{y-2x}{2}$
(c) $\frac{2x-y}{2}$ (d) $\frac{x-y}{2}$

AP-EAMCET – 2016

Ans. (b) : Given that,

$$C(s)+O_2(g)\rightarrow CO_2(g), \Delta H° = -x\,kJ/mole \quad ...(i)$$

$$2CO(s)+O_2(g)\rightarrow 2CO_2(g), \Delta H° = -y\,kJ/mole$$

or

$$CO(s)+\frac{1}{2}O_2(g)\rightarrow CO_2(g), \Delta H° = -\frac{y}{2}kJ/mole \quad ...(ii)$$

Subtracting equation (ii) from (i), we get–

$$C(s)+\frac{1}{2}O_2(g)\rightarrow CO(g)$$

and $\Delta H = -x-\left(-\frac{y}{2}\right)$

$$\Delta H = \frac{y}{2}-x$$

$$\Delta H = \frac{y-2x}{2}$$

531. Which of the following mixture of solutions follow the condition $\Delta_{mix}H < 0$ and $\Delta_{mix}V < 0$?
(i) Nitric acid + Water
(ii) Acetic acid + Pyridine
(iii) Ethanol + Water
(iv) Carbon tetra chloride + Chloroform

(a) (iii) & (iv) only (b) (ii) & (iii) only
(c) (i) & (iii) only (d) (i) & (ii) only

AP- EAPCET- 07-09-2021, Shift-I

Ans. (d) : Mixture of solution follow the conditions
$\Delta_{mix}H < 0$ and $\Delta_{mix}V < 0$ is
(i) Nitric acid + water
(ii) Acetic acid + Pyridine

532. Heat of formation of CO and CO_2 are –26.4 and –94.0 kcal/mol respectively. What is the heat of combustion of CO in k-cal?

(a) +26.4 (b) 120.6
(c) – 67.6 (d) 135.2

AP- EAMCET(Medical) -2010

Ans. (c): Given that, $\Delta_f H_{CO} = -26.4$ Kcal/mol
$\Delta_f H_{CO_2} = -94.0$ Kcal/mol

Now, $CO+\frac{1}{2}O_2 \longrightarrow CO_2$

Heat of combustion $(\Delta_C H) = \Delta_f H_{CO_2} - \left(\Delta_f H_{CO} + \frac{1}{2}\times\Delta_f H_{O_2}\right)$

@apna_pdf

or $\Delta_C H = -94.0 - \left(-26.4 + \frac{1}{2} \times 0\right)$

or $\Delta_C H = -94.0 + 26.4$

$\Delta_C H = -67.6$ kcal/mol

533. Calculate the difference between ΔE and ΔH for the following reaction at 27°C (in kcal)

$$\textbf{C(graphite)} + \textbf{H}_2\textbf{(g)} \longrightarrow \textbf{CH}_4\textbf{(g)}$$

(a) – 0.6 (b) – 1.2
(c) + 0.6 (d) + 1.2

AP - EAMCET (Medical) - 2007

Ans. (c) : For the reaction–

$C_{(graphite)} + 2H_2(g) \rightarrow CH_4(g)$

Now, $\Delta H = \Delta E + P\Delta V$

or $\Delta H = \Delta E + \Delta n_g RT$

or $\Delta E - \Delta H = -\Delta n_g RT$

Given, $\Delta n_g = 1 - 2 = -1$

$R = 1.987$ cal/mol-K

or $R \approx 2$ cal/mol-K

∴ $\Delta E - \Delta H = -(-1) \times 2 \times 300$ cal

$\Delta E - \Delta H = 600$ cal

$\Delta E - \Delta H = +0.6$ kcal

534. The heat of formation of CO (g) and CO_2 (g) are ΔH = –110 and ΔH = –393 kJmol^{-1} respectively. What is the heat of reaction (ΔH) (in kJ mol^{-1}) for the following reaction?

$$\textbf{CO(g)} + \frac{1}{2}\textbf{O}_2\textbf{(g)} \rightarrow \textbf{CO}_2\textbf{(g)}$$

(a) –504 (b) –142.5
(c) –283 (d) 504

AP-EAMCET (Engg.)-2005

Ans. (c) : Given that,

$\Delta H_{CO} = 110$ KJmol^{-1}

$\Delta H_{CO_2} = -393\,\text{KJmol}^{-1}$

For the reaction-

$$CO\ (g) + \frac{1}{2}O_2(g) \longrightarrow CO_2(g)$$

Heat of reaction (ΔH) = $(\Delta H_{product}) - (\Delta H_{reactant})$

$$\Delta H = \Delta H_{CO_2} - (\Delta H_{CO} + \frac{1}{2}\Delta H_{O_2})$$

or $\Delta H = -393 - (-110 + \frac{1}{2} \times 0)$

or $\Delta H = -393 + 110$

or $\Delta H = -283$ kJmol^{-1}

535. The enthalpy of formation of water is [Given that the bond energies of H–H, O=O and O–H bonds are 433 kJ/mol, 492 kJ/mol and 464 kJ/mol, respectively]

(a) 430 kJ/mol (b) –249 kJ/mol
(c) –461 kJ/mol (d) 215 kJ/mol

AMU-2019

Ans. (b) : $H_2(g) + \frac{1}{2}O_2(g) \rightarrow H_2O(g)$

ΔH = (BE of reactant) – (BE of product)

= (BE of H_2 + $\frac{1}{2}$ × BE of O_2) – (2×BE of OH)

$= 433 + \left(\frac{1}{2} \times 492\right) - (2 \times 464)$

= 433 + 246 – 928

= – 249 kJ/mol

536. For the reaction: $S_{(rhombic)} + O_2 \rightarrow SO_2$, ΔH = – 298 kJ mol^{-1} at 25 °C and 1 atm. Therefore, ΔH for the reaction should be

(a) – 298 kJ mol^{-1}
(b) – 298 + 8.314 × 298 kJ mol^{-1}
(c) – 298 – 8.314 × 298 kJ mol^{-1}
(d) – 298 – 2 × 8.314 × 298 kJ mol^{-1}

AMU-2017

Ans. (a) : $S_{(rhombic)} + O_2 \rightarrow SO_2$; ΔH= –298 kJ mol^{-1}
This is an exothermic process, heat released are 298 kJ mol^{-1}.Therefore, ΔH for this reaction should be= –298 kJ mol^{-}

537. For the reaction,
$H_2F_2(g) \rightarrow H_2(g) + F_2(g)$; ΔE= –14.2 kcal/mole at 25° C. The change in enthalpy of the reaction is

(a) –1.36 kJ/mole (b) –13.6 kJ/mole
(c) 1.36 kJ/mole (d) 13.6 kJ/mole

AMU-2015

Ans. (b) : $H_2F_2(g) \rightarrow H_2(g) + F_2(g)$

∵ $\Delta H = \Delta E + \Delta n_g RT$

Δn_g = No. of mole of product – No. of mole of reactant

$\Delta n_g = (1+1) - 1 = 1$

∴ ΔH= – 14.2 Kcal mol^{-1}+1×2×10^{-3}×298

= –14.2 + .6

= – 13.6 Kcal mol^{-1}

538. The heat produced on combustion of methane is approximately

(a) 890 kJ per g (b) 74.2 kJ per g
(c) 55.6 kJ per g (d) 49.5 kJ per g

AMU-2015

Ans. (c) : $CH_4(g) + 2O_2(g) \rightarrow CO_2(g) + 2H_2O(l)$
Enthalpy change for a given reaction is equal to the (sum of standard enthalpies of formation of products)– (Sum of standard enthalpies of formation of reactants)

$\Delta H = \Delta H_{products} - \Delta H_{reactants}$

∵ Enthalpy of CO_2 = –393.5kJ/mol.

Enthalpy of H_2O = –285.8 kJ/mol.

Enthalpy of CH_4= –74.9 kJ/mol.

∴ Enthalpy combustion of methane

=[–393.5+2×(–285.8)]–[–74.9+2×0]

= –965.1+74.9

= –890.2 kJ/mol.

$= \frac{890.2}{16}$ kJ/g

= –55.6kJ/g

Here, negative sign indicate that the combustion reaction of CH_4 is exothermic reaction.

@apna_pdf

539. A boy after swimming comes out from a pool covered with a film of water weighing 80g. How much heat must be supplied to evaporate this water? ($\Delta H_v^o = 40.79$ kJ mol^{-1})

(a) 1.61×10^2 kJ (b) 1.71×10^2 kJ
(c) 1.81×10^2 kJ (d) 1.91×10^2 kJ

AMU-2015

Ans. (c) : Given that,

$\Delta H_v^o = 40.79$ kJ mol^{-1}

No. of moles (n) = $\frac{80}{18}$

Heat (q) = n ΔH_v^o

$= \frac{80}{18} \times 40.79$

= 181. 28 KJ = 1.81×10^2 kJ

540. On complete combustion, 0.246 g of an organic compound gave 0.198 g of CO_2 and 0.1014 g of H_2O. The ratio of carbon and hydrogen atoms in the compound is

(a) 1 : 3 (b) 1 : 2
(c) 2 : 5 (d) 2 : 7

AMU-2014

Ans. (c) : % of C = $\frac{12}{14} \times \frac{0 \cdot 198 \times 100}{0 \cdot 246}$

= 21.95%

% of H = $\frac{2}{18} \times \frac{0 \cdot 1014 \times 100}{0 \cdot 246} = 4.57$

% of O= (100–21.95–4.57)

= 73.47

Mole of C= $\frac{21.95}{12} = 1.83$

Mole of H= $\frac{4.57}{1} = 4.57$

Mole of O= $\frac{73.47}{16} = 4.59$

Ratio= C:H = 1.83 : 4.57=2 : 5

541. The change of energy on vaporizing 1.00 kg of liquid water at 0^oC and 1 atm is

(a) 2367 kJ kg^{-1} (b) 333.4 kJ kg^{-1}
(c) -333.4 kJ mol^{-1} (d) -2367 kJ g^{-1}

AMU-2012

Ans. (c) : Enthalpy of fusion

= 6.03 kJ mol^{-1} at 0^oC

For 18g of water enthalpy of fusion = –6.03 kJ / mole

1g of water enthalpy of fusion = $\frac{6.03}{18}$

for 1kg of water enthalpy of fusion

$= \frac{-6.03 \times 1000}{18} = -333.4$ kJ/kg

542. The difference between heats of formation at constant pressure and constant volume for the reaction ,

$2C_6H_6(l) + 15O_2(g) \rightarrow 12CO_2(g) + 6H_2O(l)$ at 25°C in kJ is

(a) –7.43 (b) +3.72
(c) –3.72 (d) +7.43.

AMU – 2008

Ans. (a) : We know that, $\Delta H = \Delta E + \Delta n_g RT$.

$\therefore \Delta H - \Delta E = \Delta n_g RT$

For the reaction –

$2C_6H_6(l) + 15O_2(g) \rightarrow 12CO_2(g) + 6H_2O(l)$

$\therefore \Delta n_g$ = no. of gaseous moles of product – no. of gaseous moles of reactant .

= 12 – 15 = – 3.

$\therefore \Delta H - \Delta E = \Delta n_g RT$

$= -3 \times 8.314 \times (273 + 25)$

= – 7432.12 J = –7.432 kJ

543. The enthalpy change when 2.63 g of phosphours reacts with an excess of bromine according to the equation :

$2P(s) + 3Br_2(l) \rightarrow 2PBr_3(g)$; $\Delta_r H^o = -243$ kJ mol^{-1} will be

(Molar mass of phosphorus = 30.97 mol^{-1})

(a) 103 kJ (b) 10.3 kJ
(c) 20.6 kJ (d) 24.3 kJ

AMU – 2007

Ans. (c) **:**

$2P(s)+3Br_2(l) \rightarrow 2PBr_3(g)$, $\Delta_r H^o = -243$ kJ mol^{-1}

Therefore, 30.97 g (1 mol) of P when reacted liberates 243 kJ of energy.

1 g of P when reacted will librates = 7.846 kJ

2.6 g of P when reacted will librates = 7.846×2.63

=20.64 kJ

Since, the enthalpy change will be20.64 kJ.

544. The free energy change at 300 K for

$2CuO(s) \rightarrow Cu_2O(s) + \frac{1}{2}O_2(g)$ will be [Given that $\Delta H = 145.6$ kJ mol^{-1}, $\Delta S = 0.116$ kJ K^{-1} mol^{-1}]

(a) 11.08 kJ mol^{-1} (b) 11.88 kJ mol^{-1}
(c) 110.8 kJ mol^{-1} (d) 118.8 kJ mol^{-1}

AMU–2006

Ans. (c) : Given that, ΔH=145.6 kJ mol^{-1}

$\Delta S = 0.116$ kJ K^{-1} mol^{-1}

$\because \Delta G = \Delta H - T\Delta S$

$= (145.6 - 300 \times 0.116)$ kJ mol^{-1}

= 110.8 kJ mol^{-1}

545. Enthalpy of neutralization of all strong acids and bases has same value, because

(a) Neutralization leads to the formation of a salt and water
(b) Strong acids and bases are ionic substances
(c) Acids always give H^+ ions and bases give OH^- ions
(d) The net chemical change involves the combination of H^+ and OH^- ions to form water

Assam CEE-2014

Ans. (a) : $HCl + NaOH \rightarrow NaCl + H_2O$

ΔH neutralization = –13.7 k cal = – 57.2 kJ

Because when strong acids reacts with a strong base , then there is a formation of salt and H_2O and hence, enthalpy of neutralization is same.

@apna_pdf

546. **In which of the following neutralization reactions, the heat of neutralization is highest?**

(a) NH_4OH and H_2SO_4
(b) CH_3COOH and KOH
(c) HCl and NaOH
(d) CH_3COOH and NH_4OH

Assam CEE-2014
SRMJEEE-2008

Ans. (c) : Heat of neutralizations maximum (i.e. approximately 13.7 kcal/mole) for the neutralization of a strong acid and strong base if one of them is weak, then heat of neutralization also decreases (due to being consumed in ionization of weak electrolyte. Hence, Heat of neutralization of HCl and NaOH will be the highest.

547. **The heat of neutralisation of any strong acid and a strong base is nearly equal to :**

(a) – 75.3 kJ (b) + 57.3 kJ
(c) –57.3 kJ (d) + 75.3 kJ

BCECE-2005

Ans. (c) : Enthalpy of neutralization is defined as the enthalpy change when 1 mole of acid/base is completely neutralized by base/ acid in dilute solution.

For strong acid and strong base neutralization net chemical change is

$H^+(aq) + OH^-(aq) \rightarrow H_2O(l)$

$\Delta_r H^o = -57.3 kJ / mol$

548. **Given,**

$$C(diamond) + O_2 \longrightarrow CO_2 ; \Delta H = -395 kJ$$

$$C(graphite) + O_2 \longrightarrow CO_2 ; \Delta H = -393 kJ$$

The heat of formation of diamond from graphite is–

(a) + 2.0 kJ (b) –1.5 kJ
(c) – 788 kJ (d) 788 kJ

BCECE-2011

Ans. (a) : $C_{(Diamond)} + O_2 \rightarrow CO_2$, $\Delta H = -395$ kJ (i)

$C_{(Graphite)} + O_2 \rightarrow CO_2$, $\Delta H = -393$ kJ (ii)

Heat of formation of Diamond from graphite

$C_{(graphite)} \rightarrow C_{(Diamond)}$

equation (ii) – equation (i)

$\Delta H = -393 - (-395)$ kJ = + 2kJ

549. **The enthalpies of combustion of carbon and carbon monoxide are –393.5 and –283 kJ mol^{-1} respectively. The enthalpy of formation of carbon monoxide per mole is**

(a) 110.5 kJ (b) 676.5 kJ
(c) –675.5 kJ (d) –110.5 kJ

BCECE-2010

Ans. (d) : $C + O_2 \rightarrow CO_2$, ……(i)

$\Delta H = -393.5$ kJ mol^{-1}

$CO + \frac{1}{2}O_2 \rightarrow CO_2$……(ii)

$\Delta H = -283.0$ kJ mol^{-1}

Subtract equation (ii) from equation (i)

$$C + \frac{1}{2}O_2 \rightarrow CO$$

$\Delta H = -395.5 - (-283) = -110.5$ kJ

550. **Change in enthalpy for the reaction,**

$$2H_2O_2(l) \longrightarrow 2H_2O(l) + O_2(g)$$

if heat of formation of H_2O_2 (*l*) and H_2O(*l*) are –188 and –286 kJ/mol respectively is

(a) –196 kJ/mol (b) + 196 kJ/mol
(c) + 948 kJ/mol (d) – 948 kJ/mol

BCECE-2012

Ans. (a) : $2H_2O(1) \rightarrow 2H_2O(l) + O_2(g)$

$\Delta H = 2\,\Delta H_{H_2O} - 2\,\Delta H_{H_2O_2} + \Delta H_{O_2}$

$\Delta H = (2\times-286) - (2\times-188) + 0$

$\Delta H = -196$ kJ/mol.

551. **ΔU° of combustion of methane is –X k J mol^{-1}. The value of ΔH° is**

(a) $= \Delta U^\circ$ (b) $> \Delta U^\circ$
(c) $< \Delta U^\circ$ (d) $= 0$

BCECE-2012

Ans. (c) : $CH_4(g) + 2O_2(g) \rightarrow CO_2(g) + 2H_2O(l)$

$\Delta n_g = (n_p - n_r) = 1 - 3 = -2$ $\because \Delta n_g < 0$

$\Delta H^o = \Delta U^o + \Delta n_g RT$

$= -X - 2RT$ $\Delta H < \Delta E$

$\boxed{\Delta H^o < \Delta U^o}$

552. **From the following reactions at 298K,**

$$(A)\ CaC_2(s) + 2H_2O(l) \rightarrow Ca(OH)_2(s) + C_2H_2(g) DH^0 (kJmol^{-1}) - 127.9$$

$$(B)\ Ca(s) + \frac{1}{2}O_2(g) \rightarrow CaO(s) - 635.1$$

$$(C)\ CaO(s) + H_2O(l) \rightarrow Ca(OH)_2 - 65.2$$

$$(D)\ C(s) + O_2(s) \rightarrow CO_2(s) - 393.5$$

$$(E)\ C_2H_2(g) + \frac{5}{2}O_2(g) \rightarrow 2CO_2(g) + H_2O(e) - 1299.58$$

Calculate the heat of formation of CaC_2(s) at 298 K.

(a) –59.82 KJ mol^{-1} (b) +59.82 KJ mol^{-1}
(c) –190.22 KJ mol^{-1} (d) +22 KJ mol^{-1}

BCECE-2013

Ans. (a): (A) $CaC_2 + 2H_2O(l) \rightarrow Ca(OH)_2(s) + C_2H_2(g) = -127.9$

(B) $Ca(s) + \frac{1}{2}O_2(g) \rightarrow CaO(s) = -635.1$

(C) $CaO(s) + H_2O(l) \rightarrow Ca(OH)_2 = -65.2$

(D) $C(s) + O_2(s) \rightarrow CO_2(s) = -393.5$

(E) $C_2H_2(g) + O_2(g) \rightarrow 2CO_2(g) + H_2O = -1299.5$

Multiplying in statement (D) by 2,

Adding the equation (B) (C) (D) and Substracting from A and E

$= -635.1 + (-65.2) + (2\times-393.5) - (-1299.58 - 127.9)$

$= -635.1 - 65.2 - 787 + (1299.58 + 127)$

$= -1487.3 + 1427.48$

$= -59.82$ kJ/mole.

553. **ΔG° and ΔH° for a reaction at 300 K is –66.9 kJ mol^{-1} and –41.8 kJ mol^{-1} respectively. ΔG° for the same reaction at 330 K is–**

@apna_pdf

(a) -25.1 kJ mol^{-1} (b) $+25$ kJ mol^{-1}
(c) 18.7 kJ mol^{-1} (d) -69.4 kJ mol^{-1}

BCECE-2013

Ans. (d) : ΔH^o and ΔS^o remain constant in the given temperature range,

$$\therefore \Delta S^o = -\frac{\Delta G^o - \Delta H^o}{T}$$

$$= -\left(\frac{-66.9+41.8}{300}\right)$$

$= 0.08367$ kJK^{-1} mol^{-1}

$\therefore \Delta G^o = \Delta H^o - T\Delta S^o$

$= -41.8 - 330 \times 0.08367$

$= -69.4$ kJ mol^{-1}

554. At 1000K, from the data

$$\mathbf{N_2(g) + 3H_2(g) \longrightarrow 2NH_3(g).}$$

$$\mathbf{\Delta H = -123.77 kJmol^{-1}}$$

Substance	N_2	H_2	NH_3
P/R	3.5	3.5	4

Calculate the heat of formation of NH_3 at 300 K.

(a) -44.42 kJ mol^{-1} (b) -88.85 kJ mol^{-1}
(c) $+44.42$ kJ mol^{-1} (d) $+88.85$ kJ mol^{-1}

BCECE-2013

Ans. (a) : From Kirchhoff's equation

$\Delta H_{2\,(1000K)} = \Delta H_{1\,(300K)} + \Delta C_p\,(1000-300)$

Here, $\Delta H_{2\,(1000K)} = -123.77$ kJ Mol^{-1}

$\Delta Cp = 2Cp_{(NH_3)} - [Cp_{(N_2)} + 3Cp_{(H_2)}]$

$\Delta Cp = 2\times4R - [3.5R + 3\times3.5R]$

$\Delta Cp = 8R - 14R$

$\Delta Cp = -6R$

$\Delta Cp = -6 \times 8.314 \times 10^{-3}$kJ

$\therefore -123.77 = \Delta H_{1\,(300K)} - 6 \times 8.314 \times 10^{-3} \times 700$

or $\Delta H_{1\,(300K)} = -88.85$KJ

For two moles of NH_3

$$\therefore H_{f(NH_3)} = \frac{\Delta H_{1(300K)}}{2}$$

$$= -\frac{88.85}{2}$$

$= -44.42$ kJ mol^{-1}

555. The enthalpy changes for the following processes are listed below–

$$\mathbf{Cl_2(g) \longrightarrow 2Cl(g), 242.3 kJmol^{-1}}$$

$$\mathbf{I_2(g) \longrightarrow 2I(g), 151.0 kJmol^{-1}}$$

$$\mathbf{ICl \longrightarrow I(g) + Cl(g), 211.3 kJmol^{-1}}$$

$$\mathbf{I_2(s) \longrightarrow I_2(g), 62.76 kJmol^{-1}}$$

Given that the standard states for iodine and chlorine are $I_2(s)$ and $Cl_2(g)$, the standard enthalpy for the formation of ICl(g) is–

(a) -14.6 kJ mol^{-1} (b) -16.8 kJ mol^{-1}
(c) $+16.8$ kJ mol^{-1} (d) $+244.8$ kJ mol^{-1}

BCECE-2014

Ans. (c) : $\frac{1}{2}I_2 + \frac{1}{2}Cl_2(g) \rightarrow ICl(g)$

$$\Delta H_{ICl} = \left[\frac{1}{2}\Delta H_{I_2(S)\rightarrow I_2(g)} + \frac{1}{2}\Delta H_{I-I} + \frac{1}{2}\Delta H_{Cl-Cl}\right] - [\Delta H_{I-Cl}]$$

$$= \left[\frac{1}{2}\times62.76 + \frac{1}{2}\times151.0 + \frac{1}{2}\times242.3\right] - [211.3]$$

$= 16.83$ kJ/mol.

556. Given the following bond dissociation enthalpies (kJ mol^{-1}).

$$\mathbf{P \equiv P - 490, P - P - 209, N \equiv N - 946, N - N - 160}$$

Compare the enthalpy changes for the process

i. $2P_2(g) \longrightarrow P_4(g)$

ii. $2N_2(g) \longrightarrow N_4(g)$

(a) P_4 is feasible but N_4 is not feasible
(b) P_4 is not feasible but N_4 is feasible
(c) Both P_4 and N_4 are feasible
(d) Both P_4 and N_4 are not feasible

BCECE-2015

Ans. (a) : The process involves replacement of 2(x≡x) units by 6(x–x) bonds in the X_4 tetrahedron. Energy is released when bonds are formed and thus species formed is stable.

(i) $2P_2\,(g) \rightarrow P_4(g)$

$\Delta H = -6\times BE_{(P-P)} + 2\times BE_{(P\equiv P)}$

$= -6\times209 + 2\times490 = -274$ kJ/mol feasible,

(ii) $2N_2(g) \rightarrow N_4(g)$

$\Delta H_t = 6BE_{(N-N)} + 2BE_{(N\equiv N)}$

$= -6\times160 + 2\times946$

$= +932$ kJ mol^{-1}

Formation of N_4 is endothermic, thus is not feasible.

557. What is the enthalpy of the disproportionation of MgCl is –125 kJ/mol and the $MgCl_2$ is –642kJ/mol?

(a) -767 kJ/mol (b) 767 kJ/mol
(c) -392 kJ/mol (d) 392 kJ/mol

BCECE-2015

Ans. (c) : $Mg(s) + Cl_2(g) \rightarrow MgCl_2(s)$

$\Delta H_1 = -642$ kJ mol^{-1}

$Mg(s) + \frac{1}{2}Cl_2(g) \rightarrow MgCl(s)$

$\Delta H_2 = -125$ kJ mol^{-1}

$2MgCl \rightarrow MgCl_2 + Mg$

$\Rightarrow \Delta H = \Delta H_1 - 2\Delta H_2$

$= -642 + 2\times125$

$= -392$ kJ mol^{-1}

558. Consider the following reactions,

$$\mathbf{C(s) + O_2(g) \longrightarrow CO_2(g), \Delta H = -94kcal}$$

$$\mathbf{2CO(g) + O_2 \longrightarrow 2CO_2(g), \Delta H = -135.2kcal}$$

Then, the heat of formation of CO(g) is–

(a) 26.4 kcal (b) –26.4 kcal
(c) 41.2 kcal (d) –41.2 kcal

BCECE-2015

@apna_pdf

Ans. (b) :
$C(s) + O_2(g) \longrightarrow CO_2(g). \Delta H = -94\,kcal$ .....(1)

$CO_2(g)+O_2(g) \rightarrow CO+\frac{1}{2}O_2(g)$

$\Delta H_3 = \frac{135.2}{2} = 67.6$ kcal .....(3)

∵ The required equation,

$C(s)+\frac{1}{2}O_2=CO(g),\ \Delta H_4=?$

Adding equation (1) and (3) use get–

$C(s) + \frac{1}{2}O_2 \rightarrow CO(g)$

$\Delta H = -94 + 67.6 = -26.4$ kcal.

559. In the reaction
$CO_2(g) + H_2(g) \rightarrow CO(g) + H_2O(g)$
ΔH = 40 kJ; ΔH represents :
(a) Heat of formation
(b) Heat of combustion
(c) Heat of neutralisation
(d) Heat of reaction

BITSAT 2005

Ans. (d) : Heat of reaction, the amount of heat that must be added or removed during a chemical reaction in order to keep all of the substances present at the same temperature. The difference between enthalpy of substances present at the end of the reaction and the enthalpy of the substances present at the start of reaction. Thus, the heat of reaction determined at constant pressure is also designated the enthalpy of reaction, represented by the symbol ΔH.

560. At 25^0C and 1 bar which of the following has a non-zero ΔH_f^0 ?
(a) $Br_2(\ell)$
(b) C (graphite)
(c) $O_3(g)$
(d) $I_2(s)$

BITSAT 2009

Ans. (c) : Ozone is allotropic form of oxygen and is of higher energy (by 68 K Cal mol^{-1}) than O_2.
Hence it can not be taken as the reference in standard state.

561. If the enthalpy of vaporization of water is 186.5 kJmol^{-1}, the entropy if its vaporization will be :
(a) 0.5 kJ K^{-1} mol^{-1}
(b) 1.0 kJ K^{-1} mol^{-1}
(c) 1.5 kJ K^{-1} mol^{-1}
(d) 2.0 kJ K^{-1} mol^{-1}

BITSAT 2014

Ans. (a) : Given enthalpy of vaporization,
$\Delta H = 186.5\,kJ\,mol^{-1}$
Boiling point of water
$= 100^0C = 100 + 273 = 373\,K$
Entropy change,
$$\Delta S = \frac{\Delta H}{T} = \frac{186.5\,kJ\,mol^{-1}}{373\,K}$$
$\Delta S = 0.5$ kJ mol^{-1} K^{-1}

562. The heats of neutralisation of CH_3COOH, HCOOH, HCN and H_2S are – 13.2, –13.4, –2.9 and –3.8 k cal per equivalent respectively. Arrange the acids in increasing order of acidic strength.
(a) $HCOOH > CH_3COOH > H_2S > HCN$
(b) $CH_3COOH > HCOOH > H_2S > HCN$
(c) $H_2S > HCOOH > CH_3COOH > HCN$
(d) $HCOOH > H_2S > CH_3COOH > HCN$

BITSAT 2014

Ans. (a) : The greater the (negative value) of heat of neutralization, the more is the strength of the acid. Hence,
$HCOOH > CH_3COOH > H_2S > HCN$

563. For the dissociation reaction,
$H_2(g) \rightarrow 2H(g)$, ΔH = 162 Kcal,
heat of atomization of H is
(a) 81 Kcal
(b) 162 Kcal
(c) 208 Kcal
(d) 218 Kcal

BITSAT 2013

Ans. (a) : $\Delta H = \Delta H_{(product)} - \Delta H_{(reactant)}$
$162 = 2 \times \Delta H_H - \Delta H_{H_2}$
$\Delta H_H = \frac{162}{2} \qquad (\because \Delta H_{H_2} = 0)$
$\Delta H_H = 81\,Kcal$

564. The enthalpy of combustion of 2 moles of benzene at 27^0C differs from the value determined in bomb calorimeter by
(a) –2.494 kJ
(b) 2.494 kJ
(c) –7.483 kJ
(d) 7.483 kJ

BITSAT 2013

Ans. (c) : By bomb calorimeter, we get ΔE–
$2C_6H_6(1) + 15O_2(g) \rightarrow 12CO_2(g) + 6H_2O(l)$
$\Delta H - \Delta E = \Delta n_g RT$
Δn_g = 12+6–(15+2)=1
= (12 – 15) × 8.314 × 300 = –7.483 kJ

565. In which of the following reactions, standard entropy change (ΔS^0) is positive and standard Gibb's energy change (ΔG^0) decreases sharply with increasing temperature?
(a) $C(graphite) + \frac{1}{2}O_2(g) \rightarrow CO(g)$
(b) $CO(g) + \frac{1}{2}O_2(g) \rightarrow CO_2(g)$
(c) $Mg(s) + \frac{1}{2}O_2(g) \rightarrow MgO(s)$
(d) $\frac{1}{2}C(graphite) + \frac{1}{2}O_2(g) \rightarrow \frac{1}{2}CO_2(g)$

BITSAT 2012

Ans. (a) : Since, in the first reaction gaseous products are forming from solid carbon hence entropy will increase i.e. ΔS^0 = +ve.

@apna_pdf

$C(gr.) + \frac{1}{2}O_2(g) \rightarrow CO(g); \Delta S^0 = +ve$

Since, $\Delta G^0 = \Delta H^0 - T\Delta S^0$

Hence, the value of ΔG^0 decrease on increasing temperature.

566. Bond enthalpies of H_2, X_2 and HX are in the ratio 2 : 1 : 2. If enthalpy of formation of HX is – 50 kJ mol^{-1}, the bond enthalpy of X_2 is

(a) 100 kJ mol^{-1} (b) 300 kJ mol^{-1}

(c) 200 kJ mol^{-1} (d) 400 kJ mol^{-1}

BITSAT 2012

Ans. (a) : $\frac{1}{2}H_2 + \frac{1}{2}X_2 \rightarrow HX$

Let the bond enthalpy of X – X bond be x.

$\Delta H_{f(HX)} = -50$

$-50 = \frac{1}{2}\Delta H_{H-H} + \frac{1}{2}\Delta H_{X-X} - \Delta H_{H-X}$

$-50 = \frac{1}{2} \times 2x + \frac{1}{2} \times x - 2x = \frac{-x}{2}$

$\therefore x = 50 \times 2 = 100\,kJ\,mol^{-1}$

So, Bond enthalpy of X_2 is 100 kJ mol^{-1}

567. Given

Reaction	**Energy Change (in kJ)**
$Li(s) \rightarrow Li(g)$	**161**
$Li(g) \rightarrow Li^+(g)$	**520**
$\frac{1}{2}F_2(g) \rightarrow F(g)$	**77**
$F(g) + e^- \rightarrow F^-(g)$	**(Electron gain enthalpy)**
$Li^+(g) + F^-(g) \rightarrow LiF(s)$	**–1047**
$Li(s) + \frac{1}{2}F_2(g) \rightarrow LiF(s)$	**–617**

Based on data provided, the value of electron gain enthalpy of fluorine would be :

(a) –300 kJ mol^{-1} (b) –350 kJ mol^{-1}

(c) –328 kJ mol^{-1} (d) –228 kJ mol^{-1}

BITSAT 2016

Ans. (c) : Applying Hess's Law

$\Delta_f H^0 = \Delta_{sub}H + \frac{1}{2}\Delta_{diss}H + I.E. + E.A + \Delta_{lattice}H$

–617 = 161 + 520 + 77 + E.A. + (–1047)

E.A. = –617 + 289 = –328 kJ mol^{-1}

$\therefore$ Electron affinity of fluorine = – 328 kJ mol^{-1}

568. For vaporization of water at 1 atmospheric pressure, the values of ΔH and ΔS are 40.63 $kJmol^{-1}$ and 108.8 JK^{-1} mol^{-1}, respectively. The temperature when Gibbs energy change (ΔG) for this transformation will be zero, is :

(a) 293.4K (b) 273.4K

(c) 393.4K (d) 373.4K

BITSAT 2018

Ans. (d) : Given that,

$\Delta H = 40630\,J\,mol^{-1}$

$\Delta S = 108.8\,JK^{-1}mol^{-1}$

$\Delta G = \Delta H - T\Delta S$

When $\Delta G = 0$,

$0 = \Delta H - T\Delta S$

$T = \frac{\Delta H}{\Delta S} = \frac{40630\,J\,mol^{-1}}{108.8\,J\,k^{-1}\,mol^{-1}} = 373.4K$

569. To which of the following determination of heat, Hess's law is used?

(a) Heat of chemical reaction

(b) Heat of formation

(c) Heat of bond formation

(d) All of the above

CG PET -2008

Ans. (d) : Hess's Law - Hess's law of heat summation states that for a chemical equation that can be written as the sum of two or more steps, the enthalpy change for the overall equation is the sum of enthalpy changes for the individual steps.

570. Energy of activation of an endothermic reaction is

(a) negative (b) positive

(c) Zero (d) Cannot be predicted

CG PET- 2011

Ans. (b) : In endothermic reactions, the reactants are present at comparatively lower energy than the products, which means the products formed in the reaction are less stable than the reactants. Since, the reaction moves towards a more stable molecule, towards a less stable molecule, the overall enthalpy change of the reaction is positive.

571. Which of the following relationships is correct?

(a) $k = \frac{T\Delta S^o - \Delta H^o}{RT}$ (b) $k = \frac{\Delta H^o - T\Delta S^o}{RT}$

(c) $\ln k = \frac{T\Delta S^o - \Delta H^o}{RT}$ (d) $\ln k = \frac{\Delta H^o - T\Delta H^o}{RT}$

CG PET- 2011

Ans. (c) : $\Delta G° = -nRT\,lnk$

$\Delta H° - T\Delta S° = -nRT\,lnk$

$lnk = \frac{-(\Delta H° - T\Delta S°)}{RT}$

$lnk = \frac{T\Delta S° - \Delta H°}{RT}$

572. $C_2H_2 + \frac{5}{2}O_2 \rightarrow 2CO_2 + H_2O;\ \Delta H = -310kcal$

$C + O_2 \rightarrow O_2;\ \Delta H = -94kcal$

$H_2 + \frac{1}{2}O_2 \rightarrow H_2O;\ \Delta H = -68kcal$

On the basis of the above equations, ΔH_f (enthalpy of formation) of C_2H_2 will be

(a) –148 kcal (b) +54 kcal

(c) –54 kcal (d) –80 kcal

CG PET -2009

Ans. (b) : Given,

$C_2H_2 + \frac{5}{2}O_2 \rightarrow 2CO_2 + H_2O,\ \Delta H = -310\ kcal$.....(i)

$C + O_2 \rightarrow CO_2,\ \Delta H = -94\ kcal$............(ii)

@apna_pdf

$H_2 + \frac{1}{2}O_2 \rightarrow H_2O, \ \ \Delta H = -68$ kcal....(iii)

Enthalpy of formation of C_2H_2 will be....

$2C + H_2 \rightarrow C_2H_2$

Reverse equation (i) + equation (ii) × 2 + equation (iii)

$= -(-310) + (-94\times2)+(-68)$

$= 310 - 188 - 68$

$= +54$ kcal

573. Heat of neutralization of HCl and NaOH is

(a) −13.7 kcal (b) −13.7 J

(c) −13.7 kJ (d) None of these

CG PET- 2012

Ans. (a) : $NaOH + HCl \text{——} NaCl + H_2O$

$\Delta H = -57.1$ kJ/ mol.

As we know that heat of neutralization of a strong acid by a strong base is heat of formation of water.

Therefore, $H^+ + OH^- \rightarrow H_2O$

We know that, 1 calorie = 4.184 joule

$$= \frac{-57.1}{4.184} = -13.7\,\text{kcal}.$$

574. For the equilibrium reaction,

$$2SO_2(g) + O_2(g) \rightleftharpoons 2SO_3(g) + \Delta H$$

the increase in temperature

(a) favours the formation of SO_3

(b) favours the decomposition of SO_3

(c) does not affect the equilibrium

(d) stops the reaction

CG PET- 2012

Ans. (b) :

$2SO_2(g)+O_2(g)\rightarrow 2SO_3(g)+\Delta H$

If we increase the temperature the equilibrium reaction will shift in backword direction which mean's decomposition of SO_3 favours.

575. When 1 M H_2SO_4 is completely neutralized by NaOH, the heat liberated is 114.64 kJ. What is the enthalpy of neutralization?

(a) +114.64kJ (b) −114.64kJ

(c) −57.32kJ (d) +57.32

CG PET- 2013

Ans. (c) : Enthalpy of neutralisation: It is the change in enthalpy that occurs, when one equivalent of an acid and a base undergo a neutralisation to form H_2O and salt.

$$\underset{\text{(Sulphuric acid)}}{H_2SO_4} + \underset{\text{(Sodium hydroxide)}}{2NaOH} \longrightarrow Na_2SO_4 + 2H_2O$$

ΔH= −114.64 kJ (ΔH is (–ve) because heat is liberated)

$$\underset{\text{(2 mole)}}{2H_2O} \longrightarrow -114.64\text{ kJ}$$

$$\underset{\text{(1 mole)}}{1\,H_2O} \longrightarrow \frac{-114.64}{2}\text{ kJ}$$

= −57.32 kJ

So, enthalpy of neutralization is −57.32 kJ.

576. What is the role of a catalyst in a catalysed reaction?

(a) Lowers the activation energy

(b) Increases the activation energy

(c) Affects the free energy change

(d) Affects the enthalpy change

CG PET -2005

Ans. (a) : It is a substance which increases the rate of reaction without it self undergo any change is called catalyst.

Basically the role of catalyst in a reaction is to "lower the activation energy."

577. Consider the following reaction :

$CaO(s) + CO_2(g) \rightarrow CaCO_3(s)$

The reaction is spontaneous at low temperature because

(a) ΔH is negative ΔS is positive
ΔG is negative

(b) ΔH is negative ΔS is negative
ΔG is negative

(c) ΔH is positive ΔS is negative
ΔG is positive

(d) ΔH is positive ΔS is positive
ΔG is negative

CG PET -2018

Ans. (d) : $\Delta G = \Delta H - T\Delta S$

For spontaneous $\Delta G < 0$

and this is possible when

$\Delta H = +ve$

$\Delta S = +ve$

$\Delta G = -ve$

At low temperature

578. The heat of neutralisation of hydrogen cyanide (HCN) is −2.9 kcal mol^{-1}. This shows that heat of dissociation of HCN is

(a) + 13.7 kcal mol^{-1} (b) + 10.8 kcal mol^{-1}

(c) − 13.7 kcal mol^{-1} (d) − 13.7 kcal mol^{-1}

CG PET -2018

Ans. (b) : When a strong acid will react with a strong base, nearly 13.7 kcal mol^{-1} heat comes out from the reaction.

But when a weak acid (like HCN) go for neutralization, some heat is used up to dissociate the HCN molecules.

∵ Given, only 2.9 kcal/mol heat is coming out, means.

13.7–2.9 = + 10.8 kcal / mole heat is used up to dissociates the HCN molecules.

579. The standard enthalpy of vapourisation $\Delta_{vap}H^o$, for water at 100ºC is 40.66 kJ mol^{-1} The internal energy of vapourisation of water at 100ºC (in kJ mol^{-1}) is (assume water vapour to behave like an ideal gas)

(a) +43.76 (b) +40.66

(c) +37.56 (d) None of these

CG PET -2017

Ans. (c) : Given $H_2O(l) \rightarrow H_2O(g)$, $\Delta H = 40.6$ kJ/mol

$= 40660$ J/ mol

$R = 8.314$ J/ mol.K

∵ $\Delta H(g) = \Delta E + \Delta n_g RT$

Where Δn = number of moles of gaseous species

@apna_pdf

Here $\Delta n = 1$

$\therefore \quad \Delta E = \Delta H(g) - \Delta n_g RT$

$= 40660 - 1 \times 8.314 \times 373$

$= 40660 - 3101.22$

$= 37558.75 \, J/mol = 37.56 \, kJ/mol$

580. In which of the following $\Delta E = \Delta H$?

(a) $N_2O_4(g) \rightleftharpoons 2NO_2(g)$

(b) $2SO_2(g) + O_2(g) \rightleftharpoons 2SO_3(g)$

(c) $H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$

(d) $H_2(g) + \frac{1}{2}O_2(g) \rightleftharpoons H_2O(I)$

CG PET- 2015

Ans. (c) : $\Delta H = \Delta E + \Delta n_g RT$

$2HI(g) \rightarrow H_2(g) + I_2(g)$

$\Delta n_g = 2 - 2 = 0$

$\Delta H = \Delta E + 0 \times RT$

$\Delta H = \Delta E$

581. What is the free energy change ΔG when 10 moles of water at 100ºC and 1 atm pressure is converted into steam at 100ºC and 1 atm pressure?

(a) 540 cal
(b) –9800 cal
(c) 9800 cal
(d) 0 cal

CG PET- 2015

Ans. (d) : $H_2O(l) \rightarrow H_2O(g)$

1atm, 100°C 1atm, 100°C

$\Delta G = VdP - SdT \quad (\because SdT = 0)$

$\Delta G = VdP = \frac{nRT}{P}dP = nRT \ln\frac{P_2}{P_1} \quad (\because PV = nRT)$

$\Delta G = nRT \ln\left(\frac{1}{1}\right) = nRT \times 0 = 0$

$\boxed{\Delta G = Zero}$

582. Based on the following thermochemical equation

$\mathbf{H_2O(g) + C(s) \rightarrow CO(g) + H_2(g); \Delta H = 131kJ}$

$\mathbf{CO(g) + \frac{1}{2}O_2(g) \rightarrow CO_2(g); \Delta H = -282kJ}$

$\mathbf{H_2(g) + \frac{1}{2}O_2(g) \rightarrow H_2O(g); \Delta H = -242kJ}$

$\mathbf{C(s) + O_2(g) \rightarrow CO_2(g); \Delta H = XkJ}$

the value of X will be

(a) –393kJ
(b) –655kJ
(c) +393kJ
(d) +655kJ

CG PET- 2010

Ans. (a) :

$C(s) + O_2(g) \rightarrow CO_2(g)$

$\Delta H = xkJ$

$H_2O(g) + C(s) \rightarrow CO(g) + H_2(g)$

$\Delta H = 131 \; kJ$ .....(i)

$CO(g) + \frac{1}{2}O_2(g) \rightarrow CO_2(g)$

$\Delta H = -282 \; kJ$ ....(ii)

$H_2(g) + \frac{1}{2}O_2(g) \rightarrow H_2O(g)$

$\Delta H = -242 \; kJ$ . ...(iii)

$C(s) + O_2(g) \rightarrow CO_2(g)$

By adding equation (i), (ii), (iii), we get–

$\Delta H = 131 + (-282) + (-242)$

$= -393$ kJ

583. The standard enthalpy of formation (ΔH_f°) at 298 K for methane, CH_4 (g) is –74.8 kJ mol^{-1}. The addition information required to determine the average energy for C–H bond formation would be

(a) The dissociation energy of H_2 and enthalpy of sublimation of carbon
(b) Latent heat of vaporisation of methane
(c) The first four ionisation energies of carbon and electron gain enthalpy of hydrogen
(d) The dissociation energy of hydrogen molecule, H_2

AIEEE-2006

Ans. (a) : The standard enthalpy of formation (ΔH_f^0) of a compound is defined as the enthalpy change for the reaction that forms 1 mole of compound from its elements, with all substances in their standard states.

Carbon is found in solid state. The state of any substance affects the enthalpy change.

$C(s) \rightarrow C(g)$ sublimation

$H_2(g) \rightarrow 2H(g)$ dissociation are required for C–H bond.

584. Consider the reaction,

$N_2 + 3H_2 \longrightarrow 2NH_3$ carried out at constant temperature and pressure. If ΔH and ΔE are the enthalpy and internal energy changes for the reaction, which of the following expressions is true?

(a) $\Delta H > \Delta E$
(b) $\Delta H < \Delta E$
(c) $\Delta H = \Delta E$
(d) $\Delta H = 0$

AIEEE-2005

Ans. (b) : $N_2(g) + 3H_2(g) \rightarrow 2NH_3$

It is exothermic reaction

$\Delta n_g = 2 - 3 - 1 = -2$

$\therefore \Delta H = \Delta E + \Delta n_g RT$

$\Delta H = \Delta E + (-2) RT$

$\Delta H = \Delta E - 2 RT$

$\Delta H < \Delta E$

585. If the bond dissociation energies of XY, X_2 and Y_2 (all diatomic molecules) are in the ratio of 1:1:0.5 and ΔH_f for the formation of XY is –200 kJ mol^{-1}. The bond dissociation energy of X_2 will be

(a) 400 kJ mol^{-1}
(b) 300 kJ mol^{-1}
(c) 200 kJ mol^{-1}
(d) None of these

AIEEE-2005

Ans. (d) : Formation of XY is shown as

$X_2 + Y_2 \rightarrow 2XY$

$\Delta H = [(BE)_{X-X} + (BE)_{Y-Y}] - [\, 2\,(BE)_{X-Y}]$

@apna_pdf

If (BE) Of X–Y = a kJ/mol

Then, (BE) of (X–X) = a

Since, (BE) of (Y –Y) = $\frac{a}{2}$ $\left[\because \frac{1}{2}X_2 + \frac{1}{2}Y_2 \rightarrow XY\right]$

ΔH_f (X–Y) = – 200 kJ

–400 (for 2 mol XY) = $\left(a + \frac{a}{2} - 2a\right) = \frac{-a}{2}$

a = 800 kJ

The bond dissociation energy of X_2 = 800 kJ

586. The enthalpies of combustion of carbon and carbon monoxide are –393.5 and –283 kJ mol^{-1} respectively. The enthalpy of formation of carbon monoxide per mole is

(a) 110.5 kJ (b) 676.5 kJ
(c) –676.5 kJ (d) –110.5 kJ

AIEEE-2004

Ans. (d) : Enthalpy of formation (ΔH_f^0) -

Enthalpy changes also occur when a compound is formed from elements.

$C + O_2 \rightarrow CO_2,\ \Delta H = -393.5$ kJ ....(i)

$CO + \frac{1}{2}O_2 \rightarrow CO_2,\quad \Delta H = -283$ kJ ....(ii)

equation (ii) subtract from equation (i)

$C + \frac{1}{2}O_2 \rightarrow CO,\quad \Delta H = -393.5 - (-283) = -110.5$ kJ

587. On the basis of the following thermochemical data $\left[\Delta_f G^o H^+(aq) = 0\right]$

$$H_2O(l) \rightarrow H^+(aq) + OH^-(aq);$$

ΔH = 57.32 kJ

$$H_2(g) + \frac{1}{2}O_2(g) \rightarrow H_2O(l);$$

ΔH = –286.02 kJ

The value of enthalpy of formation of OH$^-$ ion at 25°C is

(a) –22.88 kJ (b) –228.88 kJ
(c) +228.88 kJ (d) –342.52 kJ

AIEEE-2009

Ans. (b) : Consider the heat of formation of H_2O

$$H_2(g) + \frac{1}{2}O_2(g) \rightarrow H_2O(1);\ \Delta H = -286.02 \text{ kJ}$$

$$\Delta H_r = \Delta H_{f\,(H_2O,l)} - \Delta H_{f\,(H_2,g)} - \frac{1}{2}\Delta H_{f(O_2,g)}$$

$$-286.20 = \Delta H_{f\,(H_2O,l)} - 0 - 0$$

$$\Delta H_{f\,(H_2O,l)} = -286.20$$

Now, $H_2O(l) \rightarrow H^+(aq) + OH^-(aq);\ \Delta H = 57.32$ kJ

$$\Delta H_r = \Delta H_{f\,H^+(aq)} + \Delta H_{f\,OH^-(aq)} - \frac{1}{2}\Delta H_{f(H_2O,l)}$$

$$57.32 = 0 + \Delta H_{f\,OH^-(aq)} - (-286.20)$$

$$\Delta H_{f\,OH^-(aq)} = 57.32 - 286.20 = -228.88 \text{ kJ}$$

588. Oxidising power of chlorine in aqueous solution can be determined by the parameters indicated below

$$\frac{1}{2}Cl_2(g) \xrightarrow{\frac{1}{2}\Delta_{diss}H^\ominus} Cl(g) \xrightarrow{\Delta_{EA}H^\ominus}$$

$$Cl^-(g) \xrightarrow{\Delta_{hyd}H^\ominus} Cl^-(aq)$$

The energy involved in the conversion of $\frac{1}{2}Cl_2(g)$ to $Cl^-(aq)$

(using the data, $\Delta_{diss}H^o_{Cl_2}$ = 240 kJ mol^{-1}

$\Delta_{eg}H^\ominus_{Cl}$ = –349 kJ mol^{-1},

$\Delta_{hyd}H^\ominus_{Cl}$ = –381 kJ mol^{-1}) will be

(a) +152 kJ mol^{-1} (b) –610 kJ mol^{-1}
(c) –850 kJ mol^{-1} (d) +120 kJ mol^{-1}

AIEEE-2008

Ans. (b) : Oxidising power of chlorine in aqueous solution can be estimated by calculating the over all enthalpy change of reaction.

$$\frac{1}{2}Cl_2(g) \rightarrow Cl^{-1}(aq)$$

$$\Delta H = \frac{1}{2}\Delta_{diss}H^-_{Cl_2} + \Delta_{eg}H^-_{Cl} + \Delta_{hyd}H^-_{Cl}$$

= 240/2 + (–349) + (–381) = –610 kJ/mol

589. The heats of combustion of carbon and carbon monoxide are –393.5 and –283.5 kJ mol^{-1}, respectively. The heat of formation (in kJ) of carbon monoxide per mole is

(a) 676.5 (b) −676.5
(c) –110.5 (d) 110.5

JEE Main-2016

Ans. (c) : Enthalpy change's also occur when a compound is formed from element.

$C + O_2 \rightarrow CO_2,\ \Delta H = -393.5.$ ....(i)

$CO + \frac{1}{2}O_2 \rightarrow CO_2,\ \Delta H = -283.5$ ....(ii)

equation (ii) subtract from equation (i) -

$C + \frac{1}{2}O_2 \rightarrow CO \quad \Delta H = -393.5 - (-283.5) = -110$ kJ

590. For the complete combustion of ethanol,

$$C_2H_5OH(l) + 3O_2(g) \rightarrow 2CO_2(g) + 3H_2O(l)$$

the amount of heat produced as measured in bomb calorimeter is 1364.47 kJmol^{-1} at 25°C. Assuming ideality, the enthalpy of combustion, $\Delta_C H$ for the reaction will be

[R = 8.314 JK^{-1}mol^{-1}]

(a) –1366.95 kJmol^{-1} (b) –1361.95 kJmol^{-1}
(c) –1460.50 kJmol^{-1} (d) –1350.50 kJmol^{-1}

[JEE Main 2014]

Ans. (a) : Given, ΔE = 1364.47 kJmol^{-1}

T = 25°C, R = 8.314 JK^{-1} mol^{-1}

$C_2H_5OH(l) + 3O_2(g) \rightarrow 2CO_2 + 3H_2O\ (l)$

$\Delta n_g = -1 \ \because$ complete combustion

$\because\ \Delta H = \Delta E + P\Delta V = \Delta E + \Delta n_g RT$

@apna_pdf

$$(\because P\Delta V = \Delta n_g RT)$$

$$\Delta H = -1364.47 + \left((-1)\times\frac{8.314}{1000}\times 298\right)$$

$$\Delta H = -1366.95 \text{ kJ mol}^{-1}$$

591. The combustion of benzene (l) gives CO_2(g) and H_2O(l). Given that heat of combustion of benzene at constant volume is –3263.9 kJ mol^{-1} at 25°C; heat of combustion (in kJ mol^{-1}) of benzene at constant pressure will be (R = 8.314 JK^{-1} mol^{-1})

(a) 4152.6 (b) –452.46

(c) 3260 (d) –3267.6

[JEE Main 2018]

Ans. (d) : Given, Heat of constant volume

(ΔU) = –3263.9 kJ mol^{-1}, T = 25 °C = 273 + 25 = 298 K

R = 8.314 JK^{-1} mol^{-1}

$C_6H_6(g) + O_2(g) \rightarrow CO_2(g) + H_2O(l)$

After balancing the equation,

$$C_6H_6(l) + \frac{15}{2}O_2(g) \rightarrow 6CO_2(g) + 3H_2O(l)$$

$$\because \Delta n_g = 6 - 15/2 = -3/2$$

$$\Delta U = -3263.9 \text{kJ/mol}^{-1}$$

We know that,

$$\Delta H = \Delta U + \Delta n_g RT = -3263.9 + (-1.5)\times\frac{8.314}{1000}\times 298$$

$$\Delta H = -3267.6 \text{ kJ/mol}^{-1}$$

592. Enthalpy of sublimation of iodine is 24 cal g^{-1} at 200°C. If specific heat of I_2 (s) and I_2 (vap.) are 0.055 and 0.031 cal g^{-1} K^{-1} respectively, then enthalpy of sublimation of iodine at 250°C in cal g^{-1} is

(a) 2.85 (b) 5.7

(c) 22.8 (d) 11.4

[JEE Main 2019 April Shift-1]

Ans. (c) : $\Delta H_{r,200°C}$ = 24cal/g at 200°C

$$I_2(s) \rightleftharpoons I_2(g)$$

$$\Delta H_{r,T_2} - \Delta H_{r,T_1} = \Delta C_P (T_2 - T_1)$$

$$\Delta H_{r,250} - \Delta H_{r,200} = \Delta C_P (T_2 - T_1)$$

$$\Delta H_{r,250} - 24 = (0.031 - 0.055)\times(250 - 200)$$

$$\Delta H_{r,250} = 24 - 1.2$$

$$\boxed{\Delta H_2 = 22.8 \text{ cal/g}}$$

593. The standard enthalpies of formation of Al_2O_3 and CaO are – 1675 kJ mol^{-1} and –635 kJ mol^{-1} respectively. For the reaction, $3CaO + 2Al \rightarrow 3Ca + Al_2O_3$ the standard reaction enthalpy Δ_rH^o.................kJ. (Round off to the nearest integer).

[JEE Main 2021, 17 March Shift-I]

Ans. 3 CaO + 2Al → 3Ca+Al_2O_3

$$\Delta H_f^0 = \Delta H_{fP}^0 - \Delta H_{fR}^0$$

$$= \Delta H^0_{f(Al_2O_3)} - 3\times\Delta H^0_{f(CaO)}$$

$$= -1675 - 3\times(-635)$$

= 230 kJ

594. Lattice enthalpy and enthalpy of solution of NaCl are 788 kJ mol^{-1} and 4kJ mol^{-1}, respectively. The hydration enthalpy of NaCl is

(a) –780 kJ mol^{-1} (b) 780 kJ mol^{-1}

(c) –784 kJ mol^{-1} (d) 784 kJ mol^{-1}

[JEE Main 2020, 5 Sep Shift-II]

Ans. (c) : NaCl(s) → NaCl(aq)

$\Delta H_{Sol.} = L.E + \Delta H_{hyd}$

$4 = 788 + \Delta H_{hyd}$

$\Delta H_{hyd} = -788 + 4$

$\Delta H_{hyd} = -784$ kJ/mol

595. The standard heat of formation $\left(\Delta_f H^o_{298}\right)$ of ethane (in kJ/mol), if the heat of combustion of ethane, hydrogen and graphite are –1560, –393.5 and –286 kJ/mol, respectively is ....

[JEE Main 2020, 7 Jan Shift-II]

Ans. $C_2H_6(g) + \frac{7}{2}O_2(g) \rightarrow 2CO_2 + 3H_2O$

ΔH = – 1560 kJ/mol....................(i)

$H_2(g) + \frac{1}{2}O_2(g) \rightarrow H_2O(g)$ ....(ii)

ΔH = – 393.5 kJ/mole

$C(s) + O_2(g) \rightarrow CO_2(g)$...................(iii)

ΔH = – 286 kJ/mole

$2C(s) + 3H_2(g) \rightarrow C_2H_6(g)$

ΔH = equation (iii)×2+ equation (ii) × 3 + reverse equation (i)

= –286 × 2 + (–393.5×3) – (–1560)

= –572 –1180.5 + 1560

ΔHC = –192.5 kJ/mole

596. The heat of combustion of ethanol into carbon dioxides and water is –327 kcal at constant pressure. The heat evolved (in cal) at constant volume and 27° C (if all gases behave ideally) is (R = 2 cal mol^{-1} K^{-1}) ....

[JEE Main 2020, 2 Sep Shift-II]

Ans. Given that, $\Delta H(C_2H_5OH) = -327$ kcal.

ΔT = 27°C = 273+27= 300 K, R = 2 cal mol^{-1} K^{-1}

$C_2H_5OH(l) + 3O_2(g) \rightarrow 2CO_2(g) + 3H_2O(l)$

$\Delta n_g = 2 - 3 = -1$

$\because \Delta H = \Delta E + \Delta n_g RT$

ΔH = ΔE – RT

ΔE = ΔH + RT

$$\Delta E = -327 + \frac{2}{1000}\times 300$$

ΔE = – 326.4 Kcal = –326400 cal

597. If enthalpy of atomisation for Br_2(l) is x kJ/mol and bond enthalpy for Br_2 is y kJ/mol, the relation between them

(a) is x <y (b) does not exist

(c) is x > y (d) is x = y

[JEE Main 2020, 9 Jan Shift-II]

@apna_pdf

Ans. (c) :

$$\begin{tikzcd}
\mathrm{Br_2(l)} \arrow[r, "\Delta H_{\text{atmoziation}} = x\,\text{kJ/mol}"] \arrow[d, "\Delta H_{\text{vap.}}"] & \mathrm{2Br(g)} \\
\mathrm{Br_2(g)} \arrow[ur, "\text{Bond enthalpy} = y\,\text{kJ/mol}"'] &
\end{tikzcd}$$

$Br_2(l) \rightarrow 2Br(g) \Rightarrow Br_2(l) \rightarrow 2Br(g)$

$\Delta H = x$ kJ/mol $\quad \Delta H = 2x$ kJ/mol

$Br_2(g) \rightarrow 2Br(g)$

$\Delta H = y$ kJ/mol

$Br_2(l) \rightarrow Br_2(g)$

$\Delta H = (x-y) > 0 \Rightarrow \boxed{x>y}$

598. If the standard molar enthalpy change for combustion of graphite powder is -2.48×10^2kJmol^{-1}, the amount of heat generated on combustion of 1 g of graphite powder is........kJ. (Nearest integer)

[JEE Main 2021, 22 July Shift-II]

Ans. (21):-

ΔH_c of 12 gram (1 mole) graphite $= -2.48 \times 10^2$ kJ

$= -248$

$$\Delta H_c \text{ of 1 gram graphite } = \frac{-248}{12}$$

$\Delta H_c = -20.67$ kJ/g

$\Delta H_c \approx -21$ kJ/g

599. 200 mL of 0.2 M HCl is mixed with 300 mL of 0.1 M NaOH. The molar heat of neutralisation of this reaction is –57.1 kJ. The increase in temperature in °C of the system on mixing is $x \times 10^{-2}$.

The value of x is .... (Nearest integer)

[Given, specific heat of water = 4.18 J g^{-1} K^{-1}

Density of water = 1.00 gcm^{-3}]

(Assume no volume change on mixing)

[JEE Main 2021, 27 Aug Shift-I]

Ans. Millimoles of HCl = 200 × 0.2 = 40

Millimoles of NaOH = 300 × 0.1 = 30

$$\text{Heat released } = \frac{30}{1000} \times 57.1 \times 1000 = 1713\,\text{J}$$

Mass of solution = 500ml × 1g/mL = 500 g

$$\Delta T = \frac{q}{m \times c} = \frac{1713\,\text{J}}{500 \times 4.18} = 0.8196\,\text{K}$$

$$\Delta T = 81.96 \times 10^{-2}\,\text{K} \simeq 82 \times 10^{-2}\,\text{K}$$

600. An ideal gas undergoes isothermal compression from 5m^3 to 1m^3 against a constant external pressure of 4 Nm^{-2}. Heat released in this process is used to increase the temperature of 1 mole of Al. If molar heat capacity of Al is 24J mol^{-1} K^{-1}, the temperature of Al increases by

(a) $\frac{3}{2}$K (b) 1K

(c) 2K (d) $\frac{2}{3}$K

[JEE Main 2019, 10 Jan Shift-II]

Ans. (d) : Work done by Isothermal Irreversible process for ideal gas.

$W = -P_{ext}dV = -P_{ext}(V_2-V_1) = -4(1-5) = 16$ J

For isothermal Process $\Delta U = 0$

q = 16J

$q = nC\Delta T \quad$ [n = 1, C = 24J/mole-K]

$16 = 1 \times 24 \times \Delta T$

$$\Delta T = \frac{16}{24} = \frac{2}{3}\text{ K}$$

601. The internal energy change (in J) when 90 g of water undergoes complete evaporation at 100°C is ....(Given : ΔH_{vap} for water at 373

K = 41kJ/mol, R = 8.314 JK^{-1}mol^{-1})

[JEE Main 2020, 5 Sep Shift-I]

Ans. $H_2O(l) \xrightarrow{\quad} H_2O(g)$

$$90 \text{ gm of } H_2O = \frac{90}{18} \text{ mol of } H_2O = 5 \text{ mol of } H_2O$$

$$\Delta H = \Delta U + \Delta n_g RT$$

$$5 \times 41000 = \Delta U + 1 \times 8.314 \times 373 \times 5$$

$$\Delta U = 189494.39\,\text{J}$$

602. The ionisation enthalpy of Na$^+$ formation from Na(g) is 495.8 kJ mol^{-1}, while the electron gain enthalpy of Br is –325.0 kJmol^{-1}. Given, the lattice enthalpy of NaBr is –728.4 kJmol^{-1}. The energy for the formation of NaBr ionic solid is (–)................$\times 10^{-1}$kJmol^{-1}.

[JEE Main 2021, 25 Feb., Shift-I]

Ans: $Na(s) \rightarrow Na^+(g) + \Delta H = 495.8$

$$\frac{1}{2}Br_2 + e^- \rightarrow Br^- + \Delta H = -325$$

$Na^+(g) + Br(g) \rightarrow NaBr(s) + \Delta H = -728.4$

$$Na(s) + \frac{1}{2}Br_2(l) \rightarrow NaBr(s) = \Delta H = ?$$

$\Delta H = 495.8 - 325 - 728.4$

$= -557.6$ kJ $= -5576 \times 10^{-1}$ kJ

603. Enthalpy of combustion of carbon to CO$_2$ is -393.52 kJ/mol. The heat released upon formation of 11 g of CO$_2$ from carbon and dioxygen is

(a) 35.77 kJ (b) 98.38 kJ

(c) 1574.08 kJ (d) 393.52 kJ

J & K CET-(2012)

Ans. (b) : 1 mol CO_2 = 44 g of CO_2

So, for 44 gm of CO_2

formation energy released is +393.52 kJ

∴ for 11g of CO_2

formation energy released

$$= \frac{393.52}{44} \times 11$$

$$= \frac{196.75}{22} \times 11$$

= 98.38 kJ

@apna_pdf

604. Which one of the following hydrogen halides has the least bond dissociation enthalpy?

(a) HF (b) HBr

(c) HI (d) HC*l*

J & K CET-(2016)

Ans. (c) : The amount of energy required to break a given bond to produce two radical fragments is bond dissociation.

∵ size of Halogen (F, Cl, Br, I)

As the size of halogen increases from F to I, the bond dissociation energy decreases.

605. The standard enthalpies of formation in kJ mol^{-1} for $CO_{2(g)}$' $H_2O_{(l)}$ and $C_2H_5OH_{(l)}$ are –393.5, –286.0 and –278.0 respectively. The standard enthalpy of combustion of $C_2H_5OH_{(l)}$ in kJ mol^{-1} is

(a) –923 (b) +1367

(c) +1923 (d) –1367

J & K CET-(2016)

Ans. (d) :

$C(s)+O_2(g)\rightarrow CO_2(g)$, $\Delta H = -393.5$ kJ mol^{-1}.............(i)

$$H_2(g)+\frac{1}{2}O_2(g)\rightarrow H_2O(l), \Delta H = -286\,\text{kJ mol}^{-1} \text{....(ii)}$$

$$2C(s)+3H_2(g)+\frac{1}{2}O_2(g)\rightarrow C_2H_5OH(l)$$

$\Delta H = -278.0$ kJ mol^{-1}........................(iii)

$C_2H_5OH(l)+3O_2(g)\rightarrow 2CO_2(g)+3H_2O$

$\Delta H = ?$

ΔH combustion = (i) × 2 + 3× (ii) – (iii)

ΔH combustion = 2 × (–393.5) + 3×(–286) – (–298)

= –1367 kJ mol^{-1}

606. The equilibrium constant K_c value for equilibrium at 227°C is 1×10^{10}. If the standard enthalpy change for this is –97.95 KJ mol^{-1}, the standard entropy change in JK^{-1} mol^{-1} for this equilibrium at the same temperature is (R = 8.3 J K^{-1} mol^{-1} and 2.303 ≅ 2.3)

(a) –5 (b) +5

(c) +10 (d) –10

J & K CET-(2016)

Ans. (a) : $\Delta G = -2.303\,RT\log K_c$

$= -2.3 \times 8.3 \times 500 \log(1\times10^{10}) = -95450$ J

Now, $\Delta G = \Delta H - T\Delta S$

$-95450 = -97950 - 500\,\Delta S \Rightarrow \Delta S = -5$ JK^{-1} mol^{-1}

607. What should be the correct order of lattice energy values of the following alkali halides? LiCl, KI, KCl and NaCl

(a) KI > KCl > NaCl < LiCl

(b) NaCl > KCl > LiCl > KI

(c) LiCl > KCl > KI > NaCl

(d) LiCl > NaCl > KCl > KI

J & K CET-(2017)

Ans. (d) : Lattice energy can be defined as the energy required to convert one mole of an ionic solid into gaseous ionic constituents.

Order of Lattice energy,

$\boxed{\text{LiCl > NaCl > KCl > KI}}$

608. What will be the enthalpy of formation of toluene considering the data given?

Bond energies of C – C = 79 kcal, C = C = 135 kcal, C – H = 102 kcal, heat of atomisation Of C = 156.8 kcal and heat of atomisation of H = 49.5 kcal

(a) – 43.4 kcal (b) 43.4 kcal

(c) 114.6 kcal (d) –114.6 kcal

J & K CET-(2017)

Ans. (a) : $7C(g) + 4H_2(g) \rightarrow C_7H_8(g)$

ΔH = Enthalpy of atomisation – Bond energies

= (7 × 156.8 + 8 × 49.5) – (8 × 102 + 4 × 79+3×135)

= – 43.4 kcal

609. What will be the molar entropy change when silver is heated from 227° C to 727°C? Consider the molar specific heat of Ag, $C_p = 5.3 + 0.0028\,T$

(a) 7.873 eu (b) 12.341 eu

(c) 3.214 eu (d) 5.074 eu

J & K CET-(2017)

Ans. (d) : Given,

$T_1 = 227 + 273 = 500$K

$T_2 = 727 + 273 = 1000$ K

n = 1

$C_P = 5.3 + 0.0028$ T

$$\Delta S = \frac{\Delta H}{T} = \frac{nC_P dT}{T} = \frac{(5.3+0.0028T)}{T}dT$$

Integrating both the sides,

$$\int \Delta S = \int_{T_1}^{T_2} \frac{5.3+0.0028T}{T}dT$$

$$= 5.3\int_{T_1}^{T_2}\frac{dT}{T} + 0.0028\int_{T_1}^{T_2} dT$$

$$= 5.3[\ln T]_{T_1}^{T_2} + 0.0028[T]_{T_1}^{T_2}$$

$$= 5.3\times[2.303\log T]_{T_1}^{T_2} + 0.0028[T]_{T_1}^{T_2}$$

Substituting value of T_1 = 1000 and T_2 = 500,

$$\Delta S = 5.3\times2.303[\log1000-\log500]+0.0028[1000-500]$$

$$\Delta S = 5.3\times2.303[3-2.6989]+500\times0.0028$$

$$\Delta S = 3.6752+1.4 = 5.0752\,\text{eu}$$

610. What will be the ΔH° and ΔS° values for the given cell having E° at 20° C and 30° C to be 0.18 V and 0.28 V respectively?

The cell: (Pt) H_2 / H+ || KCl /Hg_2Cl_2 / Hg

(Given: 1 F = 96500 coulombs)

(a) ΔS° = 2017 JK^{-1} and ΔH° = 630.54 kJ

(b) ΔS° = – 4532 JK^{-1} and ΔH° = 768.73 kJ

(c) ΔS° = 3425 JK^{-1} and ΔH° = –530.75 kJ

(d) ΔS° = 1930 JK^{-1} and ΔH° = 530.75 kJ

J & K CET-(2017)

Ans. (d) :

Cathode – $Hg_2Cl_2(s) + 2e^- \rightarrow 2Hg(l) + 2Cl(g)$

Anode – $2H^+ + 2e^- \rightarrow H_2$, n = 2

$\Delta G° = -nFE°$

= –2 × 96500 × 0.18

@apna_pdf

$= -209000 \times 0.18$
$= -39740J$

$$\Delta S^\circ = nF\left(\frac{dE}{dT}\right)$$

$$\frac{dE}{dt} = \frac{\Delta E}{\Delta T}$$

$$= \frac{0.28 - 0.18}{10}$$

$= 0.01 V/K$

Now,

$\Delta S^\circ = 2\times96500\times0.01 = 1930 JK^{-1}$

$\Delta H^\circ = \Delta G^\circ + T\Delta S^\circ$

$\Delta H^\circ = -34740 + 293 \times 1930$

$\Delta H^\circ = 530.75$ kJ

611. What will be the heat change at constant volume for the reaction whose heat change at constant pressure is –560kcal at 27ºC? The reaction is

$C_8H_{16} + 12O_2 \rightarrow 8CO_2 + 8H_2O$

(Given R = 2 cal mol^{-1} K^{-1})

(a) –558200 calories
(b) 442800 calories
(c) –561800 calories
(d) 368240 calories

J & K CET-(2018)

Ans. (a) : Given,

$\Delta H = -560$ kcal, T = 27 + 273 = 300 K

R = 2 cal mol^{-1} K^{-1}

$C_8H_{16}(l) + 12O_2(g) \rightarrow 8CO_2(g) + 8H_2O(l)$

$\Delta n_g = 8 - 12 = -4$

$\Delta H = \Delta E + \Delta n_g RT$

$\Delta E = \Delta H - \Delta n_g RT = -560\times10^3 - (-4\times2\times300)$

$= -560\times10^3 + 2400$

$= -557600$ cal $\simeq -558200$ cal

612. The heat of neutralisation will be highest in

(a) HCl + NaOH
(b) $NH_4OH + H_2SO_4$
(c) $CH_3COOH + NaOH$
(d) $CH_3COOH + NH_4OH$

J & K CET-(2019)

Ans. (a) : Strong acid and strong base has greater heat of neutralization than weak acid or weak base.

613. The standard enthalpy of formation of all elements in their standard state is

(a) zero
(b) unity
(c) Less than zero
(d) more than zero

J & K CET-(2019)

Ans. (a) : The standard enthalpy of formation of a substance is the enthalpy change that occurs when 1 mole of the substance is formed from its constituent elements in their standard states.

Enthalpies of all elements in their standard state are zero.

614. Calculate the enthalpy change for the reaction $C_2H_4(s) + H_2(g) \rightarrow C_2H_6(g)$ using the data given below :

$C_2H_4(g) + 3O_2(g) \rightarrow CO_2(g) + 2H_2O(l)$; $\Delta H = -1415$ kJ

$C_2H_6(g) + \frac{7}{2}O_2(g) \rightarrow 2CO_2(g) + 3H_2O(l)$; $\Delta H = -1566$ kJ

$H_2(g) + \frac{1}{2}O_2(g) \rightarrow H_2O(l)$; $\Delta H = -286$ KJ

(a) –437 kJ
(b) 135 kJ
(c) –135 kJ
(d) none of these

J & K CET-(2013)

Ans. (c) :

equation (i), $\Delta H = -1415$ KJ

equation (ii), $\Delta H = -1566$ KJ

equation (iii), $\Delta H = -286$ KJ

We know, $C_2H_4(g) + H_2(g) \rightarrow C_2H_6(g)$

$\Delta H = ?$

ΔH = Eq. (i) + Eq. (iii) – Eq. (ii)

ΔH Value is = (–1415) + (–286) – (–1566)

= –135 KJ

615. The standard enthalpy of formation of $H_2(g)$ and $Cl_2(g)$ and HCl(g) are 218 kJ/mol, 121.88 kJ/mol and –93.31 kJ/mol respectively. Calculate standard enthalpy change in kJ for

$\frac{1}{2}H_2(g) + \frac{1}{2}Cl_2(g) \rightarrow HCl(g)$

(a) +431.99
(b) –262.14
(c) –431.99
(d) +247.37

J & K CET-(2010)

Ans. (b) :

$$\Delta H = \sum \Delta H_P - \sum \Delta H_R = -93.31 - \left(\frac{218}{2} + \frac{121.88}{2}\right)$$

$$= -93.31 - 169.94 = -263.25 \simeq -262.14 \text{ kJ}$$

616. Changes in a system from an initial state to the final state were made by a different manner that remains ΔH remains same but q changes because

(a) ΔH is a path function and q is a state function
(b) ΔH is a state function and q is a path function
(c) both ΔH and q are state functions
(d) both ΔH and q are path functions.

J & K CET-(2010)

Ans. (b) : Enthalpy change- ΔH is a State function, depends only upon the initial and final states not upon the path followed.

617. The standard enthalpies of formation of A (NH_3), B (CO_2), C (HI) and D (SO_2) are respectively –46.19, –393.4, + 24.94 and –296.9 kJ mol^{-1}.

The increasing order of their stability is

(a) B < D < A < C
(b) C < A < D < B
(c) D < B < C < A
(d) A < C < D < B

J & K CET-(2009)

Ans. (b) : Lower the value of standard enthalpy of formation, higher the stability. The increasing order of standard enthalpies formation of given molecule is

$$\boxed{C < A < D < B}$$

@apna_pdf

618. In which of the following pairs the enthalpy of neutralization is less than or more than the standard value?

(a) HNO_3 and NaOH (b) HCl and NaOH

(c) HCN and NaOH (d) H_2SO_4 and NaOH

J & K CET-(2010)

Ans. (c) : The enthalpy of neutralization of strong base and strong acid always highest. However, if either the weak acid (like HCN) or the weak base some of the energy is utilised to ionise the acid/base.

So, enthalpy of neutralization is less or more then standard value.

619. When 400 mL of 0.2 n solution of a weak acid is neutralized by a dilute aqueous solution of sodium hydroxide under standard conditions, 4.4kJ amount of heat is liberated. Therefore, the standard enthalpy of neutralization of this weak acid in kJ equiv^{-1} is

(a) –11 (b) –44

(c) –55 (d) –22

J & K CET-(2009)

Ans. (c) $\therefore$ Milliequivalents of weak acid = 400 × 0.2

= 80 milliequivalents

Equivalents of the acid = 0.08 equivalent

$\therefore$ Since, heat evolved when 0.08 equivalent of acid is neutralized = 4.4 kJ

$\therefore$ The heat evolved, when 1 equivalent is neutralized, when 1 equivalent is neutralized

$$= \frac{4.4\times 1}{0.08} = 55 \text{ kJ equiv}^{-1}$$

620. Which one of the following is always not negative?

(a) Enthalpy of combustion

(b) Enthalpy of formation

(c) Enthalpy of neutralisation

(d) Lattice enthalpy

J & K CET-(2009)

Ans. (b) :

(a) Enthalpy of Combustion

Combustion is an Energy librating Process So, $\Delta H_C = -Ve$

(b) Enthalpy of formation are

Not Always Negative

$\Delta H_f^0 = +Ve$

(c) Enthalpy of Neutralization this is an Exothermic Process

$\Delta H_n = -Ve$

(d) Lattice Energy

Energy librating Process

$\Delta H = -Ve$

621. Heat of combustion of carbon monoxide at constant volume and at 17^{0}C is – 67,710 calories. The heat of combustion at constant pressure is

(a) –68,000 calories (b) –67,800 calories

(c) 67,050 calories (d) + 68,500 calories

J & K CET-(2007)

Ans. (a) : $CO(g) + \frac{1}{2}O_2(g) \rightarrow CO_2(g)$

$$\Delta n_g = (1) - \left(1 + \frac{1}{2}\right) = -\frac{1}{2}$$

$\Delta H = \Delta E + \Delta n_g RT$

$$\Delta H = -67710 - \frac{1}{2} \times 2 \times 290$$

$= -68000$ cal.

622. In which of the following reactions, the heat liberated is known as "heat of combustion"?

(a) $H^+_{(aq)} + OH^-_{(aq)} \rightarrow H_2O_{(l)} + \text{heat}$

(b) $C(\text{graphite}) + \frac{1}{2}O_{2(g)} \longrightarrow CO(g) + \text{heat}$

(c) $CH_{4(g)} + 2O_{2(g)} \rightarrow CO_{2(g)} + 2H_2O_{(l)} + \text{heat}$

(d) $H_2SO_{4(aq)} + H_2O(l) \rightarrow H_2SO_4(aq) + \text{heat}$

J & K CET-(2006)

Ans. (c) : Amount of Heat Absorbed or evolved when 1 mole substance is completely oxidised are called Heat combustion

$\Delta H_C \rightarrow$ Exothermic Process

$CH_4(g) + 2O_2(g) \rightarrow CO_2(g) + 2H_2O(l) + H$

623. Calculate ΔH (in joules) for C (graphite) → C (diamond), from the following data

$C(\text{graphite}) + O_{2(g)} \rightarrow CO_{2(g)}$; $\Delta H = -393.5$ kJ.

$C(\text{diamond}) + O_{2(g)} \rightarrow CO_{2(g)}$; $\Delta H = -395.5$ kJ.

(a) 1900 (b) -788.9×10^3

(c) 190000 (d) $+788.9\times 10^3$

J & K CET-(2006)

Ans. (a) : According to Hess' law,

$$C_{graphite} + O_2(g) \longrightarrow CO_2, \Delta H = -393.5 \text{ kJ/mol}$$

$$CO_2(g) \longrightarrow C_{diamond} + O_2(g), \Delta H = +395.4 \text{ kJ/mol}$$

$$C_{graphite} \longrightarrow C_{diamond}, \Delta H = -393.5 + 395.4 = 1.9 \text{ kJ/mol}$$

$$= 1900 \text{ J/mol}$$

624. 1 mole of H_2SO_4 is mixed with 2 moles of NaOH. The heat evolved will be

(a) 57.3 kJ (b) 2 × 57.3 kJ

(c) 57.3/2 kJ (d) cannot be predicted

J & K CET-(2004)

Ans. (b) 1 mole of H_2SO_4 completely neutralised by 2 mole of NaOH

As we know,

Gram equivalent = No. of moles x Valency factor

Valency factor of H_2SO_4 = 2

Heat evolved in the neutralization of 1gm eg. of strong acid =57.3 kJ

Heat evolved in neutralization of 2 gm eg. of strong acid = (57.3 × 2) kJ

625. The enthalpy of vapourisation of liquid water using the data

$$H_2(g) + \frac{1}{2}O_{2(g)} \rightarrow H_2O_{(l)}; \Delta H = -285.77 \text{kJ/mole}$$

$$H_2(g) + \frac{1}{2}O_{2(g)} \rightarrow H_2O_{(g)}; \Delta H = -241.84 \text{kJ/mole}$$

@apna_pdf

(a) +43.93 kJ/mol (b) –43.93 kJ/mol
(c) 527.61 kJ/mol (d) –527.61 kJ/mol

J & K CET-(2003)

Ans. (a) :

$$H_2O(l) \rightarrow H_2(g)+\frac{1}{2}O_2(g); \quad \Delta H = 285.77 \text{ kJ}$$

$$H_2(g)+\frac{1}{2}O_2(g) \rightarrow H_2O(g); \quad \Delta H = -241.84 \text{ kJ}$$

H_2O (l) → $H_2O(g)$;

$\Delta H = (285.77–241.84)$ kJ = + 43.93 kJ mol^{-1}

626. Enthalpy of NH_3 is –46 kJ mol^{-1}, ΔH for the reaction: $2NH_{3(g)} \rightarrow N_{2(g)} + 3H_{2(g)}$ is

(a) 46 kJ (b) 92 kJ
(c) –92 kJ (d) –23 kJ

J & K CET-(2002)

Ans. (b) :

$$\frac{1}{2}N_2(g)+\frac{3}{2}H_2(g) \rightarrow NH_3(g)$$

$\Delta H = –46.0$ KJ/mol

Multiply above equation with 2,

$N_2(g) + 3H_2(g) \rightarrow 2NH_3(g)$

$\Delta H = –46.0×2$

$= –92.0$ KJ/mol

Reverse above equation

$2\ NH_3(g) \rightarrow N_2\ (g) + 3H_2\ (g)$

$\Delta H = +92.0$ KJ/mol

The enthalpy change for the reaction,

$2\ NH_3(g) \rightarrow N_2(g) + 3H_2(g)$ is 92.0 KJ mol^{-1}

627. The factor which does not affect the heat of reaction is

(a) physical state of the reactants and products
(b) temperature of the reaction
(c) whether the reaction is carried out in an open vessel or a closed vessel
(d) whether the reaction is carried out directly or indirectly

J & K CET-(2002)

Ans. (d) : Heat of reaction does not depend upon whether the reaction is carried out directly or indirectly, Heat of reaction, the amount of heat that must be added or removed during a chemical reaction in order to keep all of the substances present at the same temperature.

628. The change in heat energy of a chemical reaction at constant temperature and pressure is called

(a) enthalpy (b) free energy
(c) internal energy (d) bond energy

J & K CET-(2000)

Ans. (a) : Enthalpy is the heat change in a chemical reaction at constant temperature and pressure.
Enthalpy is the sum of the internal energy and pressure times volume.
H = E + PV

629. Hess's law is used for the determination of

(a) heat of formation (b) heat of reaction
(c) heat of transition (d) all of these

J & K CET-(2000)

Ans. (d) : Hess's Law for constant Heat summation. The standard enthalpy of a reaction, which takes place in several steps, is the sum of the standard enthalpies of intermediate reactions into which the overall reactions may be divided at the same temperature.

$$\boxed{\Delta H = \Delta H_1 + \Delta H_2 + \Delta H_3}$$

630. If the enthalpy change for the reaction is $2NH_{3(g)} \rightarrow N_{2(g)} + 3H_{2(g)}$ is 92 kJ mol^{-1} the enthalpy of formation of ammonia is

(a) –23.0 kJ mol^{-1} (b) –46 kJ mol^{-1}
(c) –92.0 kJ mol^{-1} (d) 46 kJ mol^{-1}

J & K CET-(2001)

Ans. (b) : Enthalpy of reaction ($\Delta_rH°$) = –92 kJ mol^{-1}

$N_2(g) + H_2(g) \rightarrow 2NH_3(g)$

Hence, Standard enthalpy of NH_3 is equal to the $\frac{1}{2}\Delta_rH°$

$\Delta_rH°$ = 92 kJ mol^{-1}

∵ Standard enthalpy of $NH_3 = \frac{-92}{2} = -46$ kJ mol^{-1}

631. The heat of solution depends upon

(a) nature of solute
(b) nature of solvent
(c) concentration of the solution
(d) all of these

J & K CET-(2001)

Ans. (d) : Heat of solution depend on the following factor.
(a) Nature of solute particle
(b) Nature of solvent
(c) Concentration of the solution

632. The enthalpy of neutralization of NaOH with acetic acid is 55 kJ and with HCl is 57.1 kJ. This happens because

(a) some heat is required for complete ionization of acetic acid
(b) acetic acid is an organic acid
(c) acetic acid is less soluble in water
(d) acetic acid is a weak acid and required lesser alkali

J & K CET-(2001)

Ans. (a): The enthalpy of neutralization of NaOH with CH_3COOH is 55 kJ and with HCL is 57.1 kJ. This is due to that weak acid is not completely dissociated Hence, some of heat is utilized for complete ionization of weak acid. i.e. CH_3COOH

633. Lattice and hydration energies of NaCl are +777.8 kJ mol^{-1} and -774.1 kJ mol^{-1} respectively. Heat of solution of NaCl will be

(a) 1551.9 kJ mol^{-1} (b) –1519 kJ mol^{-1}
(c) –37 kJ mol^{-1} (d) +3.7 kJ mol^{-1}

J & K CET-(1999)

Ans. (d) Heat of solution = Hydration energy + lattice energy

= +777.8 – 774.1 = +3.7 kJ mol^{-1}

@apna_pdf

634. The equation for the complete combustion of propane, C_3H_8 is
$C_3H_{8(g)} + 5O_{2(g)} \rightarrow 3CO_{2(g)} + 4H_2O_{(g)}$
What is the maximum mass of carbon dioxide formed when a mixture of 0.50 mole of propane and 3.0 mole oxygen are ignited?

(a) 22.0 g (b) 29.3 g
(c) 44.0 g (d) 66.0 g

J & K CET-(1997)

Ans. (d) : Solution : -

$$C_3H_8(g) + 5O_2(g) \longrightarrow 3CO_2(g) + 4H_2O(g)$$

1 mole 5 mole 3 mole
44g 160g 132g

$\because$ 1 mole propane gives 132g CO_2
$\therefore$ 0.50 mole propane gives 132 × 0.50 = 66.0g CO_2

635. Equal volumes of molar hydrochloric acid and sulphuric acid are neutralized by dilute NaOH Solution and *x* kcal and y kcal of heat are liberated respectively. Which of the following is true?

(a) $x = y$ (b) $x = \frac{1}{2}y$
(c) $x = 2y$ (d) none of these

J & K CET-(2000, 1997)

Ans. (b) : $HCl + NaOH \rightarrow NaCl + H_2O$
or $H^+ + OH^- \rightarrow H_2O$ $\Delta H_1 = x$
$H_2SO_4 + 2NaOH \rightarrow Na_2SO_4 + 2H_2O$
or
$2H^+ + 2OH^- \rightarrow 2H_2O$ $\Delta H_2 = y$
$H^+ + OH^- \rightarrow H_2O$

$$\Delta H_1 = \frac{1}{2}\ \Delta H_2$$

$$\therefore x = \frac{y}{2}$$

636. The heat of combustion of hydrogen gas at constant pressure and at 23°C is 280 kJ mol^{-1}. The heat of combustion at constant volume and at 23°C will be (R=8.3143 J mol^{-1} K^{-1})

(a) –280 kJ mol^{-1} (b) –283.74 kJ mol^{-1}
(c) –267.69 kJ mol^{-1} (d) –278.76 kJ mol^{-1}

J & K CET-(1998)

Ans. (d) : Solution :-

$$H_2(g) + \frac{1}{2}O_2(g) \longrightarrow H_2O(g)$$

$$\Delta n_{(g)} = 1 - \left(1 + \frac{1}{2}\right)$$

$$\Delta n_{(g)} = -\frac{1}{2}$$

$$\because \Delta H = \Delta E + \Delta n_g RT$$

$$\Delta E = \Delta H - \Delta n_g RT$$

$$\Delta E = -280 - \left(\frac{-1}{2} \times \frac{8.314}{1000} \times 296\right)$$

$$\Delta E = -280 + 1.23$$

$$\Delta E = -278.77\ kJ\,mol^{-1}$$

637. The heat of combustion of cyclohexane at 25°C and constant pressure is 3919.9 kJ mol^{-1}. The reaction is
$C_6H_{12}(l) + 9O_2(g) \rightarrow 6H_2O.\ (l) + 6CO_2\ (g)$, What is the best value of ΔE for this reaction at 25°C and at constant volume?

(a) 3912.45 kJ (b) 3927.33 kJ
(c) 3924.88 kJ (d) –3424.76 kJ

J & K CET-(1997)

Ans. (b) : Given:- $\Delta H = 3919.9$ kJ mol^{-1}

$$\Delta H = \Delta E + \Delta n_g RT \quad ....(i)$$

$$\because \quad \Delta n_g = 6 - 9$$

$$\Delta n_g = -3$$

Form equation (i)

$$3919.9 = \Delta E + \left(-3 \times 8.134 \times 10^{-3} \times 298\right)$$

$$\Delta E = 3919.9 + 3 \times 8.134 \times 10^{-3} \times 298$$

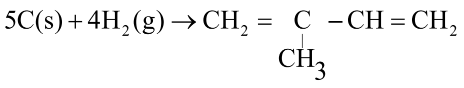
$$\Delta E = 3927.33\,kJ$$

638. Using bond energy data, calculate the heat of formation of isoprene. Given that bond energy of C – H = 98.8 kcal, H – H = 104 kcal, C – C = 83 kcal, C=C = 147 kcal and $C_{(s)} \rightarrow C_{(g)}$ = 171 kcal.

(a) 28.3 kcal (b) 20.6 kcal
(c) 283 kcal (d) 220.6 kcal

J & K CET-(1997)

Ans. (b) :



$$5C(s) + 4H_2(g) \rightarrow CH_2 = \underset{\underset{CH_3}{|}}{C} - CH = CH_2$$

$$5C(s) \longrightarrow 5C(g)$$

Bond energy of 2(C – C) ,Bond energy of 2(C = C)
Bond energy of 8(C – H)Bond energy of 4(H – H)
ΔH = Sum of B.E. of reactants – Sum of B.E. of products

B.E.=5B.E. $_{C(s) \longrightarrow C(g)}$
+4B.E.$_{(H–H)}$ – (2B.E.$_{(C–C)}$+2B.E.$_{(C=C)}$+8B.E.$_{(C–H)}$)
= (5×171+4×104) – (2×83+2×147+8×98.8)
= 1271–1250.4
B.E. = 20.6 kcal

639. The latent heat of vaporization of water is 540 cal g^{-1} at 100ºC. What will be the entropy increase when one mole of water is evaporated at 100ºC?

(a) 28 cal K^{-1} mol^{-1} (b) 26 cal K^{-1} mol^{-1}
(c) 540 cal K^{-1} mol^{-1} (d) 1.82 cal K^{-1} mol^{-1}

JCECE - 2003

Ans. (b): $\Delta G = \Delta H - T\Delta S$
At phase change $\Delta G = 0$
$0 = \Delta H - T\Delta S$
$\Delta H = T\Delta S$

$$\Delta S = \frac{\Delta H}{T} = \frac{540 \times 18}{373}$$

= 26.059 cal/mol K

@apna_pdf

640. $\mathbf{S+\frac{3}{2}O_2 \longrightarrow SO_3\ \Delta H = 2x,}$

$\mathbf{SO_2+\frac{1}{2}O_2 \longrightarrow SO_3\ \Delta H = y,}$

Then heat of formation of SO_2 is :

(a) $2x - y$ (b) $2x + y$

(c) $x + y$ (d) $\frac{2x-y}{2}$

JCECE - 2006

Ans. (a) :

$S + {}^3/_2\, O_2 \rightarrow SO_3 + 2\,x$ kcal..............(i)

$SO_2 + {}^1/_2\, O_2 \rightarrow SO_3 + y$ kcal............(ii)

Subtract eq. (ii) from (i)

$S + O_2 \rightarrow SO_2 + (2x - y)$ kcal

∵ Heat of formation of SO_2 is equal to $(2x–y)$ kcal.

641. The enthalpy of vaporization of substance is 840 J-mol^{-1} and its boiling point is-173°C. Its entropy of vaporization is:

(a) 42 J mol^{-1}K^{-1} (b) 21 J mol^{-1}K^{-1}

(c) 84 J mol^{-1}K^{-1} (d) 8.4 J mol^{-1}K^{-1}

JCECE - 2005

Ans. (d) : $\Delta G = \Delta H - T\Delta S$, at phase change $\Delta G = 0$

$$0 = \Delta H - T\Delta S$$

$$\Delta S = \frac{\Delta H}{T} \quad \because (T = -173 + 273 = 100K)$$

$$\Delta S = \frac{840}{100K} = 8.4\text{mol}^{-1}\ K^{-1}$$

642. Given the following thermochemical equations:

$\mathbf{Zn + \frac{1}{2}\ O_2 \longrightarrow ZnO + 84{,}000\ cal}$

$\mathbf{Hg + \frac{1}{2}\ O_2 \longrightarrow HgO + 21{,}700\ cal}$

Accordingly the heat of reaction for the following reaction Zn + HgO ⟶ Hg + heat is:

(a) 105,700 cal (b) 61,000 cal

(c) 105,000 cal (d) 62,300 cal

JCECE - 2005

Ans. (d) : $Zn + \frac{1}{2}O_2 \rightarrow ZnO + 84000$ cal ....(i)

$Hg + \frac{1}{2}O_2 \rightarrow HgO + 21700$ cal ....(ii)

The reaction 2 is reversed and added to the reaction 1 to obtain the reaction $Zn + HgO \rightarrow ZnO + Hg$

The heat of this reaction is 84000 – 21700 = 62300 cal.

643. The enthalpies of combustion of carbon and carbon monoxide are -393.5 and – 283 kJmol^{-1} respectively. The enthalpy of formation of carbon monoxide per mol is

(a) 110.5 kJ (b) 676.5 kJ

(c) –676.5 kJ (d) –110.5 kJ

JCECE - 2008

Ans. (d) : Combustion of C and CO are given,

C + O_2 → CO2 ; Δ H = – 393.5 kJ (i)

$CO + \frac{1}{2}O_2 \rightarrow CO_2$; Δ H = – 283 kJ (ii)

Subtract equation (ii) from equation (i)

$C + \frac{1}{2}O_2 \rightarrow CO,$

Δ H = –393.5 – (–283) = –110.5 kJ

644. An aqueous solution of 6.3 g of oxalic acid dihydrate is made upto 250 mL. The volume of 0.1 N NaOH required to completely neutralize 10 mL. of this solution is

(a) 40 mL (b) 20 mL

(c) 10 mL (d) 4 mL

JCECE - 2008

Ans. (a) : Given:- $N_2 = 0.1$, $V_1 = 10$

n – factor for H2 C2 O4. 2H2O = 2

$$\text{Normality} = \frac{\text{weight} \times 2 \times 1000}{\text{Molecular weight} \times 250}$$

$$N_1 = \frac{6.3 \times 2000}{126 \times 250} = 0.4$$

$$N_1V_1 = N_2V_2$$

$$V_2 = \frac{N_1V_1}{N_2}$$

$$V_2 = \frac{10 \times 0.4}{0.1}$$

$$V_2 = 40\,\text{mL}$$

645. If at 298 K the bond energies of C—H, C—C, C=C and H—H bonds are respectively 414, 347, 615 and 435 kJ mol^{-1}, the value of enthalpy change for the reaction $\mathbf{H_2C{=}CH_2(g)+H_2(g)\rightarrow H_3C{-}CH_3(g)}$ at 298 K will be

(a) +250 kJ (b) –250 kJ

(c) +125 kJ (d) –125 kJ

JCECE - 2008

Ans. (d) : $H_2C = CH_2 + H_2 \rightarrow H_3C - CH_3$

The value of enthalpy change for the reaction = ΔH

So, ΔH = Sum of B.E. of reactants – Sum of B.E. of products

ΔH = B.E. of (C = C) + 4B.E. of (C – H) + B.E. of (H – H) – B.E. of (C – C) – 6B.E. of (C – H)

ΔH = 615 + 4 × 414 + 435 – 347 – 6 × 414

ΔH = 1050 – 347 – 828

ΔH = 703 – 828

ΔH = −125 kJ

646. The heat of neutralisation is highest for the reaction between

(a) NH_4OH — CH_3COOH

(b) HNO_3 — NH_4OH

(c) NaOH — CH_3COOH

(d) HCl — NaOH

JCECE - 2010

@apna_pdf

Ans. (d) : Heat of neutralisation of strong acid by strong base is always greater than the heat of neutralisation of weak acid or weak base because some energy is used to ionise weak acid or weak base.

(a) $NH_4OH — CH_3COOH$
weak base — weak acid

(b) $HNO_3 — NH_4OH$
strong acid — weak base

(c) $NaOH — CH_3COOH$
strong base — weak acid

(d) $HCl — NaOH$
strong acid — strong base

$\because$ HCl is a strong acid and NaOH is a strong base.

$\therefore$ Their heat of neutralisation will be highest among the given.

647. In the combustion of 2.0 g of methane, 25 kcal heat is liberated. Heat of combustion of methane would be

(a) 150 kcal (b) 200 kcal
(c) 250 kcal (d) 350 kcal

JCECE - 2011

Ans. (b) : When 2.0 g $\left(\text{or}\frac{2}{16}\text{mol}\right)$ methane is burnt, heat evolved = 25 kcal.

$\therefore$ When 1 mol methane is burnt, heat evolved will be

$$=\frac{25}{(2/16)}=\frac{25\times16}{2}=200\,\text{kcal}$$

648. Heat of neutralisation of HF (a weak acid) with strong base is –16.4 kcal. Calculate heat of ionisation of HF in water.

(a) – 13.7 kcal (b) – 2.7 kcal
(c) + 30.1 kcal (d) + 3.01 kcal

JCECE - 2013

Ans. (b) :

$HF + OH^- \longrightarrow H_2O + F^-$; $\Delta H = -16.4$ kcal ——— (i)

$H^+ + OH^- \longrightarrow H_2O$; $\Delta H = -13.7$ kcal ——— (ii)

Subtracting the equation (i) & (ii)

the required equation (ionization of HF in water)

$HF \longrightarrow H^+ + F^-$; $\Delta H = -2.7$ kcal

649. For the reaction,
$C_3H_8(g) + 5O_2(g) \rightarrow 3CO_2(g) + 4H_2O(l)$ at constant temperature, $\Delta H - \Delta E$ is

(a) + 3RT (b) – RT
(c) + RT (d) – 3RT

JCECE - 2013

Ans. (d) : For the given reaction, $\Delta n_g = n_p - n_r = 3 - 6 = -3$

$\Delta H = \Delta E + \Delta n_g RT$

$\Delta H - \Delta E = \Delta n_g RT$

$\Delta H - \Delta E = -3RT$

650. Which of the reactions defines ΔH_f^o ?

(a) $C_{diamond} + O_2(g) \rightarrow CO_2(g)$

(b) $\frac{1}{2}H_2(g) + \frac{1}{2}F_2(g) \rightarrow HF(g)$

(c) $N_2(g) + 3H_2(g) \rightarrow 2NH_3(g)$

(d) $CO(g) + \frac{1}{2}O_2(g) \rightarrow CO_2(g)$

JCECE - 2014

Ans. (b) : ΔH_f^o, standard heat of formation, is the amount of heat evolved or absorbed when one gram mole of a substance is formed from its constituent elements.

For standard state, temperature is 25ºC or 298 K and the pressure of gaseous substance is 1 atm. Therefore, in given thermochemical equation, formation of HF represents the standard heat of formation of HF.

651. The bond dissociation energies of gaseous H_2, Cl_2 and HCl are 104, 58 and 103 kcal respectively. The enthalpy of formation of HCl gas would be

(a) –44 kcal (b) 44 kcal
(c) – 22 kcal (d) 22 kcal

JCECE - 2014

Ans. (c) : $\frac{1}{2}H_2 + \frac{1}{2}Cl_2 \longrightarrow HCl$

$\Delta H = \sum$BE of reactants – $\sum$BE of products

$$=\left[\frac{1}{2}\text{BE of}(H_2)+\frac{1}{2}\text{BE of}(Cl_2)\right]-\text{BE of}(HCl)$$

$$=\left[\left(\frac{1}{2}\times104\right)+\left(\frac{1}{2}\times58\right)\right]-103$$

$= (52 + 29) - 103$

$= -22$ kcal

652. Standard enthalpy and standard entropy change for the oxidation of NH_3 at 298 K are -382.64kJmol^{-1} and -145.6 J mol^{-1} respectively. Standard Gibbs energy change for the same reaction at 298 K is

(a) + 339.3 kJ mol^{-1} (b) – 439.3 kJ mol^{-1}
(c) – 339.3 kJ mol^{-1} (d) – 393.3 kJ mol^{-1}

JCECE - 2014

Ans. (d) : $\Delta G^o = \Delta H^o - T\Delta S^o$

$= -382.64 - 298 \times (-145.6 \times 10^{-3})$

$= -339.3\text{ kJ mol}^{-1}$

653. The heat of neutralisation of a strong acid and a strong alkali is 57.0 kJ mol^{-1}. The heat released when 0.5 mole of HNO_3 solution is mixed with 0.2 mole of KOH is

(a) 57.0 kJ (b) 11.4 kJ
(c) 28.5 kJ (d) 34.9 kJ

JCECE - 2015

Ans. (b) : 0.2 mole of KOH will neutralise 0.2 mole of HNO_3. Thus, heat evolved = 57 × 0.2 = 11.4 kJ

654. For the gaseous reaction involving complete combustion of isobutane (assuming all products and reactants are in gaseous state). The relation between ΔH and ΔE will be

(a) $\Delta H > \Delta E$ (b) $\Delta H = \Delta E$
(c) $\Delta H < \Delta E$ (d) $\Delta H = 0$ and $\Delta E = \infty$

JCECE - 2016

@apna_pdf

Ans. (a) : Combustion of isobutane will be as follows:

$$C_4H_{10}(g)+\frac{13}{2}O_2(g)\longrightarrow 4CO_2(g)+5H_2O(g)$$

$\because$ $\Delta H = \Delta E + \Delta nRT$

Where, Δn = no. of gaseous moles (products) – no. of gaseous mole (reactant)

$$\Delta n=(4+5)-\left(1+\frac{13}{2}\right)$$

$$\Delta n=+\frac{3}{2}(+ve)$$

Since, Δn is +ve

ΔH must be greater than ΔE.

$\therefore$ $\Delta H > \Delta E$

655. Given, $S+\frac{3}{2}O_2 \rightarrow SO_3 + 2x$ kcal

$$SO_2+\frac{1}{2}O_2 \rightarrow SO_3 + y \text{ kcal}$$

with the help of above reactions, find out the heat of formation of SO_2.

(a) (2x – y)
(b) (x + y)
(c) (2x + y)
(d) (2x / y)

JCECE - 2016

Ans. (a) : Our required equation will be

$S + O_2 \rightarrow SO_2$

Given, $S+\frac{3}{2}SO_2 \rightarrow SO_3 + 2x$ kcal ...(i)

$SO_2 + \frac{1}{2}O_2 \rightarrow SO_3 + y$ kcal ...(ii)

So, to get the required equation, we will subtract Eq. (ii) from Eq. (i), thus we get,

$S + O_2 \rightarrow SO_2 + (2x – y)$ kcal.

$\therefore$ (2x – y) is heat of formation of SO_2.

656. The energy released when 6 moles of octane is burnt in air will be [Given, ΔHf for $CO_2(g)$, $H_2O(g)$ and $C_8H_{18}(l)$, respectively are –490, –240 and + 160 J/mol]

(a) –37.4 kJ
(b) –20 kJ
(c) – 6.2 kJ
(d) – 35.5 kJ

JIPMER-2017

Ans. (a) : $\because$ According to Hess's Law,

$C + O_2 = CO_2,\ \Delta H = -490$ (i)

$H_2 + \frac{1}{2}O_2 = H_2O, \Delta H = -240$ (ii)

$8C + 9H_2 = C_8H_{18}, \Delta H = +160$ (iii)

By applying 8 × eqn. (i) + 9 × eqn. (ii) – eqn. (iii)

$$2\,C_8H_{18} + \frac{25}{2}O_2 = 8CO_2 + 9\,H_2O$$

So, $\Delta H = 8 \times (-490) + 9 \times (-240) - 160$

$\Delta H = -3920 - 2160 - 160$

$\Delta H = -6240\ Jmol^{-1}$

Hence, energy released when 6 moles of octane is burnt in air = 6 × – 6240 = – 37440 J

$\Delta H_R = -37.4$ kJ

657. Combustion of glucose takes place according to the equation,

$C_6H_{12}O_6 + 6O_2 \longrightarrow 6CO_2 + 6H_2O$, $\Delta H = -72$ k – cal

The energy required for combustion of 1.6 g of glucose is

(a) 0.064 k-cal
(b) 0.64 k-cal
(c) 6.4 k-cal
(d) 64 k-cal

JIPMER-2017

Ans. (b) : $6CO_2 + 6H_2O + 72\ Cal \rightarrow C_6H_{12}O_6 + 6O_2$

For production of 180 gm of glucose, heat energy is 72 kcal.

Number of moles of glucose

$$=\frac{1.6}{180}$$

So, required heat for 1.6 gm of glucose

$$=\frac{72}{180}\times 1.6 = 0.64\ \text{kcal}$$

658. When the heat of reaction at constant pressure is -2.5×10^3 cal and entropy change is 7.4 cal deg^{-1} at 25° C, the reaction is predicted as

(a) reversible
(b) spontaneous
(c) non-spontaneous
(d) irreversible

JIPMER-2017

Ans. (b) : $\Delta H = -2.5 \times 10^3$ cal

$\Delta S = 7.4$ cal deg^{-1}

$\therefore \Delta G = \Delta H - T\Delta S = -2.5\times 10^3 - 298 \times 7.4$

$\Delta G = -2.5\times 10^3 - 2205.2$

$\Delta G = -4705.2$ cal.

$\because \Delta G$ is negative so the reaction is spontaneous.

659. 0.001 mole of $[Co(NH_3)_5\ (NO_3)(SO_4)]$ was passed through a cation exchanger and the acid coming out of it required 20mL of 0.1 M NaOH for neutralization. Thus, the complex is

(a) $[Co(NH_3)_5(NO_3)]SO_4$
(b) $[Co(NH_3)_5(SO_4)]NO_3$
(c) $[Co(NH_3)_5]\ NO_3.SO_4$
(d) None of the above

JIPMER-2015

Ans. (a) : n_{eq} of complex = n_{eq} of acid released from cation exchanger = n_{eq} of NaOH.

$\therefore 0.001 \times n = 20 \times 10^{-3} \times 0.1$

$n = 2$

$\therefore$ the complex is $[Co\,(NH_3)_5\,(NO_3)]\,SO_4$

660. What would be the heat released when an aqueous solution containing 0.5 mole of HNO_3 is mixed with 0.3 mole of OH^-?

(enthalpy of neutralization is –57.1kJ)

(a) 28.5 kJ
(b) 17.1 kJ
(c) 45.7 kJ
(d) 1.7 kJ

JIPMER-2015

@apna_pdf

Ans. (b) : The enthalpy of neutralization is
–57.1 KJ/mol
0.3 mole of HNO_3 will react with 0.3 mol of OH^-
The heat released would be
0.3 mol × –57.1 kJ/mol = 17.1 kJ

661. The standard enthalpies of formation of A (NH_3),B(CO_2),C(HI) and D $(SO)_2$ are –46.19, –393.4, + 24.94 and –296.9 kJ mol^{-1} respectively. The increasing order of their stability is.

(a) B< D< A< C (b) C<A<D<B
(c) D<B<C<A (d) A<C<D<B

JIPMER-2014

Ans. (a) : Lower the value of standard enthalpy of formation, higher the stability. The increasing order of stability is given as,

$$\boxed{B< D< A< C}$$

662. The heat of formation of CO(g) and CO_2 (g) are ΔH = – 110 and ΔH = – 393 kJ mol^{-1} respectively. What is the heat of reaction (ΔH) $\left(\text{in kJ mol}^{-1}\right)$ for the following reaction?

$$CO(g)+\frac{1}{2}O_2(g)\longrightarrow CO_2(g)$$

(a) – 504 (b) – 142.5
(c) – 283 (d) 504

JIPMER-2009

Ans. (c) : According to Hess's law,

$$C+\frac{1}{2}O_2 \rightarrow CO, \Delta H = -110\,kJmol^{-1} \quad (i)$$

$$C + O_2 \rightarrow CO_2,\ \Delta H = -393\ kJmol^{-1} \quad (ii)$$

On subtracting Eq. (i) from Eq. (ii), we get

$$CO+\frac{1}{2}O_2 \rightarrow CO_2$$

$$\Delta H = -393-(-110)$$

$$\Delta H = -393+110$$

$$\boxed{\Delta H = -283\ \mathbf{k}J\ mol^{-1}}$$

663. The absolute enthalpy of neutralization of the reaction

$MgO(s)$ + $2HCl(aq)$ $\longrightarrow$ $MgCl_2(aq)$ + $H_2O(l)$ will be

(a) less than – 57.33kJ mol^{-1}
(b) – 57.33kJ mol^{-1}
(c) greater than – 57.33kJ mol^{-1}
(d) 57.33 kJ mol^{-1}

JIPMER-2007
NEET -2005

Ans. (a) : Heat of neutralization of strong acid and strong base is -57. 33 kJ. MgO is weak base while HCl is strong acid. So, the heat of neutralization of MgO and HCl is lower to – 57.33kJ because MgO requires some heat in ionisation, then net released amount of heat is decreased.

664. The enthalpy of combustion at 25°C of H_2, cyclohexane (C_6H_{12}) and cyclohexene (C_6H_{10}) are –241, –3920 and –3800 kJ/mol respectively. The heat of hydrogenation of cyclohexene is:

(a) –121kJ/mol (b) +121KJ/mol
(c) –242kJ/mol (d) +242kJ/mol

JIPMER-2006

Ans. (a) :

$$(1)\ H_2+\frac{1}{2}O_2 \rightarrow 2H_2O \quad \Delta H = -241\,kJ$$

$$(2)\ C_6H_{10}+\frac{17}{2}O_2 \rightarrow 6CO_2+5H_2O \quad \Delta H = -3800kJ$$

$$(3) C_6H_{12}+9O_2 \rightarrow 6CO_2+6H_2O \quad \Delta H = -3920kJ$$

By adding (1) , (2) and subtracting (3) we get,

$$C_6H_{10}+H_2 \rightarrow C_6H_{12}$$

So,

$$C_6H_{10}+H_2 \rightarrow C_6H_{12}$$

$$\Delta H = -241-3800+3920$$

$$\Delta H = -121\,kJ$$

665. $C_{(dia)} + O_2 \rightarrow CO_2$; ΔH = – 395.4 kJ/mole
$C_{(gr)} + O_2 \rightarrow CO_2$; ΔH = – 393.5 kJ/mole
$C_{(gr)} \rightarrow C_{(dia)}$; ΔH = ?

(a) –3.8 (b) –1.9
(c) +3.8 (d) +1.9

JIPMER-2005

Ans. (d) :
C (diamond) + O_2(g) → CO_2, Δ H = –395.4kJ/mol
C (graphites) + O_2(g) → CO_2, Δ H = –393.5 kJ/mol
On subtracting e.q. (i) by e.q. (ii) we get,
C (diamond) → C (graphite)
Δ H = −395.4 –(–393.5) = +1.9 kJ

666. For the formation of Cr_2O_3 and Al_2O_3, values of Δ_fG^o are –540 kJ mol^{-1} and –827 kJ mol^{-1} respectively. What will be the possibility for reaction of Cr_2O_3 by Al?

(a) Reduction of Cr_2O_3 by Al will take place
(b) Oxidation of Cr_2O_3 by Al will take place
(c) Neither oxidation nor reduction will take place
(d) Reaction is not feasible

JIPMER-2016

Ans. (a) :

$$2\,Cr+\frac{3}{2}O_2 \rightarrow Cr_2\,O_3\ ;\ \boldsymbol{\Delta}_f\ G^o = -540\ \mathbf{k}J\ mol^{-1} \quad (i)$$

$$2\,Al+\frac{3}{2}O_2 \rightarrow Al_2\,O_3\ ;\ \boldsymbol{\Delta}_f\ G^o = -827\ \mathbf{k}J\ mol^{-1} \quad (ii)$$

Subtracting equation (i) from (ii)

$$2Al + Cr_2O_3 \rightarrow Al_2O_3 + 2Cr$$

$$\boldsymbol{\Delta}_fG = [-827]-(-540)\ kJ\ mol^{-1}$$

$$\boldsymbol{\Delta}_fG = -287\ kJ\ mol^{-1}$$

667 In the reaction, $S+\frac{3}{2}O_2 \longrightarrow SO_3+2x\,kJ$ **and**

$$SO_2+\frac{1}{2}O_2 \longrightarrow SO_3+y\,kJ\ .$$

Heat of formation of SO_2 is

@apna_pdf

(a) x + y (b) x – y
(c) 2x – y (d) 2x + y

Karnataka-CET-2015
Kerala-CEE-2008

Ans. (c) : $S+\frac{3}{2}O_2 \rightarrow SO_3, \Delta H = -2x$ kcal (i)

$SO_2+\frac{1}{2}O_2 \rightarrow SO_3, \Delta H = -y$ kcal (ii)

Now Subtract eq. (i) from (ii), we get
Heat of formation of SO_2= (2x –y) kcal.

668. The ratio of heats liberated at 298 K from the combustion of one kg of coke and by burning water gas obtained from kg of coke is (Assume code to be 100% carbon). (Given : enthalpies of combustion of CO_2, CO and H_2 as 393.5 kJ, 285 kJ, 285 kJ respectively all at 298 K)

(a) 0.79 : 1 (b) 0.69 : 1
(c) 0.86 : 1 (d) 0.96 : 1

Karnataka-CET-2014

Ans. (b) : Given, $\Delta H_{CO_2} = 393.5$ kJ,

$\Delta H_{CO} = 285$ kJ

$\Delta H_{H_2} = 285$ kJ

The ratio of heats liberated $= \frac{\Delta H_{CO_2}}{\Delta Hco + \Delta H_{H_2}}$

$= \frac{393.5\,kJ}{285\,kJ + 285\,kJ} = \frac{0.69}{1}$

669. Given thermochemical equation,
$2H_2(g) + O_2(g) \rightarrow 2H_2O(l); \Delta H = -571.6$ kJ. Heat of decomposition of water is

(a) –571.6 kJ (b) + 571.6 kJ
(c) – 1143.2 kJ (d) + 285.8 kJ

Karnataka-CET-2013

Ans. (d) : $2H_2(g) + O_2(g) \rightarrow 2H_2O, \Delta H = -571.6$kJ

at $H_2O(l) \rightarrow H_2(g) + \frac{1}{2}O_2(g)$

$\therefore \Delta H = ?$

If reaction (i) is reversed and divided by 2, the sign ΔH change i.e.

$= +\frac{571.6}{2} = 285.8$ kJ

670. The amount of heat evolved when 500 cm^3 of 0.1 M HCl is mixed with 200 cm^3 of 0.2 M NaOH is

(a) 2.292 kJ (b) 1.292 kJ
(c) 0.292 kJ (d) 3.392 kJ

KARNATAKA-CET, 2010, 2011

Ans. (a) : $HCl + NaOH \rightarrow NaCl + H_2O$

Initial moles $\frac{500\times0.1}{1000}$ $\frac{200\times0.2}{1000}$ 0 0
= 0.05 = 0.04
Final moles
0.05 – 0.04 0 0.04 0.04
= 0.01

$\because$ For neutralisation of 1 mole of NaOH by 1 mole HCl, heat evolved = 57.3 kJ
$\therefore$ To neutralise 0.04 mole of NaOH by 0.04 mole of HCl,
heat evolved will be = 57.3 × 0.04 kJ
= 2.292 kJ

671. Enthalpy of vaporization of benzene is +35.3 kJ mol^{-1} at its boiling point, 80°C. The entropy change in the transition of the benzene in [JK^{-1} mol^{-1}] is

(a) – 441 (b) – 100
(c) + 441 (d) + 100

KARNATAKA-CET, 2010

Ans. (d) : Entropy change in the transition of the vapour to liquid

$$\Delta S_{cond} = \frac{\Delta H_{cond}}{T_b}$$

$$= \frac{35.3\times10^3\,J\,mol^{-1}}{(80+273)K}$$

$= 100\ JK^{-1}\ mol^{-1}$

672. The enthalpy of formation of NH_3 is – 46 kJ mol^{-1}. The enthalpy change for the reaction
$2NH_3(g) \rightarrow N_2(g) + 3H_2(g)$ is

(a) +184 kJ (b) + 23 kJ
(c) +92 kJ (d) + 46 kJ

KARNATAKA-CET, 2009

Ans. (c) : $2NH_3(g) \longrightarrow N_2(g) + 3H_2(g)$

$\Delta H_r = -(2 \times$ enthalpy of formation of $NH_3)$
$= -(2 \times -46) = 92$ kJ

673. When 0.2 g of 1-butanol was burnt in a suitable apparatus, the heat evolved was sufficient to raise the temperature of 200 g water by 5°C. The enthalpy of combustion of 1 butanol in kcal mol^{-1} will be

(a) +37 (b) +370
(c) -370 (d) -740
(e) -14.8

Kerala-CEE-2009

Ans. (b) : Molar mass of $C_4H_{10}O = 74\ gmol^{-1}$
Heat required to raise the temperature of 200 gm of water by 5°C.

$= m \times s \times \Delta t$
$= 200 \times 1 \times 5$
$= 1$ kcal

$\because$ 0.2 gm of 1-butanol liberates 1 kcal of heat.

So, enthalpy of combustion $= 1\times\frac{74}{0.2}$

$= 370$ kcal mol^{-1}

$\Delta H = +370$ kcal mol^{-1}

Since, the heat is liberated , $\Delta H = -370$ KCal

674. What would be the heat released when an aqueous solution containing 0.5 mole of HNO_3 is mixed with 0.3 mole of OH^- (enthalpy of neutralization is –57.1 kJ)?

@apna_pdf

(a) 28.5 kJ (b) 17.1 kJ
(c) 45.7 kJ (d) 1.7 kJ
(e) 2.85 kJ

Kerala-CEE-2005

Ans. (b) : $H^+(aq) + OH^-(aq) \rightarrow H_2O(l)$

$\Delta H = -57.1$ kJ

0.5 mol of $HNO_3 \longrightarrow [H^+] = 0.5$ mol

$[OH^-] = 0.3$ mol

1 mol of H^+ & $OH^- \longrightarrow$ energy release = 57.1 kJ

0.3 mol of H^+ & $OH^- \longrightarrow$ energy released

$= 57.1 \times 0.3$ kJ

$= 17.13$ kJ

675. The enthalpy change for the transition of liquid water to steam is 40.8 kJ mol^{-1} at 373 K. What is the entropy of vaporization of water?

(a) 209.4 (b) 109.4
(c) –109.4 (d) –209.4
(e) 250.4

Kerala-CEE-2004

Ans. (b) $H_2O\ (l) \rightarrow H_2O\ (g)$

$\Delta G = \Delta H - T\Delta S$

We know that, $\Delta S_{vapour} = \dfrac{\Delta H_{vapour}}{T}$

$\Delta H_{vapour} = 40.8$ kJ mol^{-1}

$= 40.8 \times 1000$ J mol^{-1}

T = 373 K

Thus, $\Delta S_{vapour} = \dfrac{40.8 \times 1000}{373} = 109.38 JK^{-1}mol^{-1}$

676. Molar heat capacity of aluminium is 25 JK^{-1} mol^{-1}. The heat necessary to raise the temperature of 54 g of aluminium (atomic mass 27 g mol^{-1}) from 30°C to 50°C is

(a) 1.5 kJ (b) 0.5 kJ
(c) 1.0 kJ (d) 2.5 kJ
(e) 2.0 kJ

Kerala-CEE-2011

Ans. (c) : ∵ Molar heat capacity is.

$$nC = \frac{Q}{T_2 - T_1}$$

$$Q = nC\ (T_2 - T_1)$$

$$Q = \frac{54}{27} \times 25 \times (50 - 30)$$

$$Q = 2 \times 25 \times 20$$

$$Q = 1000g \Rightarrow 1.0\ kJ$$

677. The standard enthalpies of combustion of $C_6H_6(l)$, $C_{(graphite)}$ and $H_2(g)$ are respectively –3270 kJ mol^{-1}, –394 kJ mol^{-1} and –286 kJ mol^{-1}. What is the standard enthalpy of formation of $C_6H_6(l)$ in kJ mol^{-1}?

(a) – 48 (b) + 48
(c) – 480 (d) + 480
(e) – 72

Kerala-CEE-2012

Ans. (b) :

(a) $C_6H_6 + \frac{15}{2}O_2 \rightarrow 6CO_2 + 3H_2O;\ \Delta H = -3270\,kJ\,mol^{-1}$

(b) $C_{(graphite)} + O_2 \rightarrow CO_2;\ \ \Delta H = -394\,kJ\,mol^{-1}$

(c) $H_2 + \frac{1}{2}O_2 \rightarrow H_2O;\ \ \Delta H = -286\,kJ\,mol^{-1}$

Now, Multiplication of (b) by 6 and (c) by 3, gives

(d) $6C(s) + 6O_2 \rightarrow 6CO_2;\ \ \Delta H = -394 \times 6 = -2364 kJ\,mol^{-1}$

(e) $3H_2 + \frac{3}{2}O_2 \rightarrow 3H_2O;\ \ \Delta H = -286 \times 3 = -858 kJ\,mol^{-1}$

On inverting (a) we get

(f) $6CO_2 + 3H_2O \rightarrow C_6H_6 + \frac{15}{2}O_2;\ \ \Delta H = +3270\,kJ\,mol^{-1}$

by adding (f), (e) and (d) we get :-

$6C + 3H_2 \rightarrow C_6H_6;\ \Delta H = 3270 + (-2364 - 858)$

$\Delta H = +48$ kJ mol^{-1}

678. The entropy of vaporization of a liquid is 58 JK^{-1} mol^{-1}. If 100 g of its vapour condenses at its boiling point of 123° C, the value of entropy change for the process is

(a) – 100 JK^{-1} (b) 100 JK^{-1}
(c) – 123 JK^{-1} (d) 123 JK^{-1}
(e) 1230 JK^{-1}

Kerala-CEE-2014

Ans. (a) : ∵ Entropy change when 1 mole of the liquid vapourises = 58 JK^{-1}

∴ Entropy change when 1 mole of the liquid condense = – 58JK^{-1}

Moles of the liquid used in the change = 1.724 mol.

∴ Entropy change when 1.724 moles (for 100 g) of the liquid condenses, $\Delta S = \dfrac{-58 \times 1.724}{1} = -100 JK^{-1}$

679. The lattice energy of NaCl is 788 kJ mol^{-1} This means that 788 kJ of energy is required

(a) To separate one mole of solid NaCl into one mole of Na (g) and one mole of Cl (g) to infinite distance
(b) To separate one mole of solid NaCl into one mole of Na^+ (g) and one mole of Cl^- (g) to infinite distance
(c) To convert one mole of solid NaCl into one mole of gaseous NaCl
(d) To convert one mole of gaseous NaCl into one mole of solid NaCl
(e) To separate one mole of gaseous NaCl into one mole of Na^+ (g) and one mole of Cl^- (g) to infinite distance

Kerala-CEE-2014

Ans. (b) : Lattice energy– Lattice energy is that amount of energy which is required to separate one mole of a solid into its constituents gaseous ions at infinite distances.

Since the lattice energy of NaCl is 788 kJ /mol. It means that 788 kJ of energy is required to separate one mole of solid NaCl into one mole of Na^+ (g) and one mole of Cl^- (g) to infinite distance.

@apna_pdf

680. The enthalpy of combustion of glucose (mol. wt. : 180 g mol^{-1}) is - 2840 kJ mol^{-1}. Then the amount of heat evolved when 0.9 g of glucose is burnt, will be

(a) 14.2 kJ (b) 142 kJ
(c) 28.4 kJ (d) 1420 kJ
(e) 142 kJ

Kerala-CEE-2015

Ans. (a) : Solution:-

The enthalpy of combustion of glucose = -2840 kJ/mole

180g glucose gives enthalpy of combustion = 2840 kJ/mol

1g glucose gives enthalpy of combustion = $\frac{2840}{180}$

So, 0.9g glucose gives enthalpy of combustion

$$= \frac{2840}{180} \times 0.9 = \frac{2840 \times 9}{1800}$$

$$= \frac{2840}{200} = 14.2 \text{kJ}$$

681. The standard enthalpy of formation of H_2O (l) and $Fe_2O_3(s)$ are respectively -286kJ mol^{-1} and – 824 kJ mol^{-1}. What is the standard enthalpy change for the following reaction?

$Fe_2O_3(s) + 3H_2(g) \longrightarrow 3H_2O(l) + 2Fe(s)$

(a) -538 kJ mol^{-1} (b) +538 kJ mol^{-1}
(c) -102 kJ mol^{-1} (d) +34 kJ mol^{-1}
(e) -34 kJ mol^{-1}

Kerala-CEE-2016

Ans. (e) : H_R (Heat of reaction) = ΣH_f^0 (Product)– ΣH_f^0 (reactant)

$H_R = -(3 \times 286) - (-824)$
$H_R = -858 + 824$

$\because$ H_f^0 for H_2 and Fe = 0

$\therefore$ $H_R = -34$ kJ/mol

682. The standard heat of formation of CH_4, CO_2 and H_2O (l) are –76.2, –394.8 and –285.82 kJ mol^{-1}, respectively. Heat of vaporization of water is 44 kJ mol^{-1}. Calculate the amount of heat evolved when 22.4 L of CH_4, kept under normal conditions, is oxidized into its gaseous products.

(a) 802 kJ (b) 878.4 kJ
(c) 702 kJ (d) 788.4 kJ
(e) 500 kJ

Kerala-CEE-2019

Ans. (a) : $C + 2H_2 \rightarrow CH_4$,

$\Delta_f H^o = -76.2$ kJ/mol — (1)

$C + O_2 \rightarrow CO_2$,

$\Delta_f H^o = -394.8$ kJ/mol —— (2)

$H_2 + 1/2O_2 \rightarrow H_2O$,

$\Delta_f H^o = -285.82$ kJ/mol —— (3)

H_2O (l) $\rightarrow H_2O$(g) ,

$\Delta_v H^o = 44$ kJ/mol —— (4)

Given that,

$CH_4(g) + 2O_2(g) \rightarrow CO_2 + 2H_2O(g)$
$\Delta H^o = 76.2 - 2 \times 285.82 - 394.8 + 2 \times 44$
$\Delta H^o = -802.24$ kJ/mol.

Thus, heat evolved when 22.4 lit (1 mole of CH_4) is oxidized into its gaseous product is 802.24kJ.

683. The standard enthalpies of formation of $H_2O(l)$ and $CO_2(g)$ are respectively –286 kJ mol^{-1} and –394 kJ mol^{-1}. If the standard heat of combustion of $CH_4(g)$ is –891 kJ mol^{-1}, then the standard enthalpy of formation of $CH_4(g)$ is

(a) –75 kJ mol^{-1} (b) +75 kJ mol^{-1}
(c) –211 kJ mol^{-1} (d) + 211 kJ mol^{-1}
(e) –1571 kJ mol^{-1}

Kerala-CEE-2020

Ans. (a) : $CH_4(g) + 2O_2(g) \longrightarrow CO_2(g) + 2H_2O(l)$

$\therefore$ $\Delta H = [\{\Delta_f H(CO_2) + 2\Delta_f H(H_2)\} - \{\Delta_f H(CH_4) - 2\Delta_f H(O_2)\}]$

$\Delta H = [\{-394 + (2 \times 286)\} - \{\Delta_f H(CH_4) - 2 \times 0\}]$

or $-891 = -394 - 572 - \Delta_f H(CH_4)$

or $\Delta_f H(CH_4) = -(966 - 891)$
$= -(+75 \text{ kJ mol}^{-1})$
$= -75 \text{ kJ mol}^{-1}$

$\because$ Combustion is an exothermic process So, it will taken as $\Delta H = -$ ve sign

So, option (a) is correct.

684. Bond enthalpies of A_2, B_2 and AB are in the ratio 2 : 1 : 2. If bond enthalpy of formation of AB is -100kJ mol^{-1}. The bond enthalpy of B_2 is

(a) 100 kJ mol^{-1} (b) 50 kJ mol^{-1}
(c) 200 kJ mol^{-1} (d) 150 kJ mol^{-1}

Kerala-CEE-29.08.2021
Karnataka-CET-2021

Ans. (c) : Given that,

$A_2 : B_2 : AB = 2 : 1 : 2$

$\Delta H_{AB} = -100 \text{ kJmol}^{-1}$

The following reaction take place -

$A_2 + B_2 \rightarrow 2AB$

or $\frac{1}{2}A_2 + \frac{1}{2}B_2 \rightarrow AB$

We can calculate the bond enthalpy of B_2 by the given equation -

$$\frac{1}{2}\Delta H_{A_2} + \frac{1}{2}\Delta H_{B_2} - \frac{1}{2}\Delta H_{AB} = -100$$

or $\frac{1}{2} \times 2x + \frac{x}{2} - 2x = -100$

or $x = 200 \text{ kJmol}^{-1}$

685. For the reaction

$CH_3COOH_{(l)} + 2O_{2(g)} \rightleftharpoons 2CO_{2(g)} + 2H_2O_{(l)}$

at 25ºC and 1 atm pressure, ΔH = –874kJ. Then the change in internal energy (ΔE) is :

(a) – 874 kJ (b) – 871.53 kJ
(c) – 876.47 kJ (d) + 874 kJ

Manipal-2019

@apna_pdf

Ans. (a) : Given reaction,

$$CH_3COOH(l)+2O_2(g) \rightleftharpoons 2CO_2(g)+2H_2O(l), \Delta H=-874kJ$$

We know that,

$$\Delta H = \Delta E + P\Delta V$$

from Ideal gas equation $P\Delta V = \Delta nRT$

$\Rightarrow \Delta H = \Delta E + \Delta nRT$

No. of mole of reactant = No. of mole of product

$$\Delta n = 0$$

Then, $\Delta H = \Delta E$

$$\Delta E = -874kJ$$

686. The enthalpy change for the transition of liquid water to steam is 40.8 kJ mol^{-1} at 373 K. Calculate the entropy of vaporisation of water :

(a) 109.4 JK^{-1} mol^{-1}
(b) 10.94 JK^{-1} mol^{-1}
(c) 1.094 JK^{-1} mol^{-1}
(d) 1009.4 JK^{-1} mol^{-1}

Manipal-2018

Ans. (a) : Given, $\Delta H_{vapour} = 40.8$ kJmol^{-1}, T = 373K

$$H_2O\ (l) \rightarrow H_2O\ (g)$$

$$\Delta S_{vapour} = \frac{\Delta H_{vapour}}{T}$$

$$\Delta H_{vapour} = 40.8 \text{ KJ mol}^{-1}$$
$$= 40.8 \times 1000 \text{ J mol}^{-1}$$

$$\Delta S_{vapour} = \frac{40.8 \times 1000}{373}$$
$$= 109.38 \text{ JK}^{-1} \text{ mol}^{-1}$$

687. The entropy change for the fusion of 1 mol of a solid which melts at 27ºC is (latent heat of fusion = 600 cal mol^{-1})

(a) 2 cal K^{-1}
(b) 22.2 cal K^{-1}
(c) 180 k cal K
(d) 0.5 cal^{-1} K

Manipal-2018

Ans. (a) : Given, T = 27 + 273 = 300 K

We know that,

$$\Delta S \text{ of fusion } = \frac{\Delta H_{fus.}}{T} = \frac{600}{300} = \frac{6}{3} = 2\text{cal K}^{-1}$$

688. The formation of oxide ion O^{2-} (g) require first an exothermic and then an endothermic step a shown below :

$$\mathbf{O(g) + e^- \longrightarrow O^-(g);\ \Delta H^o = -142\ kJ\ mol^{-1}}$$

$$\mathbf{O^-(g) + e^- \longrightarrow O^{2-}(g);\ \Delta H^o = 844\ kJ\ mol^{-1}}$$

This is because :

(a) Oxygen is more electronegative
(b) O$^-$ ion has comparatively larger size than oxygen atom
(c) O$^-$ ion will tend to resist the addition of another electron
(d) Oxygen has high electron affinity

Manipal-2018

Ans. (c) : Formation of the oxide ion O^{2-} (g) require first an exothermic and then an endothermic step.

$$O^{-1}(g) + e^- \rightarrow O^{-2}(g)$$

When an electron is added to negatively charged ion, it will experiences more repulsion rather than attraction.

689. Enthalpy of formation of HF and HCl are –161 kJ and –92 kJ, respectively. Select the incorrect statement on the basis of the above fact.

(a) HF is more stable than HCl
(b) HCl is more stable than HF
(c) Affinity of fluorine to hydrogen is greater than affinity of chlorine to hydrogen
(d) HF and HCl are exothermic compound

Manipal-2016

Ans. (b) : Compound for which ΔH_f is negative is more stable than the compound for which ΔH_f is positive. i.e exothermic compounds are more stable than endothermic compounds as HF with ΔH_f = 161kJ is more stable than HCl with ΔH_f = –92kJ.

690. Calculate the difference between heat of combustion of carbon monoxide gas at constant pressure and at constant volume at 27°C? (R = 2 cal K^{-1} mol^{-1})

(a) 54 cal
(b) + 600 cal
(c) – 300 cal
(d) 27 cal

MHT CET-02.05.2019, SHIFT-III

Ans. (b) : $2C(s) + O_2(g) \rightarrow 2CO(g)$

Heat of combustion of monoxide at constant pressure is ΔH and volume is ΔU.

$$\Delta H - \Delta U = n_gRT$$
$$n_g = 1$$
$$T = 27 + 273 = 300 \text{ K}$$
$$\Delta H - \Delta U = 1 \times 2 \times 300 = 600 \text{ cal.}$$

691. If C(s) +O$_2$(g) → CO$_2$(g), ΔH = –X,

$$\mathbf{CO(g) + \frac{1}{2}O_2(g) \rightarrow CO_2(g),\ \Delta H = -Y,}$$ **Calculate Δ_fH for CO$_{(g)}$ formation**

(a) – Y – X
(b) Y – X
(c) X + Y
(d) X – Y

MHT CET-02.05.2019, SHIFT-II

Ans. (b) : Given

$$C(s) + O_2(g) \rightarrow CO_2(g);\ \Delta H = -X \quad ....(i)$$

$$CO(g) + \frac{1}{2}O_2 \rightarrow CO_2;\quad \Delta H = -Y \quad ....(ii)$$

On reversing equation (ii) we get,

$$CO_2(g) \longrightarrow CO(g) + \frac{1}{2}O_2(g); \Delta H = +y \quad ....(iii)$$

Adding equation (i) & (iii),

$$C(s) + \frac{1}{2}O_2(g) \longrightarrow CO(g);\ \Delta H = -x + y = y - x$$

692. Calculate the work done during compression of 2 mol of an ideal gas from a volume of 1m^3 to 10 dm^3 300K against a pressure of 100 KPa.

(a) – 99 kJ
(b) +99 kJ
(c) + 22.98 kJ
(d) – 22.98 kJ

MHT CET-2017

Ans. (b) : We know that,

$$W = -PdV = -P(V_2 - V_1) = P(V_1 - V_2)$$
$$W = 100\,(1 - 10 \times 10^{-3}) \qquad (\because 1dm^3 = 10^{-3}m^3)$$
$$W = 100\,(1 - 0.01)$$
$$W = 100 \times 0.99 = +99kJ$$

@apna_pdf

693. Assuming enthalpy of combustion of hydrogen at 273 K is –286 kJ and enthalpy of fusion of ice at the same temperature to be +6.0 kJ, calculate enthalpy change during formation of 100 g of ice.

(a) + 1622 kJ (b) – 1622 kJ
(c) + 292 k j (d) – 292 kJ

MHT CET-2014

Ans. (b) :

$H_2(g) + \frac{1}{2}O_2(g) \rightarrow H_2O(l)\ ;\ \Delta H_{comb.} = -286KJ$ ... (i)

$H_2O(s) \rightarrow H_2O(l)\ ;\quad \Delta H_{fus.} = +6kJ$ .... (ii)

On subtracting (II) from (I)

$H_2(g) + \frac{1}{2}O_2(g) \rightarrow H_2O(s)\ ;\ \Delta H = -286 - 6$

$= -292$ KJ

$\because$ On formation of 100g ice, change in enthalpy

$= \frac{-292 \times 100}{18} = \frac{-292 \times 50}{9} = -1622$ kJ

694. Which of the following on combustion gives maximum energy?

(a) Ethane (b) Propane
(c) Methane (d) Butane

MHT CET-2012

Ans. (d) : Equation for combustion of alkanes is as follows

$$C_nH_{2n+2} + \left(\frac{3n+1}{2}\right)O_2 \rightarrow n\,CO_2 + (n+1)\,H_2O + \text{Heat}$$

Greater the value of n greater will be the heat produced. Therefore, on combustion of butane gives maximum energy.

695. The heat of neutralization of a strong acid and a strong alkali is 57.0 kJ mol^{-1}. The heat released when 0.5 mole of HNO_3 solution is mixed with 0.2 mole of KOH is

(a) 57.0 kJ (b) 11.4 kJ
(c) 28.5 kJ (d) 34.9 kJ

MHT CET-2011

Ans. (b) :

$NHO_3 + KOH \rightarrow KNO_3 + H_2O$

0.2 mole HNO_3 + 0.2 mole KOH $\rightarrow$ 0.3 mole HNO_3 unneutralized

$(\Delta H_{neut.})_{\text{strong acid + strong alkali}} = 57.0$ kJ/mol

but 0.2 mol neutralized ,

0.2 mole × 57.0 = 11.4 kJ

696. The heat of formation of water is 260 kJ. How much H_2O is decomposed by 130 kJ of heat?

(a) 0.25 mol (b) 1 mol
(c) 0.5 mol (d) 2 mol

MHT CET-2010

Ans. (c) : Given, Heat of formation = 260 kJ

$H_2 + \frac{1}{2}O_2 \rightarrow H_2O\ ;\ \Delta H = 260\,kJ$ ...... (i)

On reversing Eq. (i) we get,

$H_2O \rightarrow H_2 + \frac{1}{2}O_2\ ;\ \Delta H = -260$ kJ ……..(ii)

$\because$ By 260 kJ heat water decomposed = 1 mol

$\therefore$ 130 kJ heat will decompos water $= \frac{1 \times 130}{260} = 0.5$ mol

697. Heat of combustion of methane is –800 kJ. What is the heat of combustion for 4×10^{-4} kg of methane?

(a) – 800 kJ (b) – 3.2 × 10^4 kJ
(c) – 20 kJ (d) – 1600 kJ

MHT CET-2009

Ans. (c) : On combustion of methane,

$CH_4 + 2O_2 \rightarrow CO_2 + 2H_2O\ ;\ \Delta H_C = -800kJ$

$\because$ Heat of combustion of 16×10^{-3} kg of CH_4 = –800 kJ

$\therefore$ Heat of combustion of 4×10^{-4} kg of CH_4

$= \frac{-800 \times 4 \times 10^{-4}}{16 \times 10 - 3} = -20kJ$

698. If ΔE is the heat of reaction for
$C_2H_5OH(l) + 3O_2(g) \rightarrow 2CO_2(g) + 3H_2O(l)$
at constant volume, the ΔH (heat of reaction at constant pressure), at constant temperature is

(a) ΔH = ΔE + RT (b) ΔH = ΔE – RT
(c) ΔH = ΔE – 2RT (d) ΔH = ΔE + 2RT

MHT CET-2008

Ans. (b) : Given reaction,

$C_2H_5OH(l) + 3O_2(g) \rightarrow 2\,CO_2(g) + 3H_2O(l)$

We know that,

$\Delta H = \Delta E + \Delta nRT$

$\Delta n = 2 - 3 = -1$

$\boxed{\Delta H = \Delta E - RT}$

699. For the reaction,

$$2H_2(g) + O_2(g) \longrightarrow 2H_2O(g)\ ;\Delta H = -573.2\,kJ$$

The heat of decomposition of water per mole is

(a) 286.6 kJ (b) 573.2 kJ
(c) – 28.66 kJ (d) zero

MHT CET-2007

Ans. (a) :

$2H_2(g) + O_2(g) \longrightarrow 2H_2O(g)\ ;\Delta H = -573.2\,kJ$

On reversing and dividing by 2 we get,

$H_2O(g) \rightarrow H_2(g) + \frac{1}{2}O_2(g)\ ;\ \Delta H = +\frac{573.2}{2} = +286.6$ kJ

700. The values of ΔH and ΔS for the reaction,
$C_{(graphic)} + CO_2(g) \rightarrow 2CO(g)$
are 170 kJ and 170 J K^{-1}, respectively. This reaction will be spontaneous at

(a) 910 K (b) 1110 K
(c) 510 K (d) 710 K

NEET-2009

Ans. (b) : Given, ΔH = 170 kJ = 170 × 10^3 J

ΔS = 170 JK^{-1} mol^{-1}

For the reaction to be spontaneous, ΔG = –ve

@apna_pdf

Applying, $\Delta G = \Delta H - T\Delta S$, the value of $\Delta G = -ve$ only when $T\Delta S > \Delta H$, which is possible only when T = 1110K.

$\therefore \Delta G = 170 \times 10^3 - (1110 \times 170) = -18700J$

Thus, reaction is spontaneous at T = 1110K

701. The following two reactions are known
$Fe_2O_3(s)+3CO(g) \to 2Fe(s)+3CO_2(g);$
$\Delta H = -26.8kJ$
$FeO(s)+CO(g) \to Fe(s)+CO_2(g);\ \Delta H = -16.5kJ$
The value of ΔH for the following reaction.
$Fe_2O_3(s) + CO(g) \to 2Fe(s)+CO_2(g)$ is

(a) + 10.3 kJ (b) – 43.3 kJ
(c) – 10.3 kJ (d) + 6.2 kJ

NEET-2010

Ans. (d) : Given, equation –

$Fe_2O_3(s)+3CO(g) \to 2Fe(s)+3CO_2(g)$;
$\Delta H = -26.8$ kJ ....(i)

$FeO(s)+CO(g) \to Fe(s)+CO_2(g)$; $\Delta H = -16.5$ kJ ….(ii)

on multiplying E.q (ii) with 2, we get

$2FeO(s) + 2CO(g) \to 2Fe(s) + 2CO_2(g)$;
$\Delta H = -33kJ$ ….(iii)

On substracting Eq (iii) from (i),

$Fe_2O_3(s) + CO(g) \to 2FeO(s) + CO_2(g)$;
$\Delta H = -26.8 - (-33) = +6.2$ kJ

702. For which one of the following equation is $\Delta H^0_{reaction}$ equal to ΔH^0_f for the product?

(a) $N_{2(g)} + O_{3(g)} \to N_2O_{3(g)}$

(b) $CH_{4(g)} + 2Cl_{2(g)} \to CH_2Cl_{2(\ell)} + 2HCl_{(g)}$

(c) $Xe_{(g)} + 2F_{2(g)} \to XeF_{4(g)}$

(d) $2CO_{(g)} + O_{2(g)} \to 2CO_{2(g)}$

NEET-2003

Ans. (c) :

$$\Delta H^o_r = (\Delta H^o_f\ XeF_4) - \left[\Delta H^o_f\ Xe + \Delta H^o_f\ F_2 \times 2\right]$$

$$\searrow\ \swarrow$$

$$\text{elementary}\ \boxed{\Delta H = 0}$$

The heat of formation is defined as the heat generated or absorbed when the compound is formed from its component elements in their standard state.

703. Heat of combustion ΔH for C(s), $H_2(g)$ and $CH_4(g)$ are –94, –68 and –213 kcal/mol, Then ΔH for $C(s) + 2H_2(g) \to CH_4(g)$ is

(a) –17 kcal (b) –111 kcal
(c) –170 kcal (d) –85 kcal

NEET-2002

Ans. (a) :

$C + O_2 \to CO_2$; $\Delta H = -94$ kcal

$2H_2 + O_2 \to 2H_2O$; $\Delta H = -68 \times 2$ kcal

$CH_4 + 2O_2 \to CO_2 + 2H_2O$; $\Delta H = -213$ kcal

$C(s) + 2H_2(g) \to CH_4(g)$;

$\Delta H = -[\Delta H_{Comb.}$ of $C + 2 \times \Delta H_{Comb.}$ of $H_2]$

$= -[-213 - (-94 + 2 \times -68)] = 213 - 230 = -17$ kcal

704. Change in enthalpy for reaction,
$2H_2O_2(l) \to 2H_2O(l) + O_2(g)$
If heat of formation of $H_2O_2(l)$ and $H_2O(l)$ are –188 and –286 kJ/mol respectively, is

(a) –196 kJ/mol (b) + 196 kJ/mol
(c) + 948 kJ/mol (d) – 948 kJ/mol

NEET-2001

Ans. (a) : $2H_2O_2(l) \to 2H_2O(l) + O_2(g)$

$\Delta H = [2 \times \Delta H_f$ of $H_2O(l) + (\Delta H_f$ of $O_2) - (2 \times \Delta H_f$ of $H_2O_2(l))]$

$= (2 \times -286) + (0) - (2 \times -188)$

$= -572 + 376 = -196$ kJ/mol

705. Enthalpy of CH_4 + 1/2 $O_2 \to CH_3OH$ is negative. If enthalpy of combustion of CH_4 and CH_3OH are x and y respectively, then which relation is correct?

(a) x > y (b) x < y
(c) x = y (d) x ≥ y

NEET-2001

Ans. (b) : $CH_2 + 2O_2 \to CO_2 + 2H_2O$; $\Delta H = x$ ….(i)

$2CH_3OH + 3O_2 \to 2CO_2 + 4H_2O$; $\Delta H = y$

On equation divided by 2 we get,

$CH_3OH + 1.5O_2 \to CO_2 + 2H_2O$; $\Delta H = y$ ….(ii)

Subtract equation (i) and (ii),

$$CH_4 + \frac{1}{2}O_2 \longrightarrow CH_3OH\ ;\quad \Delta H = -ve$$

$$x - y = -ve = \boxed{y > x}$$

706. In the reaction : S + 3/2$O_2 \to SO_3$ + 2x kcal and SO_2 + 1/2 $O_2 \to SO_3$ + y kcal, the heat of formation of SO_2 is

(a) (2x + y) (b) (x – y)
(c) (x + y) (d) (2x – y)

NEET-1999

Ans. (d) :

$$S + \frac{3}{2}O_2 \to SO_3 + 2x\,kcal \quad ....(i)$$

$$SO_2 + \frac{1}{2}O_2 \to SO_3 + y\,kcal \quad ....(ii)$$

Now subtract equation (ii) & (i) we get,

$$S - SO_2 + O_2 \to 2x - y\,kcal$$

$\therefore$ Heat of formation of SO_2 is equal to 2x – y kcal.

707. Given that $C + O_2 \to CO_2$; $\Delta H^o = -x$ kJ
$2CO + O_2 \to 2CO_2$; $\Delta H^o = -y$ kJ
The enthalpy of formation of carbon monoxide will be

(a) $\frac{y-2x}{2}$ (b) 2x – y

(c) y – 2x (d) $\frac{2x-y}{2}$

WB-JEE-2014, NEET-1997

Ans. (a) :

$C + O_2 \to CO_2$; $\Delta H^o = -x$ kJ …..(i)

$2CO + O_2 \to 2CO_2$; $\Delta H^o = -y$ kJ ….(ii)

Substration equation (i) and divided by 2 equation (ii),

$$C + \frac{1}{2}O_2 \to CO\ ;\Delta H = -x - (-y/2) = \frac{y-2x}{2}$$

@apna_pdf

708. If enthalpies of formation for $C_2H_{4(g)}$, $CO_{2(g)}$ and $H_2O(l)$ at 25^0C and 1 atm pressure are 52, –394 and –286 kJ/mol respectively, then enthalpy of combustion of $C_2H_{4(g)}$ will be

(a) + 141.2 kJ/mol (b) + 1412 kJ/mol
(c) – 141.2 kJ/mol (d) – 1412 kJ/mol

NEET-1995

Ans. (d) : $C_2H_4(g) + 3O_2 \to 2CO_2 + 2H_2O$;

$\Delta H = \Delta H_{(products)} - \Delta H_{(reactant)}$

$= 2\times\Delta H_{CO_2} + 2\times\Delta H_{H_2O} - \Delta H_{C_2H_4} - 3\times\Delta H_{O_2}$

$= 2 \times (-394) + 2\times(-286) - 52 - 3 \times 0$

$= -1412$ kJ/mol

709. The bond dissociation energies of X_2, Y_2 and XY are in the ratio of 1:0.5:1. ΔH for the formation of XY is –200 kJ mol^{-1}. The bond dissociation energy of X_2 will be

(a) 200 kJ mol^{-1} (b) 100 kJ mol^{-1}
(c) 800 kJ mol^{-1} (d) 400 kJ mol^{-1}

NEET-2018

Ans. (c) :

$$\frac{1}{2}X_2 + \frac{1}{2}Y_2 \to XY \quad \Delta H = -200\,kJ/mol$$

$$1 \quad 0.5 \quad 1$$

$$X \quad X/2 \quad X$$

$$\Delta H = \sum H_R - \sum H_P \Rightarrow -200 = \left(\frac{1}{2}\times x + \frac{1}{2}\times 0.5x\right) - x$$

$200 = 0.25x \Rightarrow x = 200 \times 4 = 800$ kJ/mol

710. The heat of combustion of carbon to CO_2 is –393.5 kJ/mol. The heat released upon formation of 35.2 g of CO_2 from carbon and oxygen gas is

(a) + 315 kJ (b) – 630 kJ
(c) – 31.5 kJ (d) – 315 kJ

MHT CET-2011
NEET-2015

Ans. (d) :

$C(s) + O_2(g) \to CO_2(g)$; $\Delta H = -393.5$ kJ/mol

Heat released on formation of 44g $CO_2 = -393.5$ kJ/mol

∴ Heat released on formation of 35.2g CO_2 =

$$\frac{-393.5}{44}\times 35.2 = -314.5\,kJ/mol \simeq -315\,kJ/mol$$

711. When 5 litres of a gas mixture of methane and propane is perfectly combusted at 0^0C and 1 atmosphere, 16 litres of oxygen at the same temperature and pressure is consumed. The amount of heat released from this combustion in kJ

ΔH_{comb} (CH_4) = 890 kJ mol^{-1},
ΔH_{comb} (C_3H_8) = 2220 kJ mol^{-1} is

(a) 38 (b) 317
(c) 477 (d) 32

Karnataka NEET-2013

Ans. (b) : $\underset{x}{CH_4} + \underset{2x}{2O_2} \to CO_2 + 2H_2O$

$\underset{(5-x)}{C_3H_8} + \underset{5(5-x)}{5O_2} \to 3CO_2 + 4H_2O$

$2x + 5(5-x) = 16$

$\Rightarrow x = 3L$

∴ Heat released

$$= \frac{3}{22.4}\times 890 + \frac{2}{22.4}\times 2220 = 317\text{ kJ}$$

712. Enthalpy change for the reaction,
$4H_{(g)} \to 2H_{2(g)}$ is –869.6 kJ
The dissociation energy of H – H bond is

(a) – 434.8 kJ (b) – 869.6 kJ
(c) + 434.8 kJ (d) + 217.4 kJ

NEET-2011

Ans. (c) : Given,

$4H(g) \to 2H_2(g)$; $\Delta H = -869.6$ kJ

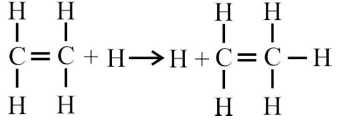
On reversing equation 1st and divided by 2 we get,

$$H_2 \to 2H_2 ; \Delta H = \frac{869.6}{2} = 434.8kJ$$

713. From the following bond energies :

H – H bond energy : 431.37 kJ mol^{-1}
C = C bond energy : 606.10 kJ mol^{-1}
C – C bond energy : 336.49 kJ mol^{-1}
C – H bond energy : 410.50 kJ mol^{-1}

Enthalpy for the reaction



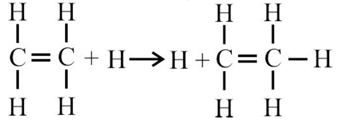
will be

(a) –343.6 kJ mol^{-1} (b) – 120.0 kJ mol^{-1}
(c) 553.0 kJ mol^{-1} (d) 1523.6 kJ mol^{-1}

NEET-2009

Ans. (b) : Given,

H-H Bond Energy = 431.37 kJ/mole
C = C Bond Energy = 606.10 kJ/mole
C – C Bond Energy = 336.44 kJ/mole
C – H Bond Energy = 410.5 kJ/mole



$\Delta H = (\Delta H)_{Reactant} - (\Delta H)_{Product}-$

$\Delta H = [1\times\Delta H_{(C=C)} + 4\times\Delta H_{(C-H)} + 1\times\Delta H_{(H-H)} -$
$6 \times\Delta H+_{(C-H)} + 1\times\Delta H_{(C-C)}]$

$\Delta H = [606.10 + 4\times410.50 + 431.37] - [6\times410.50 + 336.49]$

$= [606.1 + 1642 + 431.37] - [2463 + 336.49]$

$= 2679.47 - 2799.49 = -120.02$ kJ/mol

714. Bond dissociation enthalpy of H_2, Cl_2 and HCl are 434, 242 and 431 kJ mol^{-1} respectively. Enthalpy of formation of HCl is

(a) –93 kJ mol^{-1} (b) 245 kJ mol^{-1}
(c) 93 kJ mol^{-1} (d) –245 kJ mol^{-1}

NEET-2008

Ans. (a) $H_2 + Cl_2 \to 2HCl$

divided by 2 we get,

$$\frac{H_2}{2} + \frac{Cl_2}{2} \to HCl$$

@apna_pdf

$$\Delta H = \sum H_R - \sum H_P$$

$$= \left(\frac{434}{2} + \frac{242}{2}\right) - 431 = -93\,\text{kJ/mol}$$

715. Consider the following reactions :

(i) $H^+_{(aq)} + OH^-_{(aq)} \rightarrow H_2O(l)$; $\Delta H = -X_1$kJ mol^{-1}

(ii) $H_{2(g)} + 1/2O_{2(g)} \rightarrow H_2O(l)$; $\Delta H = -X_2$kJ mol^{-1}

(iii) $CO_{2(g)} + H_{2(g)} \rightarrow CO_{(g)} + {}_2O_{(l)}$; $\Delta H = -X_3$kJ mol^{-}

(iv) $C_2H_{2(g)} + 5/2O_{2(g)} \rightarrow 2CO_{2(g)} + H_2O_{(l)}$; $\Delta H = +X_4$kJ mol^{-1}

Enthalpy of formation of $H_2O_{(l)}$ is

(a) $-X_2$ kJ mol^{-1} (b) $+X_3$ kJ mol^{-1}
(c) $-X_4$ kJ mol^{-1} (d) $+X_1$ kJ mol^{-1}

NEET-2007

Ans. (a) :Enthalpy of formation : The amount of heat evolved or absorbed during the formation of 1 mole of a compound form its constituent elements is known as Heat of formation. So, the correct answer is

$$H_2(g) + \frac{1}{2}O_2(g) \longrightarrow H_2O(l), \Delta H = -x_2 \text{ kJ mol}^{-1}$$

716. Standard enthalpy of vaporisation $\Delta_{vap}H^0$ for water at 100^0C is 40.66 kJ mol^{-1}. The internal energy of vaporisation of water at 100^0C (in kJ mol^{-1}) is

(a) + 37.56 (b) – 43.76
(c) + 43.76 (d) + 40.66

(Assume water vapour to behave like an ideal gas)

NEET-2012

Ans. (a) : $\Delta H = \Delta E + \Delta n_g RT$

$H_2O(g) \rightarrow H_2O(g)$

$\Delta n_g = 1 - 0 = 1$

$T = 100^oC + 273K = 373K$

$\Delta H_{vap} = \Delta E + \Delta n_g RT$

$\Delta E = \Delta H_{vap} - \Delta n_g RT$

$= 40.63 - (1 \times 8.314 \times 10^{-3} \times 373)$

$= 37.53$ kJ/ mol.

717. If ΔH is the change in enthalpy and ΔE, the change in internal energy accompanying a gaseous reaction, then

(a) ΔH is always greater than ΔE
(b) ΔH < ΔE only if the number of moles of the products is greater than the number of moles of the reactants
(c) ΔH is always less than ΔE
(d) ΔH < ΔE only if the number of moles of products is less than the number of moles of the reactants.

NEET-1990

Ans. (d) :$\Delta H = \Delta E + \Delta(PV)$

$\Delta H = \Delta E + \Delta(nRT)$ [$\therefore PV = nRT$]

When number of moles in product is less than number of moles in reaction so $\Delta n = -$ve

$\Delta H < \Delta E$

718. The molar heat capacity of water at constant pressure, C, is 75 J K^{-1} mol^{-1}. When 1.0 kJ of heat is supplied to 100 g of water which is free to expand, the increase in temperature of water is

(a) 1.2 K (b) 2.4 K
(c) 4.8 K (d) 6.6 K

NEET-2003

Ans. (b) : $q = nc_p\,\Delta T$

$q = 1kJ = 1000J.$

$$n = \frac{\text{mass}}{\text{mol. weight}} = \frac{100}{18}$$

$$1000 = \frac{100}{18} \times 75 \times \Delta T$$

$\Delta T = 2.4$ K

719. When 1 mol of gas is heated of constant volume temperature is raised from 298 to 308 K. Heat supplied to the gas is 500 J. Then which statement is correct?

(a) q = w = 500 J, ΔE = 0
(b) q = ΔE = 500 J, w = 0
(c) q = w = 500 J, ΔE = 0
(d) ΔE = 0, q = w = -500 J

NEET-2001

Ans. (b) : According to first law of thermodynamics,

$\Delta E = q + W$

For constant volume, work done (W) = 0

$\Delta E = q = 500J$

720. Consider the following reaction:

$C_6H_{12}O_{6(glucose)}(s) + 6O_2(g) \rightarrow 6CO_2(g) + 6H_2O_{(g)}$, $\Delta H = -2840$ kJ

Tell the amount of energy required to generate 0.36 gm glucose following the above reverse reaction.

(a) 56.8 kJ (b) 568 kJ
(c) 5.68 kJ (d) 0.568 kJ

Tripura JEE-2019

Ans. (c) :

$C_6H_{12}O_{6(glucose)}(s) + 6O_2(g) \rightarrow 6CO_2(g) + 6H_2O_{(g)}$; $\Delta H = -2840$ kJ

On reverse reaction we get,

$6CO_2(g) + 6H_2O(g) \rightarrow C_6H_{12}O_6(s) + 6O_2(g)$; $\Delta H = 2840$ kJ

Thus for production of 1 mole $C_6H_{12}O_6 = 72 + 12 + 96 = 180$ g

For production of 0.36 g of glucose,

$$\Delta H = \frac{2840}{180} \times 0.36 = 5.68\,\text{kJ}$$

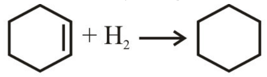
721. The enthalpy of hydrogenation of cyclohexene is –119.5 kJ mol^{-1}. If resonance energy of benzene is –150.4 kJ mol^{-1}, its enthalpy of hydrogenation would be

(a) –269.9 kJ mol^{-1} (b) –358.5 kJ mol^{-1}
(c) –508.9 kJ mol^{-1} (d) –208.1 kJ mol^{-1}

UP CPMT-2013

@apna_pdf

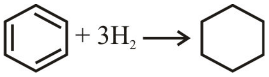
Ans. (d) : Hydrogenation of cyclohexene



Cyclohexene Cyclohexane

$\Delta H = -119.5$ kJ mol^{-1}

Hydrogenation of benzene :



$\Delta H = -3 \times 119.5$ kJ mol^{-1}

$= -358.5$ kJ mol^{-1}

The observed ΔH for hydrogenation of benzene

= ΔH + Energy needed to disturb resonance

$= -358.5 + 150.4 = -208.1$ kJ mol^{-1}

722. Given (i) $C(s)+O_2(g)\rightarrow CO_2(g)$; $\Delta H = -94.0$ kcal

(ii) $H_2(g)+\frac{1}{2}O_2(g)\rightarrow H_2O(l)$ $\Delta H = -68.4$ kcal

(iii) $CH_4(g)+O_2(g)\rightarrow CO_2(g)+2H_2O(l)$; $\Delta H = -212.4$ kcal

The heat of formation of CH_4 is

(a) –18.4 kcal (b) +18.4 kcal

(c) –443.2 kcal (d) +443.2 kcal

UP CPMT-2012

Ans. (a) : (i) $C+O_2\rightarrow CO_2$, $\Delta H = -94.0$ kcal

(ii) $H_2+\frac{1}{2}O_2\rightarrow H_2O, \Delta H = -68.4 kcal]\times 2$

(iii) $CH_4+2O_2\rightarrow CO_2+2H_2O$, $\Delta H = -212.4$ kcal

On multiplying Eq. (ii) with 2, add Eq. (i) and subtract Eq. (iii), we get

$C+2H_2+2O_2\rightarrow CO_2+2H_2O$, $\Delta H = -230.8$kcal

$CH_4+2O_2\rightarrow CO_2+2H_2O$, $\Delta H = -212.4$kcal

$C+2H_2 \rightarrow CH_4$, $\Delta H = -18.4$kcal

723. The heat of neutralisation of four acids A,B,C, and D when neutralized against a common base are 13.7, 9.4, 11.2, and 12.4 kcal respectively. The weakest and strongest among these acids are

(a) B and A respectively

(b) A and C respectively

(c) C and D respectively

(d) A and B respectively

UP CPMT-2012

Ans. (a) : Lower the value of heat of neutralisation weaker is the acid and vice-versa. Hence, B is the weakest and A is the strongest acid in the given options.

724. The enthalpy of dissolution of $BaCl_2$ (s) and $BaCl_2{\cdot}2H_2O(s)$ are –20.6 and 8.8 kJ mol^{-1} respectively. The enthalpy of hydration for

$$BaCl_2(s)+2H_2O(l)\longrightarrow BaCl_2\cdot 2H_2O(s) \text{ is}$$

(a) 29.4 kJ (b) –29.4 kJ

(c) –11.8 kJ (d) 38.2 kJ

UP CPMT-2011

Ans. (b) :

$BaCl_2(s)\rightarrow BaCl_2(aq)$; $\Delta H_1 = -20.6$ kJ …….(i)

$BaCl_2{\cdot}2H_2O(s)\rightarrow BaCl_2(aq)$; $\Delta H_2 = 8.8$ kJ …….(ii)

Substracting equation (ii) from (i) we get

$BaCl_2(s)\rightarrow BaCl_2\cdot 2H_2O(s)$; $\Delta H_1 - \Delta H_2 = -29.4$ kJ

725. The heat of combustion of methane, if the heat of formation of CH_4, CO_2, and H_2O are respectively –18.4 kcal, – 94.0 kcal, –68.4 kcal, is

(a) –212.4 kcal (b) +212.4 kcal

(c) –249.2 kcal (d) +249.2 kcal

UP CPMT-2010

Ans. (a) : $CH_4 + 2O_2 \rightarrow CO_2 + 2H_2O$

$$\Delta H_{comb} = (\Delta H_{f(CO_2)} + 2\times\Delta H_{f(H_2O)}) - (\Delta H_{f(CH_4)} + 2\times\Delta H_{f(O_2)})$$

$$=[-94.0+2\times(-68.4)-(-18.4+0)]$$

$$=-212.4 \text{ kcal}$$

726. Consider following reactions

I: $C(s)+\frac{1}{2}O_2(g)\longrightarrow CO(g), \Delta H_1 = a$

II: $CO(g)+\frac{1}{2}O_2(g)\longrightarrow CO_2(g), \Delta H_2 = b$

III: $C(s)+CO_2(g)\longrightarrow 2CO(g); \Delta H_3 = c$

Select correct Statement:

(a) Heat of formation of CO_2 is (a + b)

(b) Heat of combustion of C is (a + b)

(c) $\Delta H_3 = \Delta H_1 - \Delta H_2$

(d) All the above are correct statements

UP CPMT-2009

Ans. (d):

I: $C(s) + \frac{1}{2}O_2(g)\longrightarrow CO_2(g)$; $\Delta H_1 = a$

II: $CO(g)+\frac{1}{2}O_2(g)\longrightarrow CO_2(g)$; $\Delta H_2 = b$

III: $C(s) + CO_2(g) \longrightarrow 2CO(g)$; $\Delta H_3 = c$

On adding Eqs. I and II, we get

$$C(s) + O_2(g) \longrightarrow CO_2(g); \quad \Delta H = \Delta H_1 + \Delta H_2 = a + b$$

∴ Heat of formation of CO_2 = a + b

and heat of combustion of C = a + b

On subtracting Eqs II from I, we get

$$C(s) + CO_2(g) \longrightarrow 2CO(g); \Delta H_3 = \Delta H_1 - \Delta H_2$$

727. The heat of formation of CO (g) and CO_2 (g) are ΔH = –110 and ΔH = –393 kJ mol^{-1} Respectively. What is the heat of reaction (ΔH) (in kJ mol^{-1}) for the following reaction?

$$CO(g)+\frac{1}{2}O_2(g)\rightarrow CO_2(g)$$

(a) –504 (b) –142.5

(c) –283 (d) –504

UP CPMT-2008

@apna_pdf

Ans. (c): $C + \frac{1}{2}O_2 \rightarrow CO, \Delta H = -110\,kJ\,mol^{-1}$ …..(i)

$C + O_2 \rightarrow CO_2, \Delta H = -393\ kJ\ mol^{-1}$ …..(ii)

On subtracting eq. (i) from eq. (ii), we get

$$CO + \frac{1}{2}O_2 \rightarrow CO_2$$

$\Delta H = -393 - (-110)$

$= -283\ kJ\ mol^{-1}$

728. The enthalpies of formation of $C_2H_2(g)$ and $C_6H_6(g)$ at 298 K are 230 and 85 kJ/mol respectively. The enthalpy change for the reaction is

(a) 605 kJ/mol
(b) 865 kJ/mol
(c) –605 kJ/mol
(d) –865 kJ/mol

UP CPMT-2001

Ans. (c) : Write the chemical reaction and then use the formula $\Delta H = H_P - H_R$ to find the enthalpy change for the reaction.

$3C_2H_2(g) \longrightarrow C_6H_6(g) \quad \Delta H = H_P - H_R$

Given, H_f of $C_2H_2 = 230$ kJ/mol

H_f of $C_6H_6 = 85$ kJ/mol

$\therefore \quad \Delta H = 85 - (3 \times 230)$

$= 85 - 690$

$= -605$ kJ/mol

729. The mass of carbon anode consumed (giving only carbon dioxide) in the production of 270 kg of alminium metal from bauxite by the Hall process is

(Atomic mass of Al = 27)

(a) 180 kg
(b) 270 kg
(c) 540 kg
(d) 90 kg

UPTU/UPSEE-2007

Ans. (d) : This equation shows,

$$2A1_2O_3 + \underset{3\times12=36}{3C} \longrightarrow \underset{4\times27=108}{4Al} + 3CO_2$$

$\because$ For 108 Kg of Al, 36 Kg of C is required in above reaction,

$\therefore$ For 270 kg of Al require amount of C $= \frac{36}{108} \times 270$

$= 90$ kg

730. Formation of a solution form two components can be considered as

(i) Pure solvent → separated solvent molecules, ΔH_1

(i) Pure solute → separated solute molecules, ΔH_2

(iii) Separated solvent and solute molecules → solution, ΔH_3

Solution so formed will be ideal if

(a) $\Delta H_{soln} = \Delta H_1 - \Delta H_2 - \Delta H_3$
(b) $\Delta H_{soln} = \Delta H_3 - \Delta H_1 - \Delta H_2$
(c) $\Delta H_{soln} = \Delta H_1 + \Delta H_2 + \Delta H_3$
(d) $\Delta H_{soln} = \Delta H_1 + \Delta H_2 - \Delta H_3$

UPTU/UPSEE-2007

Ans. (c) : This solution is an ideal

$\Delta H_{Sol.} = \Delta H_1 + \Delta H_2 + \Delta H_3$

Pure solvent + pure solute $\longrightarrow$ Solution

$$\boxed{\Delta H = \Delta H_1 + \Delta H_2 + \Delta H_3}$$

731. The enthalpies of combustion of carbon and carbon monoxide are – 393.5 and – 283 kJ mol^{-1} respectively. The enthalpy of formation of carbon monoxide per mole is

(a) 110.5 kJ
(b) 676.5 kJ
(c) – 676.5 kJ
(d) – 110.5 kJ

UPTU/UPSEE-2007

Ans. (d) :

$C + O_2 \rightarrow CO_2 \qquad \Delta H = -393.5\,KJ$ ____(i)

$CO + \frac{1}{2}O_2 \rightarrow CO_2 \qquad \Delta H = -283\,KJ$ ____(ii)

Sustracting from equation (i) to (ii)

$\Delta H = (-393.5) - (-283)$

$\Delta H = -110.5\,kJ$

732. If at 298 K the bond energies of C–H, C–C, C=C and H–H bonds are respectively 414, 347, 615 and 435 kJ mol^{-1}, the value of enthalpy change for the reaction

$H_2C = CH_2\,(g) + H_2\,(g) \longrightarrow H_3C - CH_3\,(g)$

at 298 K will be

(a) +250 kJ
(b) – 250 kJ
(c) + 125 kJ
(d) – 125 kJ

UPTU/UPSEE-2007

Ans. (d) : $H_2C = CH_2(g) + H_2(g) \longrightarrow H_3C - CH_3(g)$

H–H = 435 kJ mol^{-1}

2C–H = 2×(–414) kJ mol^{-1}

C=C = 615 kJ mol^{-1}

C–C = 347 kJ mol^{-1}

Total enthalpy change is,

$\rightarrow 435 + 615 - (2\times 4141) - 347$

$= -125$ kJ mol^{-1}

733. The heat of combustion of carbon monoxide at constant pressure and at constant volume at 27^oC will differ from one another by:

(a) 27 cal
(b) 54 cal
(c) 300 cal
(d) 600 cal

UPTU/UPSEE-2006

Ans. (c) : $C(s) + \frac{1}{2}O_2(g) \longrightarrow CO(g)$

$\Delta n_g = 1 - \frac{1}{2} = \frac{1}{2}$

T = 300 K

We know,

$\Delta H = \Delta U + \Delta n_g RT$

$\Delta H - \Delta U = \Delta n_g RT$

$\Delta H - \Delta U = \frac{1}{2} \times 2 \times 300$

= 300 cal.

@apna_pdf

734. The ΔH^o_f for $CO_2(g)$, CO(g) and $H_2O(g)$ are –393.5, –110.5 and –241.8 kJ/mol respectively, the standard enthalpy change (in kJ) for the reaction.

$CO_2(g) + H_2(g) \rightarrow CO\ (g) + H_2O\ (g)$ is :

(a) 524.1 (b) 41.2

(c) –262.5 (d) –41.2

UPTU/UPSEE-2005

Ans. (b) : Given that, ΔH for $CO_2(g)$ = –393.5

CO(g) = –110.5, H_2O = –241.8

$$\Delta H = \sum \Delta H^o_{f(products)} \quad - \quad \sum \Delta H^o_{f(reactants)}$$

$$= -110.5 - 241.8 \quad - \quad (-393.5)$$

$$= +41.2 \text{ kJ.}$$

735. Hess's law is used to calculate:

(a) enthalpy of reaction

(b) entropy of reaction

(c) work done in reaction

(d) All of the above.

UPTU/UPSEE-2005

Ans. (a) : Hess's law states that enthalpy changes during the process is independent of path. So, this law is used in calculating enthalpy.

736. Enthalpy of solution of NaOH (solid) in water is – 41.6 kJ mol^{-1}. When NaOH is dissolved in water, the temperature of water:

(a) Increases (b) Decreases

(c) Does not change (d) Fluctuates indefinitely

UPTU/UPSEE-2004

Ans. (a) : According to Le-chatir Principle although the dissolution process is overall exothermic, since solubility is determined only at the saturation point, the solubility increases with increases in temperature.

737. The heat of combustion of carbon to CO_2 is –393.5 kJ/mol. The heat released upon formation of 35.2 g of CO_2 from carbon and oxygen gas is:

(a) + 315 kJ (b) – 31.5 kJ

(c) – 315 kJ (d) + 31.85 kJ

UPTU/UPSEE-2004

Ans. (c) :

Number of moles in 35.2g of $CO_2 = \frac{35.2}{44} = 0.8$ mol

Thus heat of combustion for 0.8 mol of CO_2 is –393.5×0.8 = –315 kJ

738. Which of the following equations correctly represent the standard heat of formation ($\Delta H°_f$) of methane?

(a) C (diamond) + 4H(g) $\longrightarrow$ $CH_4(g)$

(b) C (diamond) + $2H_2(g)$ $\longrightarrow$ $CH_4(g)$

(c) C (graphite) + $2H_2(g)$ $\longrightarrow$ $CH_4(g)$

(d) C (graphite) + 4H(g) $\longrightarrow$ $CH_4(g)$

UPTU/UPSEE-2004

Ans. (c) : The heat of formation of a compound is the heat evolved or absorbed when one mole of the compound is formed from its elements in their standard state. For carbon, the standard state is graphite.

$$\boxed{\Delta H^o_f\ C_{(graphite)} = 0}$$

739. Why is the heat evolved in neutralisation of HF is highest ?

(a) Due to low hydration energy of F^- ion

(b) Due to high hydration energy of F^- ion

(c) HF is a strong acid

(d) None of the above

UPTU/UPSEE-2018

Ans. (b) : • HF is a weak acid

• HF have very high enthalpy change of neutralization.

• HF, heat evolved neutralization is highest due to high Hydration energy of F^- ion.

740. At 298 K what will be the change in standard internal energy change for the given reaction $OF_2(g) + H_2O(g) \rightarrow O_2(g) + 2HF(g)$;

(a) –312.5 kJ (b) –125.03 kJ

(c) –310 kJ (d) –156 kJ

UPTU/UPSEE-2018

Ans. (c) : $\Delta H = \Delta U + \Delta n_g RT$

$$\Delta n_g = \text{moles of product} - \text{mole of reactant}$$

$$3 - 2 = +1$$

$$\Delta n_g > O$$

$$\therefore \Delta U° = H° - \Delta n_g RT$$

$$\therefore \Delta U° = (-310 \times 10^3) - (1 \times 8.314 \times 298)$$

$$= -307522.42 \text{ J}$$

$$= -307.522 \times 10^3 \text{ J}$$

$$\therefore \Delta U \simeq -310 \text{ kJ}$$

741. The enthalpy of the formation of CO_2 and H_2O are –395 kJ and –285 kJ respectively and the enthalpy of combustion of acetic acid is 869 kJ. The enthalpy of formation of acetic acid is

(a) 340 kJ (b) 420 kJ

(c) 491 kJ (d) 235 kJ

UPTU/UPSEE-2017

Ans. (c) : $CH_3COOH + 2O_2 \rightarrow CO_2 + H_2O_2$

$$H_R = \sum H^o_{f(product)} \quad - \quad \sum H^o_{f(\ reactant)}$$

$$-869 = [2 \times H^°_{f\ (CO2)} + 2 \times H^°_{f\ (H2O)}]^- \ (H^o_{f(CH_3COOH)} + O)$$

$$-869 = [2 \times (-395) + 2 \times (-285)] - H^°_{f\ (CH3COOH)}$$

$$-869 = -790 - 5\ 70 - H^°_{f\ (CH3COOH)}$$

$$\therefore H^°_{f(CH_3\ COOH)} = 1360 - 869 = -491 \text{ kJ}$$

742. If enthalpies of formation for $C_2H_4(g)$, $CO_2(g)$ and $H_2O(l)$ at 25°C and 1 atm pressure be 52, –394 and –286 kJ mol^{-1} respectively, then the enthalpy of combustion of $C_2H_4(g)$ will be

(a) –141.2 kJ mol^{-1} (b) –1412 kJ mol^{-1}

(c) +141.2 kJ mol^{-1} (d) +1412 kJ mol^{-1}

UPTU/UPSEE-2016

Ans. (b): equation ____(i) $\Delta H_1 = -52 \text{ kJ mol}^{-1}$

equation ____(ii) $\Delta H_2 = -394 \text{ kJ mol}^{-1}$

equation ____(iii) $\Delta H_3 = -286 \text{ kJ mol}^{-1}$

@apna_pdf

Reaction involved for combustion of C_2H_4 (g) IS,

$C_2H_4 + 3O_2 \rightarrow 2CO_2,\ \Delta H = ?$

2X [E.q (ii) + Eq. (iii)]– Eq(i), we get Eq. (iv)

$\Delta H = 2[\Delta H_2 + \Delta H_3] - \Delta H_1$

$= 2\,[-394 - 286] - 52$

$= -1360 - 52 = -1412$ kJ mol^{-1}

743. The enthalpy of combustion for the H_2, cyclohexene and cyclohexane are –241, –3800 and –3920 kJ mol^{-1}, respectively. Heat of hydrogenation of cyclohexene is

(a) 121 kJ mol^{-1} (b) – 121 kJ mol^{-1}

(c) + 242 kJ mol^{-1} (d) – 242 kJ mol^{-1}

UPTU/UPSEE-2015

Ans. (b) : $H_2 + \frac{1}{2}O_2 \rightarrow H_2O \quad -\ 241\,kJ\,mol^{-1}$

$C_6H_{10} + \frac{17}{2}O_2 \rightarrow 6CO_2 + 5H_2O - 3800\,kJ\,mol^{-1}$

$C_6H_{12} + 9O_2 \rightarrow 6CO_2 + 6H_2O - 3920\,kJ\,mol^{-1}$

Adding eqn.(1) and subtracting (3)

ΔH Hydrogen = –241+(–3800) – (–3920)

$= -121\ kJ\,mol^{-1}$

744. Heat of formation of H_2O is –188 kJ/mol and H_2O_2 is 286 kJ/mol. The enthalpy change for the reaction; $2H_2O_2 \longrightarrow 2H_2O + O_2$ is

(a) 196 kJ (b) –196 kJ

(c) 984 kJ (d) –984 kJ

UPTU/UPSEE-2014

Ans. (b) : $2H_2O_2 \rightarrow 2H_2O + O_2$

$H_2 + \frac{1}{2}O_2 \rightarrow H_2O \qquad \Delta H = -188 \quad (i)$

$H_2 + O_2 \rightarrow H_2O_2 \qquad \Delta H = 286 \quad (ii)$

$\Delta H°$ = Product – Reactant

= 2 × 188 – 2 × 286

= 376 – 572

$\Delta H° = -196$

745. For the reaction,

$$A(g) + 2B(g) \longrightarrow 2C(g) + 3D(g)$$

The change of enthalpy at 27°C is 19 kcal. The value of ΔE is

(a) 21.2 kcal (b) 17.8 kcal

(c) 18.4 kcal (d) 20.6 kcal

UPTU/UPSEE-2013

Ans. (b) : $\Delta n_g = 5 - 3 = 2$

$\Delta H = 19$ kcal

$= 19 \times 10^3$ cal.

$\Delta E = \Delta H - \Delta n_g RT$

$= 19 \times 10^3 - (2 \times 2 \times 300)$

= 17.8 kcal

746. If standard enthalpies of formation of CaCl (s) (hypothetical) and that of $CaCl_2$ (s) are – 188 J mol^{-1} and –795 kJ mol^{-1} respectively. calculate the value of standard heat of reaction for the following disproportionation reaction

$$2CaCl(s) \longrightarrow CaCl_2(s) + Ca(s)$$

(a) – 607 kJ mol^{-1} (b) + 607 kJ mol^{-1}

(c) – 419 kJ mol^{-1} (d) + 419 kJ mol^{-1}

UPTU/UPSEE-2012

Ans. (c) : Given that, ΔH_f^o (CaCl) = –188 kJ/mol

ΔH_f^o ($CaCl_2$) = –795 kJ/mol

Standard heat of reaction,

$\Delta H^{\circ} = \Delta H_P^{\circ} - \Delta H_R^{\circ}$

$= \Delta H_f^o(CaCl_2) + \Delta H_f^o(Ca) - 2\ \Delta H_f^o(CaCl)$

$= -795 + 0 - 2 \times (-188)$

$= -795 + 376 = -419\ kJ\,mol^{-1}$

747. Given, $H_2O\,(l) \rightarrow H_2O(g);\ \Delta H_1 = +43.7$ kJ $H_2O(s) \rightarrow H_2O(l);\ \Delta H_2 = +6.05$ kJ Calculate the enthalpy of sublimation of ice.

(a) 49. 75 kJ mol^{-1} (b) 37. 65 kJ mol^{-1}

(c) 43. 7 kJ mol^{-1} (d) 55. 23 kJ mol^{-1}

UPTU/UPSEE-2010

Ans. (a) : Given that,

$H_2O(l) \rightarrow H_2O(g)$, ΔH = +43.7 kJ

$H_2O(s) \rightarrow H_2O(l)$, ΔH = +6.05 kJ

We know that,

$\Delta H_{sublimation} = \Delta H_{fusion} + \Delta H_{vap.}$

= 43.7 + 6.05

= 49.75 kJ mol^{-1}

748. The heat of formations of CO_2(g), $H_2O(l)$ and CH_4(g) are –400 kJ mol^{-1}, –280 kJ mol^{-1} and –70 kJ mol^{-1} respectively. The heat of combustion of CH_4 in kJ mol^{-1} is

(a) 890 (b) –160

(c) –890 (d) –90

UPTU/UPSEE-2008

Ans. (c) : Given,

$\Delta H_f(CO_2, g) = -400$ kJ mol^{-1}

$\Delta H_f(H_2O, l) = -280$ kJ mol^{-1}

$\Delta H_f(CH_4, g) = -70$ kJ mol^{-1}

$\Delta H_c(CH_4, g) = ?$

$CH_4 + 2O_2 \rightarrow CO_2 + 2H_2O$

$\Delta H_r = \Delta H_f$ (product) – ΔH_f (reactant)

$= \Delta H_f(CO_2, g) + 2 \times \Delta H_f(H_2O, g) - [\Delta H_f(CH_4, g) + 2 \times \Delta H_f(O_2, g)]$

= [–400 + 2 × (–280)] – [–70 + 0]

= –400 – 560 + 70

= –890 kJ mol^{-1}

749. The value of ΔH for cooling 2 mole of an ideal monoatomic gas from 225°C to 125°C to at constant pressure will be $\left[\text{given } C_p = \frac{5}{2}R\right]$

(a) 250 R (b) –500 R

(c) 500 R (d) – 250 R

WB-JEE-2014

@apna_pdf

Ans. (b) : Given, $T_i = 225°C$, $T_f = 125°C$

$$\Delta H = -nC_p \Delta T$$

$$= -2\times\frac{5}{2}R(225-125)$$

$$= -500R$$

750. Which of the following plots represent an exothermic reaction?

(a) ln K_p 
(b) ln K_p 
(c) ln K_p 
(d) ln K_p 
WB-JEE-2016

Ans. (a) : $\ln K_p = \frac{\Delta H}{2.303T}$

When log K_p is againest plotted 1/T, then the slope is $-\frac{\Delta H}{2.303T}$ and the intercept is constant.

For an exothermic reaction, ΔH is negative. So, when log K_p is plotted against 1/T, it's straight line with positive slope and positive intercept.

5. Bond Energy

751. Bond enthalpies of A_2, B_2 and AB are in the ratio 2 : 1 : 2. If bond enthalpy of formation of AB is –100kJ mol^{-1}. The bond enthalpy of B_2 is

(a) 100 kJ mol^{-1}
(b) 50 kJ mol^{-1}
(c) 200 kJ mol^{-1}
(d) 150 kJ mol^{-1}

Kerala-CEE-29.08.2021

Ans. (c) : Given that,

$A_2 : B_2 : AB = 2 : 1 : 2$

$$\Delta H_{AB} = -100\ kJmol^{-1}$$

The following reaction take place -

$$A_2 + B_2 \rightarrow 2AB$$

or $$\frac{1}{2}A_2 + \frac{1}{2}B_2 \rightarrow AB$$

We can calculate the bond enthalpy of B_2 by the give equation -

$$\frac{1}{2}\Delta H_{A_2} + \frac{1}{2}\Delta H_{B_2} - \frac{1}{2}\Delta H_{AB} = -100$$

or $$\frac{1}{2}\times 2x + \frac{x}{2} - 2x = -100$$

or $$x = 200\ kJmol^{-1}$$

752. Which one of the following arrangements shows the bonds H–H, C–C and Si–Si in order of increasing bond energy?

(a) Si–Si < C–C < H–H
(b) C–C < H–H < Si–Si
(c) H—H < Si–Si < C–C
(d) H—H < C–C < Si–Si

SCRA 2012

Ans. (a) : Si–Si = (340 kJ/mole)
C–C = (347 kJ/mole)
H–H = (432 kJ/mole)

Greater the size of the atom, greater is the bond length and less is the bond energy. Si has more size than C and H. So the bond length between Si-Si is more and the bond dissociation energy will be less. So, the correct order is Si-Si<C-C<H-H

753. If the mass defect of a nuclide is 3.32 × 10^{-26} g, its binding energy is .... MeV.

(a) 9.31
(b) 18.62
(c) 27.93
(d) 37.24

A.P.EAMCET/2003

Ans. (b) : Given mass defect = 3.32 × 10^{-26} gm.

or $$\text{mass defect} = \frac{3.32\times10^{-26}}{1.66\times10^{-24}}\ u$$
$$= 2 \times 10^{-2}\ u$$

∴ Binding energy = mass defect × 931 MeV
= 2 × 10^{-2} × 931 MeV
= 18.62 MeV

754. If the mass defect of $_5B^{11}$ is 0.081 u, its average binding energy (in MeV) is :

(a) 8.60
(b) 6.85
(c) 5.60
(d) 5.86

A.P.EAMCET/2008

Ans. (b) : Given : Δm = 0.081 u.
Number of nucleons = 11

∴ Binding energy = Δm × 931 MeV
= 0.081 × 931
= 75.411 MeV

and average binding energy

$$= \frac{\text{Binding energy}}{\text{Number of nucleons}}$$

$$= \frac{75.411}{11}$$

= 6.85 MeV.

755. Given, the bond energies of $N \equiv N, H-H$ and $N-H$ bonds as 945, 436 and 391 kJ/mol respectively, the enthalpy of the reaction $N_2(g) + 3H_2(g) \rightarrow 2NH_3(g)$, is

(a) – 93 kJ
(b) 102 kJ
(c) 90 kJ
(d) 105 kJ

(A.P.EAMCET-1992)

Ans. (a) : Given, the reaction is

$$N_2 + 3H_2 \longrightarrow 2NH_3$$

Bond energy of $N \equiv N = 945$ kJ/mole.

Bond energy of $3(H-H) = 3\times436 = 1308$ kJ / mole

Bond energy of $6(N-H) = 6\times391 = 2346$ kJ/mole

∴ Enthalpy of reaction = reactant – product

$$= 945 + 1308 - 2346$$
$$= 2253 - 2346$$
$$= -93\ kJmol^{-1}$$

756. Average C–H bond energy is 416 kJ mol^{-1}. Which of the following is correct?

(a) $CH_4(g) + 416kJ \longrightarrow C(g) + 4H(g)$

(b) $CH_4(g) \longrightarrow C(g) + 4H(g) + 416\ kJ$

@apna_pdf

(c) $CH_4(g) + 1664\text{ kJ} \longrightarrow C(g) + 4H(g)$

(d) $CH_4(g) \longrightarrow C(g) + 4H(g) + 1664\text{ kJ}$

(A.P.EAMCET-2004)

Ans. (c) : CH_4 consists of C-H bonds.
To break CH_4 into C and 4H, the energy required =
$4 \times 416 = 1664$ kJ
∴ The requirement satisfied by the following.
$CH_4(g) + 1664\text{ kJ} \rightarrow C(g) + 4H(g)$

757. Which one of the following order is correct for the bond energies of halogen molecules?

(a) $I_2 > Cl_2 > Br_2$ (b) $Br_2 > Cl_2 > I_2$
(c) $I_2 > Br_2 > Cl_2$ (d) $Cl_2 > Br_2 > I_2$

AP EAMCET (Engg.) 2001

Ans. (d) : Bond dissociation energy of halogen family decreases down the group as the size of atom increase

Bond energy of halogen $\propto \dfrac{1}{\text{size of halogens}}$

Therefore, the order of bond energy is,
$Cl_2 > Br_2 > I_2$

758. Find the ΔH^o for the reaction $H_2O(g) + Br_2(g) \rightarrow HBr(g) + HOBr(g)$ using:
Bond energy of O – H bond in Water = 463 kJ
Bond energy of Br– Br bond in Br_2= 192 kJ
Bond energy of O – Br bond in HOBr= 234 kJ
Bond energy of H–Br bond in HBr= 364 kJ

(a) 655 kJ. mol^{-1} (b) 598 kJ. mol^{-1}
(c) 57 kJ. mol^{-1} (d) 192 kJ. mol^{-1}

AP EAPCET-6 Sep. 2021, Shift-II

Ans. (c):
The heat of reaction can be calculated based on the standard heat of formation of all reactants involved.

$$\Delta H^o = [(234+364)-(463+192)]$$
$$= 598 - 655$$
$$= -57\text{ kJ mol}^{-1}$$

759. The decreasing order of bond dissociation energies of C–C, C–H and H–H bonds in

(a) H–H> –C–H> –C–C–
(b) –C–C–> C–H> H–H
(c) –C–H> –C–C–> H–H
(d) –C–C–> H–H> –C–H

AP EAMCET (Engg.) -2007

Ans. (a) : Bond dissociation energies depend on the strength of the bonds. Higher the strength, the greater is the energy.

The bond strength depend upon the extent of overlapping which is dependent on the size of each overlapping atom. smaller the size of the atom, more will be the bond strength.

H–H> –C–H> –C–C–

760. Find the approximate value of $(\Delta H - \Delta U)$ in J. mol^{-1}, for the formation of CO from its elements at 298 K. (R = 8.314. J.K^{-1}. mol^{-1})

(a) –1238 (b) 1238
(c) 2477 (d) –2477

AP EAPCET 20.08.2021 Shift-II

Ans. (b): Given that
T = 298K
R = 8·314 J.K^{-1}. mol^{-1}

$$C(s) + \frac{1}{2}O_2(g) \rightarrow CO(g)$$

$$\Delta n_g = 1 - \frac{1}{2} = 0.5$$

$\therefore \Delta H = \Delta U + \Delta n_g RT$ ....(1)
putting these value in eq^n. (i) we get-
$\Delta H - \Delta U = 0.5 \times 8.314 \times 298$
or $\Delta H - \Delta U = 1238$ J/mol

761. Assertion: For a reaction

$$\mathbf{2NH_3(g) \rightarrow N_2(g) + 3H_2(g); \Delta H > \Delta E}$$

Reason: Enthalpy change is always greater than internal energy change.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS-2008,2014

Ans. (c): $2NH_3(g) \longrightarrow N_2(g) + 3H_2(g)$

$$\Delta H = \Delta E + \Delta n_g RT$$
$$\Delta n_g = 4 - 2 = 2$$
$$\Delta_1 H = \Delta E + 2RT$$
$$\boxed{\Delta H > \Delta E}$$

When Δn_g is negative, then enthalpy may be less than internal energy. so, reason is incorrect.

762. AB, A_2 and B_2 are diatomic molecules. If the bond enthalpies of A_2, AB and B_2 are in the ratio 1:1:0.5 and enthalpy of formation of AB from A_2 and B_2 is – 100kJ mol^{-1}. What is the bond energy of A_2:

(a) 200kJ mol^{-1} (b) 100kJ mol^{-1}
(c) 300kJ mol^{-1} (d) 400kJ mol^{-1}

AIIMS-2012

Ans. (d): Bond energy of A_2 be X then bond energy of AB is also X and bond energy of B_2 is X/2
$A_2 + B_2 \longrightarrow 2AB,$

$$= \frac{1}{2}A_2 + \frac{1}{2}B_2 \rightarrow AB$$

$$\Delta H = -100\text{ kJ}$$

$$\text{Or} - 100 = \left(\frac{X}{2} + \frac{X}{4}\right) - X$$

$$\Rightarrow \quad -100 = \left(\frac{2X + X}{4}\right) - X$$

$$-100 = \frac{2X + X - 4X}{4}$$

$$\boxed{X = 400\text{ kJ}}$$

@apna_pdf

763. Given that $\Delta H_f(H) = 218$ kJ/mol, express the H–H bond energy in kcal/mol.

(a) 52.15 (b) 911
(c) 104 (d) 52153

VITEEE- 2009
AP EAMCET (Engg.)-2009

Ans. (c) : Given : $\Delta H_f(H) = 218$ kJ/mol

$\Delta H_f(H_2) = 2 \times 218 = 436$ kJ/mol

1kcal = 4.184 kJ

$$436 \text{ kJ/mol} = \frac{1}{4.184} \times 436$$

= 104 kcal/mol

Hence, H–H energy is 104.3 kcal/mol

764. The bond energies of F_2, Cl_2, Br_2 and I_2 are 155, 244, 193 and 151kJ/mol. The weakest bond will be in

(a) Cl_2 (b) I_2
(c) Br_2 (d) F_2

AMU 2002

Ans. (b) : I_2 has weakest bond among the halogens because due to big size of iodine, the bond length is 266pm. As well as bond length decreases, the bond dissociation energy increases- Hence, the correct option is (b).

765. The bond dissociation energies of four bonds C-A, C-B, C-D and C-E respectively 240, 382, 276, 486 kJ mol^{-1}. The atom with smallest size is

(a) A (b) B
(c) D (d) E

Assam CEE-2020

Ans. (d) : C–E bond has highest bond Energy, it means that the covalent bond C–E will be strongest. Smaller is the size of atom, stronger is the covalent bond.

We can see that C–D bond has the highest bond dissociation energy of 486 kJ mol^{-1}. Hence, it is most difficult to break

766. The bond dissociation enthalpy of gaseous H_2, Cl_2 and HCl are 435, 243 and 431 kJ mol^{-1} respectively. In the same unit, enthalpy of formation of HCl gas is

(a) – 92 (b) – 184
(c) + 92 (d) + 184

Assam CEE-2018

Ans. (a) : $H_2 + Cl_2 \rightarrow 2HCl$

For 1 mole of HCl-

$$\frac{1}{2}H_2 + \frac{1}{2}Cl_2 \longrightarrow HCl$$

Enthalpy of formation:

$$= \frac{1}{2}\left(BDE_{H_2} + BDE_{Cl_2}\right) - BDE_{HCl}$$

$$= 431 - \frac{1}{2}(435 + 243)$$

= –92 kJ.

767. The H – H bond energy is 430 kJ mol^{-1} and Cl – Cl bond energy is 240 kJ mol^{-1}, ΔH for HCl is –90 kJ, The H – Cl bond energy is about :

(a) 180 kJ mol^{-1} (b) 360 kJ mol^{-1}
(c) 213 kJ mol^{-1} (d) 425 kJ mol^{-1}

BCECE-2006

Ans. (d) : Given, Bond energy,

$H_2(g) \rightarrow 2H(g)$ $\Delta H_{(H)} = +430$ kJ mol^{-1}

$Cl_2(g) \rightarrow 2Cl(g)$ $\Delta H_{(Cl)} = +240$ kJ mol^{-1}

$\Delta H_{(HCl)} = -90$ kJ

$HCl(g) \rightarrow H(g) + Cl(g)$

$$\frac{1}{2}H_2 + \frac{1}{2}Cl_2 \rightarrow HCl$$

$\Delta H_{HCl} = \Delta H_{BE}$(Reactant) + ΔH_{BE}(Product) – BE of HCl

$$-90 = \frac{1}{2} \times 430 + \frac{1}{2} \times 240 - \text{BE of HCl}$$

B.E. of HCl = 215+120+90 = 305 + 120 = 425 kJ mol^{-1}

768. $CH_2 = CH_2(g) + H_2(g) \rightarrow CH_3 - CH_3(g)$

The heat of reaction is [bond energy of $C - C = 80$ kcal, $C = C = 145$ kcal, $C - H = 98$ kcal, $H - H = 103$ kcal]

(a) –14 kcal (b) –28 kcal
(c) –42 kcal (d) – 56 kcal

BCECE-2004

Ans. (b) : Bond energy of C–C = 80 kcal

C=C = 145 kcal

C–H = 98 kcal

H–H = 103 kcal

Bond energy of reactant,

= BE of (1 × C=C + 4 × C–H + H–H)

= 145 + 4 × 98 + 103

= 640 kcal

Bond energy of product = BE of (C–C + 6 × C–H)

= (80 + 6 × 98)

= 668

ΔH_0 (Reaction) = Σbond energy of react – Σbond energy of product

= 640 – 668

= –28 kcal

769. Internal energy is sum of

(a) kinetic energy and potential energy
(b) all types of energy of the system
(c) energy of internal system
(d) None of the above

BCECE-2008

Ans. (b) : Internal energy is the energy associated with every substance, depending on the chemical nature, temperature, pressure and volume. It is the sum of many Pressure and volume. It is the sum of many type of energies such as translational energy, rational energy vibrational energy, electronic energy etc.

$U = U_{trans} + U_{rotat} + U_{vib} + U_{bonding} + U_{electronic}$

770. The C–C bond dissociation energy in kcal/mol is–

(a) 8.1 (b) 0.81
(c) 81 (d) 810

BCECE-2009

Ans. (c) : C–C Bond the amount of bond dissociation Energy is 81 kcal/mol (or 347 kJ/mol).

@apna_pdf

771. The following is endothermic reaction

(a) Decomposition of water
(b) Conversion of graphite to diamond
(c) Dehydrogenation of ethane to ethylene
(d) All of the above

BCECE-2010

Ans. (d) : The reaction during which heat is observed known as endothermic reaction.
(A) Combustion is always an exothermic procure.
(B) Decomposition of H_2O requires energy
(C) Dehydrogenation is an endothermic reaction.
(D) Graphite is more stable than diamond and energy in needed to convert graphite into diamond.

772. The energy that opposes dissolution of a solvent is

(a) hydration energy (b) lattice energy
(c) internal energy (d) bond energy

BITSAT 2006

Ans. (b) : Lattice energy opposes dissolution of a solvent. Lattice energy is the amount of energy required to dissociate 1 mole of ionic crystals into ions. If hydration energy of solid is more than lattice energy, then solid dissolves.

773. At 298 K temperature the activation energy for the reaction $x_2 + y_2 \rightarrow 2xy + 20kJ$ is 15 kJ.

What will be the activation energy for the reaction $2xy \rightarrow x_2 + y_2$?

(a) – 15 kJ (b) + 35 kJ
(c) –5 kJ (d) – 35 kJ

GUJCET-2017

Ans. (b) : ΔH_R = activation energy of forward reaction– activation energy of backward reaction–

∵ $-20 = 15 - x$

So, $x = +35$ kJ

774. The following reaction is performed at 298K

$$2NO(g) + O_2(g) \rightleftharpoons 2NO_2(g)$$

The standard free energy of formation of NO(g) is 86.6 kJ/mol at 298 K. What is the standard free energy of formation of NO_2 (g) at 298 K? ($K_p = 1.6 \times 10^{12}$)

(a) $R(298)\ In\ (1.6\times10^{12}) - 86600$
(b) $86600 + R(298)\ In\ (1.6\times10^{12})$
(c) $86600 - \dfrac{In(1.6\times10^{12})}{R(298)}$
(d) $0.5\ [2\times86600 - R\ (298)\ 1n\ (1.6\times10^{12})]$

[JEE Main 2015]

Ans. (d) : Given, $\Delta G^\circ_{f(NO)} = 86.6 kJ/mol$

$\Delta G^\circ_{f(NO_2)} = ?$, $K_p = 1.6 \times 10^{12}$

For the given reaction, $2NO(g) + O_2(g) \rightleftharpoons 2NO_2(g)$

$\Delta G^\circ = -RT\ InK_p$ ____(1)

$\Delta G^\circ_{rex.} = 2\,\Delta G^o_{f\ (NO2)} - 2\,\Delta G^o_{f\ (NO)}$ ____(2)

From equation (1) and (2)

$2\,\Delta G^o_{f\ (NO2)} - 2\,\Delta G^o_{f\ (NO)} = -RT\ InK_p$

$\Delta G^o_{f\ (NO2)} = 0.5 \times [2\,\Delta G^o_{f\ (NO)} - RT\ InK_p]$

$\Delta G^o_{f\ (NO2)} = 0.5 \times [\ 2\times86600 - R\ (298)\ ln\ 1.6\times10^{12}]$ J/mol

775. If at 298 K, the bond energies of $C—H, C—C, C=C$ and $H—H$ bonds are respectively 414,347,615 and 435 kJ mol^{-1}, the value of enthalpy change for the reaction,

$H_2C=CH_2\ (g) + H_2\ (g) \longrightarrow H_3C—CH_3$ at 298 K will be

(a) +250 kJ (b) –250 kJ
(c) +125 kJ (d) –125 kJ

AIEEE-2003

Ans. (d) : Given, $H_2C = CH_2 + H_2 \rightarrow H_3C - CH_3$

C–H = 414 kJ/mol
C – C = 347 kJ/mol
C = C = 615 kJ/mol
H – H = 435 kJ/mol

$\Delta H = 4\Delta H_{C-H} + \Delta H_{C=C} = \Delta H_{H-H} - \Delta H_{C-C} - 6\Delta H_{C-H}$

$\Delta H_{C=C} = \Delta H_{H-H} - \Delta H_{C-C} - 2\Delta H_{C-H}$

$= 615 + 435 - 347 - 2 \times 414 = -125$ kJ

776. Assuming that water vapour is an ideal gas, the internal energy change (ΔE) when 1 mole of water is vaporised at 1 bar pressure and 100°C, (Given : molar enthalpy of vaporisation of water at 1 bar and 373 K = 41 kJ mol^{-1} and R = 8.3 J mol^{-1} K^{-1}) will be

(a) 4.100 kJ mol^{-1} (b) 3.7904 kJ mol^{-1}
(c) 37.904 kJ mol^{-1} (d) 41.00 kJ mol^{-1}

AIEEE-2007

Ans. (c) : Given that,

Enthalpy, ΔH = 41 kJ/mol
= 41000 J/mol

Temperature = 100°C
= 373 K

n_g = 1mol – 0 mol = 1mol

R = 8.314 J/mol °K

So, we know that, $\Delta H = \Delta U + n_gRT$

$\Delta U = \Delta H - n_gRT$
$= 41000 - 1 \times 8.314 \times 373$
$= 41000 - 3101.122$
$= 37.89$ kJ/mol

777. The standard enthalpy of formation of NH_3 is –46.0 kJ mol^{-1}. If the enthalpy of formation of H_2 from its atoms is –436 kJ mol^{-1} and that of N_2 is –712 kJ mol^{-1}, the average bond enthalpy of N – H bond in NH_3 is

(a) –964 kJ mol^{-1} (b) +352 kJ mol^{-1}
(c) +1056 kJ mol^{-1} (d) –1102 kJ mol^{-1}

AIEEE-2010

Ans. (b) : Given, $\Delta H^\circ_f(NH_3) = 46\,kJ\,mol^{-1}$

$\Delta H^\circ_f(H_2) = -436\,kJ\,mol^{-1}$

And, $\Delta H^\circ_f(N_2) = -712\,kJ\,mol^{-1}$

$\frac{1}{2}N_2 + \frac{3}{2}H_2 \rightarrow NH_3\ ;\ \Delta H = -46.0$ KJ ....(i)

@apna_pdf

$2H \rightarrow H_2$; $\Delta H = -436$ KJ ....(ii)
$2N \rightarrow N_2$; $\Delta H = -712$ KJ ....(iii)

By equation (i) + $\left(\frac{3}{2}\times(ii)\right) + \left(\frac{1}{2}\times(iii)\right)$

Thus,

$3H + N \rightarrow NH_3$;

$$\Delta H = -46.0 + \frac{3}{2}\times(-436.0) + \frac{1}{3}\times(-712)$$
$$= -46 - 654 - 356.0$$
$$= -1056$$

$\therefore$ N–H bond energy = $\frac{+1056}{3} = +352\,KJ$

778. What will be the enthalpy of formation of NO_2 from the given bond dissociation enthalpy values? The bond dissociation enthalpy values for O_2, NO and NO_2 are as follows, $O_{2(g)}$: 0kJ/mol, $NO_{(g)}$: 90.25 kJ/mol and $NO_{2(g)}$: 33.18 kJ/mol respectively.

(a) +114.1kJ (b) +52.7kJ
(c) −52.7kJ (d) −114.1kJ

J & K CET-(2018)

Ans. (d) : Given, $O_2(g)$ = 0 kJ/mol, NO(g) = 90.25 kJ/mol, $NO_2(g)$ = 33.18 kJ/mol

$$2\,NO\,(g) + O_2(g) \rightleftharpoons 2NO_2\,(g)$$

$\Delta H^o_{Reaction} = \Sigma\Delta H_f$ (product) − ΔH_f (reactants)

= (2×33.18) − (2×90.25+0)

$\Delta H^o_{Reaction} = -114.1$ kJ

779. The bond energy of an O–H bond is 109 kcal/mol. When a mole of water is formed, then

(a) 109 kcals is released
(b) 218 kcals is absorbed
(c) 109 kcals is absorbed
(d) 218 kcals is released

J & K CET-(2003)

Ans. (d) : Bond energy of a O – H bond = 109 kcal/mol

When one mole of H_2O is formed, energy will be released.

Therefore, heat released = −109×2
= −218 kcal/mol

$\therefore$ Energy released in the formation of 1 mole of water = 218 kcal/mol

780. The dissociation energy of CH_4 and C_2H_6 to convert them into gaseous atoms are 360 and 620 kcal/mol respectively. The bond energy of C-C bond is

(a) 130 kcal/mol (b) 80 kcal/mol
(c) 180 kcal/mol (d) 260 kcal/mol

J & K CET-(1998)

Ans. (b) : Given,

Dissociation energy of CH_4 = 360 kcal/mol

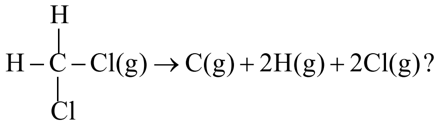
B.E. of C–H $= \frac{360}{4} = 90\,kcal$

Bond energy of ethane (C_2H_6),

1(C–C) + 6(C–H) = 620 kcal/mol
C–C + 6 × 90 = 620
C–C = 620 – 540
C–C = 80 kcal/mol

Bond energy of C–C bond = 80 kcal/mol

781. What is the △H of the reaction



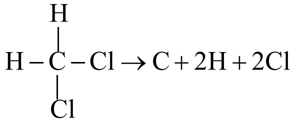
$$H-\overset{H}{\underset{Cl}{C}}-Cl(g) \rightarrow C(g) + 2H(g) + 2Cl(g)?$$

The average bond energies of C–Cl bond and C–H bond are 416 kJ and 325 kJ mol^{-1} respectively.

(a) 1482 kJ (b) 1482 J
(c) 1492 kJ (d) 1492 J

JIPMER-2010

Ans. (a): Given, Bond energy of C–Cl = 416 kJ/mol and bond energy of C–H = 325 kJ/mol



$$H-\overset{H}{\underset{Cl}{C}}-Cl \rightarrow C + 2H + 2Cl$$

$\Delta H = \Sigma BE_R - \Sigma BE_P$
$= 2 \times BE_{(C-H)} + 2BE_{(C-Cl)}$
$= 2 \times 416 + 2 \times 325$
$= 832 + 650$
$= 1482$ kJ

782. Given that, for the reaction,

$$\mathbf{\frac{1}{2}H_2 + \frac{1}{2}Cl_2 \rightarrow HCl}$$

$\Delta H_{f(HCl)} = -93$ kJ/mol
$B.E_{(H_2)} = 434$ kJ/mol
$B.E_{(Cl_2)} = 242$ kJ/mol

The bond dissociation energy of HCl is

(a) 232 kJ/mol (b) 331 kJ/mol
(c) 431 kJ/mol (d) 530 kJ/mol

JIPMER-2018

Ans. (c) : $\frac{1}{2}H_2 + \frac{1}{2}Cl_2 \rightarrow HCl$

BE = Reactant – Product
$\Delta H_{f\,(HCl)} = -93$ kJ/mole
$BE_{(H-H)} = 434$ kJ /mole
$BE_{(Cl-Cl)} = 242$ kJ /mole
Bond dissociation energy of HCl is

$$\Delta H_{f(H-Cl)} = \left(\frac{1}{2}BE_{(H-H)} + \frac{1}{2}BE_{(Cl-Cl)}\right) - BE_{(HCl)}$$

$$-93 = \left(\frac{1}{2}\times 434 + \frac{1}{2}\times 242\right) - BE_{(HCl)}$$

$-93 = (217 + 121) - BE_{(HCl)}$
$BE_{(HCl)} = 338 + 93$
$\Delta H = 431$ kJ/mol

783. Two moles of an ideal gas is expanded isothermally and reversibly at 300 K from 1L to 10 L. The enthalpy change in kJ is

@apna_pdf

(a) 11.4 kJ (b) 4.8 kJ
(c) –11.4 kJ (d) zero kJ

MHT CET-02.05.2019, SHIFT-II

Ans. (d) : We know,

$$\Delta H = \Delta U + \Delta n_g RT$$

Given, process is isothermal (i.e. $\Delta T = 0$)

Hence, Internal energy is also zero because it is a function of temperature.

$$\Delta H = 0 + 0 = 0$$

784. Identify the equation in which change in enthalpy is equal to change in internal energy

(a) $2H_2O_2(l) \rightarrow 2H_2O(l) + O_2(g)$
(b) $C(s) + O_2(g) \rightarrow CO_2(g)$
(c) $PCl_5(g) \rightarrow PCl_3(g) + Cl_2(g)$
(d) $N_2(g) + 3H_2(g) \rightarrow 2NH_3(g)$

MHT CET-02.05.2019, SHIFT-II

Ans. (b) : Change in enthalpy and internal energy given as–

$\Delta H = \Delta U + \Delta n_g RT$
(a) $2H_2O_2(l) \rightarrow 2H_2O(l) + O_2(g)$
$\Delta n_g = 1$
$\Delta H = \Delta U + \Delta n_g RT$
$\therefore$ $\Delta H = \Delta U + RT$
(b) $C(S) + O_2(g) \rightarrow CO_2(g)$
$n_g = 1 - 1 = 0$
$\Delta H = \Delta U + \Delta n_g RT$
$\Rightarrow$ $\Delta H = \Delta U$
(c) $PCl_5(g) \rightarrow PCl_3(g) + Cl_2(g)$
$\Delta n_g = 2 - 1 = 1$
$\Delta H = \Delta U + \Delta n_g RT$
$\Delta H = \Delta U + RT$
(d) $N_2(g) + 3H_2(g) \rightarrow 2NH_3(g)$
$\Delta n_g RT = 2 - 3 = -1$
$\Delta H = \Delta U + \Delta n_g RT$
$\Delta H = \Delta U - RT$

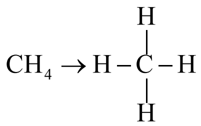
Equation given in option (b) has enthalpy change equal to internal energy change.

785. The bond energy is the energy required to

(a) dissociate one mole of the substance
(b) dissociate bond in 1 kg of the substance
(c) break one mole of similar bonds
(d) break bonds in one mole of substance

MHT CET-2007

Ans. (c) : Bond Energy is the measures of Bond strength in a chemical Bond it is the energy or Heat required to break one mole of molecule into their individual atom.



$$CH_4 \rightarrow H-\overset{\displaystyle H}{\underset{\displaystyle H}{\overset{|}{\underset{|}{C}}}}-H$$

786. If the bond energies of H–H, Br–Br, and H–Br are 433, 192 and 364 kJ mol^{-1} respectively, the ΔH^0 for the reaction $H_2(g) + Br_2(g) \rightarrow 2HBr(g)$ is

(a) –261 kJ (b) + 103 kJ
(c) + 261 kJ (d) – 103 kJ

Karnataka-CET-2016
NEET-2004

Ans. (d) : Given, Bond energy –

$BE_{H-H} = 433 kJ/mole = \Delta H$
$BE_{Br-Br} = 192$ kJ/Mole $= \Delta H$
$BE_{H-Br} = 364$ kJ/mole $= \Delta H$
$H_2(g) + Br_2(g) \rightarrow 2HBr(g)$
ΔH^o for the reaction
$\Delta H^o = \Sigma B.E_R - \Sigma B.E_P$
$= (BE_{(H-H)} + BE_{(Br-Br)}) - 2BE_{(H-Br)}$
$= (433+192) - 2(364)$
$= 625-728$
$\Delta H° = -103$ kJ

787. Given that bond energies of H – H and Cl – Cl are 430 kJ mol^{-1} and 240 kJ mol–1 respectively and ΔH_f for HCl is –90 kJ mol^{-1}, bond enthalpy of HCl is

(a) 380 kJ mol^{-1} (b) 425 kJ mol^{-1}
(c) 245 kJ mol^{-1} (d) 290 kJ mol^{-1}

NEET-2007

Ans. (b) : $H_2 + Cl_2 \rightarrow 2HCl$

$BE_{(H-H)} = 430$ kJ/mol
$BE_{(Cl-Cl)} = 240$ kJ/mol
$\Delta H(_{f\,HCl}) = -70$ kJ/mol
$\frac{1}{2}H_2 + \frac{1}{2}Cl_2 \rightarrow HCl$
$\Delta H_f = -90$ kJ/mol
$\Delta H_f = \frac{1}{2} BE_{(H-H)} + \frac{1}{2} BE_{(Cl-Cl)} - BE_{(HCl)}$
$-90 = \frac{1}{2} \times 430 + \frac{1}{2} \times 240 - BE_{(HCl)}$
$BE_{(HCl)} = 215 + 120 + 90$
$= 425$ kJ/mol

788. For the reaction

$$\mathbf{A(g) + 2B(g) \longrightarrow 2C(g) - 3D(g)}$$

the change of enthalpy at 27^o C is 19 kcal. The value of ΔE is: (R = 2.02 cal K^{-1} mol^{-1})

(a) 21.2 kcal (b) 17.8 kcal
(c) 18.4 kcal (d) 20.6 kcal

UPTU/UPSEE-2006

Ans. (b) : We know that, $\Delta H = \Delta E + \Delta n_g RT$

$\Delta n_g = 5 - 3 = 2$
$\Delta H = 19$ kcal
$= 19 \times 10^3$ cal.
$\Delta E = \Delta H - \Delta n_g RT$
$= 19 \times 10^3 - (2 \times 2 \times 300)$
$= 19000-1200 = 17800$ cal
$\simeq 17.8$ kcal

789. C-H bond energy is about 101 Kcal/mol for methane, ethane and other alkanes but is only 77 kcal/mol for C-H bond of CH_3 in toluene. this is because:

@apna_pdf

(a) of inductive effect due to -CH_3 in toluene of
(b) of the presence of benzene ring in toluene
(c) of resonance among the structures of benzyl radical in toluene
(d) aromaticity of toluene

UPTU/UPSEE-2005

Ans. (c) : C–H bond in toluene has partial double bond character due to resonance.

∴ C–H bond in toluene has less energy as compared to others.

6. Gibbs Energy Change and Equilibrium

790. Given below are two statements:

Statement I: According to the Ellingham diagram, any metal oxide with higher ΔG^o is more stable than the one with lower ΔG^o

Statement II: The metal involved in the formation of oxide placed lower in the Ellingham diagram can reduce the oxide of a metal placed higher in the diagram.

In the light of the above statements, choose the most appropriate answer from the options given below:

(a) Both Statement I and Statement II are correct.
(b) Both Statement I and Statement II are incorrect
(c) Statement I is correct but Statement II is incorrect.
(d) Statement I is incorrect but Statement II is correct.

JEE Main-26.06.2022, Shift-I

Ans. (d) : Higher value of ΔG^o like HgO, Ag_2O are less stable.

- In Ellingham diagram lower situated metals is more reactive, it can reduce higher metal oxide.

791. Standard entropies of X_2, Y_2 and XY_3 are 60, 40 and 50 /K/ mol respectively. At what temperature the following reaction will be at equilibrium.

$$\frac{1}{2}X_2+\frac{3}{2}Y_2 \rightleftharpoons XY_3, \Delta H = -30kJ$$

(a) 500 K
(b) 750 K
(c) 1000 K
(d) 1250 K

AP EAPCET 19-08-2021 Shift-I

Ans. (b) : Given, Standard entropies,

$S_{X_2} = 60\ Jk^{-1}\ mol^{-1}$ and $\Delta H = -30\ kJ$

$S_{Y_2} = 40\ Jk^{-1}\ mol^{-1}$

$S_{XY_3} = 50\ Jk^{-1}\ mol^{-1}$

$$\frac{1}{2}X_2+\frac{3}{2}Y_2 \rightleftharpoons XY_3$$

$$\Delta S = \sum S_{(Product)} - \sum S_{(Reactant)}$$

$$\therefore \Delta S_{Reaction} = 50 - \frac{3}{2}\times 40 - \frac{1}{2}\times 60 = 50 - 60 - 30$$

$$= -40\ Jk^{-1}\ mol^{-1}$$

From the Gibb's free energy equation-

$\Delta G = \Delta H - T\Delta S$ (for equilibrium $\Delta G = 0$)

$\therefore \quad \Delta H = T\Delta S$

$$\text{Or } T = \frac{\Delta H}{\Delta S} = \frac{-30\times 1000}{-40} = 750K$$

792. The temperature of K at which $\Delta G = 0$, for a given reaction with $\Delta H = -20.5\ kJ\ mol^{-1}$ and $\Delta S = -50.0\ JK^{-1}\ mol^{-1}$ is

(a) – 410
(b) 410
(c) 2.44
(d) 0.36

AP EAMCET (Engg.) -2014

Ans. (b) : Given, $\Delta H = -20.5\ kJ\ mol^{-1}$

$\Delta S = -50\ Jk^{-1}\ mol^{-1}$

$\Delta G = \Delta H - T\Delta S$

$0 = -(20500) - T(-50) \quad (\Delta G = 0)$

$20500 = 50T$

$\boxed{T = 410K}$

793. An endothermic reaction is found to have +ve entropy change. The reaction will be

(a) possible at high temperature
(b) possible only at low temperature
(c) not possible at any temperature
(d) possible at any temperature.

COMEDK-2015

Ans. (a) : Given, $\Delta S = +ve$ and $\Delta H = +ve$

Now, $\Delta G = \Delta H - T\Delta S$

For a reaction to be spontaneous, ΔG should be –ve, which is only possible at high temperature i.e. when $T\Delta S > \Delta H$.

794. The standard enthalpy of the decomposition of N_2O_4 to NO_2 is 58.04 kJ and standard entropy of this reaction is 176.7 J/K. Therefore the standard free energy changes for this reaction at 25°C is

(a) –5.39 kJ
(b) 539 kJ
(c) 5.39 kJ
(d) –539 kJ

COMEDK-2017

Ans. (c) : Given, that

Standard enthalpy of decompositions $(\Delta H) = 58.04kJ$;

Standard entropy $(\Delta S) = 176.7\ J/K$

$= 176.7\times 10^{-3}\ kJ/K.$

And temperature (T)= 25°C + 273 = 298K.

Change in free energy $(\Delta G) = \Delta H - T\Delta S$

$$= 58.04 - 298\times(176.7\times 10^{-3}) = 58.04 - 52.65$$

$$= 5.39\ kJ$$

795. The equilibrium constant of a reaction is 0.008 at 298 K. The standard free energy change of the reaction at the same temperature is

(a) +11.96 kJ
(b) –11.96 kJ
(c) –5.43 kJ
(d) –8.46 kJ

COMEDK-2020

@apna_pdf

Ans. (a) : Given, Equilibrium constant (K) = 0.008
Temperature (T) = 298 K, R = 8.314 J mol^{-1} K^{-1}

$$\Delta G^\circ = -2.303 RT \log K$$

$$\Delta G^\circ = -2.303 \times 8.314 \times 298 \times \log(0.008)$$

$$\Delta G^\circ = -5705.84 \times -2.09$$

$$\Delta G^\circ = 11964.65 = 11.96 \text{ kJ}$$

796. For the reaction

$$\mathbf{A(g) \rightleftharpoons B(g) \text{ at } 495\text{ K}, \Delta_r G^\circ = -9.478 \text{ kJ mol}^{-1}}$$

If we start the reaction in a closed container at 495 K with 22 millimoles of A, the amount of B in the equilibrium mixture is _____ millimoles. (Round off to the Nearest Integer).

$$\mathbf{\left[R = 8.314 \text{ J mol}^{-1} \text{ K}^{-1}; \ln 10 = 2.303\right]}$$

JEE Main 16.03.2021, Shift-I

Ans. (20) : Given, T = 495 K, $\Delta_r G = -9.478$ kJ mol^{-1}
R = 8.314 J mol^{-1} K^{-1}

For the reaction–

$$A(g) \rightleftharpoons B(g)$$

Now, From the relation between Gibb's free energy and rate constant—

$$\Delta G = -RT \ln(K)$$

$$-9.478 \times 10^3 = -8.321 \times 495 \times \ln(K)$$

or

$$\ln(K) = 2.203$$

or $\quad 2.303 \ln_{10}(K) = \ln 10 \qquad (\ln = 2.303)$

or

$$K = 10$$

Now, $\quad A(g) \rightleftharpoons B(g)$

$$t = 0 \quad 22 \qquad 0$$

$$t = T \quad 22 - x \qquad x$$

$$\therefore K = \frac{x}{22 - x} = 10$$

or

$x = 220 - 10x$ or $x = 20$

797. For the reaction A(g) → B(g), the value of the equilibrium constant at 300K and 1 atm is equal to 100.0. The value of $\Delta_r G$ for the reaction 300K and 1 atm in J mol^{-1} is – x R, where x is _____. (Rounded off to the interger) [R = 8.31 mol^{-1} K^{-1} and ln10 = 2.3]

JEE Main 24.02.2021, Shift-I

Ans. : (1380) Given that a reaction–

$$A(g) \rightarrow B(g)$$

K = 100
T = 300K
P = 1 atm
$\Delta G^\circ = -xR$ (J mol^{-1})
x = ?
Now,

$$\Delta G^\circ = -RT \ln(K)$$

or $\quad -8.31 \times 300 \times \log(10^2)$

$$\Delta G^\circ = -1380 R$$

Where, x = 1380R

798. Following reaction occurrs in an automobile

$$\mathbf{2C_8H_{18}(g) + 25O_2(g) \rightarrow 16CO_2(g) + 18H_2O(g)}$$

The sign of $\Delta H, \Delta S$ and ΔG would be

(a) +,–,+ (b) –,+,–
(c) –,+,+ (d) +,+,–

AIIMS-2015
NEET-1994

Ans. (b): For all combustion reaction ΔH is negative. As the number of gaseous molecules increases, entropy also increases i.e. +ve.
For a spontaneous process ΔG must be negative.

799. For a reaction to be spontaneous at all temperatures,

(a) $\Delta G = -ve, \Delta H = +ve$ and $\Delta S = +ve$
(b) $\Delta G = +ve, \Delta H = -ve$ and $\Delta S = +ve$
(c) $\Delta G = -ve, \Delta H = -ve$ and $\Delta S = -ve$
(d) $\Delta G = -ve, \Delta H = -ve$ and $\Delta S = +ve$

AIIMS-2008

Ans. (d): For Spontaneous reaction ΔG < O

$$\Delta G = (\Delta H - T\Delta S)$$

For spontanceous

$$\Delta G = -ve$$

$$\Delta H = -ve$$

$$\Delta S = +ve$$

800. A certain reaction is non spontaneous at 298K. The entropy change during the reaction is 121 JK^{-1}. Is the reaction is endothermic or exothermic ? The minimum value of ΔH for the reaction is

(a) endothermic, ΔH = 36.06 kJ
(b) exothermic, ΔH = – 36.06 kJ
(c) endothermic, ΔH = 60.12 kJ
(d) exothermic, ΔH = – 60.12 kJ

VITEEE, 2017

Ans. (a) : Given, For non spontaneous reaction
ΔG = + ve, ΔS = 121 JK^{-1}, ΔG = ΔH – TΔS
ΔG = + ve, Hence the reaction is endothermic.
The minimum value of ΔH can be obtained by putting ΔG = 0

$\therefore \quad \Delta H = T\Delta S$

$$\Delta H = 298 \times 121$$

$$\Delta H = 36.06 \text{ kJ.}$$

801. Standard entropies of X_2 , Y_2 and XY_3 are 60, 30 and 50 $JK^{-1}mol^{-1}$ respectively. For the reaction $\frac{1}{2}X_2 + \frac{3}{2}Y_2 \rightleftharpoons XY_3, \Delta H = -30$ kJ to be at equilibrium, the temperature should be:

(a) 750 K (b) 1000 K
(c) 1250 K (d) 500 K

AIPMT-2010

Ans. (a) : Given reaction is

$$\frac{1}{2}X_2 + \frac{3}{2}Y_2 \rightleftharpoons XY_3$$

@apna_pdf

$\Delta S = \Sigma S_{(product)} - \Sigma S_{(reactant)}$

$\Delta S = 50 - (60 + 30) = -40\ JK^{-1}\ mol^{-1}$

$\Delta H = -30\ KJ$

For equilibrium $\Delta G = 0$

$\Delta G = \Delta H - T\Delta S$

$\Delta H = T\Delta S$

$$T = \frac{\Delta H}{\Delta S} = \frac{-30\times10^3}{-40} = 750\,K.$$

802. The standard Gibb's free energy change, ΔG° is related to equilibrium constant, K_p as

(a) $K_p = -RT\ln\Delta G°$
(b) $K_p = \left[\frac{e}{RT}\right]^{\Delta G°}$
(c) $K_p = -\frac{\Delta G}{RT}$
(d) $K_p = e^{-\Delta G°/RT}$

VITEEE- 2010

Ans. (d) : According to Gibb's free energy.

$\Delta G = \Delta G° + RT\ln K_p$

For equilibrium condition $\Delta G = 0$

$\Delta G° = -RT\ln K_p$

$$\Rightarrow \ln K_p = \frac{-\Delta G°}{RT} \Rightarrow K_p = e^{-\Delta G°/RT}$$

ΔG° = Standard change in Gibb's free energy

K_p = Equilibrium constant

R = Universal gas constant

T = Temperature in Kelvin

803. For a cell reaction to be spontaneous, the standard free energy change of the reaction must be

(a) zero
(b) positive
(c) infinite
(d) negative

CGPET-2007
VITEEE- 2006

Ans. (d) : For spontaneous reaction free energy change is negative.

$\Delta G = -nFE$

Where F = Faraday constant

E = emf of the cell

804. For a reaction at equilibrium,

(a) $\Delta G = \Delta G° = 0$
(b) $\Delta G = 0$ but not $\Delta G°$
(c) $\Delta G° = 0$ but not ΔG
(d) $\Delta G = \Delta G° \neq 0$

SRMJEEE – 2008

Ans. (b) : As we know, Gibb's free change for any reaction in equilibrium condition is 0 i.e.

$\Delta G = \Delta G° + nRT\ln K$

or

$\Delta G° = -nRT\ln K$

805. Calculate ΔG° for the following cell reaction.

$$Zn(s) + Ag_2O(s) + H_2O(\ell) \rightarrow Zn_n^{2+}(aq.) + 2Ag(s) + 2OH^-(aq.)$$

$$E°_{Ag^+/Ag} = +0.80V \text{ and } E°_{Zn^{2+}/Zn} = -0.76V$$

(a) – 305 kJ/mol
(b) – 301 kJ/mol
(c) 305 kJ/mol
(d) 301 kJ/mol

AP-EAMCET (Engg.) 2015

Ans. (b) : Given that,

$Zn(s) + Ag_2O(s) + H_2O(l) \rightarrow Zn^{2+}(aq) + 2Ag(s) + 2OH^-(aq)$

$E°_{Ag^+/Ag} = +0.80V$ and $E°_{Zn^{2+}/Zn} = -0.76V$

$E°_{cell} = E°_{cathode} - E°_{anode}$

$\therefore\ E°_{cell} = 0.80 - (-0.76) = 1.56$ Volt

$\therefore\ \Delta G° = -nF E°_{cell}$

$\Delta G° = -2 \times 96500 \times 1.56$ (n = 2, F = 96500)

or $\Delta G° = -301$ kJ/mole

806. For the equilibrium, $PCl_5(g) \rightleftharpoons PCl_3(g) + Cl_2(g)$ at 298K. $K_c = 1.8\times10^{-7}$ then, ΔG for this reaction will be _____ [Given log 4.5 = 0.6484]

(a) $14.56\ kJ.\ mol^{-1}$
(b) $13.82\ kJ.\ mol^{-1}$
(c) $16.24\ kJ.\ mol^{-1}$
(d) $19.12\ kJ.\ mol^{-1}$

AP- EAPCET- 07-09-2021, Shift-I

Ans. (d) : Given $K_c = 1.8\times10^{-7}$

$\Delta G° = -RT\ln K_c$

$\Delta G° = -2.303RT\log_{10} K_c$

$\Delta G° = -2.303\times 8.31 \times 298\log_{10}(1.8\times10^{-7})$

$\Delta G° = -5703.103 \times \log_{10}(\log 1.8 + \log 10^{-7})$

$\Delta G° = -5703.103 \times (0.2553 - 7)$

$\Delta G° = 38465.87$

$\Delta G° = 38.46\ kJ\ mol^{-1}$

Note : The correct answer is 38.48 kJ/mole but official answer is 19.12 kJ/mole

807. In the process of ice melting at –15°C at atmospheric pressure,

(a) $\Delta G < 0$
(b) $\Delta G > 0$
(c) $\Delta G = 0$
(d) $\Delta G = \infty$

AMU – 2008

Ans. (b) : $\Delta G = \Delta H - T\Delta S$

ΔG = Positive (It means, Process is non spontaneous)

Then, Melting of ice below (0 °C / 273 k)

$\Delta G > 0$

808. The standard free energy change (ΔG°) is related to equilibrium constant (K) as

(a) $\Delta G° = -2.303\ RT\log K$
(b) $\Delta G° = RT\log K$
(c) $\Delta G° = 2.303\ RT\log K$
(d) $\Delta G° = -2.303\ RT\ln K$

Manipal-2018
AMU 2002

Ans. (a) : The relation between standard free energy change (ΔG°) and equilibrium constant (K) is given below-

$$\Delta G° = -2.303\ RT\log K$$

809. For a process to occur spontaneously

(a) $(\Delta H - T\Delta S)$ must be negative
(b) $(\Delta H + T\Delta S)$ must be negative
(c) ΔH must be negative
(d) ΔS must be negative

Assam CEE-2014

@apna_pdf

Ans. (a) : For a process to occurs spontaneously–

ΔG Must be Negative

$\Delta G < O$ (Negative)

$\Delta G = \Delta H - T\Delta S$

If ΔG = Negative

Then,

$(\Delta H - T\Delta S)$ must be Negative.

810. For the reduction of Ag^+ ions with copper metal the Standard cell potential was found to be 0. 46 V at 25° C. The value of standard Gibb's free energy will be

(a) -89.0 kJ mol^{-1} (b) -890 J mol^{-1}

(c) -44.5 kJ mol^{-1} (d) -98.0 kJ mol^{-1}

Assam CEE-2019

Ans. (a) : Given, $E^o_{cell} = 0.46$ V

$$Cu + 2Ag^+ \rightarrow Cu^{2+} + 2Ag$$

We know,

$$\Delta G^o = -nFE^o_{cell}\ (n = 2, F = 96500)$$
$$= -2\times 96500 \times 0.46 = -88780\ J]$$
$$= -88.780\ kJ \simeq -89kJ$$

811. For $CaCO_3(s) \rightleftharpoons CaO(s) + CO_2(g)$ at 927°C, $\Delta H = 176kJ\ mol^{-1}$ then ΔE is :

(a) 180 kJ (b) 186.4 kJ

(c) 166.0 kJ (d) 160 kJ

BCECE-2006

Ans. (c) : Given, $\Delta H = 176kJ\ mol^{-1}$,

$$T = 927°C + 273 = 1200\ K$$
$$\Delta H = \Delta E + \Delta n_g RT$$
$$176 = \Delta E + 8.314 \times 10^{-3} \times (273+927)$$
$$176 = \Delta E + 9.9768$$
$$\Delta E = 166\ KJ$$

812. For $A \longrightarrow B, \Delta H = 4k\ cal\ mol^{-1}$ $\Delta S = 10\ cal\ mol^{-1}$ reaction is spontaneous when temperature can be :

(a) 400 K (b) 300 K

(c) 500 K (d) none of these

BCECE-2004

Ans. (c) : Given, $\Delta H = 4k\ cal\ mol^{-1}$

$$\Delta S = 10\ cal\ mol^{-1}$$
$$\Delta G = \Delta H - T\Delta S$$

For spontaneous reaction, $\Delta G = -Ve$

$$T\Delta S > \Delta H$$

or $$T > \frac{\Delta H}{\Delta S} = \frac{4\times1000}{10}$$

$$T > 400$$

It means temperature Should be greater then 400K

813. For a system in equilibrium

(a) $\Delta G = 0$ (b) $\Delta G > 0$

(c) $\Delta G < 0$ (d) $\Delta H = 0$

BCECE-2009

Ans. (a) : If $\Delta G > 0$, then $K < 0$, and the reaction must proceed to the left to reach equilibrium.

If $\Delta G = 0$, then $K = 0$, and the reaction is at equilibrium.

When $\Delta G < 0$, then $K > 0$, it means reaction is spontaneous.

814. For a chemical reaction, ΔG is always less than zero (ΔG <0) if

(a) ΔH and $T\Delta S$ both are positive

(b) ΔH and $T\Delta S$ both are negative

(c) ΔH is negative and $T\Delta S$ is positive

(d) ΔH is positive and $T\Delta S$ is negative

CG PET -2019

Ans. (c) : For a chemical Reaction It $\Delta G < 0$ or Negative then

$$\Delta G = (\Delta H - T\Delta S)$$
$$\Delta G = -\Delta H + T\Delta S$$
$$\because \Delta H = -ve \text{ and } T\Delta S = +ve$$

815. Cell reaction is spontaneous when

(a) ΔG° is negative (b) ΔG° is positive

(c) ΔE°_{red} is positive (d) ΔE°_{red} is negative

CG PET -2007

Ans. (a) : $\Delta G = -NF\ E_{cell}$

E_{cell} is an intensive property but ΔG is an extensive property.

If the electrode potential is assumed to be positive then,

When $\Delta G < 0$, the spontaneous cell reaction.

When $\Delta G > 0$, the non-spontaneous cell reaction.

816. Which of the following relation is correct?

(a) $\Delta H = \Delta G + T\Delta S$ (b) $\Delta H = -\Delta G - T\Delta S$

(c) $\Delta H = \Delta G - T\Delta S$ (d) $\Delta H = -\Delta G + T\Delta S$

CG PET -2004

Ans. (a) :

Gibbs Free Energy

$$\Delta H = \Delta G + T\Delta S$$

Where, ΔH = enthalpy change

ΔS = entropy change

T = temperature

$$\Delta H = \Delta G + T\Delta S$$
$$\Delta G = \Delta H - T\Delta S$$

817. For a spontaneous reaction, the ΔG, equilibrium constant (K) and E°_{cell} will be respectively

(a) –ve, > 1, –ve (b) –ve, <1, –ve

(c) +ve, >1, –ve (d) –ve, >1, +ve

AIEEE-2005

Ans. (d) : We know

$\Delta G^o = -2.303\ RT \log K$

$\Delta G^o = -nFE^0_{cell}$

For spontaneous process

$K > 1$ and $E_{cell} = +ve$

and $\Delta G^o = -ve$

@apna_pdf

818. In an irreverible process taking place at constant T and p and in which only pressure-volume work is being done, the change in Gibbs free energy (dG) and change in entropy (dS), satisfy the criteria

(a) $(dS)_{V,E} < 0, (dG)_{T,p} < 0$
(b) $(dS)_{V,E} > 0, (dG)_{T,p} < 0$
(c) $(dS)_{V,E} = 0, (dG)_{T,p} = 0$
(d) $(dS)_{V,E} = 0, (dG)_{T,p} > 0$

AIEEE-2003

Ans. (b) : An irreversible process (i.e. spontaneous process)
$(ds)_{V,E}$ (change in entropy) = + ve > 0
$(dG)_{T,p}$ (change in Gibbs free energy) = –ve < 0

819. The correct relationship between free energy change in a reaction and the corresponding equilibrium constant K_c is

(a) $\Delta G = RT\ 1n\ K_c$
(b) $-\Delta G = RT\ 1nK_c$
(c) $\Delta G° = RT\ 1nK_c$
(d) $-\Delta G° = RT\ 1nK_c$

AIEEE-2003

Ans. (d) : $\Delta G = \Delta G° + RT\ln K_c$

K_c = Reaction quotient at equilibrium

$\Delta G = 0$ (at equilibrium)

Then,

$$\boxed{-\Delta G^o = RT\ln K_c}$$

820. A reaction is non-spontaneous at the freezing point of water but is spontaneous at the boiling point of water, then

	ΔH	**ΔS**
(a)	+ve	+ve
(b)	–ve	–ve
(c)	–ve	+ve
(d)	+ve	–ve

AIEEE-2002

Ans. (a) : We know,

$\Delta G = \Delta H - T\Delta S$

At lower temperature, process is non spontaneous. It means $\Delta G > 0$ and $\Delta H > 0$.
At high temperature, process is spontaneous. It means $\Delta G > 0$ and $\Delta S > 0$

821. In a fuel cell, methanol is used as fuel and oxygen gas is used as an oxidiser. The reaction is

$$CH_3OH(l) + \frac{3}{2}O_2(g) \longrightarrow CO_2(g) + 2H_2O(l)$$

At 298 K standard Gibb's energies of formation for $CH_3OH(l)$, $H_2O(l)$ and CO_2 (g) are –166.2, –237.2 and –394.4 kJ mol^{-1}, respectively. If standard enthalpy of combustion of methanol is –726 kJ mol^{-1}, efficiency of the fuel cell will be

(a) 80%
(b) 87%
(c) 90%
(d) 97%

AIEEE-2009

Ans. (d) : Given that,

$$\Delta G^o_{f(CH_3OH)} = -166.2 kJ\,mol^{-1}$$

$$\Delta G^o_{f(H_2O)} = -237.2\ kJ\ mol^{-1}$$

$$\Delta G^o_{f(CO_2)} = -394.4 kJ\,mol^{-1}$$

$$\Delta H = -726\ kJ\ mol^{-1}$$

$$\because \Delta G = \Sigma\Delta G^o_{f(products)} - \Sigma\Delta G^o_{f(reactant)}$$

$= -394.4 - 2\ (237.2) + 166.2$
$= -702.6\ kJ\ mol^{-1}$

now efficiency of fuel cell

$$= \frac{\Delta G}{\Delta H} \times 100$$

$$= \frac{702.6}{726} \times 100$$

$= 97\%$

822. The incorrect expression among the following is

(a) $\dfrac{\Delta G_{system}}{\Delta G_{total}} = -T$

(b) In isothermal process,

$$W_{reversible} = -nRT\ In \frac{V_f}{V_i}$$

(c) $\ln K = \dfrac{\Delta H° - T\Delta S°}{RT}$

(d) $K = e^{-\Delta G°/RT}$

AIEEE-2012

Ans. (c) : $\Delta G° = -RT\ lnK$ (i)

$\Delta G° = \Delta H° - T\Delta S°$ (ii)

from equation (i) and (ii)

$-(\Delta H° + T\Delta S°) = RT\ ln\ K$

$$\ln K = \frac{\Delta H° - T\Delta S°}{RT}$$

823. The standard reaction Gibbs energy for a chemical reaction at an absolute temperature T is given by,

$\Delta_r G° = A - BT$

Where A and B are non-zero constants.

Which of the following is true about this reaction?

(a) Endothermic if, A < 0 and B > 0
(b) Exothermic if, B < 0
(c) Exothermic if, A > 0 and B < 0
(d) Endothermic if, A > 0

JEE Main-2019, Shift-II

Ans. (d) : Given, $\Delta_r G° = A - BT$ ….(i)
We know that the relation,
$\Delta G° = \Delta H - T\Delta S$ ….(ii)
Comparing the equation.
$A = \Delta H,\ B = \Delta S$
If $\Delta H > 0$ it means reaction is endothermic

@apna_pdf

824. For the chemical reaction, $X \rightleftharpoons Y$, the standard reaction Gibbs energy depends on temperature T (in K) as

$\Delta_r G°$ (in kJ mol^{-1}) $= 120 - \frac{3}{8}T$

The major component of the reaction mixture at T is

(a) Y if T = 280 K (b) X if T = 350 K
(c) X if T = 315 K (d) Y if T = 300 K

JEE Main-2019, Shift-I

Ans. (c) : $\Delta_r G°$ (in kJ mol^{-1}) $= 120 - \frac{3}{8}T$

At equilibrium $\Delta G = 0$

$\therefore$ $T = 320$ K

$X \rightleftharpoons Y$

If $T > 320$ K

ΔG becomes negative

$\Delta G = -ve$

$Y > X$

$T < 320$

$X > Y$

825. A process will be spontaneous at all temperature if

(a) $\Delta H > 0$ and $\Delta S < 0$ (b) $\Delta H < 0$ and $\Delta S > 0$
(c) $\Delta H < 0$ and $\Delta S < 0$ (d) $\Delta H > 0$ and $\Delta S > 0$

JEE Main-2019, Shift-I

Ans. (b) : For spontaneous process at all temperature.
$\Delta G < 0$ and $\Delta H < 0$ and $\Delta S > 0$

826. The incorrect match in the following is

(a) $\Delta G° < 0, K > 1$ (b) $\Delta G° = 0, K = 1$
(c) $\Delta G° > 0, K < 1$ (d) $\Delta G° < 0, K < 1$

JEE Main-2019, Shift-II

Ans. (d) : $\Delta G = \Delta G^o + RT\ln K$

At equilibrium ($\Delta G = 0$)

$\Delta G^o + RT\ln K = 0$

$\Delta G^o = -RT\ln K$

If $K<1$

Then $\Delta G^o > 0$

827. For a dimerisation reaction

$2A(g) \longrightarrow A_2(g)$,

at 298 K, $\Delta U^\Theta = -20$ kJ mol^{-1},

$\Delta S^\Theta = -30$ JK^{-1} mol^{-1}, then the ΔG^Θ will be ....J.

JEE Main-2020, Shift-II

Ans. (13538)

Given that,

$\Delta G = \Delta H - T\Delta S$ ....(i)

$\Delta H = \Delta U + \Delta n_g RT$ ....(ii)

and

Δn_g = change gaseous moles of (product – reactant)

$\Delta n_g = (2–2) = -1$

$\Delta H = -20\times10^3 + (-1)(8.314)\times298$

$\Delta H = -22477.52$ J

and

$\Delta G = \Delta H - T\Delta S$

$= -22477.52 - (298) \times (-30)$

$= -13537.5$ J

$\simeq 13538$ J

828. For the reaction; $A(l) \longrightarrow 2B(g)$

$\Delta U = 2.1$ kcal, $\Delta S = 20$ cal K^{-1} at 300 K.

Hence, ΔG in kcal is..........

JEE Main-2020, Shift-I

Ans. (2.70) Given, R = 2 cal/mol-K

$\Delta U = 2.1$ kcal $= 2100$ cal

$\Delta S = 20$ cal K^{-1}

$T = 300$ K

$\Delta H = \Delta U + \Delta n_g RT$ ($\Delta n_g = 2–0 = 2$)

$= 2100 + 2 \times 2 \times 300$

$= 3300$ cal

$\Delta G = \Delta H - T\Delta S$

$= 3300 - 300 \times 20$

$= 2700$ cal

$= 2.7$ kcal

829. Which is the correct Gibb's Helmholtz equation?

(a) $\Delta H = \Delta G - T.\Delta S$ (b) $\Delta S = \frac{1}{T}[\Delta G - \Delta H]$

(c) $\Delta S = \frac{1}{T}[\Delta H - \Delta G]$ (d) $-\Delta G = \Delta H - T.\Delta S$

JCECE - 2003

Ans. (c): Equation of Gibb's free Energy

$\Delta G = \Delta H - T\Delta S$

$T\Delta S = \Delta H - \Delta G$

$\Delta S = \frac{1}{T}(\Delta H - \Delta G)$

830. If equilibrium constant is 2.6×10^{-8} at 298 K, then find the value of ΔG^o.

(a) - 43.36 kJ (b) - 63.2 kJ
(c) - 23.3 kJ (d) + 40 kJ

JIPMER-2019

Ans. (a) : Given, $K = 2.6\times10^{-8}$, $T = 298$ K

$R = 8.314$ J/k mol

$\Delta G^o = -2.303\, RT \log K$

$\Delta G^o = -2.303 \times 8.314 \times 298 \log(2.6 \times 10^{-8})$

$\Delta G^o = 432790.01$

$\Delta G^o = 43.27$ kJ

$\simeq 43.27$ kJ $\simeq 43.36$ kJ

831. When compared to ΔG^o for the formation of Al_2O_3, the ΔG^o for the formation of Cr_2O_3 is

(a) Higher (b) Lower
(c) Unpredicted (d) Same

Karnataka-CET, 2008

Ans. (a) : Between Al_2O_3 and Cr_2O_3, Al_2O_3 is more stable, so its ease of formation is high i.e., ΔG^o is negative or less than that of Cr_2O_3.
Hence, ΔG^o of $Cr_2O_3 > \Delta G^o$ of Al_2O_3.

@apna_pdf

832. In equilibrium state the value of ΔG is

(a) zero
(b) negative
(c) positive
(d) may be negative or positive

Karnataka-CET-2007

Ans. (a) : In the equilibrium state the value of ΔG is zero.

833. Which of the following can help predict the rate of a reaction if the standard Gibbs free energy of reaction (ΔG) is known?

(a) Equilibrium constant
(b) ΔH
(c) ΔU
(d) Heat liberated during the course of reaction in calorimeter
(e) Both (a) and (b)

Kerala-CEE-2018

Ans. (a) : We know, ΔG^o (Gibbs free energy) is related to K (equilibrium constant)

$\Delta G° = -2.303\ RT \log_{10} K$

K = Equilibrium const.

R = Gas constant

T = Temperature (K)

by knowing the value of K we can find out the rate of a reaction.

834. The equilibrium constant for a reaction is 10. ΔG^o will be the value of $\Delta G^\ominus$ (R = 8.314 JK^{-1} mol^{-1}, T = 300 K)

(a) – 5527 kJ mol^{-1}
(b) – 5.527 kJ mol^{-1}
(c) – 55.27 kJ mol^{-1}
(d) + 5.527 kJ mol^{-1}

Manipal-2017

Ans. (b) : $\Delta G^\ominus = -2.303RT \log K$

$\Delta G^\ominus = -2.303 \times 8.314 \times 300 \log 10$

$= -57441.4\ J\ mol^{-1}$

$\Delta G^\ominus = -5.74\ kJ/mole^{-1}$

835. The criterion for a spontaneous process is

(a) $\Delta G > 0$
(b) $\Delta G < 0$
(c) $\Delta G = 0$
(d) $\Delta S_{total} < 0$

MHT CET-2016

Ans. (b) :

For spontaneous process ΔS = +ve (Because of disorderness or randomness)

For a process to be spontaneous $\Delta G < 0$.

836. Enthalpy of hydrogenation of one mole of benzene to cyclohexane is [Resonance energy of benzene = – 150.4 kJ/mole.

Enthalpy of hydrogenation of cyclohexene = – 119.5 kJ/mole]

(a) –208.1 kJ/mole
(b) –358.1 kJ/mole
(c) +150.4 kJ/mole
(d) –269.9 kJ/mole

TS EAMCET 04.08.2021, Shift-I

Ans. (a) : Enthalpy of hydrogenation of cyclohexene = – 119.5 kJ/mol

Calculated enthalpy of benzene = 3 × (–119.5) = 338.5 kJ/mol

Resonance energy of benzene = – 150.4 kJ/mol

Actual value of enthalpy = Cal. enthalpy – resonance energy

= (–358.5) – (–150.4)

= – 208.1 kJ/mol

Hence, the enthalpy of hydrogenation of benzene is – 208.1 kJ/mol

837. $PbO_2 \rightarrow PbO, \Delta G_{298} < 0$

$SnO_2 \rightarrow SnO, \Delta G_{298} > 0$

Most probable oxidation state of Pb and Sn will be

(a) Pb^{4+}, Sn^{4+}
(b) Pb^{4+}, Sn^{2+}
(c) Pb^{2+}, Sn^{2+}
(d) Pb^{2+}, Sn^{4+}

NEET-2001

Ans. (d) : Given, $\overset{+4}{PbO_2} \longrightarrow \overset{+2}{PbO},\ \Delta G_{298} < 0$

ΔG = –ve means reaction is spontaneous in forward direction.

Thus, stability of $Pb^{2+} > Pb^{4+}$

$\overset{+4}{SnO_2} \rightarrow \overset{+2}{SnO} \quad \Delta G_{298} > 0,$

ΔG = +ve thus, backward reaction is spontaneous.

Thus, stability of $Sn^{4+} > Sn^{2+}$

Thus, Pb^{2+} and Sn^{4+}.

838. Standard enthalpy and standard entropy changes for the oxidation of ammonia at 298 K are – 382.64 kJ mol–1 and –145.6 J mol–1, respectively Standard Gibbs' energy change for the same reaction at 298 K is

(a) -221.1 kJ mol^{-1}
(b) -339.3 kJ mol^{-1}
(c) -439.3 kJ mol^{-1}
(d) –523.2 kJ mol^{-1}

NEET-2004

Ans. (b) : Given that,

$\Delta H = -382.64\ kJ, \Delta S = -145.6J = -145.6 \times 10^{-3}\ kJ$

$T = 298\ K, \Delta G = ?$

$\Delta G = \Delta H - T\Delta S$

$= -382.64 - 298 \times (-145.6 \times 10^{-3})$

$= -382.640 + 43.38$

$= -339.3\ kJ\ mol^{-1}$

839. Identify the correct statement for change of Gibb's energy for a system (ΔG_{system}) at constant temperature and pressure.

(a) if $\Delta G_{system} > 0$, the process is spontaneous.
(b) if $\Delta G_{system} = 0$, the system has attained equilibrium
(c) if $\Delta G_{system} = 0$, the system is still moving in particular direction
(d) if $\Delta G_{system} < 0$, the process is not spontaneous.

NEET-2006

Ans. (b) : If the Gibbs free energy for a system (ΔG_{system}) is equal to zero, then system is present in equilibrium at a constant temperature and pressure.

$\Delta G = \Delta_r G^o + RT \ln K\ ;\ \Delta G = 0$

$\Delta_r G^o = -RT \ln K$

K = equilibrium constant

If $\Delta G_{system} < 0$, then the process is spontaneous

@apna_pdf

840. For vaporization of water at 1 atmospheric pressure, the values of ΔH and ΔS are 40.63 kJ mol^{-1} and 108.8 J K^{-1} mol^{-1}, respectively. The temperature when Gibbs' energy change (ΔG) for this transformation will be zero, is

(a) 273.4 K (b) 393.4 K

(c) 373.4 K (d) 293.4 K

NEET-2010

Ans. (c) : Given ΔH = 40.63 kJ/mol, ΔS = 108.8 J/K–mol

According to Gibbs equation

$$\Delta G = \Delta H - T\Delta S$$

Given, $\Delta G = 0$

$\Delta H = T\Delta S$

$$T = \frac{40.63\times10^3}{108.8}$$

$T = 373.4$ K

841. For the reaction, $X_2O_4(l) \to 2XO_2(g)$

$\Delta U = 2.1$ kcal, $\Delta S = 20$ cal K^{-1} at 300 K

hence, ΔG is

(a) 2.7 kcal (b) – 2.7 kcal

(c) 9.3 kcal (d) –9.3 kcal

NEET-2014

Ans. (b) : Given that,

$\Delta U = 2.1$ kcal $= 2.1 \times 10^3$ cal

$\Delta S = 20$ cal K^{-1}

$T = 300$ K

$R = 2$ cal/mol K

We know,

$\Delta H = \Delta U + \Delta n_g RT$ .....(i)

$(\Delta n_g = 2 - 0 = 2)$

$\Delta H = 2.1 \times 1000 + 2 \times 2 \times 300$

$= 3300$ cal

Gibbs free energy,

$\Delta G = \Delta H - T\Delta S$

$= 3300 - 300 \times 20$

$= -2700$ cal

$= -2.7$ kcal

842. A reaction having equal energies of activation for forward and reverse reactions has

(a) $\Delta H = 0$ (b) $\Delta H = \Delta G = \Delta S = 0$

(c) $\Delta S = 0$ (d) $\Delta G = 0$

NEET, 2013

Ans. (a) : Change in Enthalpy

$\Delta H = \Delta E$

$\Delta H = E_{af} - E_{ab}$

$(E_a)_f \longrightarrow$ Activation energy for Forward reaction

$(E_a)_b \longrightarrow$ Activation Energy for Backward reaction

$(Ea)_f = (Ea)_b$

It $\Delta H = 0$

then

$(Ea)_f = (Ea)_b$

843. In which of the following reactions, standard reaction entropy change (ΔS^0) is positive and standard Gibbs energy change (ΔG^0) decrease sharply with increasing temperature?

(a) $C_{(graphite)} + \frac{1}{2}O_2(g) \to CO(g)$

(b) $CO(g) + \frac{1}{2}O_2(g) \to CO_2(g)$

(c) $Mg(s) + \frac{1}{2}O_2(g) \to MgO(g)$

(d) $\frac{1}{2}C_{(graphite)} + \frac{1}{2}O_2(g) \to CO(g)$

NEET-2012

Ans. (a) : (a) $C_{(graphite)} + \frac{1}{2}O_2(g) \to CO(g)$

$$\Delta n_g = 1 - \frac{1}{2} = \frac{1}{2}$$

(b) $CO(g) + \frac{1}{2}O_2(g) \to CO_2(g)$

$$\Delta n_g = 1 - \frac{3}{2} = \frac{-1}{2}$$

(c) $Mg(s) + \frac{1}{2}O_2(g) \to MgO(g)$

$$\Delta n_g = \frac{-1}{2}$$

(d) $\frac{1}{2}C_{(graphite)} + \frac{1}{2}O_2(g) \to CO(g)$

$$\Delta n_g \ \frac{1}{2} - \frac{1}{2} = 0$$

The change in Δn_g highest which indicate the more gaseous product is formed

844. Which of the following relation is incorrect?

(a) $\Delta G^o = -RT \ln k$ (b) $k = e^{\frac{-\Delta G^o}{RT}}$

(c) $e^{\frac{-\Delta G^o}{2.303RT}}$ (d) $\ln k = -\frac{\Delta G^o}{RT}$

UP CPMT-2014

Ans. (c) : $\Delta G° = -RT \ln k$

$$\ln k = -\frac{\Delta G^o}{RT}$$

$$K = e^{-\Delta G^o/RT}$$

$$K = e^{\frac{-\Delta G^0}{2.303RT}}$$

845. The reaction, A + B ⇌ C + D, is studied in 1 L vessel at 250°C. The initial concentration of A was 3n and that of B was n. When equilibrium was attained, equilibrium concentration of C was found to be equal to the equilibrium concentration B, then concentration of D at equilibrium will be

(a) $\frac{n}{2}$ (b) $\left(3n - \frac{1}{2}\right)$

(c) $\left(n - \frac{n}{2}\right)n$ (d) n

UP CPMT-2013

@apna_pdf

Ans. (a) : Given equilibrium is,

$$A + B \rightleftharpoons C + D$$

Initial concentration: 3n n 0 0

at equilibrium 3n – x n – x x x

At equilibrium the concentration of C is equal to concentration of B

$$(n - x) = x$$
$$n = 2x$$
$$x = \frac{n}{2}$$

So, the concentration of $C\left(\frac{n}{2}\right)$ is equal to the concentration of D.

Thus, the concentration of $D(x) = \frac{n}{2}$

846. What will be the value of ΔG and ΔG^0 for the reaction, $A + B \rightleftharpoons C + D$ at 27^0C for which K = 10^2 ?

(a) $\Delta G = 0; \Delta G^0 = -11.48$ kJ mol^{-1}

(b) $\Delta G = 0; \Delta G^0 = 11.48$ kJ mol^{-1}

(c) $\Delta G = -11.48$ kJ mol^{-1}; $\Delta G^0 = 0$

(d) $\Delta G = 11.48$ kJ mol^{-1}; $\Delta G^0 = 0$

UPTU/UPSEE-2018

Ans. (c) : $\Delta G = \Delta G^\circ + RT$

At equilibrium

$\Delta G = 0$

$0 = \Delta G^\circ + 2.303\ R \times T \times \log K_{eq.}$

$\Delta G^\circ = -2.303\ RT \log K_{eq.}$

$= -2.303 \times 8.314 \times 10^{-3} \times 300 \times \log_{10} 10^2$

$= -2.303 \times 8.314 \times 10^{-3} \times 300 \times 2$

$\Delta G^\circ = -11.48$ kJ

7. Enthalpy and standard Enthalpies For Different Types of Reaction

847. At 25°C and 1 atm pressure , the enthalpy of combustion of benzene (*l*) and acetylene (g) are –3268 kJmol^{-1} and –1300 kJmol^{-1}, respectively. The change in enthalpy for the reaction $3C_2H_2(g) \rightarrow C_6H_6(l)$, is

(a) + 324 kJ mol^{-1} (b) + 632 kJ mol^{-1}

(c) – 632 kJ mol^{-1} (d) – 732 kJmol^{-1}

JEE Main-25.06.2022, Shift-II

Ans. (c) : $3C_2H_2(g) \longrightarrow C_6H_6(l)$

$$\Delta H \text{ of } C_6H_6 = -3268\,\text{kJ/mol}$$
$$\Delta H \text{ of } C_2H_2 = -1300\,\text{kJ/mol}$$
$$\Delta_c^\circ H = \sum(\Delta H)_{\text{Reactant}} - \sum(\Delta H)_{\text{Product}}$$
$$= 3 \times \Delta H_{C_2H_2} - \Delta H_{C_6H_6}$$
$$= 3 \times (-1300) - (-3268)$$
$$= -632\,\text{kJ/mol}$$

848. For combustion of one mole of magnesium in an open container at 300 K and 1 bar pressure $\Delta_c H^{-}$ = –601.70 kJmol^{-1}, the magnitude of change in internal energy for the reaction is _____ kJ. (Nearest integer)
(Given : R = 8.3 J K^{-1} mol^{-1})

JEE Main-28.06.2022, Shift-II

Ans. (600) : Given that, ΔH = –601. 70 kJ, R = 8.3 JK^{-1} mol^{-1}, T = 300 K

$$Mg(s) + \frac{1}{2}O_2(g) \longrightarrow MgO(s)$$
$$\Delta n_g = 1 - \left(\frac{1}{2} + 1\right) = -1/2$$

Since, $\Delta H = \Delta U + \Delta n_g RT$

$\Delta U = \Delta H - \Delta n_g RT$

$= -601.70 + \frac{1}{2} \times 8.3 \times 300 \times 10^{-3}$

$= -601.70 + 1.245$

$= -600.455$ kJ $\simeq -600$ kJ

849. For complete combustion of methanol the

$$CH_3OH(l) + \frac{3}{2}O_2(g) \rightarrow CO_2(g) + 2H_2O(l)$$

amount of heat produced as measured by bomb calorimeter is 726 kJmol^{-1} at 27^{o}C. The enthalpy of combustion for the reaction is –x kJmol^{-1}, where x is ____. (Nearest integer)
(Given: R=8.3 JK^{-1} mol^{-1})

JEE Main-26.06.2022, Shift-I

Ans. (727) : Given that, ΔU = – 726 kJ/mol

R = 8.3 JK^{-1} mol^{-1}, T = 27 + 273 = 300 K

$$CH_3OH(l) + \frac{3}{2}O_2(g) \longrightarrow CO_2(g) + 2H_2O(l)$$
$$\Delta n_g = 1 - \frac{3}{2} = -\frac{1}{2}$$

$\Delta H = \Delta U + \Delta n_g RT$

$= -726 + \left(-\frac{1}{2}\right) \times 8.3 \times 300 \times 10^{-3}$

$= -727.245$ KJ/mol ≈ -727 KJ/mol

Then x is 727.

850. The standard enthalpy of formation of CH_4(g), CO_2(g) and H_2O(l) are –75 kJ mol^{-1}, –393 kJ mol^{-1} and –286 kJ mol^{-1} respectively. The amount of heat liberated (in kJ) when 3.2 g of methane gas is burnt under standard conditions is

(a) 89 (b) 278

(c) 890 (d) 965

(e) 178

Kerala CEE -03.07.2022

Ans. (e) : $CH_4(g) + 2O_2(g) \rightarrow CO_2(g) + 2H_2O(g)$

$\Delta H_c = \sum \Delta H_{f\,(\text{products})} - \sum \Delta H_{f\,(\text{reactants})}$

$= -393 - 572 + 75$

$= -890$ KJ/mol

@apna_pdf

1 mole methane of heat liberated = 890 kJ

16 gm of CH_4 on combustion liberate

$$=\frac{800}{16}\times 3.2$$

$$=178\,\text{KJ}$$

851. **$2O_3(g) = 3O_2(g)$**

At 300 K, ozone is fifty percent dissociated. The standard free energy change at this temperature and 1 atm pressure is (–) _____ J mol^{-1}. (Nearest integer)

[Given: In 1.35 = 0.3 and R = 8.3 J K^{-1}mol^{-1})

JEE Main-24.06.2022, Shift-I

Ans. (747) :

$$\underset{(1-0.5)=0.5}{\overset{1}{2O_3(g)}} \longrightarrow \underset{\frac{3}{2}\times 0.5=0.75\,\text{mole}}{\overset{0}{3O_2(g)}}$$

Total moles = 1.25

$$K_p=\frac{\left(P_{O_2}\right)^3}{\left(P_{O_3}\right)^2}=\frac{\left(\frac{0.75}{1.25}\right)^3}{\left(\frac{0.5}{1.25}\right)^2}=\frac{(3/5)^3}{(2/5)^2}=\frac{0.216}{0.16}=1.35$$

$\Delta G^o = -RT \ln K_p$

$= -8.3 \times 300 \ln (1.35)$

$= -8.3 \times 300 \times 0.3$

$= -747$ J/mole

852. **A fish swimming in water body when taken out from the water body is covered with a film of water of weight 36 g. When it is subjected to cooking at 100°C, then the internal energy for vaporization in kJ mol^{-1} is ———. [nearest integer]**

[Assume steam to be an ideal gas. Given $\Delta_{vap}H^-$ for water at 373 K and 1 bar is 41.1 kJ mol^{-1}; R=8.31 J K^{-1} mol^{-1}]

JEE Main-26.06.2022, Shift-II

Ans. (38) : Given that, Weight of water = 36 gm

Mole of water $= \frac{36}{18} = 2$ moles

T = 373 K, $\Delta_{vap}H° = 41.1$ kJ/mol

$\because \quad \Delta V = \Delta H - nRT$

$= 41.1 - 3.31 \times 373 \times 10^{-3}$

$= 38$ kJmol^{-1}

853. **The standard entropy change for the reaction $4Fe(s) + 3O_2(g) \longrightarrow 2Fe_2O_3(s)$ is –550 J K^{-1} at 298 K.**

[Given: The standard enthalpy change for the reaction is –165 kJ mol^{-1}]. The temperature in K at which the reaction attains equilibrium is______. (Nearest integer)

JEE Main-25.06.2022, Shift-I

Ans. (300) :

$4Fe(s) + 3O_2(g) \rightarrow 2FeO_3(s)$; $\Delta S = -550$ J/K

At equilibrium, $\Delta G^o = 0$

$\Delta G^o = \Delta H^o - T\Delta S^o$

$= \Delta H^o - T\Delta S^o$

$T\Delta S^o = \Delta H^o$

$$T=\frac{\Delta H^o}{\Delta S^o}=\frac{-165\times 10^3}{-550}=300$$

$$\boxed{T=300\text{K}}$$

854. **17.0 g of NH_3 completely vapourises at –33.42°C and 1 bar pressure and the enthalpy change in the process is 23.4kJ mol^{-1}. The enthalpy change for the vapourisation of 85g of NH_3 under the same conditions is ——— kJ.**

JEE Main-29.06.2022, Shift-I

Ans. (117) : ΔH_{vap} of 17 gm of NH_3 = 23.4 kJ mol^{-1}

So, $\quad \Delta H_{vap}$ of 85 gram $= \frac{23.4}{17}\times 85$

$= 23.4 \times 5 = 117$ kJ

855. $N_2(g)+3H_2(g) \rightleftharpoons 2NH_3(g)$

Then ΔH is equal to :

(a) ΔU + 2RT (b) ΔU – 2RT

(c) ΔU + RT (d) ΔU – RT

CG PET-22.05.2022

Ans. (b) : $N_2(g)+3H_2(g) \rightleftharpoons 2NH_3(g)$

$\Delta n_g = 2 - (1 + 3) = -2$

$\because \quad \Delta H = \Delta U + \Delta n_g RT$

$= \Delta U + (-2) RT$

$\Delta H = \Delta U - 2 RT$

856. **At 25°C and 1 atm pressure, the enthalpies of combustion are as given below :**

Substance	**H_2**	**C(graphite)**	**$C_2H_6(g)$**
$\frac{\Delta_c H^-}{\text{kJ mol}^{-1}}$	**–286.0**	**–394.0**	**–1560.0**

The enthalpy of formation of ethane is

(a) +54:0 kJ mol^{-1} (b) –68.0 kJ mol^{-1}

(c) –86.0 kJ mol^{-1} (d) +97.0 kJ mol^{-1}

JEE Main-24.06.2022, Shift-II

Ans. (c) : Given that,

(i) $C_2H_6(g) + \frac{7}{2}O_2(g) \longrightarrow 2CO_2(g) + 3H_2(l)$ ΔH° = –1560 kJ/mol

(ii) $C(s) + O_2(g) \longrightarrow CO_2(g)$ ΔH° = – 394 kJ/mol

(iii) $H_2(g)+\frac{1}{2}O_2(g) \longrightarrow H_2O(g)$ ΔH° = – 286 kJ/mol

For ethane,

$2C(s) + 3H_2(g) \longrightarrow C_2H_6(g)$

$\Delta H_r^o = \Delta H^o$ (reactant) – ΔH^o (Product)

$= 2 \times (-394) + 3(-286) - (-1560)$

$= -788 - 858 + 1560$

$= -86$ kJ/mole.

@apna_pdf

07.

Chemical Equilibrium

1. Law of Chemical Equilibrium and Equilibrium Constant

1. 2 moles of PCl_5 is decomposed in 2 litre closed vessel. At Equilibrium the percentage decomposition of PCl_5 is 40% . The value of Equilibrium constant is:

(a) 0.267 (b) 0.0267
(c) 2.67 (d) 26.7

CG PET-22.05.2022

Ans. (a) :

$$PCl_5 \rightleftharpoons PCl_3 + Cl_2$$

$$\frac{2\times 60}{100} \quad \frac{2\times 40}{100} \quad \frac{2\times 40}{100}$$

∵ Volume of container = 2 liter

$$K_c = \frac{\left(\frac{2\times 40}{100\times 2}\right)^2}{\frac{2\times 60}{100\times 2}}$$

$$\because K_c = 0.267$$

2. For a given chemical reaction
$\gamma_1A + \gamma_2B \rightarrow \gamma_3C + \gamma_4D$
Concentration of C changes from 10 m mol dm^{-3} to 20 m mol dm^{-3} in 10 seconds. Rate of appearance of D is 1.5 times the rate of disappearance of B, which is twice the rate of disappearance of A. The rate of appearance of D has been experimentally determined to be 9 mmol dm^{-3} s^{-1}. Therefore the rate of reaction is_______mmol dm^{-3} s^{-1}. (Nearest Integer)

JEE Main-25.06.2022, Shift-I

Ans. (1m mol dm^{-3} S^{-1}) : For given chemical reation

$$\gamma_1A + \gamma_2B \longrightarrow \gamma_3C + \gamma_4D$$

$$\text{Given, } +\frac{d[D]}{dt} = \frac{-3}{2}\frac{d[B]}{dt}$$

$$\Rightarrow \quad \frac{-1}{2}\frac{d[B]}{dt} = \frac{+1}{3}\frac{d[D]}{dt}$$

$$\Rightarrow \quad \frac{-d[B]}{dt} = -2\frac{d[A]}{dt}$$

$$\Rightarrow \quad -\frac{1}{2}\frac{[B]}{dt} = \frac{-d(A)}{dt} + \frac{d[B]}{dt}$$

$$= 9\text{m mol dm}^{-3}\ S^{-1}$$

$$\Rightarrow \quad \frac{+d[C]}{dt} = \frac{20-10}{10} = 1\text{m mol dm}^{-3}S^{-1}$$

$$\frac{+d[C]}{dt} = \frac{1}{9}\times\frac{+d[D]}{dt}$$

$$9A + 2B \rightarrow \frac{1}{3}C + 3D$$

$$\Rightarrow \quad 3A + 6V \rightarrow C + 9D$$

$$\text{Rate of reaction} = \frac{+d[C]}{dt}$$

$$= 1\text{m mol dm}^{-3}\ S^{-1}$$

3. The standard free change ($\Delta G°$) for 50% dissociation of N_2O_4 into NO_2 at 27°C and 1 atm pressure is –X J mol^{-1}. The value of X is____. (Nearest Integer).
[Given: R = 8.31 J K^{-1} mol^{-1}, log 1.33 = 0.1239, In 10 = 2.3]

JEE Main-25.06.2022, Shift-I

Ans. (710) : $N_2O_4 \rightleftharpoons 2NO_2(g)$

$$1-\alpha \qquad 2\alpha$$

$$K_p = \frac{4\alpha^2P}{1-\alpha} = \frac{4\times(0.5)^2\times 1}{1-(0.5)^2} = \frac{1}{0.75}$$

$$K_p = \frac{4}{3}$$

$$\Delta G^o = -2.3RT\log K_p$$

$$= -2.3 \times 8.31 \times 300 \times \log(1.33)$$

$$= -710.4J\ mol^{-1}$$

$$= -710\ J\ mol^{-1}$$

$$= 710\ mol^{-1}$$

4. $2NOCl(g) \rightleftharpoons 2NO(g) + Cl_2\ (g)$
In an experiment, 2.0 moles of NOCl was placed in a one-litre flask and the concentration of NO after equilibrium established was found to be 0.4 mol/L. The equilibrium constant ag 30°C is_____10^{-4}.

JEE Main-27.06.2022, Shift-I

Ans. (125 × 10^{-4}) :

	$2NOCl$	$\rightleftharpoons 2NO$	$+\ Cl_2$
At initially	2mole	0	0
At equilibrium	$(2-0.4)$	0.4	0.2

$$K_c = \frac{(NO)^2(Cl_2)}{(NOCl)^2} = \frac{(0.4)^2(0.2)}{(1.6)^2}$$

$$= 0.0125$$

$$= 125 \times 10^{-4}$$

5. Some of the reactions and their equilibrium constants K_c are given. Choose the reaction which proceeds rarely at the given temperature.

@apna_pdf

(a) $2H_2(g) + O_2(g) \rightleftharpoons 2H_2O(g)$; $K_c = 2.4 \times 10^{47}$ at 500 K

(b) $H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$; $K_c = 57.0$ at 700 K

(c) $H_2(g) + Cl_2(g) \rightleftharpoons 2HCl(g)$; $K_c = 4.0\times10^{31}$ at 300 K

(d) $N_2(g) + O_2(g) \rightleftharpoons 2NO(g)$; $K_c = 4.8 \times 10^{-31}$ at 298 K

(e) $H_2(g) + Br_2(g) \rightleftharpoons 2HBr(g)$; $K_c = 5.4\times10^{18}$ at 300 K

Kerala CEE -03.07.2022

Ans. (d) :

$N_2(g)+O_2(g) \rightleftharpoons 2NO(g); K_c = 4.8\times10^{-31}$ at 298 K

This reaction is proceeds rarely at the given temperature (at 298K).

6. The equilibrium constants for the following two reactions at 298 K are given below

$$2A \rightleftharpoons B + C \,;\; K_1 = 16$$

$$2B + C \rightleftharpoons 2X \,;\; K_2 = 25$$

What is the value of K for the reaction,

$$A+\frac{1}{2}B \rightleftharpoons X \text{ at } 298\,K\,?$$

(a) $\frac{1}{5}$ (b) $\frac{1}{40}$ (c) $\frac{5}{4}$ (d) $\frac{4}{5}$

(e) 20

Kerala CEE -03.07.2022

Ans. (e) : Given that $2A \rightleftharpoons B+C$, $K_1 = 16$

$$K_1 = \frac{[B][C]}{[A]^2} \qquad \ldots\ldots\ (1)$$

$$2B+C \rightleftharpoons 2X,\ K_2 = 25$$

$$K_2 = \frac{[X]^2}{[B]^2[C]}$$

$$\text{Or } [x] = \left(K_2[B]^2[C]\right)^{1/2} \qquad \ldots\ldots(2)$$

$$\therefore \quad A + \frac{1}{2}B \rightleftharpoons X$$

$$K = \frac{[X]}{[A][B]^{1/2}} \qquad \ldots\ldots\ (3)$$

Putting the value of [x] in equation (3)

$$K = \frac{\left(K_2[B]^2[C]\right)^{1/2}}{[A][B]^{1/2}}, \qquad K = \frac{\sqrt{25}\times[B][C]^{1/2}}{[A][B]^{1/2}}$$

$$K = \frac{5\times[B]^{1/2}[C]^{1/2}}{[A]} \qquad \ldots\ldots(4)$$

From equation (1) and (4) we get

$$K = 5\times(K_1)^{1/2}$$

$$= 5\times(16)^{1/2} = 5\times4 = 20$$

7. PCl_5 dissociates as

$PCl_5\,(g) \rightleftharpoons PCl_3\,(g) + Cl_2\,(g)$

5 moles of PCl_5 are placed in a 200 litre vessel which contains 2 moles of N_2 and is maintained at 600 K. The equilibrium pressure is 2.46 atm. The equilibrium constant K_p for the dissociation of PCl_5 is_____× 10^{-3} (nearest integer)

(Given : R = 0.082 L atm K^{-1} mol^{-1}; Assume ideal gas behaviour)

JEE Main-24.06.2022, Shift-II

Ans. (1107) : Given that, P = 2.46 atm

R = 0.082 L atm K^{-1} mol^{-1}
T = 600 K
V = 200 liter

	$PCl_5(g) \rightleftharpoons$	$PCl_3(g) +$	$Cl_2(g)$
Initial mole	5 mole	0	0
At equi.	(5–x)	x	x

$$n_{total} = (5+x)+n_{N_2} = (5+x)+2 = (7+x)$$

At equilibrium

$$PV = nRT$$

$$n_{total} = \frac{PV}{RT} = \frac{2.46\times200}{0.082\times600} = 10$$

$$n_{total} = (7+x) = 10\ ;\ x = 3$$

$$\therefore \quad K_p = \frac{\left(\frac{3}{10}\times2.46\right)\left(\frac{3}{10}\times2.46\right)}{\left(\frac{2}{10}\times2.46\right)}$$

$$= \frac{3}{10\times2}\times2.46\times3$$

$$= \frac{9\times2.46}{10\times2}$$

$= 1107$

8. 1 mole of HI is heated in a closed container of capacity of 2 L. At equilibrium half a mole of HI is dissociated. The equilibrium constant of the reaction is

(a) 0.25 (b) 0.35
(c) 1 (d) 0.5

Karnataka CET-17.06.2022, Shift-II

Ans. (a) :

	$2HI \rightleftharpoons$	H_2 +	I_2
At initial	1	0	0
At equilibium	0.5	0.25	0.25

$$K_c = \frac{[H_2][I_2]}{[HI]^2}$$

$$K_c = \frac{\frac{0.25\times0.25}{2}}{\frac{0.5\times0.5}{2}}$$

$$= \frac{1}{4}$$

$= 0.25$

@apna_pdf

9. Consider the following gaseous equilibria with equilibrium constants K_1 and K_2 respectively.

$$SO_2(g)+\frac{1}{2}O_2(g) \rightleftharpoons SO_3(g)$$

$$2SO_3(g) \rightleftharpoons 2SO_2(g)+O_2(g)$$

The equilibrium constants are related as

(a) $K_1^2=\frac{1}{K_2}$ (b) $2K_1=K_2^2$

(c) $K_2=\frac{2}{K_1^2}$ (d) $K_2^2=\frac{1}{K_1}$

BCECE 2018, COMDEK-2017
UPTU/UPSEE 2016
Karnataka-CET, 2010, 2011
WB-JEET 2011, CGPET 2010

Ans. (a) : For the reaction,

$$SO_2(g)+\frac{1}{2}O_2(g) \rightleftharpoons SO_3(g)$$

Equilibrium constant, $K_1=\frac{[SO_3]}{[SO_2][O_2]^{1/2}}$ … (i)

For the reaction,

$$2SO_3(g) \rightleftharpoons 2SO_2(g)+O_2(g)$$

Equilibrium constant, $K_2=\frac{[SO_2]^2[O_2]}{[SO_3]^2}$ … (ii)

On squaring both sides in equation (i), we get–

$$K_1^2=\frac{[SO_3]^2}{[SO_2]^2[O_2]} \quad \text{… (iii)}$$

From equation (ii) × equation (iii), we get–

$$K_1^2 \times K_2=1$$

or $K_2=\frac{1}{K_1^2}$

or $K_1^2=\frac{1}{K_2}$

10. Equilibrium constants K_1 and K_2 for the following equilibria

$$NO(g)+\frac{1}{2}O_2 \overset{K_1}{\rightleftharpoons} NO_2(g)$$

and $2NO_2(g) \overset{K_2}{\rightleftharpoons} 2NO(g)+O_2(g)$ are related as

(a) $K_2=\frac{1}{K_1}$ (b) $K_2=K_1^2$

(c) $K_2=\frac{K_1}{2}$ (d) $K_2=\frac{1}{K_1^2}$

JIMPER–2017, Karnataka- CET -2016
JCECE – 2012, NEET - 2005

Ans. (d) : (i) $NO(g)+\frac{1}{2}O_2(g) \overset{K_1}{\rightleftharpoons} NO_2(g)$

For this reaction equilibrium constant–

$$K_1=\frac{[NO_2]}{[NO][O_2]^{1/2}} \quad \text{…(i)}$$

(ii) $2NO_2(g) \overset{K_2}{\rightleftharpoons} 2NO+O_2(g)$

For this reaction equilibrium constant–

$$K_2=\frac{[NO]^2[O_2]}{[NO_2]^2} \quad \text{…(ii)}$$

Squaring equation (i), we get–

$$K_1^2=\frac{[NO_2]^2}{[NO]^2[O_2]}$$

or $\frac{1}{K_1^2}=\frac{[NO]^2[O_2]}{[NO_2]^2}$ …(iii)

From equation (ii) and (iii), we get–

$$K_2=\frac{1}{K_1^2}$$

11. A reversible chemical reaction is having two reactants, in equilibrium. If the concentration of the reactants are doubled then the equilibrium constant will

(a) be doubled (b) become one fourth

(c) be halved (d) remain the same

COMEDK-2020
WB JEE-2012
JCECE - 2010

Ans. (d) : Equilibrium constant depends only upon the temperature, not depend upon the concentration of reactant. Thus, on doubling concentration, equilibrium constant remains the same.

12. The equilibrium constant of the following are

$$N_2+3H_2 \rightleftharpoons 2NH_3; \quad K_1$$

$$N_2+O_2 \rightleftharpoons 2NO; \quad K_2$$

$$H_2+\frac{1}{2}O_2 \rightleftharpoons H_2O; \quad K_3$$

The equilibrium constant (K) of the reaction:

$2NH_3+\frac{5}{2}O_2 \overset{K}{\rightleftharpoons} 2NO+3H_2O$ will be

(a) $K_2K_3^3/K_1$ (b) K_2K_3/K_1

(c) $K_2^3K_3/K_1$ (d) $K_1K_3^3/K_2$

WB JEE-2018, CGPET-2016
NEET-2007, 2007, 2003

Ans. (a) : $N_2+3H_2 \rightleftharpoons 2NH_3;\ K_1$ …. (i)

$N_2+O_2 \rightleftharpoons 2NO;\ K_2$ …. (ii)

$H_2+\frac{1}{2}O_2 \rightleftharpoons H_2O;\ K_3$ ….(iii)

Multiply by 3 in equation (iii), we get –

$3H_2+\frac{3}{2}O_2 \rightleftharpoons 3H_2O;\ K_3^3$ …(iv)

Add eq^n. (ii) and (iv) and then subtract eq^n.(i), we get –

$$2NH_3+\frac{5}{2}O_2 \overset{K}{\rightleftharpoons} 2NO+3H_2O$$

$$\therefore\ K=\frac{K_2K_3^3}{K_1}$$

@apna_pdf

13. For the reaction, $N_2(g) + O_2(g) \rightleftharpoons 2NO(g)$, the equilibrium constant is K_1. The equilibrium constant is K_2 for the reaction, $2NO(g) + O_2(g) \rightleftharpoons 2NO_2(g)$. What is K for the reaction, $NO_2(g) \rightleftharpoons \frac{1}{2}N_2(g) + O_2(g)$?

(a) $1/(4K_1K_2)$ (b) $(1/K_1K_2)^{1/2}$
(c) $1/(K_1,K_2)$ (d) $1/(2K_1,K_2)$

JIMPER-2014
NEET 2011

Ans. (b) : The reaction –

$N_2 + O_2 \rightleftharpoons 2NO;$ K_1 ... (i)

$2NO + O_2 \rightleftharpoons 2NO_2;$ K_2 ...(ii)

Add the equation (i) and (ii) and reversed then divided by 2, we get–

$$NO_2 \rightleftharpoons \frac{1}{2}N_2 + O_2$$

Hence, the expression for the net reaction becomes –

$$K = \sqrt{\frac{1}{K_1.K_2}} \text{ or } \frac{1}{(K_1 \cdot K_2)^{1/2}}$$

14. The equilibrium constant for a reaction,

$$N_2(g) + O_2(s) \rightleftharpoons 2NO(g)$$

is 4×10^{-4} at 2000 K. In the presence of catalyst, the equilibrium is attained 10 times faster. The equilibrium constant in presence of catalyst at 2000K is–

(a) 10×10^{-4} (b) 4×10^{-2}
(c) 4×10^{-4} (d) 40×10^{-4}

Karnataka-CET 2017
BCECE-2010

Ans. (c) : The equilibrium constant in the presence of a catalyst at 2000K is same as the equilibrium constant in the absence of catalyst at 2000K. It is 4×10^{-4}

The presence of catalyst does not affect the value of the equilibrium constant. It only increases the rates of forward and reverse reaction to equal extent.

15. In the reaction,

$$Fe(OH)_3(s) \rightleftharpoons Fe^{3+}(aq) + 3OH^-(aq)$$

if the concentration of OH^- ions is decreased $\frac{1}{4}$ by times, then the equilibrium concentration of Fe^{3+} will increase by

(a) 8 times (b) 16 times
(c) 64 times (d) 4 times

Karnataka-CET-2016
NEET 2008

Ans. (c) : $Fe(OH)_3(s) \rightleftharpoons Fe^{3+}(aq) + 3OH^-(aq)$

$$K_{eq} = \frac{[Fe^{3+}][OH^-]^3}{[Fe(OH)_3]} = \frac{[Fe^{3+}][OH^-]^3}{1}$$

When $[OH^-]$ is decreased by $\frac{1}{4}$ times, K becomes.

$$K_{eq} = [Fe^{3+}]\left(\frac{1}{4}[OH^-]\right)^3$$

$$= [Fe^{3+}]\frac{1}{64}[OH^-]^3$$

To keep the value of K_{eq} constant, the $[Fe^{3+}]$ must be increased by 64 times. So, that K_{eq} remains as such.

$$K_{eq} = 64 \times \frac{1}{64}[Fe^{3+}][OH^-]^3$$

$$K_{eq} = [Fe^{3+}]\,[OH^-]^3$$

16. If K_1 and K_2 are respective equilibrium constants for two reactions

$$XeF_6(g) + H_2O(g) \rightleftharpoons XeOF_4(g) + 2HF(g)$$

$$XeO_4(g) + XeF_6(g) \rightleftharpoons XeOF_4(g) + XeO_3F_2(g)$$

the equilibrium constant for the reaction

$$XeO_4(g) + 2HF(g) \rightleftharpoons XeO_3F_2(g) + H_2O(g)$$

will be

(a) $\frac{K_1}{K_2^2}$ (b) $K_1.K_2$

(c) $\frac{K_1}{K_2}$ (d) $\frac{K_2}{K_1}$

BITSAT 2006
NEET-1998

Ans. (d) : For the reaction –

$XeF_6(g) + H_2O(g) \rightleftharpoons XeOF_4(g) + 2HF(g)$

Equilibrium constant (K_1) –

$$K_1 = \frac{[XeOF_4][HF]^2}{[XeF_6][H_2O]} \quad \text{... (i)}$$

And for the reaction –

$XeO_4(g) + XeF_6(g) \rightleftharpoons XeOF_4(g) + XeO_3F_2(g)$

Equilibrium constant (K_2) –

$$K_2 = \frac{[XeOF_4][XeO_3F_2]}{[XeO_4][XeF_6]} \quad \text{... (ii)}$$

For reaction

$XeO_4(g) + 2HF(g) \rightleftharpoons XeO_3F_2(g) + H_2O(g)$

$$K = \frac{[XeO_3F_2][H_2O]}{[XeO_4][HF]^2}$$

Clearly, from equation (i) and (ii) the new equilibrium constant (K) –

$$K = \frac{K_2}{K_1}$$

17. For the reaction,

$A + B \rightleftharpoons C + D$,

the initial concentrations of A and B are equal. The equilibrium concentration of C is two times the equilibrium concentration of A. The equilibrium constant is

(a) 4 (b) $\frac{1}{4}$

(c) 9 (d) $\frac{1}{9}$

COMEDK-2012
CG PET- 2010
JIMPER-2006

@apna_pdf

Ans. (a) : For the given reaction–

	A	+ B ⇌	C	+ D
Initial	x	x	0	0
At equi.	0	0	2x	2x

Hence, equilibrium constant–

$$K_c = \frac{[C][D]}{[A][B]}$$

$$K_c = \frac{[2x][2x]}{[x][x]}$$

$$K_c = 4$$

18. The reaction,

$$\mathbf{2A(g) + B(g) \rightleftharpoons 3C(g) + D(g)}$$

Is begain with the concentrations of A and B both at an initial value of 1.00 M. When equilibrium is reached, the concentration of D is measured and found to be 0.25 M. The value for the equilibrium constant for this reaction is given by the expression

(a) $[(0.75)^3(0.25)] \div [(1.00)^2(1.00)]$
(b) $[(0.75)^3(0.25)] \div [(0.50)^2(0.75)]$
(c) $[(0.75)^3(0.25)] \div [(0.50)^2(0.25)]$
(d) $[(0.75)^3(0.25)] \div [(0.75)^2(0.25)]$

VITEEE- 2012
NEET Mains-2010

Ans. (b) : The reaction is given as–

	2A(g) +	B(g) ⇌	3C(g) +	D(g)
Initial	1	1	0	0
At eq.	(1 – 0.50)	(1 – 0.25)	3 × 0.25	0.25

The value of equilibrium constant is given by–

$$K_c = \frac{[C]^3[D]}{[A]^2[B]} \quad \text{or } K_c = \frac{(0.75)^3(0.25)}{(0.50)^2(0.75)}$$

19. For a reversible reaction, if the concentration of the reactants is reduced to half, the equilibrium constant will be ....

(a) doubled
(b) halved
(c) reduced to one-fourth
(d) remains same

AP EAMCET (Engg.) 18.09.2020, Shift-I
AP EAMCET (Engg.) 21.09.2020, Shift-II

Ans. (d) : The value of equilibrium constant K_{eq} is independent of initial concentrations of reactants and products. So, options (a), (b) and (c) are not correct, i.e. for a reversible reaction, if the concentration of the reactants is reduced to half, the equilibrium constant will be remains same.

20. $\mathbf{H_2(g) + 2AgCl(s) \rightleftharpoons 2Ag(s) + 2HCl(aq)}$

E^0_{cell} at 25 ^{0}C for the cell is 0.22 V. The equilibrium constant at 25^{0}C is

(a) 2.8×10^7 (b) 5.2×10^8
(c) 2.8×10^5 (d) 5.2×10^4

Karnataka-CET-2021
Kerala-CEE-29.08.2021

Ans. (a) : Given that, $E^\circ_{Cell} = 0.22V$

For the reaction-

$$H_2(g) + 2AgCl(s) \rightleftharpoons 2Ag(s) + 2HCl(aq)$$

Here n=2 (as, $Ag^{2+} + 2e^- \rightarrow 2Ag$)

We know that,

$$E^\circ_{Cell} = \frac{0.0591}{n}\log K$$

$$\log K = \frac{n}{0.0591}E^\circ_{cell}$$

$$\log K = \frac{2}{0.0591} \times 0.22$$

$$\log K = 7.44$$

$$K = \text{antilog}\,(7.44)$$

$$K = 2.8 \times 10^7$$

21. The equilibrium constant for the equilibrium $PCl_5(g) \rightleftharpoons PCl_3(g) + Cl_2(g)$ at a particular temperature is 2×10^{-2} mol dm^{-3}. The number of moles of PCl_5 that must be taken in a one-litre flask at the same temperature to obtain a concentration of 0.20 mol of chlorine at equilibrium is

(a) 2.0 (b) 2.2
(c) 1.8 (d) 0.2
(e) 0.1

Kerala-CEE-2020, 2015

Ans. (b) : Given that,
Equilibrium constant (K_c) = 2×10^{-2} mol dm^{-3}

	$PCl_5(g)$ ⇌	$PCl_3(g)$ +	$Cl_2(g)$
Initial :	x	0	0
At equi. :	(x – 0.2)	0.2	0.2

∴ $$K_c = \frac{[PCl_3][Cl_2]}{[PCl_5]}$$

or $$K_c = \frac{0.2 \times 0.2}{x - 0.2}$$

or $$2 \times 10^{-2} = \frac{0.2 \times 0.2}{x - 0.2}$$

or $$x - 0.2 = \frac{0.2 \times 0.2}{0.2 \times 10^{-1}}$$

or $$x = 2 + 0.2 = 2.2$$

22. For the reaction $A(g) \rightleftharpoons C(g) + D(g)$; ΔH = –Q kJ.
The equilibrium constant cannot be disturbed by

(a) Addition of A
(b) Addition of D
(c) Increasing of pressure
(d) Increasing of temperature

Kerala-CEE-29.08.2021

Ans. (c) : The equilibrium constant cannot be disturbed by increasing the pressure. the addition of catalyst also does not affect equilibrium. Equilibrium constant is directly proportional to temperature.

@apna_pdf

23. The equilibrium constant (K_p) for the formation of ammonia from its constituent elements at 27°C is 1.2 × 10^{-4} and at 127°C is 0.60 × 10^{-4}. Calculate the mean heat of formation of ammonia mole in this temperature range.

(a) –82.64 Cal (b) –826.4 Cal
(c) –1652.8 Cal (d) –165.2 Cal

TS EAMCET 05.08.2021, Shift-I

Ans. (b): Given that,

$K_1 = 1.2 \times 10^{-4}$, $K_2 = 0.60 \times 10^{-4}$

$T_1 = 27^0C = 300K$, $T_2 = 127^0C = 400K$

From van't Hoff's equation –

$$\log\frac{K_2}{K_1} = \frac{-\Delta H}{2.303\times R}\left(\frac{1}{T_1}-\frac{1}{T_2}\right)$$

or $$\log\frac{0.60\times10^{-4}}{1.2\times10^{-4}} = \frac{-\Delta H}{2.303\times8.314}\left(\frac{1}{300}-\frac{1}{400}\right)$$

or $$\log 0.5 = \frac{-\Delta H}{19.147}\left(\frac{100}{300\times400}\right)$$

or $$\Delta H = -0.3010\times19.147\times300\times4$$

$$= -\ 6915.8964J$$

$$= -1654.52 \text{ Cal}$$

Hence, the mean heat of formation of ammonia mole

$$= \frac{-1654.52}{2} = 827.26 \approx -826.4\,\text{Cal}$$

24. The number of moles of NH_3, that must be added to 2L of 0.80 M $AgNO_3$ in order to reduce the concentration of Ag^+ ions to 5.0×10^{-8} M ($K_{formation}$ for $[Ag(NH_3)_2]^+ = 1.0\times10^8$) is .... (Nearest integer)

[Assume no volume change on adding NH_3]

JEE Mains-27.08.2021, Shift-I

Ans. (4) $Ag^+_{(aq.)} + 2NH_{3(aq.)} \rightleftharpoons Ag(NH_3)^+_{2(aq.)}$

$$\begin{array}{llll} t=0 & 0.8 & \left(\frac{a}{2}\right) & 0 \\ t=\infty & 5\times10^{-8} & \left(\frac{a}{2}-1.6\right) & 0.8 \end{array}$$

$$K = \frac{[Ag(NH_3)_2^+]}{[NH_3]^2[Ag^+]}$$

$$\therefore \quad \frac{0.8}{(5\times10^{-8})\left(\frac{a}{2}-1.6\right)^2} = 10^8$$

$$\frac{a}{2}-1.6 = 0.4$$

$$a = 4$$

25. For the following three reactions (i), (ii) and (iii), equilibrium constants are given

$CO(g) + H_2O(g) \rightleftharpoons CO_2(g) + H_2(g)$;K_1

$CH_4(g) + H_2O(g) \rightleftharpoons CO(g) + H_2(g)$;K_2

$CH_4(g) + 2H_2O(g) \rightleftharpoons CO_2(g) + 4H_2(g)$;K_3

Which of the following relations is correct?

(a) $K_1\sqrt{K_2} = K_3$ (b) $K_1K_3 = K_2$
(c) $K_3 = K_1K_2$ (d) $K_3 = (K_2)^3(K_1)^2$

TS EAMCET 10.08.2021, Shift-I

Ans. (c) $CO(g) + H_2O(g) \rightleftharpoons CO_2(g) + H_2(g); K_1$ ...(i)

$CH_4(g) + H_2O(g) \rightleftharpoons CO(g) + 3H_2(g); K_2$ .....(ii)

After adding equation (i) and (ii), we get–

$CH_4(g) + 2H_2O(g) \rightleftharpoons CO_2(g) + 4H_2(g); K_3$ .....(iii)

Which is equal to equation (iii), so,

$K_3 = K_1K_2$

26. A catalyst is a substance which

(a) Changes the equilibrium concentration of the products
(b) Changes the energy of the reactants
(c) Shortens the time to reach equilibrium
(d) Changes the equilibrium constant

AP EAPCET 24.08.2021 Shift-II

Ans. (c): A catalyst is a substance which shortens the time to reach equilibrium. A catalyst increases the rate of the chemical reaction by making available a new low energy pathway for the conversion of reactants to product.

27. The reaction $N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$ is exothermic and reversible. A mixture of $N_2(g)$, $H_2(g)$ and $NH_3(g)$ is at equilibrium in a closed container. When a certain quantity of extra $H_2(g)$ is introduced into the container, while keeping the volume constant, then which statement among the following is true ?

(a) The pressure inside the container will not change
(b) Equilibrium condition will not change
(c) The temperature will increase
(d) The temperature will decrease

AP EAPCET 24.08.2021 Shift-II

Ans. (c): The reaction $N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$ is reversible and exothermic (means heat released) and extra $H_2(g)$ is introduced into a container while keeping the volume constant then the temperature will increase.

28. When reaction is carried out at standard states then at the equilibrium ______

(a) $\Delta H^0 = 0$
(b) $\Delta S^0 = 0$
(c) Equilibrium Const K = 0
(d) Equilibrium Const K = 1

AP EAPCET 23-08-2021 Shift-I

Ans. (d) : The reaction is carried out at standard states then at the equilibrium constant (K) is equal to 1.

$$\text{i.e. } K = \frac{[\text{Product}]}{[\text{Reactant}]}$$

∵ At equilibrium, [product] = [reactant] = 1

$$\therefore \quad K = \frac{1}{1} = 1$$

29. For the following Assertion and Reason, the correct option is

Assertion (A) When Cu (II) and sulphide ions are mixed, they react together extremely quickly to give a solid.

@apna_pdf

Reason (R) The equilibrium constant of Cu^{2+} (aq) + S^{2-} (aq) $\rightleftharpoons$ CuS(s) is high because the solubility product is low

(a) Both (A) and (R) are false.
(b) Both (A) and (R) are true and (R) is the explanation for (A)
(c) Both (A) and (R) are true but (R) is not the explanation for (A)
(d) (a) is false and (R) is true.

[JEE Mains 2020, 2 Sep Shift-I]

Ans. (c) : When Cu (II) and sulphide ions are mixed, they react together extremely quickly to give a solid. Hence, the equilibrium constant of Cu^{2+} is high because the solubility product is low.

30. In the equilibrium mixture, $KI + I_2 \rightleftharpoons KI_3$; the concentration of KI and I_2 is made two fold and three fold respectively. The concentration of KI_3 becomes :

(a) two fold (b) three fold
(c) five fold (d) six fold

Manipal-2020

Ans. (a) : $KI+I_2 \rightarrow KI_3$ or $I^-+I_2 \rightarrow I_3^-$ from KI
On increasing concentration of KI and I_2 two fold and three fold respectively, the concentration of KI_3 becomes two fold.

31. The equilibrium constant for the following reactions are given at 25°C

$2A \rightleftharpoons B+C$, $K_1 = 1.0$

$2B \rightleftharpoons C+D$, $K_2 = 16$

$2C+D \rightleftharpoons 2P$, $K_3 = 25$

The equilibrium constant for the reaction

$P \rightleftharpoons A + \frac{1}{2}B$ at 25°C is

(a) $\frac{1}{20}$ (b) 20
(c) $\frac{1}{42}$ (d) 21

WB-JEE-2020

Ans. (a) : Given that,

$$2A \rightleftharpoons B+C, \quad K_1=10$$

$$K_1 = \frac{[B][C]}{[A]^2}$$

$$2B \rightleftharpoons C+D, \quad K_2=16$$

$$K_2 = \frac{[C][D]}{[B]^2}$$

$$2C+D \rightleftharpoons 2P, \quad K_3=25$$

$$K_3 = \frac{[P]^2}{[C]^2[D]}$$

Required reaction is:

$$P \rightleftharpoons A+\frac{1}{2}B$$

$$K_4 = \frac{[A][B]^{1/2}}{[P]}$$

$$\therefore K_4 = \sqrt{\frac{1}{K_3}\times\frac{1}{K_2}\times\frac{1}{K_1}}$$

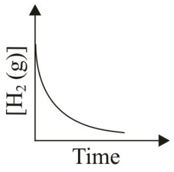
$$K_4 = \sqrt{\frac{1}{25}\times\frac{1}{16}\times\frac{1}{1.0}}$$

$$K_4 = \frac{1}{5}\times\frac{1}{4}\times 1$$

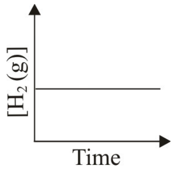
$$K_4 = \frac{1}{20}$$

32. Consider the following equilibrium system
$2NH_3$ (g) → N_2(g) +$3H_2$ (g)
Which of the following graphs represents [H_2(g)] after equilibrium has been established?

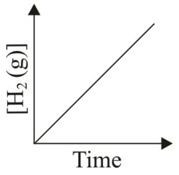
(a)



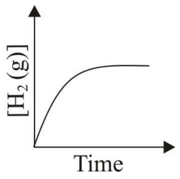
(b)



(c)



(d)



Assam CEE-2019

Ans. (b) : In the given reaction–

$$2NH_3(g) \rightarrow N_2(g)+3H_2(g)$$

At equilibrium concentration of product with constant with time.

33. Assertion: If value of equilibrium constant is K_c for $A+B \rightleftharpoons C$. If chemical reaction is reversed $C \rightleftharpoons A+B$, then value of equilibrium constant will be $1/K_c$.
Reason: Equilibrium constant depends upon the expression of chemical reaction.

(a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS 25 May 2019 (Evening)

Ans. (a) Given the equilibrium constant (K_c) of reaction,

$$A + B \rightleftharpoons C, K_c$$

$$C \rightleftharpoons A + B, \frac{1}{K_c}$$

The value of equilibrium constant depend upon the expression are chemical reaction.
The value of equilibrium constant depend on the stoichiometry equation.

@apna_pdf

34. 2 moles PCl_5 were introduced in a 2 L flask and heated at 625 K to establish equilibrium when 60% of PCl_5 was dissociated into PCl_3 and Cl_2. The equilibrium constant is

(a) 0.90 (b) 1.8

(c) 0.128 (d) 0.53

AMU-2019

Ans. (a) : The given reaction is – $PCl_5 \rightleftharpoons PCl_3 + Cl_2$

Initial conc.	1	0	0
At equi.	(1 – 0.6)1	0.6	0.6

[∵ Initial concentration of $PCl_5 = \frac{2\,\text{mole}}{2\,\text{L}} = 1$ mole/L]

$$\text{Now, } K = \frac{[PCl_3][Cl_2]}{[PCl_5]}$$

$$= \frac{0.6 \times 0.6}{0.4} = 0.09 \times 10 = 0.9$$

35. At a certain temperature, equilibrium constant (K_c) is 16 for the reaction.

$$SO_2(g) + NO_2(g) \rightleftharpoons SO_3(g) + NO(g)$$

If one mole of each of the four gases are taken in one litre container, the equilibrium concentration of NO will be

(a) 0.4 mole (b) 1.6 mole

(c) 0.6 mole (d) 0.66 mole

AMU-2019

Ans. (b) : Given that, $K_c = 16$

The reaction is –

	$SO_2(g)$ +	$NO_2(g)$ ⇌	$SO_3(g)$ +	$NO(g)$
Initial conc.	1	1	1	1
At equi.	(1 – x)	(1 – x)	(1+ x)	(1 + x)

$$\text{So, } \frac{[NO][SO_3]}{[SO_2][NO_2]} = 16$$

$$16 = \frac{(1+x)(1+x)}{(1-x)(1-x)}$$

$16\,(1 - x)^2 = (1 + x)^2$

$4\,(1 - x) = (1 + x)$

$5x = 3$

$x = 3/5$

$$\text{So, conc. of NO} = (1 + x) = \left(1 + \frac{3}{5}\right) = \frac{8}{5} = 1.6 \text{ mole}$$

36. The equilibrium constant for the reaction, $N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$ and , $2N_2(g) + 6H_2 \rightleftharpoons 4NH_3(g)$ are K_1 and K_2, respectively. The relationship between K_1 and K_2 is

(a) $K_2 = K_1^2$ (b) $K_2 = K_1^{-2}$

(c) $K_2 = K_2^2$ (d) $K_2 = \sqrt{K_1}$

(e) $K_2 = \sqrt{K_2}$

Kerala-CEE-2019

Ans. (a) : The equilibrium constant for the given reaction–

$$K_1 = \frac{[NH_3]^2}{[N_2][H_2]^3} \quad \text{..... (1)}$$

$$K_2 = \frac{[NH_3]^4}{[N_2]^2[H_2]^6} = \left(\frac{[NH_3]^2}{[N_2][H_2]^3}\right)^2 \quad \text{..... (2)}$$

Putting value of K_1 in eq^n. (2), we get –

$K_2 = (K_1)^2$ Or $K_2 = K_1^2$

37. In the equilibrium, $H_2 + I_2 \rightleftharpoons 2HI$, if at a given temperature the concentrations of the reactants are increased, the value of the equilibrium constant, K_c, will

(a) increase

(b) decrease

(c) remain the same

(d) cannot be predicted with certainty

WB-JEE-2019

Ans. (c) : Equilibrium constant does not depend on the molar concentration of reactants. It is only affected by the change in temperature.

So, the equilibrium constant will remain the same.

38. Change in volume of the system does not alter the number of moles in which of the following equilibrium ?

(a) $N_2(g) + O_2(g) \rightleftharpoons 2NO(g)$

(b) $PCl_5(g) \rightleftharpoons PCl_3(g) + Cl_2(g)$

(c) $N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$

(d) $SO_2Cl_2(g) \rightleftharpoons SO_2(g) + Cl_2(g)$

BCECE-2018

Ans. (a) : According to Le chatlier's principal if some changes are made in a system then the system will move in that direction where it can get released from any stress.

The change in volume will not affect the system if the change in the number of moles is zero.

$N_2(g) + O_2(g) \rightarrow 2NO(g)$

In this reaction $\Delta n = 2 - 2 = 0$

So, change in volume will not affect the system.

$PCl_5 \rightarrow PCl_3 + Cl_2$

In this reaction $\Delta n = 2 - 1 = 1$

So, change in volume will not affect the system.

$N_2(g) + 3H_2(g) \rightarrow 2NH_3(g)$

In this reaction $\Delta n = 2 - 4 = -2$

So, change in volume will affect the system.

$SO_2Cl_2(g) \rightarrow SO_2(g) + Cl_2(g)$

In this reaction $\Delta n = 2 - 1 = 1$

So, change in volume will affect the system.

39. For $2N_2O_5 \rightarrow 4NO_2 + O_2$, rate and rate constants are 2×10^{-3} and 4×10^{-4} respectively. Then the concentration of N_2O_5 at that time will be

(a) 0.5×10^{-4} (b) 0.5×10^{-3}

(c) 2 (d) 5

JCECE - 2018

Ans. (d) : $2N_2O_5 \rightarrow 4NO_2 + O_2$ … (i)

The given reaction is an example of first order reaction.

Rate = 2×10^{-3}

Rate constant = 4×10^{-4}

Hence,

@apna_pdf

∵ Rate = k $[N_2O_5]$

$2 \times 10^{-3} = 4 \times 10^{-4}[N_2O_5]$

∴ $\frac{2\times10^{-3}}{4\times10^{-4}} = [N_2O_5]$

$0.5 \times 10 = [N_2O_5]$

$5 = [N_2O_5]$

The concentration of N_2O_5 at that time will be 5.

40. Consider the equilibrium $X_2 + Y_2 \rightleftharpoons P$.

Find the stoichiometric coefficient of the P using the data given in the following table:

X_2/mol L^{-1}	Y_2/mol L^{-1}	P/mol L^{-1}
1.14×10^{-2}	0.12×10^{-2}	2.52×10^{-2}
0.92×10^{-2}	0.22×10^{-2}	3.08×10^{-2}

(a) 1 (b) 2

(c) 3 (d) 0.5

(e) 4

Kerala-CEE-2018

Ans. (b) : Given that

$$X_2 + Y_2 \rightleftharpoons xP$$

Let the coefficient of P be x

So, $K = \frac{[P]^x}{[X_2][Y_2]}$

According to the question

$$K_1 = \frac{(2.52\times10^{-2})^x}{(1.14\times10^{-2})\times(0.12\times10^{-2})}$$

and,

$$K_2 = \frac{(3.08\times10^{-2})^x}{(0.92\times10^{-2})\times(0.22\times10^{-2})}$$

Now substitute the values of x given in option one by one

(a) $K_1 = \frac{(2.52\times10^{-2})}{(1.14\times10^{-2})\times(0.12\times10^{-2})} = 1842.10$

$K_2 = \frac{(3.08\times10^{-2})}{(0.92\times10^{-2})\times(0.22\times10^{-2})} = 1521.73$

$\because K_1 \neq K_2$ thus option (a) is incorrect.

(b) $K_1 = \frac{(2.52\times10^{-2})^2}{(1.14\times10^{-2})\times(0.12\times10^{-2})} = 46.42$

$K_2 = \frac{(3.08\times10^{-2})^2}{(0.92\times10^{-2})\times(0.22\times10^{-2})} = 46.86$

$\because K_1 \approx K_2$

Hence, the stoichiometric coefficient is 2.

41. A certain reaction occurs in two steps as

(i) $2SO_2(g) + 2NO_2(g) \longrightarrow 2SO_3(g) + 2NO(g)$

(ii) $2NO(g) + O_2(g) \longrightarrow 2NO_2(g)$

(a) $NO_2(g)$ is intermediate

(b) NO(g) is intermediate

(c) NO(g) is catalyst

(d) $O_2(g)$ is intermediate

MHT CET-2018

Ans. (b) : NO(g) is intermediate as it is produced in the first step and consumed in the second step. A catalyst may be consumed in the first step and produced in the second step.

42. There are two statements, one labeled as Assertion (A) and the other as Reason (R) Examine both the statements carefully and mark the correct choice.

(A) At equilibrium, the mass of each of the reactants and products remains constant

(R) At equilibrium, the rate of forward reaction is equal to the rate of backward reaction.

(a) Both (A) and (R) are correct and (R) is the correct explanation of (A).

(b) Both (A) and (R) are correct but (R) is not the correct explanation of (A).

(c) (A) is correct but (R) is wrong.

(d) (A) is wrong but (R) is correct.

J & K CET-(2017)

Ans. (a) : At equilibrium the concentration of each of the reactants and products becomes constant. Thus the mass of the reactants and products remains constants as the rate of forward reaction is equal to the rate of backward reaction.

43. The equilibrium constant (K_c) for the following equilibrium

$2SO_2(g) + O_2(g) \rightleftharpoons 2SO_3(g)$

at 563 K is 100. At equilibrium, the number of moles of SO_3 in the 10 litre flask is twice the number of moles of SO_2, then the number of moles of oxygen is

(a) 0.4 (b) 0.3

(c) 0.2 (d) 0.1

AP EAMCET-2017

Ans. (a) : Given that, equilibrium constant (K_c) =100

According to the equilibrium equation-

$$\begin{array}{lccc} & 2SO_2(g) & + O_2(g) & \rightleftharpoons 2SO_3(g) \\ \text{Initially} & x & y & 0 \\ \text{At equil.} & \frac{2x}{10} & \frac{y}{10} & \frac{2x}{10} \end{array}$$

Let, y be the no. of moles of oxygen.

$$\therefore K_{eq} = \frac{(2x/10)^2}{(x/10)^2 \times \left(\frac{y}{10}\right)}$$

or $100 = \frac{40}{y} \Rightarrow y = 0.4$

44. (i) $H_3PO_4(aq) \rightleftharpoons H^+(aq) + H_2PO_4^-(aq)$

(ii) $H_2PO_4^-(aq) \rightleftharpoons H^+(aq) + HPO_4^{2-}(aq)$

(ii) $HPO_4^{2-}(aq) \rightleftharpoons H^+(aq) + PO_4^{3-}(aq)$

The equilibrium constants for the above reactions at a certain temperature are K_1, K_2 and K_3 respectively. The equilibrium constant for the reaction.

$H_3PO_4 \rightleftharpoons 3H^+(aq) + PO_4^{3-}(aq)$ in terms of K_1, K_2, and K_3 is

@apna_pdf

(a) $K_1 + K_2 + K_3$ (b) $\frac{K_1}{K_2 + K_3}$

(c) $\frac{K_3}{K_1 K_2}$ (d) $K_1 K_2 K_3$

AP EAMCET-2017

Ans. (d) : The equilibrium reactions are -

$H_3PO_4(aq) \rightleftharpoons H^+(aq) + H_2PO_4^-(aq)$

$$\therefore K_1 = \frac{[H^+][H_2PO_4^-]}{H_3PO_4} \quad ......(1)$$

$$H_2PO_4^-(aq) \longrightarrow H^+(aq) + HPO_4^{2-}(aq)$$

$$K_2 = \frac{[H^+][HPO_4^{2-}]}{[H_2PO_4^-]} \quad ....(2)$$

and $HPO_4^{2-}(aq) \longrightarrow H^+(aq) + PO_4^{3-}(aq)$

$$K_3 = \frac{[H^+][PO_4^{3-}]}{[HPO_4^{2-}]} \quad ....(3)$$

Multiply equation (1), (2), and (3), we get

$K_1 \times K_2 \times K_3 =$

$$\frac{[H^+][H_2PO_4^-]}{[H_3PO_4]} \times \frac{[H^+][HPO_4^{2-}]}{[H_2PO_4^-]} \times \frac{[H^+][PO_4^{3-}]}{HPO_4^{2-}}$$

$$K_1K_2K_3 = \frac{3[H^+][PO_4^{3-}]}{[H_3PO_4]}$$

$K_1K_2K_3 = K$

45. For the reaction, $2HI(g) \rightleftharpoons H_2(g)+I_2(g)$ the degree fo dissociation (α) of HI (g) is related to equilibrium constant K_p by the expression

(a) $\sqrt{\frac{1+2K_p}{2}}$ (b) $\sqrt{\frac{2K_p}{1+2K_p}}$

(c) $\frac{2\sqrt{K_p}}{1+2\sqrt{K_p}}$ (d) $\frac{1+2\sqrt{K_p}}{2}$

UPTU/UPSEE-2017

Ans. (c) : For the reaction:

$$2HI(g) \rightleftharpoons H_2(g) + I_2(g)$$

	$2HI(g)$	$H_2(g)$	$I_2(g)$
initial	1	0	0
at eq.	$1-\alpha$	$\frac{\alpha}{2}$	$\frac{\alpha}{2}$

∵ Partial pressure = mole fraction × total pressure

and $K_p = \frac{P_{H_2} \times P_{I_2}}{P_{HI}^2}$

$$\Rightarrow P_{H_2} = \left(\frac{\alpha}{2}\right)P_T$$

$$P_{I_2} = \left(\frac{\alpha}{2}\right)P_T$$

$$P_{HI} = (1-\alpha)P_T$$

$$\text{Hence, } K_p = \frac{\left[\left(\frac{\alpha}{2}\right)P_T\right]^2}{[(1-\alpha)^2.P_T^2]}$$

$$\frac{\alpha}{1-\alpha} = 2\sqrt{K_p}$$

$$\alpha = 2\sqrt{K_p}(1-\alpha)$$

$$2\sqrt{K_p} - 2\sqrt{K_p}.\alpha = \alpha$$

$$2\sqrt{K_p} = \alpha(1+2\sqrt{K_p})$$

$$\alpha = \frac{2\sqrt{K_p}}{1+2\sqrt{K_p}}$$

46. Equlilbrium constants for the following reactions at 1200 K are given

$2H_2O(g) \rightleftharpoons 2H_2(g) + O_2(g), K_1 = 6.4 \times 10^{-8}$

$2CO_2(g) \rightleftharpoons 2CO(g) + O_2(g), K_2 = 1.6 \times 10^{-6}$

The equilibrium constant for the reactions $H_2(g)+CO_2(g) \rightleftharpoons CO(g)+H_2O(g)$, at 1200 K will be

(a) 0.05 (b) 20 (c) 0.2 (d) 5.0

WB-JEE-2017

Ans. (d) : For the given reaction:

$2H_2O(g) \rightleftharpoons 2H_2(g) + O_2(g),$ $K_1 = 6.4\times10^{-8}$

or $H_2O(g) \rightleftharpoons H_2(g) + \frac{1}{2}O_2(g),$ $K_1' = \sqrt{K_1}$

Reverse the above reaction, we get–

$H_2(g) + \frac{1}{2}O_2(g) \rightleftharpoons H_2O(g),$ $K_1'' = \frac{1}{K_1}$ .....(i)

$2CO_2(g) \rightleftharpoons 2CO(g) + O_2(g),$ $K_2 = 1.6\times10^{-6}$

$CO_2(g) \rightleftharpoons CO(g) + \frac{1}{2}O_2(g),$ $K_2' = \sqrt{K_2}$ .....(ii)

On adding eq^n. (i) and (ii)

$$H_2(g) + CO_2(g) \rightleftharpoons CO(g) + H_2O(g)$$

$$K = \frac{\sqrt{K_2}}{K_1} = \frac{\sqrt{1.6\times10^{-6}}}{\sqrt{6.4\times10^{-8}}}$$

$$K = \frac{\sqrt{10^2}}{\sqrt{4}} = \sqrt{25} = 5$$

47. Among the following, the equilibrium which is not affected by an increase in pressure is

(a) $C(s) + H_2O(g) \rightleftharpoons CO(g) + H_2(g)$

(b) $3Fe(s) + 4H_2O(g) \rightleftharpoons Fe_3O_4(s) + 4H_2(g)$

(c) $2SO_3(g) \rightleftharpoons 2SO_2(g) + O_2(g)$

(d) $H_2(g) + I_2(s) \rightleftharpoons 2HI(g)$

UPTU/UPSEE-2016

Ans. (b): As several moles of gaseous species are equal on both sides. Hence, for option (b) equilibrium is not affected by an increase in pressure.

48. For the reaction,

$A(S) + B(g) + Heat \rightleftharpoons 2C(s) + 2D(g)$

at equilibrium, if pressure of B is doubled, then to re-establish the equilibrium, the factor by which concentration of D changes, will be

(a) 2 (b) $\sqrt{2}$

(c) 3 (d) $\sqrt{3}$

BCECE-2016

@apna_pdf

Ans. (b) : For the given reaction–

$$A(s) + B(g) + Heat \rightleftharpoons 2C(s) + 2D(g)$$

Equilibrium constant k_p is–

$$K_p = \frac{(P_D)^2}{P_B} \qquad ...(i)$$

When the pressure of B is doubled –

$P'_B = 2P_B$

Then, new equilibrium constant–

$$K_p = \frac{(P'_D)^2}{2P_B} \qquad ...(ii)$$

On comparing (i) and (ii) we get

$$P'_D = \sqrt{2}P_D$$

49. Two equilibrium, $AB \rightleftharpoons A^+ + B^-$ and $AB + B^- \rightleftharpoons AB_2^-$ are simultaneously maintained in a solution with equilibrium constants, K_1 and K_2 respectively. The ratio of $[A^+]$ to $[AB_2^-]$ in the solution is

(a) directly proportional to $[B^-]$
(b) inversely proportional to $[B^-]$
(c) directly proportional to the square of $[B^-]$
(d) inversely proportional to the square of $[B^-]$

KEAM- 2013

Ans. (d): If two equilibria $AB \rightleftharpoons A^+ + B^-$ and $AB + B^- \rightleftharpoons AB_2^-$ are simultaneously maintained in a solution with equilibrium constant K_1 and K_2 respectively then.

$$K_1 = \frac{[A^+][B^-]}{[AB]}, K_2 \frac{[AB_2^-]}{[AB][B^-]}$$

Dividing K_1 by K_2, we get–

$$\therefore \quad \frac{K_1}{K_2} = \frac{[A^+][B^-]^2}{[AB_2]^-}$$

$$\therefore \quad \frac{[A^+]}{[AB_2]} \times \frac{1}{[B^-]^2}$$

50. The equilibrium constant values, under the same conditions of temperature and pressure, for the equilibria $A_2 + 3B_2 \rightleftharpoons 2AB$ and $AB_3 \rightleftharpoons \frac{1}{2}A_2 + \frac{3}{2}B_2$ are respectively, x mol^{-2} L^2 and y mol L^{-1}. The correct relation between x and y is

(a) $x = 2y$
(b) $y = 2x$
(c) $x = y^{1/2}$
(d) $y = x^{-1/2}$

J & K CET-(2016)

Ans. (d) : For this reaction–

$$A_2 + 3B_2 \rightleftharpoons 2AB_2$$

Equilibrium constant–

$$K_1 = x \text{ mol}^{-2}L^2 \qquad ...(i)$$

$$AB_3 \rightleftharpoons \frac{1}{2}A_2 + \frac{3}{2}B_2$$

Equilibrium constant–

$$K_2 = y \text{ mol } L^{-1} \qquad ...(ii)$$

Equation (ii) is obtained by reversing equation (i) and then diving by 2,

$$\therefore \quad K_2 = \frac{1}{\sqrt{K_1}}$$

$$\Rightarrow \quad y = \frac{1}{\sqrt{x}}$$

$y = x^{-1/2}$

51. For a reaction,

$$\mathbf{A + B \rightleftharpoons C + D,}$$

at equilibrium, one third of A and B are consumed. The value of equilibrium constant will be

(a) 0.5
(b) 0.25
(c) 0.025
(d) 5

JCECE - 2016

Ans. (b) : Reaction given is.

	A	$+$	B	$\rightleftharpoons C$	$+D$
initial	C		C	0	0
at equilibrium	$C\left(1-\frac{1}{3}\right)$		$C\left(1-\frac{1}{3}\right)$	$\frac{C}{3}$	$\frac{C}{3}$

Also, at equilibrium (V same for all)

[A] = [B] and [C] = [D]

Therefore, equilibrium constant is–

$$K = \frac{\text{Concentration of product}}{\text{Concentration of reactant}}$$

$$K = \frac{\left[\frac{C}{3V}\right]\left[\frac{C}{3V}\right]}{\left[\frac{2C}{3V}\right]\left[\frac{2C}{3V}\right]}$$

$$= \frac{1}{4} = 0.25$$

52. If the equilibrium constant for $N_2(g) + O_2(g) \rightleftharpoons 2NO(g)$ is K the equilibrium constant for $\frac{1}{2}N_2(g) + \frac{1}{2}O_2(g) \rightleftharpoons NO(g)$ will be

(a) $\frac{1}{2}K$
(b) K
(c) K^2
(d) $K^{1/2}$

NEET-2015

Ans. (d) : For the reaction –

$$N_2(g) + O_2(g) \rightleftharpoons 2NO(g)$$

Equilibrium constant–

$$K = \frac{[NO]^2}{[N_2][O_2]}$$

And, $\frac{1}{2}N_2(g) + \frac{1}{2}O_2(g) \rightleftharpoons NO(g)$

For this reaction now equilibrium reaction–

$$K' = \frac{[NO]}{[N_2]^{1/2}[O_2]^{1/2}}$$

On, squaring both sides –

$$(K')^2 = \frac{[NO]^2}{[N_2][O_2]}$$

$(K')^2 = K$

$K' = K^{1/2}$

@apna_pdf

53. For the reaction, $A(s) + 2B^+(aq) \rightarrow A^{2+}(aq) + 2B(s)$, the E^0 is 1.18 V. Then equilibrium constant for the reaction is

(a) 10^{10} (b) 10^{20}
(c) 10^{40} (d) 10^{60}

J & K CET-(2015)

Ans. (c) : Given the reaction –

$A(s) + 2B^+(aq) \rightarrow A^{2+}(aq) + 2B(s)$

$E^o = 1.18$ V.

$$\text{So, } \log_{10} K = \frac{nE^o_{cell}}{0.059}$$

$$= \frac{2\times1.18}{0.059}$$

$$\log_{10}K = 40$$

$$K = 10^{40}$$

54. Equilibrium constants are given for the following two equilibria.

$$\textbf{(i)}\ A_2(g) + B_2(g) \rightleftharpoons 2AB(g);$$

$$K = 2\times10^{-4}\ L\ mol^{-1}$$

$$\textbf{(ii)}\ 2AB(g) + C_2(g) \rightleftharpoons 2ABC(g);$$

$$K = 2\times10^{-2}\ L\ mol^{-1}$$

Calculate the equilibrium constant for the following equilibrium.

$$ABC(g) \rightleftharpoons \frac{1}{2}A_2(g) + \frac{1}{2}B_2(g) + \frac{1}{2}C_2(g)$$

(a) 500 $mol^{1/2}\,L^{1/2}$ (b) 4×10^{-6} $mol^{1/2}\,L^{1/2}$
(c) 500 $mol^{-1/2}\,L^{1/2}$ (d) 200 $mol^{1/2}\,L^{-1/2}$
(e) 500 $mol^{1/2}\,L^{-1/2}$

Kerala-CEE-2015

Ans. (c) :

$$A_2(g) + B_2(g) \rightleftharpoons 2AB(g)$$

$$K_1 = \frac{[AB]^2}{[A_2][B_2]}$$

$$2\times10^{-4} = \frac{[AB]^2}{[A_2][B_2]} \ \ldots\ldots\ldots\ldots\ldots\text{(i)}$$

$$2AB(g) + C_2(g) \rightleftharpoons 2ABC(g)$$

$$K_2 = \frac{[ABC]^2}{[AB]^2[C_2]}$$

$$2\times10^{-2} = \frac{[ABC]^2}{[AB]^2[C_2]} \ \ldots\ldots\ldots\ldots\ldots\text{(ii)}$$

$$ABC(g) \rightleftharpoons \frac{1}{2}A_2(g) + \frac{1}{2}B_2(g) + \frac{1}{2}C_2(g)$$

$$K_3 = \frac{[A_2]^{1/2}[B_2]^{1/2}[C_2]^{1/2}}{[ABC]}$$

Eq^n. (i) and eq^n. (ii) are added, reversed and divided by 2 then we get eq^n. (iii)

$$\text{Therefore,}\quad K_3 = \frac{1}{\sqrt{K_1\times K_2}}$$

$$= \frac{1}{\sqrt{2\times10^{-4}\times2\times10^{-2}}}$$

$$= \frac{1000}{2}$$

$$= 500\ M^{-1/2}L^{1/2}$$

55. HA is a weak acid. At 25^0C, the molar conductivity of 0.02 MHA is $150\Omega^{-1}$ cm^2 mol^{-1}, If its Λ^o_m is 300 Ω^{-1} cm^2 mol^{-1} the equilibrium constant of HA dissociation is

(a) 0.0001 (b) 0.005
(c) 0.01 (d) 0.02

J & K CET-(2015)

Ans. (c) : Given that,

molar conductivity (Λ_m) = $300\Omega^{-1}$ cm^2 mol^{-1}

Limiting molar conductivity ($\Lambda^o{}_m$) = $150\Omega^{-1}$ cm^2 mol^{-1}

Concentration (c) = 0.02 m

$$\therefore \text{ Degree of dissociation } (\alpha) = \frac{\Lambda_m}{\Lambda^o_m} = \frac{150}{300} = 0.5$$

Now, we can determine the value of its dissociation constant.

$$K_a = \frac{C\alpha^2}{(1-\alpha)}$$

$$K_a = \frac{0.02\times(0.5)^2}{(1-0.5)}$$

$$K_a = \frac{0.02\times0.5\times0.5}{0.5}$$

$$K_a = 0.01$$

56. If the value of equilibrium constant for a particular reaction is 1.6×10^{12}, then at equilibrium the system will contain

(a) Mostly products
(b) Similar amounts of reactions and products
(c) All reactions
(d) Mostly reactions

NEET-2015 Cancelled

Ans. (a) : Given that

The value of equilibrium constant K is 1.6×10^{12} which is very high.

$$K = \frac{[\text{Product}]}{[\text{Reactants}]}$$

This indicates the ratio of product concentration to reactant concentration is very high.

Hence, the reaction mixture mostly contains products.

57. For the following equilibrium (omitting charges).

I. $M + Cl \rightarrow MCl$, $K_{eq} = \beta_1$
II. $MCl + Cl \rightarrow MCl_2$, $K_{eq} = \beta_2$
III. $MCl_2 + Cl \rightarrow MCl_3$, $K_{eq} = \beta_3$
IV. $M + 3Cl \rightarrow MCl_3$, $K_{eq} = K$

then relationship between K, β_1, β_2 and β_3 is

(a) $K = \beta_1\,\beta_2\beta_3$
(b) $\log K = \log\beta_1 + \log\beta_2 + \log\beta_3$
(c) $pK = p_{\beta_1} + p_{\beta_2} + p_{\beta_3}$
(d) All of the above

JIMPER-2015

Ans. (d) : When the add reactions (i), (ii) and (iii) we get reaction (iv).

@apna_pdf

When individual reactions are added their equilibrium constant values are multiplied.

$K = \beta_1\beta_2\beta_3$

Taking log on both sides –

$\log K = \log\beta_1 + \log\beta_2 + \log\beta_3$

But, $pK = -\log K$

Hence, $pK = p\beta_1 + p\beta_2 + p\beta_3$

58. If $Ag^+ + 2NH_3 \rightleftharpoons Ag(NH_3)_2^+; K_1 = 1.7 \times 10^7$

$Ag^+ + Cl^- \rightleftharpoons AgCl; K_2 = 5.4 \times 10^9$

Then, for $AgCl + 2NH_3 \rightleftharpoons \left[Ag(NH_3)_2^+\right] + Cl^-$ equilibrium constant will be

(a) 4.68×10^{-3} (b) 5.2×10^{-17}

(c) 0.31×10^{-2} (d) 3.1×10^{-2}

JIMPER-2015

Ans. (c) : For the reaction–

$Ag^+ + Cl^- \rightleftharpoons AgCl; \quad K_2 = 5.4 \times 10^9$

Now, reverse the above reaction –

$AgCl \rightleftharpoons Ag^+ + Cl^-$

New, equilibrium constant–

$$K_2 = \frac{1}{5.4 \times 10^9} = 1.85 \times 10^{-10} \quad \text{...(i)}$$

$Ag^+ + 2NH_3 \rightleftharpoons [Ag(NH_3)_2]^+; \; K_1 = 1.7 \times 10^7$...(ii)

Add reaction (i) and (ii), we get

$AgCl + 2NH_3 \rightleftharpoons [Ag(NH_3)_2]^+ + Cl^-$

So, $K = K_1K_3$

$K = 1.7 \times 10^7 \times 1.85 \times 10^{-10} = 0.31 \times 10^{-2}$

59. XY_2 dissociates as

$XY_2\,(g) \rightleftharpoons XY\,(g) + Y\,(g)$

When the initial pressure of XY_2 is 600 mm Hg, the total equilibrium pressure is 800 mm Hg. Calculate K for the reaction assuming that the volume of the system remains unchanged.

(a) 50 (b) 100

(c) 166.6 (d) 400.0

UPTU/UPSEE-2014

Ans. (b) : The dissociates of XY_2 is–

$XY_2(g) \rightleftharpoons XY(g) + Y(g)$

Initial pressure of XY_2 is 600 mm Hg. The total pressure at equilibrium is 800 mm Hg. Let x mm Hg of XY_2 dissociates to reach equilibrium x mmHg of XY and x mm Hg of Y will be formed at equilibrium. (600 – x) mm Hg of XY_2 will be present at equilibrium.

Total pressure = (600 – x)+x+x=600+x mm Hg

But total pressure = 800 mm Hg

So, 600+x=800

x=200

Thus, the equilibrium pressures are:

P_{xy_2} = 600-x = 600-200=400 mm Hg

Pxy = x = 200 mm Hg

Py = x = 200 mm Hg

Assuming volume of system to remain constant, the value of

$$K_p = \frac{P_{xy}P_y}{P_{xy_2}}$$

$$K_p = \frac{200 \times 200}{400}$$

K_p = 100 mm Hg

60. Consider the following equilibria involving SO_2 (g) and their corresponding equilibrium constants:

$SO_2\,(g) + \frac{1}{2}O_2\,(g) \xrightleftharpoons{K_1} SO_3\,(g)$

$2SO_3\,(g) \xrightleftharpoons{K_2} 2SO_2\,(g) + O_2\,(g)$

Which one of the following is correct?

(a) $K_2 = K_1^2$ (b) $K_2^2 = K_1$

(c) $K_2 = K_1$ (d) $K_2K_1^2 = 1$

SCRA-2014

Ans. (d) : Given the reversible reaction are :

$$SO_2(g) + \frac{1}{2}O_2(g) \rightleftharpoons SO_3(g)$$

The equilibrium expression is :

$$K_1 = \frac{[SO_3(g)]}{[SO_2(g)][O_2(g)]^{1/2}} \quad \text{.....(i)}$$

And, $2SO_3(g) \rightleftharpoons 2SO_2(g) + O_2(g)$

The equilibrium expression is :

$$K_2 = \frac{[SO_2(g)]^2\,[O_2(g)]}{[SO_3(g)]^2} \quad \text{.....(ii)}$$

Taking square both side in equation (i) we get,

$$K_1^2 = \frac{[SO_3(g)]^2}{[SO_2(g)]^2\,[O_2(g)]} \quad \text{.....(iii)}$$

Multiply the equation (ii) and (iii), we get– $K_2K_1^2 = 1$

61. One mole of PCl_5 is heated in a closed 2 dm^3 vessel. At equilibrium 40% PCl_5 is dissociated. Calculate the equilibrium constant.

(a) 0.066 (b) 0.154

(c) 0.133 (d) 0.266

COMEDK-2014

Ans. (c) :

	PCl_5	$\rightleftharpoons$	PCl_3	$+ Cl_2$
Initial conc.	$\frac{1}{2} = 0.5$		0	0
Equi. conc.	$\frac{1-0.4}{2} = \frac{0.6}{2}$		$\frac{0.4}{2}$	$\frac{0.4}{2}$

$$K_c = \frac{[PCl_3][Cl_2]}{[PCl_5]} = \frac{\frac{0.4}{2} \times \frac{0.4}{2}}{\frac{0.6}{2}} = \frac{(0.4)^2}{2 \times 0.6} = 0.133$$

62. In the reaction at constant volume,

$C(s) + CO_2(g) \rightleftharpoons 2CO(g)$

argon gas is added which does not take part in the reaction; choose the correct statement.

(a) The equilibrium constant is unchanged.

(b) The equilibrium shifts in the forward direction.

@apna_pdf

(c) The equilibrium shifts in the backward direction.
(d) The direction of equilibrium depends on the amount of argon added.

AMU-2014

Ans. (a) : Equilibrium constant depends only upon temperature, not on the concentration. Thus, it remains unchanged when an inert gas like Argon is added.
Further, Argon is added at the constant volume i.e. the relative molar concentration of the substance will not change. Hence, the equilibrium position of the reaction remain unaffected.

63. For the reaction at equilibrium $N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$, some inert gas is added at constant volume. In this situation, which of the following statements is correct?
(a) More of NH_3 gas is produced
(b) Less of NH_3 gas is produced
(c) K_p of the reaction is increased
(d) No effect on the production of NH_3

Assam CEE-2014

Ans. (d) : $N_2(g)+3H_2(g) \rightleftharpoons 2NH_3(g)$
According to Le-chatelier's principle for the given reaction.
When an inert gas is added to an equilibrium at constant volume there will be no effect on the equilibrium.
Hence, no effect on the production of NH_3.

64. The equilibrium constant for the aromatization reaction of acetylene is 8. The aromatization reaction is given below

$$3C_2H_2 \xrightarrow[\text{tube}]{\text{Red hot}} C_6H_6$$

If the equilibrium concentration of acetylene is found to be 0.5 then the equilibrium concentration of benzene (C_6H_6) is
(a) 0.5 mol L^{-1} (b) 1 mol L^{-1}
(c) 0.25 mol L^{-1} (d) 2 mol L^{-1}

UP CPMT-2014

Ans. (b) : For the given reaction, $K_c = \dfrac{[C_6H_6]}{[C_2H_2]^3}$

$$8 = \frac{[C_6H_6]}{(0.5)^3}$$

$$[C_6H_6] = 8 \times (0.5)^3 \simeq 1 \text{mol } L^{-1}$$

65. The equilibrium constant for the reaction

$$H_2(g)+I_2(g) \rightleftharpoons 2HI(g)$$

at a certain temperature is 49. What will be the equilibrium constant for the reaction

$$HI(g) \rightleftharpoons \frac{1}{2}H_2(g)+\frac{1}{2}I_2(g)$$

at the same temperature?
(a) 7 (b) $\dfrac{1}{7}$
(c) 24.5 (d) 98

Assam CEE-2014

Ans. (b) : $H_2(g)+I_2(g) \rightleftharpoons 2HI(g)$
Equilibrium constant for the given reaction K = 49.
Now, reaction is rivers and dividing by 2–

$$HI(g) \rightleftharpoons \frac{1}{2}H_2(g)+\frac{1}{2}I_2(g)$$

Then, the new equilibrium constant K' is $= \dfrac{1}{\sqrt{K}}$

Hence, $K' = \dfrac{1}{\sqrt{49}} = \dfrac{1}{7}$

66. K_c for the reaction, $[Ag(CN)_2]^- \rightleftharpoons Ag^+ + 2CN^-$, the equilibrium constant at 25^0C is 4.0×10^{-19}, then the silver ion concentration in a solution which was originally 0.1 molar in KCN and 0.03 molar in $AgNO_3$ is :
(a) 7.5×10^{18} (b) 7.5×10^{-19}
(c) 7.5×10^{19} (d) 7.5×10^{-18}

BITSAT-2014

Ans. (d) : Given that, $K_c = 4 \times 10^{-19}$

	2KCN	+ AgNO$_3$ ⇌	$[Ag(CN)_2]^-$	+ KNO$_3$	+ K^+
t = 0	0.1	0.03	0	0	0
t = equ.	(0.1 – 0.06)	(0)	(0.03)	(0.03)	(0.03)

∵	$[Ag(CN)_2]^-$ ⇌	Ag^+	+ $2CN^-$
	0.03	a	0.04 (Left from KCN)
	0.03 – a	a	0.049

Hence, $K_c = \dfrac{[Ag^+]\cdot[CN^-]^2}{[Ag(CN)_2]^-}$

$$4 \times 10^{-19} = \frac{[a]\cdot[0.04]^2}{[0.03]}$$

$a = 7.5 \times 10^{-18}$

67. The mixture of reactants and products in the equilibrium state is called
(a) chemical mixture
(b) equilibrium mixture
(c) chemical equilibrium
(d) dynamic equilibrium.

J & K CET-(2014)

Ans. (b) : The mixture of reactants and products in the equilibrium state is called equilibrium mixture.
This state of equilibrium is called chemical equilibrium and nature of this state is dynamic instead of static.

68. The thermodynamic equilibrium constant, K_a for the reaction:
$CuO(s) + H_2(g) \rightleftharpoons Cu(s) + H_2O(g)$ is given by

(a) $K = \dfrac{[Cu][H_2O]}{[CuO][H_2]}$ (b) $K = \dfrac{[Cu][H_2O]}{[H_2]}$

(c) $K = \dfrac{[H_2O]}{[CuO][H_2]}$ (d) $K = \dfrac{[H_2O]}{[H_2]}$

AMU-2013

Ans. (d) : $CuO(s)+H_2(g) \rightleftharpoons Cu(s)+H_2O(g)$

$$K_c = \frac{[H_2O]}{[H_2]}$$

As a general rule the concentration of pure solids and pure liquids are not included when writing on equilibrium equation.

@apna_pdf

69. Steam reacts with iron at high temperature to give hydrogen gas and $Fe_3O_4(s)$. The correct expression for the equilibrium constant is

(a) $\frac{P^2_{H_2}}{P^2_{H_2O}}$ (b) $\frac{(P_{H_2})^4}{(P_{H_2O})^4}$

(c) $\frac{(P_{H_2})^4[Fe_3O_4]}{(P_{H_2O})^4[Fe]}$ (d) $\frac{[Fe_3O_4]}{[Fe]}$

AMU-(2013)

Ans. (b): The reaction that takes place is following :

$$3Fe(s)+4H_2O(steam) \rightleftharpoons Fe_3O_4(s)+4H_2(g)$$

$$K_p=\frac{(P_{H_2})^4}{(P_{H_2O})^4}$$

Note–Only gaseous products are reactants are considered.

70. Equilibrium constant for the reaction, $NH_4OH+H^+ \rightleftharpoons NH_4^+ + H_2O$ is 1.8×10^9. Hence, equilibrium constant for $NH_3(aq) + H_2O \rightleftharpoons NH_4^+ + OH^-$ is –

(a) 1.8×10^{-5} (b) 1.8×10^{5}

(c) 1.8×10^{-9} (d) 5.59×10^{-10}

BCECE-2013

Ans. (a) : $NH_2OH + H^+ \rightleftharpoons NH_4^+ + H_2O$

$$K=\frac{[NH_4^+][H_2O]}{[NH_4OH][H^+]}$$

$$\text{or } 1.8\times10^9=\frac{[NH_4^+][H_2O]}{[NH_4OH][H^+]} \quad ...(i)$$

$$NH_3 + H_2O \rightleftharpoons NH_4^+(aq) + OH^-(aq)$$

$$K'=\frac{[NH_4^+][OH^-]}{[NH_3][H_2O]}$$

$$K'=\frac{[NH_4^+][OH^-]}{[NH_4OH]} (\because NH_3 + H_2O \rightarrow NH_4OH) \text{ ... (ii)}$$

Eq^n. (ii) divided by eq^n. (i), we get–

$$\frac{K'}{K}=\frac{[NH_4^+][OH^-][NH_4OH][H^+]}{[NH_4OH][NH_4^+][H_2O]}\{H_2O \rightarrow \text{excess}\}$$

$$\frac{K'}{K}=[OH^-][H^+] \quad ...(iii)$$

We know that

$K_w = [H^+]\ [OH^-]$

$10^{-14} = [H^+]\ [OH^-]$

So, from eq^n. (iii), we get –

$$\frac{K'}{K}=10^{-14}$$

$K' = 10^{-14} \times 1.8 \times 10^9$

$K' = 1.8 \times 10^{-5}$

71. For the following reaction, $NO_2(g) + CO(g) \rightarrow NO(g) + CO_2(g)$, the rate law is Rate = $k[NO_2]^2$. If 0.1 mole of gaseous carbon monoxide is added at constant temperature to the reaction mixture which of the following statements is true ?

(a) Both k and the reaction rate remain the same

(b) Both k and the reaction rate increase

(c) Both k and the reaction rate decrease

(d) Only k increases, the reaction rate remain the same

(e) Only the reaction rate increases; k remains the same

Kerala-CEE-2013

Ans. (a) : $NO_2(g)+CO(g) \rightarrow NO(g)+CO(g)$

$\because$ Rate of reaction, $\left(\frac{dx}{dt}\right) = k[NO_2]^2$

$\therefore$ Rate is independent of CO

Hence on adding more CO to the reaction mixture both k and rate remain the same.

72. Two equilibria, $AB \rightleftharpoons A^+ + B^-$ and $AB + B^- \rightleftharpoons AB_2^-$ are simultaneously maintained in a solution with equilibrium constants, K_1 and K_2 respectively. The ratio of $[A^+]$ to $[AB_2^-]$ in the solution is

(a) directly proportional to $[B^-]$

(b) inversely proportional to $[B^-]$

(c) directly proportional to the square of $[B^-]$

(d) inversely proportional to the square of $[B^-]$

(e) independent $[B^-]$

Kerala-CEE-2013

Ans. (d) : $AB \xrightleftharpoons{K_1} A^+ + B^-$

$$\therefore K_1=\frac{[A^+][B^-]}{[AB]} \text{ ....(i)}$$

$$AB + B^- \xrightleftharpoons{K_2} AB_2^-$$

$$K_2=\frac{[AB_2^-]}{[AB][B^-]} \text{ ....(ii)}$$

On dividing eq^n. (i) and eq^n. (ii), we get–

$$\frac{[A^+][B^-]}{[AB]}\times\frac{[AB][B^-]}{[AB_2^-]}=\frac{K_1}{K_2}$$

$$\text{or } \frac{[A^+][B^-]^2}{[AB_2^-]}=K'$$

$$\text{Where } K'=\frac{K_1}{K_2}=\text{constant}$$

$$\text{or } \frac{[A^+]}{[AB_2^-]}=K' \times \frac{1}{[B^-]^2}$$

$$\text{or } \frac{[A^+]}{[AB_2^-]} \propto \frac{1}{[B^-]^2}$$

73. The equilibrium constants for the reaction, $Br_2 \rightleftharpoons 2Br$ at 500 K and 700 K are 1×10^{-10} and 1×10^{-5} respectively. The reaction is

(a) endothermic (b) exothermic

(c) fast (d) slow

UPTU/UPSEE-2013

@apna_pdf

Ans. (a) : Given that:
The equilibrium constants for the reaction, $Br_2 \rightleftharpoons 2Br$ at 500K and 700K are 1×10^{-10} and 1×10^{-5} respectively. The reaction is endothermic.
An endothermic reaction is characterized by absorption of heat. When heat is added, the position of the equilibrium shifts to forward direction. With increase in temperature, the value of the equilibrium constant increase for an endothermic reaction and decrease for exothermic reaction.

74. For a gas in equilibrium with a liquid, the ratio of the concentration of the gas in the solution plase to that in the gaseous phase is constant at constant temperature, only if molecules undergo

(a) ionisation (b) dissociation
(c) isolation (d) reaction with solvent

UPTU/UPSEE-2012

Ans. (c) : According to Henry's law;

$$\frac{\text{Concentration of gas in solution}}{\text{Concentration of gas in the gaseous phase}} = \text{constant}$$

Only there is simple solvation (isolation then stablisation). Not possible in the case of ionisation or dissociation.

75. Reaction,

$$\mathbf{BaO_2(s) \rightleftharpoons BaO(s) + O_2(g); \Delta H = +ve.}$$

In equilibrium condition, pressure of O_2 depends on

(a) increased mass of BaO_2
(b) increased mass of BaO
(c) increased temperature of equilibrium
(d) increased mass of BaO_2 and BaO both

BCECE-2012

Ans. (c) : The given reaction is –

$$BaO_2(s) \rightleftharpoons BaO(s) + O_2(g); \quad \Delta H = +ve$$

Since ΔH is +ve for this reaction. So, it is endothermic in nature. On increasing the temperature, by applying Le Chatelier's principal, we can see that the reaction proceeds in a forward direction on increasing temperature. So, the pressure of O_2 will increase the temperature at equilibrium.

76. The correct order of equilibrium constants for the reaction is

$$H_2CO + H_2O \xrightleftharpoons{K_1} H_2C(OH)_2$$

$$CH_3CH_2CHO + H_2O \xrightleftharpoons{K_2} CH_3CH_2CH(OH)_2$$

$$CH_3COCH_3 + H_2O \xrightleftharpoons{K_3} CH_3C(OH)_2CH_3$$

(a) $K_1 > K_2 > K_3$ (b) $K_1 < K_2 < K_3$
(c) $K_1 > K_3 > K_2$ (d) $K_1 < K_3 < K_2$

AMU-2012

Ans. (a) : $H_2CO + H_2O \xrightleftharpoons{K_1} H_2(COH)_2$

$$CH_3CH_2CHO + H_2O \xrightleftharpoons{K_2} CH_3CH_2CH(OH)_2$$

$$CH_3COCH_3 + H_2O \xrightleftharpoons{K_3} CH_3C(OH)_2CH_3$$

Due to steric effect, the order of equilibrium constants will be

$$K_1 > K_2 > K_3$$

77. Given that the equilibrium constant for the reaction, $2SO_2(g) + O_2(g) \rightleftharpoons 2SO_3(g)$ has a value of 278 at a particular temperature. What is the value of the equilibrium constant for the following reaction at the same temperature ?

$$\mathbf{SO_3(g) \rightleftharpoons SO_2(g) + \frac{1}{2}O_2(g)}$$

(a) 1.8×10^{-3} (b) 3.6×10^{-3}
(c) 6.0×10^{-2} (d) 1.3×10^{-5}

NEET-Mains 2012

Ans. (c) : The given equilibrium equation–

$$2SO_2(g) + O_2(g) \rightleftharpoons 2SO_3(g), K = 278$$

Now for $SO_2 + \frac{1}{2}O_2 \rightleftharpoons SO_3$ will have $\sqrt{K}$

So, reverse the above reaction:

$SO_3(g) \rightleftharpoons SO_2(g) + \frac{1}{2}O_2(g)$ will have

$$= \frac{1}{\sqrt{K}} = \frac{1}{\sqrt{278}} = 6\times10^{-2}$$

78. The equilibrium constant for the reaction, $aA + bB \rightleftharpoons cC + dD$ is K, then the equilibrium constant for the reaction, $naA + nbB \rightleftharpoons ncC + ndD$

(a) K (b) K^n
(c) $\frac{1}{K^n}$ (d) $\frac{1}{K^{n-1}}$

UP CPMT-2012

Ans. (b) : $aA + bB \rightleftharpoons cC + dD$

$$\text{Equilibrium constant } K = \frac{[C]^c[D]^d}{[A]^a[B]^b}$$

$$naA + nbB \rightleftharpoons ncC + ndD$$

$$\text{Equilibrium constant, } K_1 = \frac{[C]^{nc}[D]^{nd}}{[A]^{na}[B]^{nb}}$$

$$= \left(\frac{[C]^c[D]^a}{[A]^a[B]^b}\right)^n = K^n$$

79. Phosphorus pentachloride dissociates as follows in a closed reaction vessel,

$$\mathbf{PCl_5(g) \rightleftharpoons PCl_3(g) + Cl_2(g)}$$

If total pressure at equilibrium of the reaction mixture is p and degree of dissociation of PCl_5 is x, the partial pressure of PCl_3 will be

(a) $\left(\frac{x}{x+1}\right)p$ (b) $\left(\frac{2x}{1-x}\right)p$
(c) $\left(\frac{x}{x-1}\right)p$ (d) $\left(\frac{x}{1-x}\right)p$

UP CPMT-2012

Ans. (a) :

$$\begin{array}{ccccc} PCl_5(g) & \rightleftharpoons & PCl_3(g) & + & Cl_2(g) \\ (1-x) & & x & & x \end{array}$$

Total number of moles at equilibrium

@apna_pdf

$= (1–x) + x + x = 1 + x$

Therefore, $P_{PCl_3} = \left(\frac{x}{1+x}\right) \times p$

80. For the homogeneous reaction.

$$4NH_3 + 5O_2 \rightleftharpoons 4NO + 6H_2O$$

the equilibrium constant K_c has the units

(a) $conc.^{+10}$
(b) $conc.^{+1}$
(c) $conc.^{-1}$
(d) it is dimensionless

JIMPER-2012

Ans. (b) : The unit of the equilibrium constant K_c is $(mole/litre)^{\Delta n}$.

Where, Δn is the difference in the total number of gaseous reactants.

For the reaction–

$$4NH_3(g) + 5O_2(g) \rightleftharpoons 4NO(g) + 6H_2O(g)$$

$$\Delta n = 4 + 6 - (4 + 5) = 1$$

Hence, the unit of the equilibrium constant K_c will be $(mole/litre)^{\Delta n}$

$= (mole/litre)^1$

= conc.

81. The reaction, $SO_2 + Cl_2 \rightarrow SO_2Cl_2$ is exothermic and reversible. A mixture of $SO_2(g)$, $Cl_2(g)$ and $SO_2Cl_2(I)$ is at equilibrium in a closed container. Now a certain quantity of extra SO_2 is introduced into the container, the volume remaining the same. Which of the following is/are true?

(a) The pressure inside the container will not change
(b) The temperature will not change
(c) The temperature will increase
(d) The temperature will decrease

BITSAT-2012

Ans. (c) : $SO_2 + Cl_2 \rightleftharpoons SO_2Cl_2 + Heat$

For the above reaction, on adding SO_2 the equilibrium will shift in forward direction, i.e. more heat will be evolved. So temperature will increase.

82. For the reaction

$$N_2O_5 \longrightarrow 2NO_2 + \frac{1}{2}O_{2,}$$

$$\frac{-d[N_2O_5]}{dt} = k_1[N_2O_5]$$

$$\frac{d[NO_2]}{dt} = k_2[N_2O_5]$$

$$\frac{d[O_2]}{dt} = k_3[N_2O_5]$$

(a) $2k_1 = k_2 = 4k_3$
(b) $k_1 = k_2 = k_3$
(c) $2k_1 = 4k_2 = k_3$
(d) none of these

AMU-2011

Ans. (a) : The reaction is –

$$N_2O_5 \rightarrow 2NO_2 + \frac{1}{2}O_2 \qquad \text{... (i)}$$

$$\frac{-d[N_2O_5]}{dt} = k_1[N_2O_5] \qquad \text{... (ii)}$$

$$\frac{d[NO_2]}{dt} = k_2[N_2O_5] \qquad \text{...(iii)}$$

$$\frac{d[O_2]}{dt} = k_3[N_2O_5] \qquad \text{...(iv)}$$

From eq^n. (i), we get–

$$\frac{-d[N_2O_5]}{dt} = \frac{1}{2}\frac{d[NO_2]}{dt} = \frac{2d[O_2]}{dt}$$

From eq^n. (ii), (iii) and (iv), we get–

$$k_1[N_2O_5] = \frac{1}{2}k_2[N_2O_5] = 2k_3[N_2O_5] \qquad \text{.....(v)}$$

Multiplying by 2 in eq^n. (v), we get –

$2k_1[N_2O_5[= k_2 [N_2O_5] = 4k_3 [N_2O_5]$

Dividing by $[N_2O_5]$, we get–

$2k_1 = k_2 = 4k_3$

83. The equilibrium constants for the reactions

$$N_2 + 3H_2 \rightleftharpoons 2NH_3$$

and $\frac{1}{2}N_2 + \frac{3}{2}H_2 \rightleftharpoons NH_3$

are K_1 and K_2 respectively. Which one of the following is the correct relationship?

(a) $K_1 = 2K_2$
(b) $K_1 = \frac{1}{2}K_2$
(c) $K_2 = \sqrt{K_1}$
(d) $K_1 = K_2$

BCECE-2011

Ans. (c) : The reaction is –

$$N_2 + 3H_2 \rightleftharpoons 2NH_3$$

$$K_1 = \frac{[NH_3]^2}{[N_2][H_2]^3} \ldots\ldots\ldots\ldots\text{(i)}$$

$$\frac{1}{2}N_2 + \frac{3}{2}H_2 \rightleftharpoons NH_3$$

$$K_2 = \frac{[NH_3]}{[N_2]^{1/2}[H_2]^{3/2}}$$

Squaring on both sides –

$$K_2^2 = \frac{[NH_3]^2}{[N_2][H_2]^3} \qquad \text{... (ii)}$$

From (i) & (ii) we get

$$K_2^2 = K_1 \Rightarrow K_2 = \sqrt{K_1}$$

84. In the reaction,

$$N_2(g) + O_2(g) \rightleftharpoons 2NO(g) + 180.7\,kJ,$$

on increasing the temperature, the production of NO

(a) increases
(b) decreases
(c) remains same
(d) Cannot be predicted

BCECE-2011

Ans. (a) : The reaction is –

$$N_2(g) + O_2(g) \rightleftharpoons 2NO(g)\ 180.7kJ$$

Here, $\Delta H = 180.7$ kJ

ΔH is positive so the given reaction is endothermic reaction. And the case of endothermic reaction if we increase the temperature means we provided the heat to the system then equilibrium shift forward direction. So, the production of NO will be increase.

@apna_pdf

85. Final pressure is higher than initial pressure of a container filled with an ideal gas at constant temperature. What will be the value of equilibrium constant?

(a) K = 1.0 (b) K = 10.0

(c) K > 1.0 (d) K < 1.0

GUJCET-2011

Ans. (d): Number of gaseous moles increases as pressure increase at equilibrium for the reaction.

$$P(g) \rightleftharpoons Q(g) + R(g)$$

$$1(1-\alpha) \qquad 0\alpha \qquad 0\alpha$$

$$\therefore\ K_p = \frac{\alpha^2 \times p_{eq}}{1-\alpha^2} = \frac{1 \times p_{eq}}{1/\alpha^2 - 1}$$

For $\alpha < 1$, $P_{eq} < 1$ [$\because P_{initial} < P_{final}$]

$K_p < 1.0$

Hence the option (d) is correct.

86. In the reversible reaction.

$$2NO_2 \underset{k_2}{\overset{k_1}{\rightleftharpoons}} N_2O_4$$

the rate of disappearance of NO_2 is equal to

(a) $\frac{2k_1}{k_2}[NO_2]^2$

(b) $2k_1[NO_2]^2 - 2k_2[N_2O_4]$

(c) $2k_1[NO_2]^2 - k_2[N_2O_4]$

(d) $(2k_1 - k_2)[NO_2]$

VITEEE- 2011

Ans. (c) : In the reversible reaction

$$2NO_2 \underset{k_2}{\overset{k_1}{\rightleftharpoons}} N_2O_4$$

The concentration of NO_2 is decrease in the forward reaction and increase in backward reaction.

The rate of disappearance of NO_2 in the forward reaction is $-\frac{1}{2}\frac{d[NO_2]}{dt} = k_1[NO_2]^2$

$$-\frac{d[NO_2]}{dt} = 2k_1[NO_2]^2$$

Rate of formation of NO_2 in the reversible reaction is $\frac{d[NO_2]}{dt} = k_2[N_2O_4]$

$\therefore$ rate of disappearance of

$$NO_2 = 2k_1[NO_2]^2 - k_2[N_2O_4]$$

87. The unit of equilibrium constant for the following reaction is

$$2NO_2(g) \rightleftharpoons N_2O_4(g)$$

(a) mol L^{-1}

(b) L mol^{-1}

(c) $mol^{-1}L^{-1}$

(d) equilibrium constant is unitless

UPTU/UPSEE-2011

Ans. (b) : $2NO_2(g) \rightleftharpoons N_2O_4(g)$

$$K_c = \frac{[N_2O_4]}{[NO_2]^2} = \frac{mol\,L^{-1}}{(mol\,L^{-1})^2} = L\,mol^{-1}$$

88. If the equilibrium constant for reaction (i) is 2, what is the equilibrium constant for reaction (ii)?

$$CO_2 \rightleftharpoons CO + \frac{1}{2}O_2 \text{ ---------(i)}$$

$$2CO + O_2 \rightleftharpoons 2CO_2 \text{ ---------(ii)}$$

(a) $\frac{1}{4}$ (b) $\frac{1}{2}$

(c) 1 (d) 2

UPTU/UPSEE-2011

Ans. (a) : $CO_2 \rightleftharpoons CO + \frac{1}{2}O_2$

The equilibrium constant for the reaction–

$$K_c = \frac{[CO][O_2]^{1/2}}{[CO_2]}$$

$$CO_2 \rightleftharpoons CO + \frac{1}{2}O_2$$

The equilibrium constant for the reaction–

$$K_c = \frac{[CO_2]^2}{[CO]^2[O_2]} = \left(\frac{1}{K_c}\right)^2 = \frac{1}{2^2} = \frac{1}{4}$$

89. One mole of pure ethyl alcohol is mixed with one mole of acetic acid at room temperature and it is found that at equilibrium two-third mole of ester and two-third mole of water are present in the reaction mixture. What is the equilibrium constant for the reaction?

(a) 1 (b) 2

(c) 4 (d) 6

SCRA-2010

Ans. (c) $C_2H_5OH(l) + CH_3COOH(l) \rightleftharpoons CH_3COOC_2H_5(l) + H_2O$

Initially	1	1	0	0
At equil.	1 – 2/3	1 – 2/3	2/3	2/3

$$\therefore\quad K_{eq} = \frac{[CH_3COOC_2H_5][H_2O]}{[C_2H_5OH][CH_3COOH]}$$

$$K_{eq} = \frac{2/3 \times 2/3}{1/3 \times 1/3} = 4$$

90. In the reaction of a A + 2B → C + 2D, the initial rate, $-\frac{d[A]}{dt}$ at t=0 was found to be $2.6 \times 10^{-2}\,Ms^{-1}$. What is the value of $-\frac{d[B]}{dt}$ at $t = 0$ in Ms^{-1}?

(a) 2.6×10^{-2} (b) 5.2×10^{-2}

(c) 1.0×10^{-1} (d) 6.5×10^{-3}

CG PET- 2010

Ans. (b) : $A + 2B \rightarrow C + 2D$

$$-\frac{d[A]}{dt} = -\frac{1}{2}\frac{d[B]}{dt}$$

or $$-\frac{d[B]}{dt} = 2 \times -\frac{d[A]}{dt}$$

$$= 2 \times 2.6 \times 10^{-2}\,Ms^{-1}$$

$$= 5.2 \times 10^{-2}\,Ms^{-1}$$

@apna_pdf

91. For the reversible reaction.

$$A(s)+B(g) \rightleftharpoons C(g)+D(g);\ \Delta G^{\circ}=-350\text{kJ}$$

Which one of the following statements is true?

(a) The entropy change is negative
(b) Equilibrium constant is greater than one
(c) The reaction should be instantaneous
(d) The reaction is thermodynamically not feasible

Karnataka-CET, 2010

Ans. (b) : In the reversible reaction,

$$A(s)+B(g) \rightleftharpoons C(g)+D(g);\qquad \Delta G^{\circ}=-350\text{kJ}$$

Since, the randomness increases (because solid is changing into gas), entropy will increase and thus, ΔS is positive. Reversible reaction never undergo to completion (i.e. never be instantaneous)

$\because$ For the given reaction, $\Delta G^{\circ}=-350\text{kJ}$

We know that, $\Delta G^{\circ}=-RT\log K$

$-350=-RT\log K$

i.e., K (equilibrium constant) is greater than one. Moreover, the reaction is thermodynamically feasible.

92. Consider the following reactions in which all the reactants and the products are in gaseous state.

$$\mathbf{2PQ \rightleftharpoons P_2+Q_2; K_1=2.5\times10^5}$$

$$\mathbf{PQ+\frac{1}{2}R_2 \rightleftharpoons PQR;\ K_2=5\times10^{-3}}$$

The value of K_3 for the equilibrium

$$\mathbf{\frac{1}{2}P_2+\frac{1}{2}Q_2+\frac{1}{2}R_2 \rightleftharpoons PQR, is}$$

(a) 2.5×10^{-3}
(b) 2.5×10^{3}
(c) 1.0×10^{-5}
(d) 5×10^{-3}
(e) 5×10^{-3}

Kerala-CEE-2010

Ans. (c) : Given the reaction are:

$2PQ \rightleftharpoons P_2+Q_2;\ K_1=2.5\times10^5$ ....(i)

$PQ+\frac{1}{2}R_2 \rightleftharpoons PQR : K_2=5\times10^{-3}$.......(ii)

Reverse first reaction:

$P_2+Q_2 \rightleftharpoons 2PQ$

$K_3=\frac{1}{K_1}=\frac{1}{2.5\times10^5}=0.000004$ ....(iii)

Divide above reaction with 2

$\frac{1}{2}P_2+\frac{1}{2}Q_2 \rightleftharpoons PQ$

$K_4=\sqrt{K_3}=\sqrt{0.000004}=0.002$ ....(iv)

Add reaction (ii) & (iv)

$\frac{1}{2}P_2+\frac{1}{2}Q_2+\frac{1}{2}R_2 \rightleftharpoons PQR$ ....(v)

$K_5=0.002\times5\times10^{-3}=1.0\times10^{-5}$

93. For a reversible chemical reaction where the forward process is exothermic. Which of the following statements is correct?

(a) The backward reaction has higher activation energy than the forward reaction
(b) The backward and the forward processes have the same activation energy
(c) The backward reaction has lower activation energy
(d) No activation energy is required at all since energy is liberated in the process.

WB-JEE-2010

Ans. (a) : If forward reaction is exothermic it means that higher energy is released during forward reaction which implies than it is easy to bring reaction forward. So, forward reaction has lower activation energy than backward reaction.

94. $\mathbf{A+B \rightleftharpoons C+B}$

Initially moles of A and B are equal. At equilibrium, moles of C are three times that of A. The equilibrium constant of the reaction will be

(a) 1
(b) 3
(c) 4
(d) 9

CG PET -2009

Ans. (d) : Given the reaction–

$$\begin{array}{llllllll} & A & + & B & \rightleftharpoons & C & + & D \\ \text{at } t=0 & 1 & & 1 & & 0 & & 0 \\ t=\text{eq}^{n}. & (1-\alpha) & & (1-\alpha) & & \alpha & & \alpha \end{array}$$

Now, $[C]=3[A]$

$\alpha=3(1-\alpha)$

$\alpha=\frac{3}{4}$

Hence, the equilibrium constant–

$$\therefore\quad K_c=\frac{\alpha^2}{(1-\alpha)^2}$$

$$=\frac{\left(\frac{3}{4}\right)^2}{\left(\frac{1}{4}\right)^2}$$

$=K_c=9$

95. If for $\mathbf{N_2+3H_2 \rightleftharpoons 2NH_3, K_{eq}=1.6\times10^{-5}}$, then the value of $\mathbf{K'_{eq}}$ for the reaction

$$\mathbf{NH_3 \rightleftharpoons \frac{1}{2}N_2+\frac{3}{2}H_2 \text{ will be}}$$

(a) 6.25
(b) 25
(c) 250
(d) 500

CG PET -2009

Ans. (c) : For reaction –

$N_2+3H_2 \rightleftharpoons 2NH_3$

$K_{eq}=\frac{[NH_3]^2}{[N_2][H_2]^3}=1.6\times10^{-5}$ ....(i)

And

$NH_3 \rightleftharpoons \frac{1}{2}N_2+\frac{3}{2}H_2$

$K'_{eq}=\frac{[N_2]^{\frac{1}{2}}[H_2]^{\frac{3}{2}}}{[NH_3]}$ ....(ii)

Squaring on both sides

@apna_pdf

$$(K'_{eq}) = \left[\frac{[N_2]^{1/2}[H_2]^{3/2}}{[NH_3]}\right]^2$$

$$(K'_{eq})^2 = \frac{[N_2][H_2]^3}{[NH_3]^2}$$

On multiply equation (i) and (ii)

$$\left[K_{eq} \times (K'_{eq})^2\right] = \frac{[NH_3]^2}{[N_2][H_2]^3} \times \frac{[N_2][H_2]^3}{[NH_3]^2}$$

$$K_{eq} \times (K'_{eq})^2 = 1$$

$$(K'_{eq})^2 = \frac{1}{K_{eq}}$$

$$(K'_{eq})^2 = \frac{1}{1.6\times10^{-5}}$$

$$K'_{eq} = \sqrt{\frac{1}{1.6\times10^{-5}}}$$

$$K'_{eq} = \sqrt{\frac{10^5\times10}{1.6\times10}}$$

$$K'_{eq} = \sqrt{\frac{10^6}{16}}$$

$$K'_{eq} = \frac{10^3}{4}$$

$$K'_{eq} = \frac{1000}{4}$$

$$K'_{eq} = 250$$

96. In a reversible reaction, at equilibrium, the net heat change of the reaction is

(a) positive (b) negative
(c) zero (d) cannot be predicted

AP-EAMCET(MEDICAL)-2009

Ans. (c) : In a reversible reaction, at equilibrium, the free energy will be zero. Thus, the net heat change will be also zero.

97. The equilibrium constant for the given reaction is 100.

$$\mathbf{N_2(g) + 2O_2(g) \rightleftharpoons 2NO_2(g)}$$

What is the equilibrium constant for the reaction given below?

$$\mathbf{NO_2(g) \rightleftharpoons \frac{1}{2}N_2(g) + O_2(g)}$$

(a) 10 (b) 1
(c) 0.1 (d) 0.01

VITEEE-2009

Ans. (c) : The equilibrium reaction is–

$$N_2(g) + 2O_2(g) \rightleftharpoons 2NO_2(g)$$

$$\therefore \quad K_1 = \frac{[NO_2]^2}{[N_2][O_2]^2}$$

$$\text{or} \quad 100 = \frac{[NO_2]^2}{[N_2][O_2]^2} \qquad \ldots.(i)$$

And, $NO_2(g) \rightleftharpoons \frac{1}{2}N_2(g) + O_2(g)$

$$\therefore \quad K_2 = \frac{[N_2]^{1/2}[O_2]}{[NO_2]}$$

$$\text{or } K_2^2 = \frac{[N_2][O_2]^2}{[NO_2]^2} \qquad \ldots.(ii)$$

Multiplying equations (i) and (ii), we get–

$$100 \times K_2^2 = 1$$

$$\Rightarrow K_2^2 = \frac{1}{100} \text{ or } K_2 = \frac{1}{10} = 0.1$$

98. What is the equation for the equilibrium constant (K_c) for the following reaction?

$$\mathbf{\frac{1}{2}A(g) + \frac{1}{3}B(g) \underset{}{\overset{T(K)}{\rightleftharpoons}} \frac{2}{3}C(g)}$$

(a) $K_c = \frac{[A]^{1/2}[B]^{1/3}}{[C]^{3/2}}$ (b) $K_c = \frac{[C]^{3/2}}{[A]^2[B]^3}$

(c) $K_c = \frac{[C]^{2/3}}{[A]^{1/2}[B]^{1/3}}$ (d) $K_c = \frac{[C]^{2/3}}{[A]^{1/2}+[B]^{1/3}}$

JIMPER-2009

Ans. (c) : Equilibrium constant is $\frac{[\text{Product}]}{[\text{Reactants}]}$

For the reaction

$$\frac{1}{2}A + \frac{1}{3}B \rightleftharpoons \frac{2}{3}C$$

Equilibrium constant will be = $\frac{[C]^{2/3}}{[A]^{1/2}[B]^{1/3}}$

99. The equilibrium for the reaction is 100.

$$\mathbf{N_2(g) + 2O_2(g) \rightleftharpoons 2NO_2(g)}$$

What is the equilibrium constant for the reaction given below?

$$NO_2(g) \rightleftharpoons \frac{1}{2}N_2(g) + O_2(g)$$

(a) 10 (b) 1
(c) 0.1 (d) 0.01

AP EAMCET (Engg.)-2009

Ans. (c): Given reaction is -

$$N_2(g) + 2O_2(g) \rightleftharpoons 2NO_2(g)$$

$$\therefore \quad K_1 = 100 = \frac{[NO_2]^2}{[N_2][O_2]^2} \qquad \ldots..(i)$$

and, $NO_2(g) \rightleftharpoons \frac{1}{2}N_2(g) + O_2(g)$

$$K_2 = \frac{[N_2]^{1/2}[O_2]}{[NO_2]}$$

$$K_2^2 = \frac{[N_2][O_2]^2}{[NO_2]^2} \qquad \ldots.. (ii)$$

On multiplying Eqs. (i) and (ii), we get –

$$100 \times K_2^2 = 1$$

@apna_pdf

$$K_2^2 = \frac{1}{100}$$

$$K_2 = \sqrt{\frac{1}{100}}$$

$$K_2 = \frac{1}{10}$$

$K_2 = 0.1$

100. $2HI(g) \rightleftharpoons H_2(g) + I_2(g)$

The equilibrium constant of the above reaction is 6.4 at 300 K. If 0.25 mole each of H_2 and I_2 are added to the system, the equilibrium constant will be

(a) 6.4 (b) 0.8
(c) 3.2 (d) 1.6

Karnataka-CET, 2009

Ans. (a) :

$$\underset{\substack{t=0\\ t=t_{eq}\ 2x}}{2HI(g)} = \underset{\substack{0.25\\ (0.25-x)}}{H_2(g)} + \underset{\substack{0.25\\ (0.25-x)}}{I_2(g)} \qquad K_{eq} = \frac{[H_2][I_2]}{[HI]} = 6.4$$

$$K_{eq} = 6.4 = \frac{(0.25-x)(0.25-x)}{(2x)^2}$$

$$\Rightarrow \quad 6.4 = \frac{(0.25-x)^2}{(2x)^2} = \left(\frac{0.25-x}{2x}\right)^2$$

$$\Rightarrow \quad \frac{0.25-x}{2x} = 2.53 \qquad [\sqrt{6.4} = 2.53]$$

$$\Rightarrow \quad 0.25 - x = 5.06x$$

$0.25 = 5.06x + x$

$0.25 = 6.06x$

$$x = \frac{0.25}{6.06} = 0.041$$

$[H_2] = [I_2] = 0.25 - x$

$[H_2] = [I_2] = 0.25 - 0.041$

$[H_2] = [I_2] = 0.209$ mol

$HI = 2x$

$[HI] = 2 \times 0.041 = 0.081$ mol

And, equilibrium constant will be same, as temperature is not changing $K_{eq} = 6.4$.

101. The dissociation constant for acetic acid and HCN at 25ºC are 1.5×10^{-5} and 4.5×10^{-10} respectively. The equilibrium constant for the equilibrium,

$CN^- + CH_3COOH \rightleftharpoons HCN + CH_3COO^-$

would be

(a) 3.0×10^{-3} (b) 3.0×10^{-4}
(c) 3.0×10^{4} (d) 3.0×10^{5}

NEET-2009

Ans. (c) : $CN^- + CH_3COOH = HCN + CH_3COO^-$

$K_1 = 1.5 \times 10^{-5}$ .....(i)

$HCN = H^+ + CN^-$

$K_2 = 4.5 \times 10^{-10}$ .....(ii)

$CN^- + CH_3COOH = HCN + CH_3COO^-$

K = ?

On subtracting equation (ii) from eq. (i) we get:

$$K = \frac{K_1}{K_2} = \frac{1.5 \times 10^{-5}}{4.5 \times 10^{-10}} = \frac{15}{45} \times 10^{-5}$$

$$K = \frac{1}{3} \times 10^5$$

$K = 0.3 \times 10^5$

$K = 3.0 \times 10^4$

102. For the reaction

$2HI(g) \rightleftharpoons H_2(g) + I_2(g) - Q$ kJ,

the equilibrium constant depends upon

(a) temperature (b) pressure
(c) catalyst (d) volume

Karnataka-CET, 2008

Ans. (a) : $2HI(g) \rightleftharpoons H_2(g) + I_2(g) - Q\,kJ$

$$\Delta n_g = n_p - n_R = 2 - 2 = 0$$

As the number of moles of products and reactant are equal, so equilibrium constant is not affected by any change in pressure and volume. Catalyst also does not affect the equilibrium constant. It is an endothermic reaction, hence equilibrium constant depends only upon the temperature.

103. On doubling p and V with constant temperature, the equilibrium constant will–

(a) remain constant (b) become double
(c) become one-fourth (d) None of the above

BCECE-2008

Ans. (a) : On doubling P and volume (V) with constant temperature, the equilibrium constant (K) will remain constant.

104. In which of the following reactions, the concentration of the product is higher than the concentration of the reactant at equilibrium ? (K = equilibrium constant)

(a) $A \rightleftharpoons B; K = 0.001$ (b) $M \rightleftharpoons N; K = 10$
(c) $X \rightleftharpoons Y; K = 0.005$ (d) $R \rightleftharpoons P; K = 0.01$

AIIMS-2008

Ans. (b): We know that,

$$K = \frac{[Product]}{[Reactant]}$$

Hence, [Product] = K [Reactant]

∴ [Product] > Reactant, when K > 1

Hence, option b is the only correct answer as K = 10 > 1

105. Consider the reaction .

$CO(g) + H_2O(g) \rightleftharpoons CO_2(g) + H_2(g)$

the equilibrium amount of $CO_2(g)$ can be increased at a given temperature by

(a) adding a suitable catalyst
(b) decreasing the volume of the container
(c) adding an inert gas
(d) increasing the amount of CO(g).

AMU-2008

Ans. (d) : If an additional amount of any reactant is added the rate of forward reaction increases. In general, in a chemical equilibrium, increasing the concentration of the reactants results in shifting the equilibrium in favour of products.

@apna_pdf

106. The rate law for a reaction between the substances A and B is given by rate = K$[A]^n[B]^m$. On doubling the concentration of A and having the concentration of B, the ratio of the new rate to the earlier rate of the reaction will be as

(a) $\frac{1}{2^{m+n}}$ (b) (m+n)

(c) (n-m) (d) $2^{(n-m)}$

JCECE - 2008

Ans. (d) : rate = K $[A]^n$ $[B]^m$

On doubling the concentration of A and making the volume of B half, the new rate becomes

$2^n \times \left(\frac{1}{2}\right)^m = 2^{n-m}$ times the earlier rate.

So, ration is 2^{n-m}

107. A 20 litre container at 400 K contains $CO_2(g)$ at pressure 0.4 atm and an excess of SrO (neglect the volume of solid SrO). The volume of the container is now deceased by moving the movable piston fitted in the container. The maximum volume of the container, when pressure of CO_2 attains its maximum value, will be

(Given that : $SrCO_3(s) \rightleftharpoons SrO(s) + CO_2(g)$ K_p = 1.6 atm)

(a) 10 Litre (b) 4 Litre

(c) 2 Litre (d) 5 Litre

(NEET-2007

Ans. (d) : Given that,

$$SrCO_3(s) \rightleftharpoons SrO(s) + CO_2(g)$$

Kp = 1.6 atm.

The initial pressure Pco_2 = 0.4 atm

The final pressure $P'co_2$ = Kp = 1.6 atm

The initial volume v = 20L

The final volume $V' = \frac{PV}{P'}$

$$= \frac{0.4 \text{ atm} \times 20L}{1.6 \text{ atm}}$$

= 5L

Hence, the maximum volume the container when the pressure of CO_2 attains its max. volume will be 5 liters.

108. The equilibrium constant of the following reaction aA + bB $\rightleftharpoons$ cC + dD is K

the equilibrium constant of the reaction, ncC + ndD $\rightleftharpoons$ naA + nbB, will be

(a) K^n (b) $\frac{n}{K}$

(c) n.K (d) $\frac{1}{K^n}$

AMU-2007

Ans. (d) : For reaction–

aA + bB $\rightleftharpoons$ cC + dD

$$K = \frac{[C]^c[D]^d}{[A]^a[B]^b} \quad .....(i)$$

And, ncC + ndD $\rightleftharpoons$ naA + nbB

$$K' = \frac{[A]^{na}[B]^{nb}}{[C]^{nc}[D]^{nd}}$$

$$\frac{1}{K'} = \frac{[C]^{nc}[D]^{nd}}{[A]^{na}[B]^{nb}}$$

$$\frac{1}{K'} = \left[\frac{[C]^c[D]^d}{[A]^a[B]^b}\right]^n \quad .....(ii)$$

On putting value of K in equation (ii)–

$$\frac{1}{K'} = K^n$$

$$K' = \frac{1}{K^n}$$

109. The equilibrium constant for the reaction,

$$SO_2(g) + \frac{1}{2}O_2(g) \rightleftharpoons SO_3(g)$$

is 5 × 10^{-2} atm. The equilibrium constant of the reaction, $2SO_3(g) \rightleftharpoons 2SO_2(g) + O_2(g)$

(a) 100 atm (b) 200 atm

(c) 4 × 10^2 atm (d) 6.25 × 10^4 atm

AP-EAMCET-2007

Ans. (c) : Given that, $K_1 = 5 \times 10^{-2}$ atm.

For the reaction–

$$SO_2(g) + \frac{1}{2}O_2(g) \overset{K_1}{\rightleftharpoons} SO_3(g)$$

$$\therefore \quad K_1 = \frac{[SO_3]}{[SO_2][O_2]^{1/2}} \quad .....(i)$$

And, $2SO_3(g) \overset{K_2}{\rightleftharpoons} 2SO_2(g) + O_2(g)$

$$K_2 = \frac{[SO_2]^2[O_2]}{[SO_3]^2} \quad .....(ii)$$

From equation (i) and (ii), we get

$$K_2 = \frac{1}{K_1^2} \quad .....(iii)$$

Putting the value of K_1 in equation (iii) we get,

$$K_2 = \frac{1}{(5 \times 10^{-2})^2} = \frac{1}{25 \times 10^{-4}}$$

$$K_2 = \frac{10000}{25} = 4 \times 10^2 \text{ atm}$$

110. Which of the following reactions is an example of reversible reaction?

(a) $Pb(NO_3)_2(aq) + 2NaI(aq) \rightarrow PbI_2(s) + 2NaNO_3(aq)$

(b) $2Na(s) + 2H_2O(l) \rightarrow 2NaOH(aq) + H_2(g)$

(c) $AgNO_3(aq) + HCl(aq) \rightarrow AgCl(s) + HNO_3(aq)$

(d) $KNO_3(aq) + NaCl(aq) \rightarrow KCl(aq) + NaNO_3(aq)$

SRMJEEE – 2007

Ans. (d) : A reaction in which reactant and product in equilibrium with each other is known as reversible reaction.

$$KNO_3(aq) + NaCl(aq) \longrightarrow KCl(aq) + NaNO_3(aq)$$

All are in aqueous state that's why follow the properties of reversible reaction.

@apna_pdf

111. At T(K), 100 L of dry oxygen is present in a sealed container. It is subjected to silent electrical discharge, till the volumes of oxygen and ozone become equal. What is the volume (in L) of ozone formed at T (K)?

(a) 50 (b) 60
(c) 30 (d) 40

AP-EAMCET-2006

Ans. (d) : Initially when T = 0

$$\underset{3x}{3O_2} \rightleftharpoons \underset{2x}{2O_3}$$

At T K, total volume of O_2 and O_3 is 100L hence after time T when the reaction is completed total volume of oxygen and ozone will be–

$$3x + 2x = 100$$

$$x = \frac{100}{5} = 20 \text{ mL}$$

$\therefore$ Volume of ozone formed = 2x = 2 × 20 = 40 mL

112. Equation $\log\frac{K_2}{K_1} = \frac{\Delta H}{2.303R}\left(\frac{T_2 - T_1}{T_1T_2}\right)$, n is

(a) Van der Waals' equation
(b) Kirchoff's equation
(c) Gas equation
(d) Van't Hoff equation

CG PET -2006

Ans. (b) : $\log\frac{K_2}{K_1} = \frac{\Delta H}{2.303R}\left(\frac{T_2 - T_1}{T_1T_2}\right)$

The above equation is Van't Hoff equation.

113. $A(g) + 3B(g) \rightleftharpoons 4C(g)$.

Initially concentration of A is equal to that of B. The equilibrium concentration of A and C are equal. K_c is :

(a) 0.08 (b) 0.8
(c) 8 (d) 80
(e) $\frac{1}{8}$

Kerala-CEE-2005

Ans. (c) : The reaction is:

$$A(g) + 3B(g) \rightleftharpoons 4C(g)$$

t = 0 1 1 0
teq. 1–x 1–3x 4x

According to question–

$$1 - x = 4x$$
$$1 = 4x + x$$
$$1 = 5x$$
$$x = \frac{1}{5}$$

For above reaction–

$$K_c = \frac{[C]^4}{[A][B]^3}$$

$$K_c = \frac{(4x)^4}{(1-x)(1-3x)^3}$$

$$K_c = \frac{\left(\frac{4}{5}\right)^4}{\left(\frac{4}{5}\right)\left(1-\frac{3}{5}\right)^3}$$

$$K_c = \frac{\left(\frac{4}{5}\right)^4}{\left(\frac{4}{5}\right)\left(\frac{2}{5}\right)^3}$$

$K_c = 8$

114. In Haber process, 30 litre of dihydrogen and 30 liters of dinitrogen were taken for reactions which yielded only 50% of the expected product. What will be the composition of gaseous mixture under the above said condition in the end ?

(a) 20 litre ammonia, 20 litre nitrogen, 15 litre hydrogen
(b) 10 litre ammonia, 25 litre nitrogen, 15 litre hydrogen
(c) 20 litre ammonia, 10 litre nitrogen, 30 litre hydrogen
(d) 20 litre ammonia, 25 litre nitrogen, 15 litre hydrogen

NEET-2005

$$N_2 + 3H_2 \Leftrightarrow 2NH_3$$

Ans. (b) : 30 30 0
30-x 30-3x 2x

But, 2x = 50%, of the expected (20Lt) product = 10 lit

x = 5

$\therefore$ Vol. of N_2 at eq. = 30-5 = 25 lit
Vol. of H_2 at eq. = 30-3×5=15 lit
Vol. of NH_3 at eq. = 2×5 = 10 lit

115. The equilibrium $P_4(g) + 6Cl_2(g) \rightleftharpoons 4PCl_3(g)$ is attained by mixing equal moles of P_4 and Cl_2 in an evacuated vessel. Then, at equilibrium

(a) $[Cl_2] > [PCl_3]$ (b) $[Cl_2] > [P_4]$
(c) $[P_4] > [Cl_2]$ (d) $[Cl_3] > [P_4]$

J & K CET-(2004)

Ans. (c) : The reaction is –

$$P_4(g) + 6Cl_2(g) \rightleftharpoons 4PCl_3(g)$$

t = 0 1 1 0
$t = t_{equi.}$ 1 − α 1 − 6α 4α

It attained by mixing equal moles (take 1 moles of each) of P_4 and Cl_2 in an evacuated vessel.

Then at equilibrium,

$$[P_4] = \frac{1-\alpha}{V} \text{ and } [Cl_2] = \frac{1-6\alpha}{V}$$

$\therefore$ $[P_4] > [Cl_2]$

From the reaction stoichiometry, we observe that 1 mole of P_4 will react with 6 moles of Cl_2. So more number of moles of Cl_2 are consumed than those of P_4 to reach equilibrium.

116. In which of the following reactions, the concentration of product at equilibrium : (K = equilibrium constant)

(a) $A \rightleftharpoons B;\ K = 0.01$ (b) $R \rightleftharpoons P;\ K = 1$
(c) $X \rightleftharpoons Y;\ K = 10$ (d) $L \rightleftharpoons J;\ K = 0.025$

AP-EAMCET (Engg.)-2004

@apna_pdf

Ans. (b) : In the reversible reaction, the concentration of reactant will be equal to concentration of product only when the value of rate constant is unity. For the reaction –

$$R \rightleftharpoons P$$

$$\therefore \quad K = \frac{[P]}{[R]}$$

Given, $K = 1$

$$\therefore \quad [P] = [R]$$

117. The term- (dc/dt) in a rate equation refers to the

(a) concentration of the reactant
(b) decreases in concentration of the reactant with time
(c) increase in concentration of the reactant with time
(d) velocity constant of the reaction

CG PET -2004

Ans. (b) : The term $-\left(\frac{dc}{dt}\right)$ in rate expression indicates the decrease in concentration of the reactant with time. It is negative sign with is used to show the decrease in concentration of the reactant.

118. If the rate expression for a chemical reaction is given by rate = $k[A]^m[B]^n$

(a) the order of the reaction is m
(b) the order of the reaction is n
(c) the order of the reaction is m + n
(d) the order of the reaction is m – n

CG PET -2004

Ans. (c) : Order is the sum of power of the concentration of the reactants present in rate law expression.

$$\text{Rate} = k[A]^n.[B]^m$$

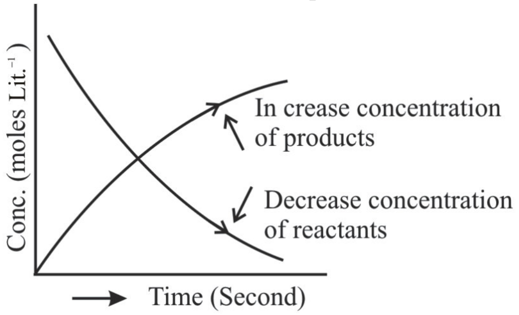
Hence, the order of reaction is = n + m or m + n

119. The rate of a chemical reaction :

(a) increase as the reaction proceeds
(b) decrease as the reaction proceeds
(c) may increase or decrease during reaction
(d) remain constant as the reaction

BCECE-2003

Ans. (b) : The rate of chemical reaction is directly proportional to the concentration of the reactants i.e. rate of reaction decreases with decrease of concentration and increases with increase in concentration. As the reaction progresses the reactant is converted into the product and thus the concentration of reactants decreases while that of product increases.



120. Consider the following reaction equilibrium?
$N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$

Initially, 1 mole of N_2 and 3 moles of H_2 are taken in a 2 L flask. At equilibrium state, if the number of moles of N_2 is 0.6, what is the total number of moles of all gases present in the flask?

(a) 0.8 (b) 1.6
(c) 3.2 (d) 6.4

AP-EAMCET-2003

Ans. (c) : For the equilibrium reaction–

	$N_2(g)$	$+ 3H_2(g)$	$\rightleftharpoons 2NH_3(g)$
Initial mole	1	3	0
At equilibrium	0.6 = (1–x)	(3–3x)	2x

$\therefore$ Number of moles of $N_2 \Rightarrow (1 - x) = 0.6$

$$1 - x = 0.6$$
$$x = 1 - 0.6 = 0.4$$

$\therefore$ Total number of moles at equilibrium–

$$= (1 - x) + (3 - 3x) + 2x$$
$$= 4 - 2x$$
$$= 4 - 2 \times 0.4$$
$$= 3.2 \text{ moles}$$

121. In the reaction

$PCl_5(g) \rightleftharpoons PCl_3(g) + Cl_2(g)$,

The equilibrium concentrations of PCl_5 and PCl_3 are 0.4 and 0.2 mol/L respectively. If the value of K_c is 0.5, what is the concentration of Cl_2 in mol/L?

(a) 2.0 (b) 1.5
(c) 1.0 (d) 0.5

AP-EAMCET (Medical), 2003

Ans. (c) : Given that,

$[PCl_5] = 0.4\text{mol/L}, [PCl_3] = 0.2 \text{ mol/L}$
$K_c = 0.5, [Cl_2] = ?$

Give the reaction–

$$PCl_5(g) \rightleftharpoons PCl_3(g) + Cl_2(g)$$

Now, $K_c = \frac{[PCl_3][Cl_2]}{[PCl_5]}$

or $[Cl_2] = \frac{K_c[PCl_5]}{[PCl_3]}$

or $[Cl_2] = \frac{0.5 \times 0.4}{0.2}$

or $[Cl_2] = 1.0 \text{ mol/L}$

122. One mole of A(g) is heated to 300°C in a closed one liter vessel till the following equilibrium is reached : $A(g) \rightleftharpoons B(g)$

The equilibrium constant of this reaction at 300°C is 4. What is the concentration of B (in mol L^{-1}) at equilibrium?

(a) 0.2 (b) 0.6
(c) 0.8 (d) 0.1

AP-EAMCET (Medical), 2002

Ans. (c) : Given that, $K_c = 4$

For the given reaction–

$$A(g) \rightleftharpoons B(g)$$

@apna_pdf

Initial conc. 1 0

At equi. $(1 - x)$ x

$$\therefore \quad K_c = \frac{[B]}{[A]}$$

or $$4 = \frac{x}{1 - x}$$

or $$4 - 4x = x$$

or $$x = \frac{4}{5}$$

or $$x = 0.8$$

123. $A + 2B \rightleftharpoons 2C + D$, initial concentration of B was 1.5 times that of A, but the equilibrium concentration of A and B are found to be equal. The equilibrium constant for the reaction is :

(a) 4 (b) 8

(c) 12 (d) 16

IIT-JEE-2000

Ans. (a): $A + 2B \rightleftharpoons 2C + D$

	A	2B	2C	D
Initial	1	1.5	0	0
Equi.	1– x	1.5 – 2x	2x	x

At equilibrium [A] = [B]

$$1 - x = 1.5 - 2x$$

$$x = 0.5$$

$$\therefore \quad K_c = \frac{[C]^2[D]}{[A][B]^2}$$

$$K_c = \frac{(2x)^2(x)}{(1-x)(1.5-2x)^2}$$

$$K_c = \frac{1 \times 1 \times 0.5}{0.5 \times 0.5 \times 0.5}$$

$$K_c = 4$$

124. One mole of CH_3COOH and one mole of C_2H_5OH reacts to produce $\frac{2}{3}$ mole of $CH_3COOC_2H_5$. The equilibrium constant is:

(a) 2 (b) +2

(c) –4 (d) +4

JEE-Main-2013

Ans. (d):

$$CH_3COOH + C_2H_5OH \rightarrow CH_3COOC_2H_5 + H_2O$$

	CH_3COOH	C_2H_5OH	$CH_3COOC_2H_5$	H_2O
At t=0	1	1	0	0
At equi.	$1-\frac{2}{3}$	$1-\frac{2}{3}$	$\frac{2}{3}$	$\frac{2}{3}$

Let, the volume = V L

$$\therefore \quad [CH_3COOH] = \frac{1}{3} V \text{ mol/L}$$

$$[C_2H_5OH] = \frac{1}{3} V \text{ mol/L}$$

$$[CH_3COOC_2H_5] = \frac{2}{3} V \text{ mol/L}$$

$$[H_2O] = \frac{2}{3} V \text{ mol/L}$$

$$K = \frac{[CH_3COOC_2H_5][H_2O]}{[CH_3COOH][C_2H_5OH]}$$

$$\therefore \quad K = \frac{\frac{2}{3}V \times \frac{2}{3}V}{\frac{1}{3}V \times \frac{1}{3}V} = 4$$

125. If K_1 and K_2 are the equilibrium constants of the equilibriums A and B respectively, what is the relationship between the two constants?

(1) $SO_2(g) + \frac{1}{2}O_2(g) \rightleftharpoons SO_3(g); K_1$

(2) $2SO_3(g) \rightleftharpoons 2SO_2(g) + O_2(g); K_2$

(a) $K_1 = K_2$ (b) $K_1 = \frac{1}{K_2}$

(c) $K_2 = K_1^2$ (d) $K_1^2 = \frac{1}{K_2}$

AP EAMCET (Medical)-1998

Ans. (d): The equilibrium reaction are :

$$SO_2(g) + \frac{1}{2}O_2(g) \xrightleftharpoons{K_1} SO_3(g)$$

And, $$2SO_3(g) \xrightleftharpoons{K_2} 2SO_2(g) + O_2(g)$$

For the first equilibrium reaction –

$$K_1 = \frac{[SO_3]}{[SO_2][O_2]^{1/2}} \quad \text{.....(1)}$$

Similarly, for second –

$$K_2 = \frac{[SO_2]^2[O_2]}{[SO_3]^2}$$

Taking square root both side –we get

$$K_2^2 = \frac{[SO_2][O_2]^{1/2}}{[SO_3]}$$

or $$\frac{1}{\sqrt{K_2}} = \frac{[SO_3]}{[SO_2][O_2]^{1/2}} \quad \text{.....(2)}$$

Equating equation (1) and (2) we get

$$K_1 = \frac{1}{\sqrt{K_2}}$$

or $$K_1^2 = \frac{1}{K_2}$$

126. The equilibrium for the following reaction will be: $3A + 2B \rightarrow C$

(a) $\frac{[3A][2B]}{[C]}$ (b) $\frac{[C]}{[3A][2B]}$

(c) $\frac{[C]}{[A]^2[B]^2}$ (d) $\frac{[C]}{[A]^3[B]^2}$

NEET-1999

Ans. (d): The reaction is –

$$3A + 2B \rightarrow C$$

The expression for the equilibrium constant will be

$$K_c = \frac{[C]}{[A]^3[B]^2}$$

@apna_pdf

127. The equilibrium constant of a reaction is 300. If the volume of a reaction flask is tripled, the equilibrium constant will be

(a) 300 (b) 100
(c) 600 (d) 150

AIIMS-1996

Ans. (a): As we know that, equilibrium constant depends only upon temperature and here temperature is constant.
So, the equilibrium constant will remain unaffected and will not change with change in the volume (pressure or conc.).
So, equilibrium constant will be 300.

128. The equilibrium constant for the reaction $N_2 + 3H_2 \rightleftharpoons 2NH_3$ is K, then the equilibrium constant for the equilibrium $2NH_3 \rightleftharpoons N_2 + 3H_2$ is,

(a) $\sqrt{K}$ (b) $\sqrt{\frac{1}{K}}$
(c) $\frac{1}{K}$ (d) $\frac{1}{K^2}$

NEET-1996

Ans. (c) : The reaction is :

$$N_2 + 3H_2 \rightleftharpoons 2NH_3$$

$$K = \frac{[NH_3]^2}{[N_2][H_2]^3} \quad .....(i)$$

And, $2NH_3 \rightleftharpoons N_2 + 3H_2$

$$K' = \frac{[N_2][H_2]^3}{[NH_3]^2} \quad .....(ii)$$

On solving eq^n. (i) & (ii), we get–

$$K' = \frac{1}{K}$$

129. The law of equilibrium was first given by

(a) Boyle (b) Goldberg
(c) Waage (d) both (b) and (c)

AIIMS-1994

Ans. (d) : According to Guldberg and Waage, the rate at which substance reacts is directly proportional to its active mass (i.e. molar concentration)

$$aA + bB \rightleftharpoons xX + yY$$

$$K_C = \frac{[x]^x[y]^y}{[A]^a[B]^b}$$

K_C = equilibrium constant.

130. K_1 and K_2 are equilibrium constant for reaction (i) and (ii) respectively,

$N_2(g) + O_2(g) \rightleftharpoons 2NO(g)$ .... (i)

$NO(g) \rightleftharpoons \frac{1}{2}N_2(g) + \frac{1}{2}O_2(g)$ .... (ii)

(a) $K_1 = \left(\frac{1}{K_2}\right)^2$ (b) $K_1 = K_2^2$
(c) $K_1 = \frac{1}{K_2}$ (d) $K_1 = (K_2)^0$

NEET-1989

Ans. (a) : The reaction is:

$$N_2(g) + O_2(g) \rightleftharpoons 2NO(g)$$

$$K_1 = \frac{[NO]^2}{[N_2][O_2]} \quad .....(i)$$

$$NO(g) \rightleftharpoons \frac{1}{2}N_2(g) + \frac{1}{2}O_2(g)$$

$$K_2 = \frac{[N_2]^{1/2}[O_2]^{1/2}}{[NO]}$$

Squaring on both sides

$$(K_2)^2 = \frac{[N_2][O_2]}{[NO]^2} \quad .....(ii)$$

On solving eq^n. (i) & (ii), we get–

$$(K_2)^2 = \frac{1}{K_1}$$

$$K_1 = \left(\frac{1}{K_2}\right)^2$$

131. Given that the equilibrium constant for the reaction $2SO_2(g) + O_2(g) \rightleftharpoons 2SO_3(g)$ has a value of 278 at a particular temperature. What is the value of the equilibrium constant for the following reaction at the same temperature?

$$SO_3(g) \rightleftharpoons SO_2(g) + \frac{1}{2}O_2(g)$$

(a) 1.8×10^{-3} (b) 3.6×10^{-3}
(c) 6.0×10^{-2} (d) 1.3×10^{-5}

VITEEE-2018

Ans. (c) : The given reaction is –

$$2SO_2(g) + O_2(g) \rightleftharpoons 2SO_3(g)$$

$$\therefore \quad K = \frac{[SO_3]^2}{[SO_2]^2[O_2]} \quad ....(1)$$

Given, K = 278

And, $SO_3(g) \rightleftharpoons SO_2(g) + \frac{1}{2}O_2(g)$

K' = ?

Where, K' = equilibrium constant.

$$K' = \frac{[SO_2][O_2]^{1/2}}{[SO_3]}$$

Taking square both side – we get

$$K'^2 = \frac{[SO_2]^2[O_2]}{[SO_3]^2} \quad .....(2)$$

Substituting the values from equation (1), we get–

$$K'^2 = \frac{1}{K}$$

or $$K' = \sqrt{\frac{1}{278}} = \sqrt{35.97 \times 10^{-4}}$$

$$K' = 6 \times 10^{-2}$$

132. For which one of the following systems at equilibrium, at constant temperature will the doubling of the volume cause a shift to the right?

@apna_pdf

(a) $H_2(g)+Cl_2(g)\rightleftharpoons 2HCl(g)$

(b) $2CO(g)+O_2(g)\rightleftharpoons 2CO_2(g)$

(c) $N_2(g)+3H_2(g)\rightleftharpoons 2NH_3(g)$

(d) $PCl_5(g)\rightleftharpoons PCl_3(g)+Cl_2(g)$

VITEEE-2018

Ans. (d) : For the reaction, $PCl_5(g) \rightleftharpoons PCl_3(g) + Cl_2(g)$ is at equilibrium as well as constant temperature, doubling the volume will cause a shift to the right.

The number of moles of gaseous products is more than the no. of moles of gaseous reactant. Doubling the volume will reduce the pressure to one half. The equilibrium will shift to right to increase the pressure.

133. The rate constant for forward reaction and backward reaction of hydrolysis of ester are 1.1 × 10^{-2} and 1.5 × 10^{-3} per minute respectively. Equilibrium constant for the reaction is

$CH_3COOC_2H_5+H_2O\rightleftharpoons CH_3COOH+C_2H_5OH$

(a) 33.7 (b) 7.33

(c) 5.33 (d) 33.3

VITEEE-2014

Ans. (b) : Given data,

$k_f = 1.1 \times 10^{-2}$

$k_b = 1.5 \times 10^{-3}$

$K_{eq} = ?$

$CH_3COOC_2H_5 + H_2O \rightleftharpoons CH_3COOH + C_2H_5OH$

The equilibrium constant for the reaction is–

$$K_{eq} = \frac{k_f}{k_b} = \frac{1.1\times10^{-2}}{1.5\times10^{-3}} = 7.33.$$

134. For the following three reactions I, II and III, equilibrium constants are given

(I) $CO(g) + H_2O(g) \rightleftharpoons CO_2(g) + H_2(g); K_1$

(II) $CH_4(g) + H_2O(g) \rightleftharpoons CO(g) + 3H_2(g); K_2$

(III) $CH_4(g)+2H_2O(g) \rightleftharpoons CO_2(g)+4H_2(g);K_3$

Which of the following relations is correct?

(a) $K_1 \sqrt{K_2} = K_3$ (b) $K_2 \sqrt{K_3} = K_1$

(c) $K_3 = K_1 K_2$ (d) $K_3K_2^3 = K_1^2$

UPSEEE/UPTU-2019

Ans. (c) : $CO(g) + H_2O(g) \rightleftharpoons CO_2(g) + H_2(g);$ K_1

$CH_4(g) + H_2O(g) \rightleftharpoons CO(g) + 3H_2(g);$ K_2

Adding both equations, we get –

$CH_4(g) + 2H_2O(g) \rightleftharpoons CO_2(g) + 4H_2(g)$

$K_3 = K_1K_2$

Hence, option (c) is correct.

135. The equilibrium constant (K_c) for the reaction $N_2(g) + O_2(g) \rightarrow 2NO(g)$ at temperature T is 4 × 10^{-4}. The value of K_c for the reaction $NO(g)\rightarrow\frac{1}{2}N_2(g)+\frac{1}{2}O_2(g)$ at the same temperature is

(a) 0.02 (b) 2.5 × 10^2

(c) 4 × 10^{-4} (d) 50.0

AIEEE-2012

Ans. (d) : Given equations are –

$N_2(g) + O_2(g) \rightleftharpoons 2NO(g)$

$$K_c = \frac{[NO]^2}{[N_2][O_2]}$$

or $$4\times10^{-4} = \frac{[NO]^2}{[N_2][O_2]} \quad .....(i)$$

And, $$NO \rightleftharpoons \frac{1}{2}N_2 + \frac{1}{2}O_2$$

$$K' = \frac{[N_2]^{1/2}[O_2]^{1/2}}{[NO]}$$

On squaring on both sides –

$$(K')^2 = \frac{[N_2][O_2]}{[NO]^2} \quad .....(ii)$$

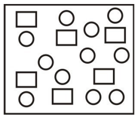
On substituting value of eq^n (i), we get–

$$(K')^2 = \frac{1}{K}$$

$$K' = \frac{1}{\sqrt{K}} = \frac{1}{\sqrt{4\times10^{-4}}} = \frac{1}{2\times10^{-2}}$$

$K' = 50$

136. In the figure shown below, reactant A (represented by square) is in equilibrium with product B (represented by circle). The equilibrium constant is



(a) 4 (b) 2

(c) 8 (d) 1

JEE-Main-2020

Ans. (b) : In the above image

$$\text{Equilibrium constant} = \frac{[\text{Product}]}{[\text{Reactant}]} = \frac{11}{6} \approx 2$$

137. For the following reactions, equilibrium constants are given:

$S(s)+O_2(g)\rightleftharpoons SO_2(g);K_1=10^{52}$

$2S(s)+3O_2(g)\rightleftharpoons 2SO_3(g);\ K_2=10^{129}$

The equilibrium constant for the reaction, $2SO(g)+O_2(g)\rightleftharpoons 2SO_3(g)$ is

(a) 10^{25} (b) 10^{77}

(c) 10^{154} (d) 10^{181}

JEE-Main-2019

Ans. (a) $S(s) + O_2(g) \rightleftharpoons SO_2(g);\ K_1 = 10^{52}$ ...(i)

$2S(s) + 3O_2(g) \rightleftharpoons 2SO_3(g); K_2 = 10^{129}$ ...(ii)

Multiplying equation (i) by (ii) and reversing if–

$$2SO_2(g) \rightleftharpoons 2S(s) + 2O_2(g);\ K_1' = \frac{1}{K_1^2} \quad .....(iii)$$

Adding equation (ii) and equation (iii), we get–

$2SO_2(g) + O_2(g) \rightleftharpoons 2SO_3(g);\ K_3 = K_2 \times K_1'$

$$K_3 = K_2 \times \frac{1}{K_1^2} = 10^{129} \times \frac{1}{(10^{52})^2} = 10^{25}$$

@apna_pdf

138. An open beaker of water in equilibrium with water vapour is in a sealed container. When few grams of glucose are added to the beaker of water, the rate at which water molecules

(a) leaves the solution decreases
(b) leaves the solution increases
(c) leaves the vapour increases
(d) leaves the vapour decreases

JEE-Main-02.09.2020, Shift-I

Ans. (c) : The vapour pressure of solution will be less than vapour pressure of pure solvent, so some vapour molecules will get condensed to maintain new equilibrium. So, leaves the vapour increases is correct answer.

139. The equilibrium constant for the reaction $A(s) \rightleftharpoons M(s)+\frac{1}{2}O_2(g)$ is $K_p = 4$. At equilibrium, the partial pressure of O_2 is.......atm.
(Round off to the nearest integer)

JEE-Main-2021

Ans. 16 : For the reaction –

$$A(s) \rightleftharpoons M(s)+\frac{1}{2}O_2(g) \qquad K_p = 4$$

$K_p = (Po_2)^{1/2}$
$4 = (Po_2)^{1/2}$
$(4)^2 = Po_2$
$Po_2 = 16$

140. $2SO_2(g)+O_2(g) \longrightarrow 2SO_3(g)$ The above reaction is carried out in a vessel starting with partial pressure Pso_2 = 250m bar, Po_2 = 750m bar and Pso_3 = 0. When the reaction is complete, the total pressure in the reaction vessel is .... m bar. (Round off of the nearest integer).

JEE-Main-2021

Ans. 875 : $2SO_2(g)+O_2(g) \longrightarrow 2SO_3(g)$

Initial	250 m bar	750m bar	0
Final adding	–250m bar	–125m bar	250m bar
	0	625	250

Final total = 625 + 250 = 875m bar.

141. The equilibrium constant K_c at 298 K for the reaction $A+B \rightleftharpoons C+D$ is 100. Starting with an equimolar solution with concentration of A,B,C and D all equal to 1M, the equilibrium concentration of D is ....×10^{-2} M. (Nearest integer)

JEE-Main-2016

Ans. 182 :

	A	+ B	⇌ C	+ D
Initially	1	1	1	1
at equilibrium	1 – x	1 – x	1 + x	1 + x

Equilibrium constant–

$$K_c = \frac{(1+x)^2}{(1-x)^2}$$

$$100 = \left(\frac{1+x}{1-x}\right)^2$$

$$10 = \frac{1+x}{1-x}$$

$$x = \frac{9}{11}$$

So, equilibrium concentration of

$$D = 1+x = 1+\frac{9}{11} = \frac{20}{11} = 1.818$$
$$= 181.8 \times 10^{-2}$$
$$= 182 \times 10^{-2}$$

2. Law of Mass Action

142. What is the equilibrium expression for the reaction,

$P_4(s) + 5O_2(g) \rightleftharpoons P_4O_{10}(s)$?

(a) $K_c = \frac{[P_4O_{10}]}{[P_4][O_2]^5}$ (b) $K_c = \frac{[P_4O_{10}]}{5[P_4][O_2]}$

(c) $K_c = [O_2]^5$ (d) $K_c = \frac{1}{[O_2]^5}$

JCECE - 2008, UPTU/UPSEE-2007

Ans. (d) : The reaction is

$$P_4(s)+5O_2(g) \rightleftharpoons P_4O_{10}(s)$$

$$K_c = \frac{[P_4O_{10}]}{[P_4][O_2]^5}$$

We know that the concentration of solids is unity.

So, $K_c = \frac{1}{[O_2]^5}$

143. The rate, at which a substance reacts, depends upon its

(a) equivalent mass (b) molecular mass
(c) active mass (d) atomic mass

AMU-2001, AIIMS-1996

Ans. (c): The rate at which a substance reacts depends upon its active mass as the rate of reaction is directly proportional to concentration of each reactant and product.

144. Which of the following statements is true when equilibrium is established in the reaction ?
$A + B \rightleftharpoons C + D$, K_C =10

(a) [C][D] = [A] [B]
(b) [C] = [A]and [B] = [D]
(c) [A][B] = 0.1 [C][D]
(d) [A] = [B] = [C] = [D] = 10M

AP-EAPCET 24.08.2021 Shift-II

Ans. (c) : Given reaction is –

$A + B \rightleftharpoons C + D$, $K_c = 10$

Rate law of reaction at equilibrium.

$$K_c = \frac{[C]\,[D]}{[A]\,[B]} = 10 = \frac{[C][D]}{[A][B]}$$

10 [A][B] = [C][D]

@apna_pdf

$$[A][B] = \frac{1}{10}[C][D]$$

$$[A][B] = 0.1\ [C][D]$$

145. For a reaction taking place in three steps, the rate constants are k_1, k_2 and k_3 and overall rate constant is $k = \frac{k_1k_3}{k_2}$. If the energies of activation E_1, E_2 and E_3 are 60, 30 and 10 kJ mol^{-1} respectively, then the overall energy of activation is

(a) 30 kJ mol^{-1} (b) 40 kJ mol^{-1}

(c) 60 kJ mol^{-1} (d) 100 kJ mol^{-1}

AMU-2014

Ans. (b) : Given,

$$K = \frac{K_1K_2}{K_3}$$

On taking log both sides:

$$\log K = \log K_1 + \log K_2 - \log K_3 \qquad .....(i)$$

We know that:

$$\log k = \log A - \frac{Ea}{2.303\ RT}$$

So, from (i)

$$\log A - \frac{Ea}{2.303RT} = \log A - \frac{Ea_1}{2.303RT} + \frac{Ea_2}{2.303RT} - \frac{Ea_3}{2.303RT}$$

$Ea = Ea_1 + Ea_3 - Ea_2$

$= 60 + 10 - 30$

$= 70 - 30 = 40$ kJ mol^{-1}

146. The K_p value for the reaction,

$$H_2 + I_2 \rightleftharpoons 2HI$$

at 460 °C is 49. If the initial pressure of H_2 and I_2 is 0.5 atm respectively, what will be the partial pressure of H_2 at equilibrium?

(a) 0.111 atm (b) 0.123 atm

(c) 0.133 atm (d) 0.222 atm

AMU-2014

Ans. (a) :	H_2	+	I_2	$\rightleftharpoons$	2HI
initially	0.5atm		0.5atm		0
at eq.	(0.5-x) atm		(0.5-x) atm		2x atm

$$Kp = \frac{(P_{HI})^2}{P_{H_2}.P_{I_2}}$$

$$49 = \frac{(2x)^2}{(0.5-x)(0.5-x)}$$

$$49 = \frac{(2x)^2}{(0.5-x)^2}$$

$$7 = \frac{2x}{0.5-x}$$

$2x = 3.5 - 7x$

$9x = 3.5$

$$x = \frac{3.5}{9} = 0.388$$

$\therefore \quad PH_2 = 0.5 - 0.388 = 0.111$ atm

147. The values of K_{sp} of $CaCO_3$ and CaC_2O_4 are 4.7×10^{-9} and 1.3×10^{-9} respectively at 25°C. If the mixture of these two is washed with water, what is the concentration of Ca^{2+} ions in water?

(a) 5.831×10^{-5} M (b) 6.856×10^{-5} M

(c) 3.606×10^{-5} M (d) 7.746×10^{-5} M

Karnataka-NEET-2013

Ans. (d) : $CaCO_3 \longrightarrow \underset{x}{Ca^{2+}} + \underset{x}{CO_3^{2-}}$

$$CaC_2O_4 \longrightarrow \underset{y}{Ca^{2+}} + \underset{y}{C_2O_4^{2-}}$$

Now, $[Ca^{2+}] = x+y$

And, $x(x+y) = 4.7\times10^{-9}$

$y(x+y) = 1.3\times10^{-9}$

Dividing equation (i) and (ii) we get,

$$\frac{x}{y} = 3.6 \Rightarrow x = 3.6y$$

Putting this value in equation (ii) we get,

$y(3.6y+y) = 1.3\times10^{-9}$

On solving, we get $y = 1.68\times10^{-5}$

And, $x = 3.6\times1.68\times10^{-5} = 6.048\times10^{-5}$

$\therefore \quad [Ca^{2+}] = (x+y) = (6.048\times10^{-5}) + (1.68\times10^{-5})$

$\therefore \quad [Ca^{2+}] = 7.728\times10^{-5}M$

148. If 1.0 mole of I_2 is introduced into 1.0 litre flask at 1000 K, at equilibrium ($K_c = 10^{-6}$), which one is correct?

(a) $[I_2(g)] > [I^-(g)]$ (b) $[I_2(g)] < [I^-(g)]$

(c) $[I_2(g)] = [I^-(g)]$ (d) $[I_2(g)] = \frac{1}{2}[I^-(g)]$

BITSAT-2013

Ans. (a) : $\underset{1-x}{I_2} \rightleftharpoons \underset{2x}{2I^-}$

$$K_c = \frac{(2x)^2}{(1-x)} = 10^{-6}$$

It shows that $(1-x) > 2x \Rightarrow \boxed{I_2 > I^-}$

149. 630 mg of oxalic acid is equivalent to

(a) 100 mL of 0.2 N $KMnO_4$

(b) 100 mL of 0.05 N $KMnO_4$

(c) 100 mL of 0.01 N $KMnO_4$

(d) 100 mL of 0.1 N $KMnO_4$

COMEDK-2011

Ans. (d) : At equivalence point:

No. of gram equivalents of oxalic acid = No. of gram equivalents of oxalic acid

$$= \frac{w}{Eq.wt.} = \frac{630\times10^{-3}}{63} = 1\times10^{-2} = 0.01$$

Now, no. of gram equivalents in

(a) 100 mL of 0.2 N $KMnO_4$ = $0.2\times\frac{100}{1000} = 0.02$

(b) 100 mL of 0.05 N $KMnO_4$ = $0.05\times\frac{100}{1000} = 0.005$

(c) 100 mL of 0.01 N $KMnO_4$ = $0.01\times\frac{100}{1000} = 0.001$

(d) 100 mL of 0.1 N $KMnO_4$ = $0.1\times\frac{100}{1000} = 0.01$

@apna_pdf

150. For the reaction $A+3B \longrightarrow 2C+D$, which one of the following is not correct?

(a) Rate of disappearance of A = Rate of formation of D

(b) Rate of formation of $C=\frac{2}{3}\times$Rate of disappearance of B

(c) Rate of formation of $D=\frac{1}{3}\times$Rate of disappearance of B

(d) Rate of disappearance of A = 2 × Rate of formation of C

AP- EAMCET(Medical) -2010

Ans. (d): For the reaction-

$$A+3B \longrightarrow 2C+D$$

We can write the rate of formation and deformation of reactant and product for the above reaction-

$$\frac{-d[A]}{dt}=-\frac{1}{3}\frac{d[B]}{dt}=+\frac{1}{2}\frac{d[C]}{dt}=+1\frac{d[D]}{dt}$$

We get the following conclusion–

(1) rate of disappearance of A = rate of formation of D.

(2) rate of formation of $C=\frac{2}{3}\times$ rate of disappearance of B.

(3) rate of formation of $D=\frac{1}{3}\times$rate of disappearance of B.

(4) rate of disappearance of $A=\frac{1}{2}\times$rate of formation of C.

151. According to Ellingham diagram, the oxidation reaction of carbon to carbon monoxide may be used to reduce which one of the following oxides at the lowest temperature?

(a) Al_2O_3 (b) Cu_2O

(c) MgO (d) ZnO

(e) FeO

Kerala-CEE-2010

Ans. (b) : Cu_2O is least stable among all so the oxidation reaction of carbon to carbon monoxide may be used to reduce this at the lowest temperature.

152. By applying law of mass action, the equilibrium constant K for the reaction
$HA + H_2O \rightleftharpoons H_3O^+ + A^-$

(a) $K=\frac{[HA][H_2O]}{[H_3O^+][A^-]}$ (b) $K=\frac{[H_3O^+][A^-]}{[HA][H_2O]}$

(c) $K=\frac{[H_3O^+][H_2O]}{[A^-][HA]}$ (d) $K=\frac{[HA][A^-]}{[H_2O][H_3O^+]}$

J & K CET-(2007)

Ans. (b) : The reaction is :

$$HA+H_2O \rightleftharpoons H_3O^+ + A^-$$

The equilibrium constant $K=\frac{[\text{Product}]}{[\text{Reactant}]}$

So, $K=\frac{[H_3O^+][A^-]}{[HA][H_2O]}$

153. Which of the following is not a characteristic property of chemical equilibrium?

(a) Rate of forward reaction is equal to rate of backward reaction at equilibrium

(b) After reaching the chemical equilibrium, the concentrations of reactants and products remain unchanged with time

(c) For $A(g) \rightleftharpoons B(g)$, K_c is 10^{-2}, If this reaction is carried out in the presence of catalyst, that value of K_c decreases

(d) After reaching the equilibrium, both forward and backward reactions continue to take place

AP-EAMCET-2006

Ans. (c) : For $A(g) \rightleftharpoons B(g)$, $K_c = 10^{-2}$
If this reaction is carried out in the presence of catalyst, the value of K_C (equilibrium constant) not effect.

154. The equilibrium constant for the reaction $H_2O(g)+CO(g) \rightleftharpoons H_2(g)+CO_2(g)$ is 64. The rate constant for the forward reaction is 160, the rate constant for the backward reaction is:

(a) 0.4 (b) 2.5

(c) 6.2 (d) 10.24×10^3

AP-EAMCET (Med.)-1999

Ans. (b) : Given values:- $K_c = 64$, $K_f = 160$, $K_b = ?$
For the equilibrium reaction-

$$H_2O + CO \rightleftharpoons H_2 + CO_2$$

At equilibrium-

$$K_c=\frac{k_f}{k_b}$$

Where- K_c = Equilibrium constant
k_f = Rate of forward reaction
k_b = Rate of backward reaction

$$k_b=\frac{160}{64}$$

or $k_b = 2.5$

155. The equilibrium constant (K_c) for the reaction $HA+B \rightleftharpoons BH^+ + A^-$ is 100. If the rate constant for the forward reaction is 10^5, rate constant for the reverse reaction is

(a) 10^{-3} (b) 10^{-5}

(c) 10^7 (d) 10^3

AP-EAMCET-1994

Ans. (d) : Given that, $K_c = 100$, $k_f = 10^5$, $k_b = ?$

$$HA+B \rightleftharpoons C(g)+D(g)$$

At equilibrium-

$$K_c=\frac{k_f}{k_b}$$

or $k_b=\frac{k_f}{K_c}$

Putting the value, we get-

$$k_b=\frac{10^5}{100}=10^3$$

@apna_pdf

3. Activation Energy, Standard Free Energy

156. Hydrolysis of sucrose is given by the following reaction. Sucrose + H_2O $\rightleftharpoons$ Glucose + Fructose. If the equilibrium (K_c) is 2 × 10^{13} at 300 K, the value of ΔG^o at the same temperature will be

(a) – 8.314 J $mol^{-1}K^{-1}$ × 300 K × ln (2 × 10^{13})
(b) 8.314 J $mol^{-1}K^{-1}$ × 300 K × ln (2 × 10^{13})
(c) 8.314 J $mol^{-1}K^{-1}$ × 300 K × ln (3 × 10^{13})
(d) – 8.314 J $mol^{-1}K^{-1}$ × 300 K × ln (4 × 10^{13})

NEET-2020

Ans. (a) : Given data: $K_c = 2\times10^{13}$, T = 300 K, ΔG^o = ?
The relation between standard Gibbs energy and equilibrium constant is givens by -

$\Delta G^o = -RT \ln K_c$
$= -8.314\ Jmol^{-1}K^{-1} \times 300K \times \ln (2 \times 10^{13})$.

157. Assertion: At equilibrium, $\Delta G = 0$.
Reason: At equilibrium, $\Delta G^o = RT \log K_c$.

(a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS 25 May 2019 (Morning)

Ans. (c) : When ΔG is 0, reaction has achieved equilibrium. A mathematical expression of this thermodynamic view of equilibrium can be described by the following equation.

$\Delta G = \Delta G^o = RT \ln K_c$.

158. The value of $\log_{10}K$ for the reaction A $\rightleftharpoons$ B is

(Given : $\Delta_f H^o(298K) = -54.07 kJmol^{-1}$
$\Delta_r S^o = 10JK^{-1}mol^{-1}$
$R = 8.314 JK^{-1}mol^{-1}$)

(a) 5
(b) 10
(c) 95
(d) 100

BCECE-2018

Ans. (b) : Given: $\Delta H = -54.07$ kJ mol^{-1}
$\Delta S = 10\ JK^{-1}\ mol^{-1}$

We know that,

$\Delta G^\circ = \Delta H^\circ_{298} - T\Delta S^\circ_{298}$
$= -54.07 \times 1000 - 298\times10$
$= -54070 - 2980$
$= -57050$ J

And, $\Delta G^\circ = -2.303RT \log_{10}K$
$-57050 = -2.303 \times 8.314 \times 298 \times \log_{10}K$
$-57050 = -5705.8 \times \log_{10}K$
$\frac{57050}{5705.8} = \log_{10} K$
$\log_{10}K = 10$

159. The dissociation energy of CH_4 and C_6H_6 to convert them into gaseous atom are 360 and 620 kcal/mol respectively. The bond energy of C–C bond is

(a) 260 kcal mol^{-1}
(b) 180 kcal mol^{-1}
(c) 130 kcal mol^{-1}
(d) 80 kcal mol^{-1}

BCECE-2018

Ans. (d) : Given,
Dissociation energy of CH_4 = 360 kcal mol^{-1}
Dissociation energy of C_6H_6 = 620 kcal mol^{-1}

$\therefore$ Bond energy of C─H bond $= \frac{360}{4} = 90$ kJ

Bond energy of ethane:
(C–C) + 6 (C–H) = 620 kJ/mol
(C–C) + 6 × 90 = 620
(C–C) + 540 = 620
(C–C) = 620-540
(C–C) = 80
So, bond energy of (C–C) is 80 k calmol^{-1}

160. One mole of ethanol is produced reacting graphite, H_2 and O_2 together. The standard enthalpy of formation is –277.7 kJ mol^{-1}. Calculate the standard enthalpy of the reaction when 4 moles of graphite is involved

(a) –277.7
(b) –555.4
(c) –138.85
(d) –69.42
(e) –1110.8

Kerala-CEE-2018

Ans. (b) : When graphite reacted with H_2 and O_2 then one mole of ethanol is formed. The chemical reaction is given below-

$$2C(s) + 3H_2(g) + \frac{1}{2}O_2(g) \rightarrow C_2H_5OH(l)$$

$\Delta H_f = -277.7$ kJ/mol

If 2 moles of graphite is involved, the standard enthalpy of reaction is –277.7 kJ/mol. When 4 moles of graphite is involved then standard enthalpy of reaction will be 2×(–277.7 kJ/mol) = – 555.4 kJ/mol

161. $\Delta_r G^\circ$ for the conversion of O_2 to ozone,

$\frac{3}{2}O_2(g) \longrightarrow O_3(g)$ at 298 K is

(K_p for this conversion is 1×10^{-29})

(a) 16.54 kJ mol^{-1}
(b) 165.4 kJ mol^{-1}
(c) 1654 kJ mol^{-1}
(d) 1.654 kJ mol^{-1}

COMEDK-2015

Ans. (b) : Given, $K_p = 1 \times 10^{-29}$, T = 298 K, $\Delta_r G^o$ = ?
The conversion reaction of ozone is -

$$\frac{3}{2}O_2(g) \longrightarrow O_3(g)$$

The relation between standard Gibb's free energy and equilibrium constant is -

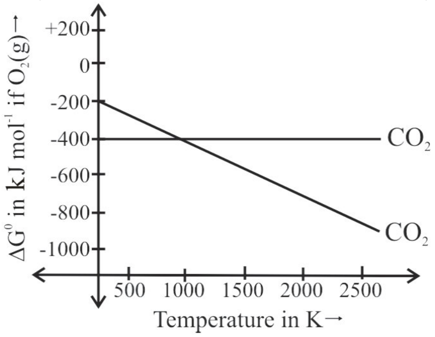
$\Delta_r G^o = -RT \ln K_p$
or $\Delta_r G^\circ = -2.303 RT \log K_p$
$= -2.303 \times 8.314 \times 298 \times \log (1\times10^{-29})$
$= 165469.6$ J mol^{-1} = 165.47 kJ mol^{-1}

@apna_pdf

162. From the Ellingham graphs on carbon, which of the following statements is false?
(a) CO reduces Fe_2O_3 to Fe at less than 983 K
(b) CO is less stable than CO_2 at more than 983 K
(c) CO reduces Fe_2O_3 to Fe in the reduction zone of blast furnace
(d) CO_2 is more stable than CO at less then 983 K

Karnataka-CET-2012

Ans. (b) : CO_2 is less stable than CO at more than 983K. At these temperature, the ΔG value of formation of CO is more negative than the ΔG value of formation of CO_2. More negative, the value of ΔG, the greater is the tendency of the element to combine with oxygen.



163. If the activation energy for the forward reaction is 150 kJ mol^{-1} and that of the reverse reaction is 260 kJ mol^{-1}. What is the enthalpy change for the reaction?
(a) 410 kJ mol^{-1} (b) 110 kJ mol^{-1}
(c) –110 kJ mol^{-1} (d) –410 kJ mol^{-1}
(e) 90 kJ mol^{-1}

Kerala-CEE-2010

Ans. (c) : Given,
Activation energy of forward reaction (E_f) = 150 kJ mol^{-1}
Activation energy of backward reaction (E_b) = 260 kJ mol^{-1}
Enthalpy change for a reversible reaction is -
$\Delta H = E_f$ (forward) – E_b (backward)
$\Delta H = 150 - 260$
$= -110$ kJ mol^{-1}

164. Calculate the standard enthalpy change (in kJ mol^{-1}) for the reaction

$$H_2(g) + O_2(g) \longrightarrow H_2O_2\,(g)$$

Given that bond enthalpies of H—H, O═O, O—H and O—O (in kJ mol^{-1}) are respectively 438, 498, 464 and 138.
(a) –130 (b) –65
(c) +130 (d) – 334
(e) +334

Kerala-CEE-2010

Ans. (a) : Given,
Bond enthalpy of H–H = 438 kJ mol^{-1}
Bond enthalpy of O = O = 498 kJ mol^{-1}
Bond enthalpy of O–H = 464 kJ mol^{-1}
Bond enthalpy of O–O = 138 kJ mol^{-1}
For the reaction-

$$H_2(g) + O_2(g) \rightarrow H_2O_2(g)$$

$\therefore$ ΔH^o = [Bond Energy]$_{Reactant}$ – [Bond Energy]$_{Product}$
ΔH^o = [(Bond energy of H–H) + (Bond energy of O–O)] –[2 (Bond energy of O–H) + (Bond energy of O–O)]
= [438+498] –[2×464+138]
= 936 – 1066
= –130 kJ mol^{-1}

165. The first $(\Delta_i H_1)$ and second $(\Delta_i H_2)$ ionisation enthalpies (in kJ mol^{-1}) and the $(\Delta_{eg}H^o)$ electron gain enthalpy (in kJ mol^{-1}) of the elements I, II, III, IV and are given below

Element	$\Delta_i H_1$	$\Delta_i H_2$	$\Delta_{eg}H^o$
I	520	7300	– 60
II	419	3051	– 48
III	1681	3374	– 328
IV	1008	1846	– 295
V	2372	5251	+ 48

The most reactive metal and the least reactive non-metal of these are respectively
(a) I and V (b) V and II
(c) II and V (d) IV and V
(e) V and III

Kerala-CEE-2010

Ans. (c)
(a) The metal I can form a stable MX halide.
(b) The metal II is the most reactive metal. It has very low value of first ionization energy.
(c) The element III is the most reactive non-metal. Its electron gain enthalpy is most negative.
(d) The element IV is the least reactive non-metal as it has least negative electron gain enthalpy among the non-metals.
(e) The element V is the least reactive element as it has highest value of first ionization energy and positive election gain enthalpy.

166. $N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$ + 22 kcal. The activation energy for the forward reaction is 50 kcal. What is the activation energy for the backward reaction ?
(a) – 72 kcal (b) – 28 kcal
(c) + 28 kcal (d) + 72 kcal

AP - EAMCET (Medical) - 2007

Ans. (d) : Given,
enthalpy change of the reaction = 22 kcal
activation energy of forward reaction (E_f) = 50 kcal
activation energy of backward reaction (E_b) = ?
For the reaction–

$$N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g) \quad \Delta H = -22\text{kcal}$$

As we know that formation of ammonia is a exothermic reaction. The activation energy for the forward reaction (E_f) is 50 kcal.
$\therefore$ $\Delta H = E_f - E_b$
or $E_b = E_f - \Delta H$
or E_b = 50 kcal – (–22 kcal)
or E_b = 72 kcal.

@apna_pdf

167. The reactions with low activation energy are always

(a) adiabatic (b) slow
(c) non-spontaneous (d) fast

VITEEE- 2006

Ans. (d) : The reactions with low activation energies are always fast where as the reactions with high activation energy are always slow.

168. A chemical reaction is catalysed by 'X' therefore, 'X'

(a) increases the activation energy
(b) does not affect the equilibrium constant of the reaction
(c) decreases the enthalpy of the reaction
(d) decreases the velocity constant of the reaction

CG PET -2006

Ans. (b) : A catalyst increases the rate of the chemical reaction by making available a new low energy pathway for the conversion of reactants to products. It increases the rate of forward and reverse reactions that pass through the same transition state and does not affect equilibrium. Catalyst lowers the activation energy for the forward and reverse reactions by exactly the same amount.

4. Degree of Dissociation

169. For a reaction at equilibrium

$$A(g) \rightleftharpoons B(g) + \frac{1}{2}C(g)$$

The relation between dissociation constant (K), degree of dissociation (α) and equilibrium pressure (p) is given by:

(a) $K = \dfrac{\alpha^{\frac{1}{2}}p^{\frac{3}{2}}}{\left(1+\frac{3}{2}\alpha\right)^{\frac{1}{2}}(1-\alpha)}$

(b) $K = \dfrac{\alpha^{\frac{3}{2}}p^{\frac{1}{2}}}{(2+\alpha)^{\frac{1}{2}}(1-\alpha)}$

(c) $K = \dfrac{(\alpha p)^{\frac{3}{2}}}{\left(1+\frac{3}{2}\alpha\right)^{\frac{1}{2}}(1-\alpha)}$

(d) $K = \dfrac{(\alpha p)^{\frac{3}{2}}}{(1+\alpha)(1-\alpha)^{\frac{1}{2}}}$

JEE Main-24.06.2022, Shift-I

Ans. (b) : For a given reaction at equilibrium-

$$A(g) \rightleftharpoons B(g) + \frac{1}{2}C(g)$$

	$A(g)$	$B(g)$	$\frac{1}{2}C(g)$
Initially	1	0	0
At equi.	(1–α)	α	$\frac{\alpha}{2}$

$$\therefore\ n_{(total)} = 1 - \alpha + \alpha + \frac{\alpha}{2} = 1 + \frac{\alpha}{2}$$

$$\text{So, } K_p = \frac{\left(\frac{\alpha}{1+\frac{\alpha}{2}}\times p\right)\left(\frac{\alpha/2}{1+\frac{\alpha}{2}}p\right)^{1/2}}{\left(\frac{1-\alpha}{1+\frac{\alpha}{2}}p\right)}$$

$$K_p = \frac{\alpha\left(\frac{\alpha}{2}\right)^{1/2}p^{1/2}}{(1-\alpha)^{1/2}\left(1+\frac{\alpha}{2}\right)^{1/2}}$$

$$K_p = \frac{\alpha^{3/2}p^{1/2}}{(2+\alpha)^{1/2}(1-\alpha)}$$

170. The overall complex dissociation equilibrium constant for $[Cr(H_2O)_6]^{3+}$ ion is 5×10^{-12} the overall stability constant of the complex is

(a) 2×10^{-11} (b) 5×10^{11}
(c) 5×10^{10} (d) 2×10^{11}
(e) 0.2×10^{11}

Kerala CEE -03.07.2022

Ans. (d) : Given, that–

Complex dissociation equilibrium constant $K = 5\times10^{-12}$

We know,

Dissociation constant is the reciprocal of the stability constant $\left(\beta = \frac{1}{K}\right)$

So, overall stability constant $\beta = \left(\frac{1}{5\times10^{-12}}\right)$

$= 0.2 \times 10^{12}$

$= 2 \times 10^{11}$

171. The value of Van't Hoff factor for 0.1 M $Ba(NO_3)_2$ solution is 2.74. The degree of dissociation is–

(a) 100% (b) 92%
(c) 87% (d) 74%

MHT CET-02.05.2019, SHIFT-III
JIMPER-2018
BCECE-2016
J & K CET-(2003)

Ans. (c) : $Ba(NO_3)_2 \rightleftharpoons Ba^{2+} + 2NO_3^-$

$i = 1+2\alpha$

$\therefore\ 2.74 = 1+2\alpha$

$\alpha = \frac{1.74}{2} = 0.87 = 87\%$

The Van't Hoff's factor for 0.1 M $Ba(NO_3)_2$ solution is 2.74. The degree of dissociation is 87%.

172. Van't Hoff factor of $Ca(NO_3)_2$ is

(a) One (b) Two
(c) Three (d) Four

J & K CET-(2013)
BCECE-2008
UP CPMT-2006

@apna_pdf

Ans. (c) : $Ca(NO_3)_2 \rightleftharpoons Ca^{2+} + 2NO_3^-$

It furnishes 3 ions per formula unit. So, its Van't Hoff factor is 3.

173. Precipitation takes place when the product of concentration of ions is

(a) more than solubility product
(b) negligible
(c) less than the solubility product
(d) equal to the solubility product

J & K CET-2005, 2001

Ans. (a) : Precipitation takes place when ionic product of concentration of ions is greater that solubility product.

174. The degree of dissociation (α) of a weak electrolyte, A_xB_y is related to van't Hoff factor (i) by the expression

(a) $\alpha = \frac{i-1}{(x+y-1)}$
(b) $\alpha = \frac{i-1}{x+y-1}$
(c) $\alpha = \frac{x+y-1}{i-1}$
(d) $\alpha = \frac{x+y+1}{i-1}$

Tripura JEE-2022
[AIEEE 2011]

Ans. (a) : Van't Hoff factor

$$\underset{1-\alpha}{AxBy} \rightleftharpoons \underset{\alpha x}{xA^{y+}} + \underset{\alpha y}{yB^{x-}}$$

Total amount of species = 1+(x+y–1)α

Van't Hoff factor $i = \frac{1+(x+y-1)\alpha}{1}$

$$\alpha = \frac{i-1}{(x+y-1)}$$

175. The Van't Hoff factor i for an electrolyte which undergoes dissociation and association in solvents are respectively

(a) greater than 1 and greater than 1
(b) less than 1 and greater than 1
(c) less than 1 and less than 1
(d) greater than 1 and less than 1

BITSAT – 2012
NEET-2011

Ans. (d) : When an electrolyte dissociates Van't Hoff factor *i* is greater than 1 and when it associated the *i* is less than 1.

176. The degree of dissociated of $PCl_5(\alpha)$ obeying the equilibrium;

$$PCl_5 \rightleftharpoons PCl_3 + Cl_2$$

is related to the pressure (p) at equilibrium by

(a) $\alpha \propto p$
(b) $\alpha \propto \frac{1}{\sqrt{p}}$
(c) $\alpha \propto \frac{1}{p^2}$
(d) $\alpha \propto \frac{1}{p^4}$

BITSAT 2016, UP CPMT-2013

Ans. (b) : $PCl_5(g) \rightleftharpoons PCl_3(g) + Cl_2(g)$

Before reaction 1 0 0
At equilibrium 1 – α α α
Total number of moles at equilibrium
= (1 – α) + α + α = (1 + α)
If p is the total pressure at equilibrium, then

$$P_{PCl_5} = \frac{(1-\alpha)}{(1+\alpha)} \times p$$

$$P_{PCl_3} = \frac{\alpha}{(1+\alpha)} \times p$$

$$P_{Cl_2} = \frac{\alpha}{(1+\alpha)} \times p$$

$$K_p = \frac{P_{PCl_3} \times P_{Cl_2}}{P_{PCl_5}}$$

$$= \frac{[\alpha p/(1+\alpha)][\alpha p/(1+\alpha)]}{(1-\alpha)p/(1+\alpha)}$$

$$= \frac{\alpha^2}{(1+\alpha)(1-\alpha)} \times p = \frac{\alpha^2}{1-\alpha^2} \times p$$

or $\alpha^2 = \frac{K_p}{p}$

or $\alpha = \sqrt{\frac{K_p}{p}}$ $(1 - \alpha^2 = 1)$

or $\alpha \propto \frac{1}{\sqrt{p}}$

177. Which one of the following electrolytes has the same value of Van't Hoff factor (i) as that of $K_4[Fe(CN)_6]$?

(a) $Al_2(SO_4)_3$
(b) K_2SO_4
(c) $K_3[Fe(CN)_6]$
(d) $Al(NO_3)_3$

JIMPER-2018
NEET-1994

Ans. (a) : For $K_4[Fe(CN)_6]$

$$K_4[Fe(CN)_6] \longrightarrow \underbrace{4K^+ + [Fe(CN)_6]^{4-}}_{n=5}$$

Since, n for strong electrolytes so i = 5
For, $Al_2(SO_4)_3$

$$Al_2(SO_4)_3 \longrightarrow \underbrace{2Al^{3+} + 3SO_4^{2-}}_{n=5}$$

Hence, $K_4[Fe(CN)_6]$ and $Al_2(SO_4)_3$ has same Van"t Hoff factor (i)

178. Which of the following acids has the smallest dissociation constant?

(a) $CH_3CHFCOOH$
(b) FCH_2CH_2COOH
(c) $BrCH_2CH_2COOH$
(d) $CH_3CHBrCOOH$

JCECE - 2011
WB JEE-2008

Ans. (c) : Lower the acidic character, smaller is the value of dissociation constant.

Acidity ∝ dissociation constant.

–I (inductive effect) of F is more than Br, so $CH_3CHFCOOH$ is a stronger acid as compared to $CH_3CHBrCOOH$.

As the distance between electron withdrawing group and —COOH group increases, acidity decreases.

Thus, the order of acidity and thus, of dissociation constant is

$$\underset{\text{(smallest } K_a)}{BrCH_2CH_2COOH} < FCH_2CH_2COOH$$

$$< CH_3CHBrCOOH < CH_3CHFCOOH$$

@apna_pdf

179. For a concentrated solution of a weak electrolyte A_xB_y, the degree of dissociation is given as

(a) $\alpha = \sqrt{K_{eq}/C(x+y)}$

(b) $\alpha = \sqrt{K_{eq}C/(xy)}$

(c) $\alpha = (K_{eq}/C^{x+y-1}x^xy^y)^{1/(x+y)}$

(d) $\alpha = \sqrt{K_{eq}/xyC}$

Kerala-CEE-2008
AMU-2011

Ans. (c) : Dissociation of weak electrolyte AxBy as

$$\begin{array}{lccc} & A_xB_y & \rightleftharpoons xA^{y+} & + yB^{x-} \\ \text{At } t=0 & C & 0 & 0 \\ \text{At equi.} & C(1\text{-}\alpha) & xC\alpha & yC\alpha \end{array}$$

Applying law of mass action–

$$K_{eq.} = \frac{[xC\alpha]^x[yC\alpha]^y}{[C(1-\alpha)]}$$

For weak electrolytes $\alpha <<< 1$,

$\because \quad 1-\alpha = 1$

$\therefore \quad K_{eq}C = x^xy^y[C\alpha]^{x+y}$

$$\frac{K_{eq.}}{C^{x+y-1}} = x^xy^y(\alpha)^{x+y}$$

$$\alpha = \left(\frac{K_{eq}.}{(C^{x+y-1})x^xy^y}\right)^{\frac{1}{x+y}}$$

180. The dissociation equilibrium of gas AB_2 can be represented as

$$2AB_2(g) \rightleftharpoons 2AB(g) + B_2(g)$$

The degree of dissociation 'x' and is small compared to 1.The expression relating the degree of dissociation(x) with equilibrium constant K_p and total pressure p is

(a) $(2K_p/p)$
(b) $(2K_p/p)^{1/3}$
(c) $(2Kp/p)^{1/2}$
(d) (K_p/p)

JIMPER-2014
NEET-2008

Ans. (b) : The reaction is -

$$\begin{array}{ccc} 2AB_2(g) & \rightleftharpoons 2AB(g) & + B_2(g) \\ 2(1-x) & 2x & x \end{array}$$

Moles at equilibrium = 2 (1 – x) + 2x +x
= x + 2

$$K_p = \frac{[P_{AB}]^2[P_{B_2}]}{[P_{AB_2}]^2} = \frac{\left(\frac{2x}{x+2}\times p\right)^2\left(\frac{x}{2+x}\times p\right)}{\left(\frac{2(1-x)}{x+2}\times p\right)^2}$$

$$K_p = \frac{\frac{4x^3}{x+2}\times p}{4(1-x)^2} = \frac{4x^2\times p}{2}\times\frac{1}{4}$$

$$x = \left(\frac{2K_p}{p}\right)^{1/3} \quad (\text{as } 1-x \approx 1, 2+x \approx 2)$$

181. The degree of dissociation for a 0.1M $Al_2(SO_4)_3$ solution having Van't Hoff factor value of 4.2 will be

(a) 80%
(b) 90%
(c) 75%
(d) 85%

Assam CEE-2021

Ans. (a) : $Al_2(SO_4)_3 \rightarrow 2Al^{3+} + 3SO_4^{2-}$

$$\begin{array}{lccc} t=0 & 1 & 0 & 0 \\ t=\text{time} & 1-\alpha & 2\alpha & 3\alpha \end{array}$$

$$i = \frac{1-\alpha+2\alpha+3\alpha}{1} = 4\cdot2$$

$= 1 + 4\alpha = 4.2$

$4\alpha = 3.2$

$\alpha = 0.8$

= 80%

182. At a fixed concentration, the molar conductance of aqueous sodium hydroxide at 298 K is found to be 10 ohm^{-1} cm^2, mol^{-1}. At infinite dilution nd 298 K, its molar conductance is found to be 242 ohm^{-1}, cm^2, mol^{-1}. Find the degree of ionization of sodium hydroxide at the same concentration and temperature.

(a) 2.06%
(b) 4.13%
(c) 0.04%
(d) 10%

AP- EAPCET- 07-09-2021, Shift-I

Ans. (b) Degree of dissociation (α) =

$$= \frac{\text{molar conductivity at conc.}(\Lambda_m^c)}{\text{molar conductivity at infinite dilution}(\Lambda_m^\infty)}$$

$$(\alpha) = \frac{10\,\Omega^{-1}\,cm^2\,mol^{-1}}{242\,\Omega^{-1}\,cm^2\,mol^{-1}}$$

$= 0.0413$

$= 4.13\%$

183. 0.01 moles of a weak acid HA (Ka = 2.0×10^{-6}) is dissolved in 1.0 L of 0.1 M HCI solution. The degree of dissociation of HA s........$\times10^{-5}$ (Round off the nearest integer).
[Neglect volume change on adding HA. Assume degree of dissociation<<]

[JEE Mains 2021, 17 March Shift-I]

Ans. (2) : (x = 2)

$$\underset{0.1}{HCL} \longrightarrow \underset{0.1}{H^+} + \underset{0.1}{Cl^-}$$

$$\begin{array}{lccc} & HA(aq) & \rightleftharpoons H^+(aq) & + A^-(aq) \\ \text{Initially} & 10^{-2} & 0 & 0 \\ \text{At eq.} & (1\text{–}\alpha)10^{-2} & 0.01\alpha+0.1 & 0.01\alpha \\ & \approx 10^{-2} & \approx 0.1 & \approx 10^{-2}\alpha \end{array}$$

Now, $\quad K_a = \dfrac{[H^+][A^-]}{[HA]}$

$$2\times10^{-6} = \frac{(0.1)(10^{-2}\alpha)}{10^{-2}}$$

$\alpha = 2\times10^{-5}$

184. At 298K, the ratio of dissociated water to that of undissociated water is [Assume pure water]

(a) 1×10^{-7}
(b) 1.8×10^{-9}
(c) 1×10^{-3}
(d) 1,000

TS-EAMCET 09.08.2021, Shift-I

@apna_pdf

Ans. (b) : Assuming pure water (c) = 55.55

$$\begin{array}{lccccc} & H_2O & \rightleftharpoons & H^+ & + & OH^- \\ \text{Initial con.} & c & & 0 & & 0 \\ \text{after diss.} & c-\alpha & & \alpha & & \alpha \\ & (55.55-10^{-7}) & & (10^{-7}) & & (10^{-7}) \end{array}$$

Undissociated water = 55.55 – 10^{-7} $(\because\ 10^{-7} \approx 0)$

= 55.55

Dissociated water = 10^{-7}

$\therefore$ The ratio of dissociated water to that of undissociated water $= \dfrac{\text{Dissociated water}}{\text{Undissociated water}}$

$$= \frac{10^{-7}}{55.55} = 1.8\times10^{-9}$$

185. In a solvent 50% of an acid HA dimerises and the rest dissociates. The Van't Hoff factor of the acid is .... × 10^{-2}.
(Round off to the nearest integer)
[JEE Mains 2021, 27 July Shift-II]

Ans. (125) : The reaction is

$$\begin{array}{lcccccc} & 2HA \rightleftharpoons & H_2A_2, & HA \rightleftharpoons & H^+ & + & A^- \\ \text{Initial moles} & a\times\dfrac{50}{100} & 0 & a\times\dfrac{50}{100} & 0 & & 0 \\ \text{Final moles} & 0 & 0.25a & 0 & 0.5a & & 0.5a \end{array}$$

Now, $i = \dfrac{\text{final moles}}{\text{initial moles}}$

$$i = \frac{0.25a + 0.5a + 0.5a}{0.5a + 0.5a}$$

$i = 1.25$

$i = 125 \times 10^{-2}$

186. A 1 molal $K_4Fe(CN)_6$ solution has a degree of dissociation of 0.4. Its boiling point is equal to that of another solution which contains 18.1 weight percent of a non-electrolytic solute A. The molar mass of A is........u. (Round off to the nearest integer).
[Density of water = 1.0 g cm^{-3}]
[JEE Mains 2021, 17 March Shift-II]

Ans. (85) : Since boiling point is the same, elevation in boiling point is also the same for both solutions.

$(\Delta T_B)K_4\,[Fe\,(CN)_6] = (\Delta T_B)_A$

$(i\,K_Bm)\ K_4[Fe(CN)_6] = (i\,K_Bm)_A$

$$(1+4\alpha)\times1 = \frac{1\times\dfrac{18.1}{M}\times1000}{100-18.1}$$

$$2.6 = \frac{18.1}{M}\times\frac{1000}{18.9}$$

M = 85

187. The successive equilibrium constant for the stepwise dissociation of a tribasic acid are K_1, K_2, and K_3, respectively. The equilibrium constant for the overall dissociation is

(a) $(K_1 + K_2 + K_3)$
(b) $\sqrt[3]{(K_1 + K_2 + K_3)}$
(c) $(K_1 \times K_2 \times K_3)^3$
(d) $K_1 \times K_2 \times K_3$

TS-EAMCET (Engg.), 06.08.2021

Ans. (d): The equilibrium constant at first dissociation constant–

Since, $H_3A \overset{K_1}{\rightleftharpoons} H_2A^- + H^+$

$$K_1 = \frac{[H_2A^-][H^+]}{[H_3A]} \qquad .....(i)$$

$$H_2A^- \overset{K_2}{\rightleftharpoons} HA^{2-} + H^+$$

$$K_2 = \frac{[HA^{2-}][H^+]}{[H_3A^-]} \qquad .....(ii)$$

$$HA^{2-} \overset{K_3}{\rightleftharpoons} A^{3-} + H^+$$

$$K_3 = \frac{[A^{3-}][H^+]}{[HA^{2-}]} \qquad .....(iii)$$

Thus, $H_3A \overset{K_a}{\rightleftharpoons} A^{3-} + 3H^+$

$$K_a = \frac{[A^{-3}][H^+]^3}{[H_3A]}$$

Thus, equilibrium constant for the over all dissociation.

$$\boxed{K_a = K_1 \times K_2 \times K_3}$$

188. Match the following

List-I **Acid**	**List-II** **K_a (ionization constant)**
(a) HCN	(I) 6.8 × 10^{-4}
(b) $H_2C_2O_4$	(II) 8.9 × 10^{-8}
(c) H_2S	(III) 4.9 × 10^{-10}
(d) Niacin	(IV) 5.6 × 10^{-2}
	(V) 1.5 × 10^{-5}

The correct match is
Options :

	A	**B**	**C**	**D**
(a)	I	III	IV	V
(b)	V	II	III	IV
(c)	II	III	IV	V
(d)	III	IV	II	V

TS EAMCET 04.08.2021, Shift-I

Ans. (d) : Ionization constant is a constant that depends upon the equilibrium between ions and molecules that are not ionized in a solution or liquid.

	Acid	**K_a (Ionization constant)**
(A)	HCN	4.9 × 10^{-10}
(B)	$H_2C_2O_4$	5.6 × 10^{-2}
(C)	H_2S	8.9 × 10^{-8}
(D)	Niacin	1.5 × 10^{-5}

189. The stepwise formation of $[Cu(NH_3)_4]^{2+}$ is below:

$$Cu^{2+} + NH_3 \overset{K_1}{\rightleftharpoons} \left[Cu\left(NH_3\right)\right]^{2+}$$

$$\left[Cu\left(NH_3\right)\right]^{2+} + NH_3 \overset{K_2}{\rightleftharpoons} \left[Cu\left(NH_3\right)_2\right]^{2+}$$

$$\left[Cu\left(NH_3\right)_2\right]^{2+} + NH_3 \overset{K_3}{\rightleftharpoons} \left[Cu\left(NH_3\right)_3\right]^{2+}$$

$$\left[Cu\left(NH_3\right)_3\right]^{2+} + NH_3 \overset{K_4}{\rightleftharpoons} \left[Cu\left(NH_3\right)_4\right]^{2+}$$

The value of stability constants K_1, K_2, K_3 and K_4 are 10^4, 1.58×10^3, 5×10^2 and 10^2 respectively. The overall equilibrium constants for dissociation of

@apna_pdf

$[Cu(NH_3)_4]^{2+}$ is $x\times10^{-12}$. The value of x is______. (Rounded off to the nearest integer)

JEE Mains 24.02.2021, Shift-I

Ans. (1) : $Cu^{2+}+NH_3 \xrightleftharpoons{K_1} [Cu(NH_3)]^{2+}$

$[Cu(NH_3)]^{2+}+NH_3 \xrightleftharpoons{K_2} [Cu(NH_3)_2]^{2+}$

$[Cu(NH_3)_2]^{2+}+NH_3 \xrightleftharpoons{K_3} [Cu(NH_3)_3]^{2+}$

$[Cu(NH_3)_3]^{2+}+NH_3 \xrightleftharpoons{K_4} [Cu(NH_3)_4]^{2+}$

So, $K = K_1 \times K_2 \times K_3 \times K_4$

$= 10^4 \times 1.58 \times 10^3 \times 5 \times 10^2 \times 10^2$

$K = 7.9 \times 10^{11}$

Where, K = Equilibrium constant for formation of $[Cu(NH_3)_4]^{2+}$ is $\frac{1}{K}$

$$K' = \frac{1}{K}$$

$$K' = \frac{1}{7.9\times10^{11}}$$

$= 1.26 \times 10^{-12} = (x \times 10^{-12})$

So, the value of x = 1.26.

190. When 9.45 g of $ClCH_2COOH$ is added to 500 mL of water, its freezing point drops by 0.5°C. The dissociation constant of $ClCH_2COOH$ is $x \times10^{-3}$. The value of x is ____. (rounded off to the nearest integer)
$[K_f(_{H_2O}) = 1.86\ K\ kg\ mol^{-1}]$

JEE Mains 24.02.2021, Shift-I

Ans. : Given– $\Delta T_p = 0.5°C$, $K_p = 1.86\ Kkg\ mol^{-1}$

The dissociation of $ClCH_2COOCH$ is :

$$ClCH_2COOH \rightleftharpoons ClCH_2COO^- + H^+$$

$i = 1 + (2 - 1)\alpha$

$i = 1 + \alpha$

Now, $\Delta T_p = iK_pm$

$$0.5 = (1+\alpha)\times1.86\times\frac{9.45\times1000}{94.5\times500}$$

or $1+\alpha = \frac{2.5}{1.86} \quad \Rightarrow \alpha = \frac{32}{93}$.

Now, $ClCH_2COOH \rightleftharpoons ClCH_2COO^- + H^+$

$C - C\alpha \qquad C\alpha \qquad C\alpha$

$$\therefore\ K_a = \frac{C\alpha\times C\alpha}{(C-C\alpha)} = \frac{C\alpha^2}{(1-\alpha)} \quad \left(\because C = \frac{0.1\times1000}{500} = 0.2\right)$$

or $$K_a = \frac{0.2\times(32)^2}{\left(1-\frac{32}{93}\right)(93)^2}$$

or $$K_a = \frac{0.2}{61}\times93\times\frac{(32)^2}{(93)^2}$$

or $K_a = 36\times10^{-3}$ (Given ; $K_a = x \times10^{-3}$)

$\therefore$ $x\times10^{-3} = 36\times10^{-3}$

or $x = 36$

191. A 1 molal $K_4[Fe(CN)_6]$ solution has a degree of dissociation of 0.4. Its boiling point is equal to that of another solution which contains 18.1 weight percent of a non electrolytic solute A. The molar mass of A is ________ u. (Round off to the Nearest Integer).
[Density of water =1.0 g cm^{-3}]

JEE Mains 17.03.2021, Shift-II

Ans. (85) :

Given that, degree of dissociation (α) = 0.4

The dissociation of potassium ferrocyanide is:

$$K_4[Fe(CN)_6] \rightleftharpoons 4K^+ + [Fe(CN)_6]^{4-}$$

Initial conc.	1m	0	0
Final conc.	(1–α)m	4α	α
∴	= 0.6 m	=1.6m	0.4

Effective molality = 0.6+1.6+0.4=2.6m

For same boiling point, the molatity of another solution should also be 2.6 m. Now, 18.1 weight percent solution means 18.1 g solute is present in 100g solution and here , (100–18.1) = 81.9 g water

Now, $2.6 = \frac{18.1/M}{81.9/1000}$

or $M = 85$

192. If in the reaction, $N_2O_4 \rightleftharpoons 2NO_2$; α is the degree of dissociation of N_2O_4, then total number of moles at equilibrium is :

(a) (1 – α)
(b) (1 + α)
(c) $(1 - \alpha)^2$
(d) $(1 + \alpha)^2$

Manipal-2020

Ans. (b) :

$$N_2O_4 \rightleftharpoons 2NO_2$$

t = 0	1	0
t = teq	1– α	2x

∴ Total moles = 1–α + 2α

= (1 + α)

193. The K_{sp} for the following dissociation is 1.6×10^{-5}

$$PbCl_2(s) \rightleftharpoons Pb^{2+}(aq) + 2Cl^-(aq)$$

Which of the following choices is correct for a mixture of 300 mL 0.134 M $Pb(NO_3)_2$ and 100 mL 0.4 M NaCl?

(a) $Q < K_{sp}$
(b) $Q > K_{sp}$
(c) $Q = K_{sp}$
(d) Not enough data provided

[JEE Mains 2020, 9 Jan Shift-I]

Ans. (b) : $PbCl_2(s) \rightleftharpoons Pb^{2+}_{(aq.)} + 2Cl^-_{(aq.)}$

$$[Pb^{2+}] = \frac{300\times0.134}{400} = 1.005\times10^{-1}M$$

$$[Cl^-] = \frac{100\times0.4}{400} = 10^{-1}M$$

Reaction quotient, $Q = [Pb^{2+}][Cl^-]^2$

$$= \frac{300\times0.134}{400}\times\left[\frac{100\times0.4}{400}\right]^2$$

@apna_pdf

$$=1.005\times10^{-1}\times(10^{-1})^2$$
$$=1.005\times10^{-3}$$
$$Q > K_{sp}$$

194. When 0.05 M dimethyl amine is dissolve in 0.1 M NaOH solution then the percentage dissociation of dimethyl amine is: $(K_b)_{(CH_3)_2NH} = 5\times10^{-4}$

(a) 5×10^{-5} (b) 5×10^{-3}
(c) 5×10^{-1} (d) 5×10^{-2}

AIIMS 26 May 2019 (Morning)

Ans. (c): Given that: Concentration of dimethyl amine = 0.05 M, $K_b = 5 \times 10^{-4}$

$(OH^-) = 0.1+0.05\,\alpha \approx 0.1$

$$K_b = \frac{(C\alpha)(OH^-)}{(C-C\alpha)}$$

$$5\times10^{-4} = \frac{\alpha\times0.1}{1-\alpha}$$

$\alpha = 5 \times 10^{-1}\%$

195. K_2HgI_4 is 40% ionised in aqueous solution. The value of its Van't Hoff factor (i) is

(a) 1.6 (b) 1.8
(c) 2.2 (d) 2.0

[JEE Mains 2019, 11 Jan Shift-II]

Ans. (b) : The ionisation of K_2HgI_4 is given as–

$$K_2HgI_4 \longrightarrow 2K^+ + HgI_4^{2-}$$

$i = 1+(n-1)\alpha$

$\alpha = 0.4,\ n = 3$

So, $i = 1+2 \times 0.4 = 1.8$

196. Calculate Van't Hoff factor (i) for an aqueous solution of $K_3[Fe(CN)_6]$ having a degree of dissociation (α) equal to 0.778.

(a) 4.334 (b) 3.334
(c) 0.222 (d) 2.334

GUJCET-2019

Ans. (b) : The reaction is :

$$K_3[Fe(CN)_6] \rightarrow 3K^+ + [Fe(CN)_6]^{3-}$$

Here there are 4 ions form So:

$i = 1+(n-1)\alpha$

$i = 1+(4-1)0.778$

$i = 3.334$

197. Relationship between Van't Hoff's factor (i) and degree of dissociation (α) is

(a) $i = \dfrac{\alpha-1}{n'-1}$ (b) $i = \dfrac{\alpha-1}{1-n'}$

(c) $\alpha = \dfrac{1-i}{n'-1}$ (d) $\alpha = \dfrac{i-1}{n'-1}$

MHT CET-02.05.2019, SHIFT-II

Ans. (d) : Relationship between Van't Hoff factor (i) and degree of dissociation (α) is given by

$$\alpha = \frac{1-i}{n'-1}$$

The relationship can be obtained as follows-

For the reaction

$$\begin{array}{lccc} & A & \rightleftharpoons & n'B \\ \text{Initially} & 1\,\text{mole} & & 0 \\ \text{After diss.} & 1-\alpha & & n'\alpha \end{array}$$

Total no. of moles present in the solution

$= (1-\alpha) + n'\alpha$

$= 1 + (n'-1)\alpha$

Van't Hoff factor (i) = $1 + (n' - \alpha)$, $\alpha > 1$ if $n' \geq 2$

So, $\alpha = \dfrac{i-1}{n'-1}$

198. Degree of dissociation of an acid HCl is 95%. 0.192 g of the acid is present in 0.5 L of solution. The pH of the solution is :

(a) 2 (b) 1
(c) 3 (d) 4

Manipal-2018

Ans. (a) : Given, Amount of acid = 0.192g

$$\therefore \text{ No. of moles of acid} = \frac{0.192}{36.5} = 0.0053$$

Volume = 0.5 L

$$\text{Molarity of HCl} = \frac{0.0053}{0.5} = 1.06\times10^{-2}\,M$$

$[H^+]$ in HCl solution–

$= 1.06 \times 10^{-2} \times \dfrac{95}{100}$

$= 100.7 \times 10^{-4}$

$= 1 \times 10^{-2}$

Thus pH = $-\log[H]^+$

$= -\log(1 \times 10^{-2})$

$= 2$

199. For the following equilibrium $N_2O_4 \rightleftharpoons 2NO_2$ in gaseous phase, NO_2 is 50% of the total volume, when equilibrium is set up. Hence, percent dissociation of N_2O_4 is :

(a) 50% (b) 25%
(c) 66.66% (d) 33.33%

BCECE-2017

Ans. (d) : The dissociation of N_2O_4 is–

$$N_2O_4 \rightleftharpoons 2NO_2$$

Initial 1 0

At equilibrium $1-x$ $2x$

Total numbers of moles = $1-x+2x = 1+x$

$$\therefore \%\text{ of } NO_2 \text{ by Volume} = \frac{2x}{1+x}\times100 = 50$$

$$x = \frac{1}{3}$$

Hence, % dissociation = 33.33%

200. The Van't Hoff's factor 'i' accounts for

(a) extent of solubility of solute
(b) extent of mobility of solute
(c) extent of dissolution of solute
(d) extent of dissociation of solute

Karnataka-CET-2017

Ans. (d) : The Van't Hoff's factor (i) accounts for the extent of dissociation of solute.

@apna_pdf

201. For which among the following equimolar aqueous solutions Van't Hoff factor has the lowest value?

(a) Aluminium chloride (b) Potassium sulphate
(c) Ammonium chloride (d) Urea

MHT CET-2017

Ans. (d) : For the aqueous solution of urea, Van't Hoff factor has the lowest value.

Urea is non-electrolyte and does not dissociate in aqueous solution. Hence, Vant Hoff factor is 1.

For Aluminium chloride $AlCl_3$–

$$AlCl_3 \rightarrow Al^{3+} + 3Cl^-$$
$$i = 4$$

For potassium sulphate K_2SO_4

$$K_2SO_4 \rightarrow 2K^+ + SO_4^{2-}$$
$$i = 3$$

202. When an electrolyte is dissociated in solution, the van't Hoff's factor (i) is

(a) > 1 (b) < 1
(c) = 0 (d) = 1

Karnataka-CET-2016

Ans. (a) : When an electrolyte is dissolved in the solution, it breaks into ions and hence the Van't Hoff factor will be greater than 1 (i > 1).

203. When PCl_5 is heated it gasifies and dissociates into PCl_3 and Cl_2. The density of the gas mixture at 200°C is 70.2. What is the degree of dissociation of PCl_5 at 200°C?

(a) 0.485 (b) 0.242
(c) 0.845 (d) 0.542

AMU-2016

Ans. (a) : The dissociation of PCl_5 is–

$$PCl_5(g) \rightarrow PCl_3(g) + Cl_2(g)$$

The initial vapour density will be same, it would be $M_{PCl_5}/2$.

$\therefore$ Initial vapour density = (31+5×35.5)/2=104.25

Vapour density at equilibrium at 200°C= 70.2

$\therefore$ Total moles at equilibrium

$$(1+\alpha) = \frac{\text{Vapour density initial}}{\text{Vapour density at equilibrium}}$$

$$(1+\alpha) = \frac{104.25}{70.2} = 1.485$$

$$1+\alpha = 1.485$$
$$\alpha = 0.485$$

204. The percentage hydrolysis of 0.15 solution of ammonium acetate, K_a for CH_3COOH is 1.8×10^{-5} and K_b for NH_3 is 1.8×10^{-5}

(a) 0.556 (b) 4.72
(c) 9.38 (d) 5.56

BITSAT-2016

Ans. (a) : Given that, K_a for $CH_3COOH = 1.8 \times 10^{-5}$

K_b for $NH_3 = 1.8\times10^{-5}$

The degree of hydrolysis:

$$h = \sqrt{\frac{K_w}{K_a \times K_b}} = \sqrt{\frac{1\times10^{-14}}{1.8\times10^{-5}\times1.8\times10^{-5}}}$$

$$h = 0.556$$

205. 0.6 mL of acetic acid is dissolved in 1 litre of water. The value of Van't Hoff factor is 1.04. What will be the degree of dissociation of the acetic acid?

(a) 0.01 (b) 0.02
(c) 0.03 (d) 0.04

AMU-2015

Ans. (d) : Given, Van't Hoff factor (*i*) = 1.04

The dissociation reaction of CH_3COOH is–

	$CH_3COOH \rightleftharpoons$	$CH_3COO^- +$	H^+
Before diss.	1	0	0
After diss.	$(1-\alpha)$	α	α

Van't Hoff factor (*i*) = $(1 - \alpha) + \alpha + \alpha$

$$1.04 = 1 + \alpha$$

or $\alpha = 0.04$

206. Which of the following compounds have the same value of Van't Hoff's factor (*i*) as that of $Al_2(SO_4)_3$?

(a) $K_4[Fe(CN)_6]$ (b) NaCl
(c) $Al(NO_3)_3$ (d) Na_2SO_4

COMEDK-2015

Ans. (a) : (a) The dissociation of $K_4[Fe(CN)_6]$ is–

$$K_4[Fe(CN)_6] \Rightarrow 4K^+ + [Fe(CN)_6]^{4-}$$

Here, Van't Hoff factor (*i*) = 4 + 1 = 5

(b) $NaCl \rightarrow Na^+ + Cl^-$

$i = 2$

(c) $Al(NO_3)_3 \rightarrow Al^{3+} + 3NO_3^-$

$i = 4$

(d) $Na_2SO_4 \rightarrow 2Na^+ + 5O_4^{2-}$

$i = 3$

Hence, option (a) have value of vant Hoff's factor (i) same as that of $Al_2(SO_4)_3$.

207. Which of the following compound possesses the C—H bond with the lowest bond dissociation energy?

(a) Toluene (b) Benzene
(c) n-pentane (d) 2, 2-dimethyl propane

Karnataka-CET-2015

Ans. (a) : Toluene has the lowest C – H bond dissociation energy compare to other three The C – H bond of the methyl group is in hyper conjugation with benzene nucleus. Hence it is easy to break.

208. Van't Hoff factor of centimolal solution of $K_3[Fe(CN)_6]$ is 3.333. Calculate the per cent dissociation of $K_3[Fe(CN)_6]$.

(a) 33.33 (b) 0.78
(c) 78 (d) 23.33

MHT CET-2015

Ans. (c) : Given, Van't Hoff's factor = 3.333, %α = ?

The dissociation of $K_3[Fe(CN)_6]$ is–

$$K_3[Fe(CN)_6] \rightarrow 3K^+ + [Fe(CN)_6]^{3-}$$
$$i = 1 + (n-1)\alpha$$

Here, $n = 4$

$\therefore$ $i = 1 + (4-1)\alpha$

So, $3.333 = 1 + (4-1)\alpha$

$3.333 - 1 = 3\alpha$

or $3\alpha = 2.333$

@apna_pdf

$$\alpha = \frac{2.333}{3}$$

$$\alpha = 0.777$$

Percent dissociation = 0.777 × 100

≈ 78%

209. Van't Hoff's factors of equimolal solutions of sodium chloride, barium chloride and glucose in water are

(a) 2, 3, 0 respectively
(b) 2, 3, 6 respectively
(c) 2, 3, 4 respectively
(d) 2, 3, 1 respectively

COMEDK-2014

Ans. (d) : Van't Hoff factor (*i*) gives the extent of association or dissociation of the solute particles in the solution.

$$NaCl(aq) \rightarrow Na^+ + Cl^-$$

van't Hoff's factor (*i*) = 2

And, $BaCl_2 \rightarrow Ba^{2+} + 2Cl^-$

van't Hoff's factor (*i*) = 3

Glucose does not undergoes dissociation or association (*i*) = 1.

Hence, option (d) is correct.

210. What will be the degree of ionisation of 0.05 M acetic acid if its pK_a value is 4.74?

(a) 0.019%
(b) 1.9%
(c) 3.0%
(d) 4.74%

JCECE - 2014

Ans. (b) : Given, Concentration = 0.05 M, pK_a = 4.74

The ionisation of acetic acid is–

$$\begin{array}{lccc} & CH_3COOH & \rightleftharpoons CH_3COO^- & + H^+ \\ \text{Initially} & 1 & 0 & 0 \\ \text{At equilibrium} & 1-\alpha & \alpha & \alpha \end{array}$$

$pK_a = -\log K_a = 4.74$

∴ K_a = antilog (4.74)

$K_a = 1.82 \times 10^{-5}$

From, $K_a = \frac{C\alpha^2}{(1-\alpha)} = C\alpha^2$ $(1 - \alpha \approx 1)$

$$\alpha = \sqrt{\frac{K_a}{C}} = \sqrt{\frac{1.82\times10^{-5}}{0.05}} = 0.019 \text{ or } 1.9\%$$

211. The value of vant Hoff's factor for $Hg_2(NO_3)_2$ is

(a) 1
(b) 2
(c) 3
(d) 4

UP CPMT-2014

Ans. (c) : $Hg_2(NO_3)_2$ ionizes as –

$$Hg_2(NO_3)_2 \longrightarrow Hg_2^{2+} + 2NO_3^-$$

So, van't Hoff's factor, i = 3

212. On adding 0.1 M solution each of $[Ag^+]$, $[Ba^{2+}]$, $[Ca^{2+}]$ in Na_2SO_4 solution, species first precipitated is
[$K_{sp}BaSO_4 = 10^{-11}$, $K_{sp}CaSO_4 = 10^{-6}$ and $K_{sp}Ag_2SO_4 = 10^{-5}$]

(a) Ag_2SO_4
(b) $BaSO_4$
(c) $CaSO_4$
(d) All of these

JCECE - 2013

Ans. (b) : Solubility of $BaSO_4$, (X) = $\sqrt{K_{sp}} = \sqrt{10^{-11}}$

$= 3.16 \times 10^{-6}$ $molL^{-1}$

Solubility of Ag_2SO_4, $4x^3 = K_{sp}$

$$x = \sqrt[3]{\frac{10^{-5}}{4}} = 1\times10^{-2}\,mol\,L^{-1}$$

Least solubility is of $BaSO_4$, hence it will precipitate first.

213. Accumulation of Lactic acid ($HC_3H_5O_3$), a monobasic acid in tissues leads to pain and a feeling to fatigue. In a 0.10 M aqueous solution, Lactic acid is 3.7% dissociates. The value of dissociation constant, K_a, for this acid will be

(a) 1.4×10^{-5}
(b) 1.4×10^{-4}
(c) 3.7×10^{-4}
(d) 2.8×10^{-4}

Karnataka NEET 2013

Ans. (b) :

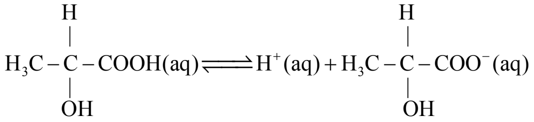
Degree of dissociation $(\alpha) = 3.7\% = \frac{3.7}{100} = 0.037$

According to Ostwald's formula,

$K_a = \alpha^2 C$

$K_a = (0.037)^2 \times 0.10 = 1.369\times10^{-4} = 1.4\times10^{-4}$

214. The degree of ionization of 0.10 M lactic acid is 4.0%



$$H_3C-\underset{OH}{\overset{H}{C}}-COOH(aq) \rightleftharpoons H^+(aq) + H_3C-\underset{OH}{\overset{H}{C}}-COO^-(aq)$$

The value of K_c is

(a) 1.66×10^{-5}
(b) 1.66×10^{-4}
(c) 1.66×10^{-3}
(d) 1.66×10^{-2}

AP-EAMCET (Engg.) 2013

Ans. (b) : Given that, Degree of ionisation $(\alpha) = 4\%$

$$\alpha = \frac{4}{100} = 0.04$$

The ionisation of lactic acid is–

$$\begin{array}{lccc} & CH_3CH(OH)COOH & \rightleftharpoons CH_3CH(OH)COO^- & + H^+ \\ \text{Initial concentration} & C & 0 & 0 \\ \text{At equilibrium} & C(1-\alpha) & C\alpha & C\alpha \end{array}$$

∴ At equilibrium $(K_c) = \frac{C\alpha \cdot C\alpha}{C(1-\alpha)} = \frac{C\alpha^2}{(1-\alpha)}$

$$K_c = \frac{0.1\times0.04\times0.04}{(1-0.04)}$$

$$K_c = 1.66\times10^{-4}$$

215. What will be the % of the N_2H_4 that has reacted with water in solution, when 0.32 g of N_2H_4 are dissolved in water and the total volume was made 4 L (given, K_b for $N_2H_4 = 6 \times 10^{-8}$ M)

(a) 3%
(b) 3.6%
(c) 2%
(d) 0.489%

UP CPMT-2013

Ans. (d) : Given, Amount of N_2H_4 = 0.32g

Total volume = 4L

Concentration or molarity of hydrazine solution

$= \frac{0.32}{32}\times\frac{1}{4}M = 0.25 \times 10^{-2}$ M

Ionisation of hydrazine–

$$\begin{array}{lccc} & NH_2NH_2 + H_2O & \rightleftharpoons NH_2NH_3^{\oplus} & + OH^- \\ \text{Initial conc.} & C & 0 & 0 \\ \text{Equi.conc.} & C(1-\alpha) & C\alpha & C\alpha \end{array}$$

@apna_pdf

$$\therefore \quad K_b = \frac{[NH_2NH_3^{\oplus}][OH^-]}{[NH_2NH_2]}$$

$$K_b = \frac{C\alpha \times C\alpha}{C(1-\alpha)} \qquad (\alpha <<< 1)$$

$$\text{or} \quad K_b = C\alpha^2$$

$$\text{or} \quad \alpha = \sqrt{\frac{K_b}{C}}$$

$$= \sqrt{\frac{6\times10^{-8}}{0.25\times10^{-2}}}$$

$$= 0.489 \times 10^{-2}$$

Degree of ionisation = 0.489×10^{-2}

% of N_2H_4 that has reacted with water (% ionisation)

$= (0.489 \times 10^{-2}) \times 100$

$= 0.489\%$

216. At 25ºC, the dissociation constant of a base, BOH, is 1.0 × 10^{-12}. The concentration of hydroxyl ions in 0.01 M aqueous solution of the base would be

(a) 2.0×10^{-6} mol L^{-1}
(b) 1.0×10^{-5} mol L^{-1}
(c) 1.0×10^{-6} mol L^{-1}
(d) 1.0×10^{-7} mol L^{-1}

JCECE - 2012

Ans. (d) : Given that, $K_b = 1.0 \times 10^{-12}$

$[BOH] = 0.01$ M

Base (BOH) is dissociated as follows–

$$BOH \rightleftharpoons B^+ + OH^-$$

So, the dissociation constant of base BOH–

$$K_b = \frac{[B^+][OH^-]}{[BOH]} \qquad \ldots(i)$$

At equilibrium,

$$[B^+] = [OH^-]$$

$$\therefore \quad K_b = \frac{[OH^-]^2}{[BOH]}$$

$$\text{Thus,} \quad 1.0 \times 10^{-12} = \frac{[OH^-]^2}{0.01}$$

$$[OH^-]^2 = 1 \times 10^{-14}$$

$$[OH^-] = 1.0 \times 10^{-7} \text{ mol L}^{-1}$$

217. The degree of ionization of 0.4 M acetic acid will be ($K_a = 1.8\times10^{-5}$)

(a) 6.71×10^{-3}
(b) 1.6×10^{-3}
(c) $0.4\times1.8\times10^{-5}$
(d) 1.8×10^{-5}

MHT CET-2012

Ans. (a) : Given, Concentration (C) = 0.4 M

$K_a = 1.8\times10^{-5}$

The ionisation of acetic acid is–

$$CH_3COOH \rightleftharpoons CH_3COO^- + H^+$$

$$\therefore \quad K_a = C\alpha^2$$

$$1.8 \times 10^{-5} = 0.4 \times \alpha^2$$

$$\alpha = \sqrt{\frac{1.8\times10^{-5}}{0.4}}$$

$$\alpha = 6.71 \times 10^{-3}$$

218. An acid HA ionises as $HA \rightleftharpoons H^+ + A^-$ The pH of 1.0 M solution is 5. Its dissociation constant would be

(a) 1×10^{-10}
(b) 5
(c) 5×10^{-8}
(d) 1×10^{-5}

[AIEEE 2011]

Ans. (a) : Given, pH = 5, concentration = 1 M, K_a = ?

The acid HA ionises as:

$$HA \rightleftharpoons H^+ + A^-$$

Also, 1 M solution means [HA] = 1

$$\text{So,} \quad K_a = \frac{[H^+][A^-]}{HA} = \frac{(10^{-5})(10^{-5})}{1}$$

$$K_a = 1 \times 10^{-10}$$

219. The van't Hoff factor (*i*) for a dilute aqueous solution of sucrose is

(a) zero
(b) 1.0
(c) 1.5
(d) 2.0

J & K CET-(2011)

Ans. (b) : The dilute aqueous solution of sucrose cannot associated or dissociated.

Hence, van't Hoff factor '*i*' is one

i = 1(No. of association or dissociation)

i > 1 (for dissociation)

i < 1 (for association)

220. Which of the following compounds corresponds to Van't Hoff factor (*i*) to be equal to 2 for dilute solution?

(a) K_2SO_4
(b) $NaHSO_4$
(c) Sugar
(d) $MgSO_4$

JCECE - 2011

Ans. (d) : *i* = 2 means two ions are present in the solution.

$$K_2SO_4 \longrightarrow \underbrace{2K^+ + SO_4^{2-}}_{3\text{ ions}}$$

$$NaHSO_4 \longrightarrow \underbrace{Na^+ + H^+ + SO_4^{2-}}_{3\text{ ions}}$$

$$\text{Sugar} \longrightarrow \text{No ions}$$

$$MgSO_4 \longrightarrow \underbrace{Mg^{2+} + SO_4^{2-}}_{2\text{ ions}}$$

Thus, van't Hoff factor is 2 for dilute solution of $MgSO_4$.

221. The degree of dissociation of PCl_5 at 1 atm and 298 K is 0.2. The value of K_p is

(a) 0.42 atm
(b) 0.24 atm
(c) 0.48 atm
(d) 0.042 atm

SRMJEEE – 2010

Ans. (d) : The dissociation of PCl_5 is :

$$PCl_5 \rightleftharpoons PCl_3 + Cl_2$$

$$\begin{array}{llll} \text{Initially} & 1 & 0 & 0 \\ \text{At equi.} & 1-\alpha & \alpha & \alpha \end{array}$$

Total mole (Δn_g) = 1 + 1 – 1 = 1

Given – α = 0.2 at 1 atm pressure

$$K_p = \frac{n_{PCl_5} \times n_{Cl_2}}{n_{PCl_5}} \times \left[\frac{P}{\Sigma_n}\right]^{\Delta n_g}$$

@apna_pdf

$$K_p = \frac{\alpha \times \alpha}{(1-\alpha)}\left[\frac{P}{1+\alpha}\right]^1$$
$$K_p = \frac{\alpha^2 \times P}{1-\alpha^2}$$
$$K_p = \frac{(0.2)^2 \times 1}{1-(0.2)^2}$$
$$K_p = \frac{0.2 \times 0.2}{0.96}$$
$$K_p = 0.0416$$
$$K_p \approx 0.042$$

222. If $BaCl_2$ ionizes to an extent of 80% in aqueous solution, the value of van't Hoff factor is

(a) 2.6　　(b) 0.4
(c) 0.8　　(d) 2.4

AP-EAMCET- (Engg.) - 2010

Ans. (a) : Ionisation of $BaCl_2$ is–

$$BaCl_2(s) \xrightarrow{H_2O} Ba^{2+} + 2Cl^-$$

Initial　1　0　0
at 80% aqueous sol. (1–0.8)　0.8　2×0.8=1.6

$$\text{van't Hoff factor (i)} = \frac{\text{No. of moles after reaction}}{\text{Initial no. of moles}}$$
$$i = \frac{(1-0.8)+0.8+1.6}{1}$$
$$i = 2.6$$

223. Approximate relationship between dissociation constant of water (K) and ionic product of water (K_w) is

(a) $K_w = K$　　(b) $K_w = 55.6 \times K$
(c) $K_w = 18 \times K$　　(d) $K_w = 14 \times K$

A.M.U. – 2009

Ans. (b) : Dissociation constant–

$$H_2O \rightleftharpoons H^+ + OH^-$$
$$K = \frac{[H^+][OH^-]}{[H_2O]}$$
$$K = \frac{10^{-14}}{55.6}$$

$\because$　$K_w = 1 \times 10^{-14}$

Hence,　$K_w = 55.6 \times K$

224. Van't Hoff factor of aq K_2SO_4 at infinite dilution has value equal to

(a) 1　　(b) 2
(c) 3　　(d) between 2 and 3

AMU-2009

Ans. (c) : At infinite dilution, complete dissociation will take place. So,

$$K_2SO_4 \rightarrow 2K^+ + SO_4^{2-}$$

van't Hoff factor = 2 + 1 =3

225. The degree of dissociation of $Ca(NO_3)_2$ in dilute aq. solution containing 7.0 g of salt per 100 g of water at 100°C is 70%. If vapour pressure of water at 100°C is 760 mm Hg. The vapour pressure of solution is

(a) 735　　(b) 730
(c) 760　　(d) 746

[BITSAT – 2009]

Ans. (d) : The molar mass of calcium nitrate is 164 g/mol.

7 g of calcium nitrate $\frac{7}{164} = 0.0427$ moles

The molar mass of water is 18 g/mol.

100 g of water $\frac{100}{18} = 5.56$ moles

The mole fraction of calcium nitrate $= \frac{0.0427}{0.0424+5.56}$
$= 0.00762$

The degree of dissociation α = 70% = 0.7

The van't Hoff factor = [1+(n–1)α]
i = [1+(3–1)0.7]
i = 2.4

The relative lowering of the vapour pressure

$$\frac{P^\circ - P}{P^\circ} = ix$$
$$\frac{760-P}{760} = 2.4 \times 0.00762 = 0.018$$

760–P=13.9
P = 746.10mm

226. At a certain temperature, the dissociation constants of formic acid and acetic acid are 1.8×10^{-4} and 1.8×10^{-5} respectively. The concentration of acetic acid solution in which the hydrogen ion has the same concentration as in 0.001 M formic acid solution is equal to

(a) 0.01 M　　(b) 0.001 M
(c) 0.1 M　　(d) 0.0001 M
(e) 0.1010 M

Kerala-CEE-2009

Ans. (a) : Given that,

Dissociation constant of formic acid $(K_{a_1}) = 1.8 \times 10^{-4}$

Dissociation constant of acetic acid $(K_{a_2}) = 1.8 \times 10^{-5}$

Concentration of acetic acid $(C_1) = 0.001$ M

$\therefore$　$H^+ = \sqrt{K_a \cdot C}$

So,　$K_{a_1} \cdot C_1 = K_{a_2} \cdot C_2$

$$1.8 \times 10^{-4} \times 0.001 = 1.8 \times 10^{-5} \times C_2$$
$$C_2 = \frac{1.8\times10^{-7}}{1.8\times10^{-5}}$$
$$C_2 = 10^{-2}$$
$$C_2 = 0.01 \text{ M}$$

227. 0.1 M solution of which of the following has almost unity degree of dissociation ?

(a) Ammonium chloride　　(b) Potassium chloride
(c) Sodium acetate　　(d) All of the above

MHT CET-2009

Ans. (b) : Among the given only potassium chloride (KCl) is a strong electrolyte, so its degree of dissociation is almost unity.

228. The degree of dissociation of a 0.01 M weak acid is 10^{-3}. Its pOH is

(a) 5　　(b) 3
(c) 9　　(d) 11

MHT CET-2009

@apna_pdf

Ans. (c) : Given, Concentration = 0.01 M

Degree of dissociation (α) = 10^{-3}

pOH = ?

$$\therefore \quad [H^+] = K_a C$$
$$= \alpha^2 \times C^2 \qquad [\because\ K_a = \alpha^2 C]$$
$$= (10^{-3})^2 . (0.01)^2$$
$$= 10^{-5}$$
$$pH = -\log [H^+] = -\log 10^{-5} = 5$$
$$pOH = 14 - 5 = 9$$

229. In a 500 mL flask, the degree of dissociation of PCl_5 at equilibrium is 40% and the initial amount is 5 moles. The value of equilibrium constant in mol L^{-1} for the decomposition of PCl_5 is

(a) 2.33
(b) 2.66
(c) 5.32
(d) 4.66

AP-EAMCET-2008

Ans. (b) :

$$\begin{array}{llll} & PCl_5 \rightleftharpoons & PCl_3 + & Cl_2 \\ \text{Initial} & 5 & 0 & 0 \\ \text{Conc. at Equilibrium} & \dfrac{5(1-\alpha)}{0.5} & \dfrac{5\alpha}{0.5} & \dfrac{5\alpha}{0.5} \end{array}$$

Given that,

Degree of dissociation of PCl_5 at equilibrium (α)=40%
= 0.4

$$\therefore \quad K_c = \frac{[PCl_3][Cl_2]}{[PCl_5]}$$
$$= \frac{\left(\frac{5\times0.4}{0.5}\right)\left(\frac{5\times0.4}{0.5}\right)}{\left(\frac{5\times0.6}{0.5}\right)} = \frac{16}{6} = 2.66\ \text{mol/L}$$

230. Assertion (A) The aqueous solution of CH_3COONa is alkaline in nature.

Reason (R) : Acetate ion undergoes anionic hydrolysis.

The correct answer is

(a) Both (A) and (R) are true and (R) is the correct explanation of (A)
(b) Both (A) and (R) are true and (R) is not correct explanation of (A)
(c) (A) is true but (R) is not true
(d) (A) is not true but (R) is true

AP-EAMCET-2008

Ans. (a) : The aqueous solution of CH_3COONa is alkaline in nature.

$$CH_3COONa \underset{}{\overset{\text{Ionisation}}{\rightleftharpoons}} CH_3COO^- + \underset{\text{Strong base}}{Na^+}$$
$$CH_3COO^- + H_2O \rightarrow CH_3COOH + OH^-$$

Acetate ion undergoes anionic hydrolysis due to excess of OH^- ions.

231. The equilibrium constants K_{p_1} and K_{p_2} for the reactions $X \rightleftharpoons 2Y$ and $Z \rightleftharpoons P + O$, respectively are in the ratio of 1:9. If the degree of dissociation of X and Z be equal, then the ratio of total pressure at these equilibria is

(a) 1:36
(b) 1:1
(c) 1:3
(d) 1:9

NEET-2008

Ans. (a) : The reaction is–

$$\begin{array}{lcc} & X \rightleftharpoons & 2Y \\ \text{Initially} & 1 & 0 \\ \text{At equilibrium} & (1-x) & 2x \end{array}$$

Total moles = 1 – x + 2x = 1 + x

$$p_Y = \frac{2x}{1+x} \cdot P_1, \quad p_X = \frac{1-x}{1+x} \cdot P_1$$
$$\therefore \quad K_{p_1} = \frac{p_Y^2}{p_X}$$
$$K_{p_1} = \frac{(2x)^2}{(1+x)^2} \times \frac{(1+x)}{(1-x)} \times P_1$$
$$K_{P_1} = \frac{(2x)^2}{(1-x)}\left(\frac{P_1}{1+x}\right)$$
$$\begin{array}{lcc} Z \rightleftharpoons & P + & Q \\ 1 & 0 & 0 \\ (1-x) & x & x \end{array}$$

Similarly,

$$K_{P_2} = \frac{(x)^2}{(1-x)}\left(\frac{P_2}{1+x}\right)$$

Given that :

$$\frac{K_{p_1}}{K_{p_2}} = \frac{1}{9}$$
$$\frac{\frac{4x^2}{(1-x)}\left(\frac{P_2}{1+x}\right)}{\frac{x^2}{(1-x)}\left(\frac{P_1}{1+x}\right)} = \frac{1}{9}$$
$$\frac{4\times P_1}{P_2} = \frac{1}{9}$$
$$\frac{P_1}{P_2} = \frac{1}{36}$$
$$P_1 : P_2 = 1:36$$

232. An acid solution of 0.005M has a pH of 5. The degree of ionization of acid is

(a) 0.1×10^{-2}
(b) 0.2×10^{-2}
(c) 0.5×10^{-4}
(d) 0.6×10^{-6}

BCECE-2007

Ans. (b) : Given, Concentration = 0.005 M, pH = 5

Degree of ionization = ?

$$\because \quad pH = -\log[H^+]$$
$$\text{or} \quad 5 = -\log[H^+]$$
$$\text{or} \quad [H^+] = 10^{-5}$$
$$\text{Now,} \quad \alpha = \frac{\text{actual ionisation}}{\text{molar concentration}}$$
$$\alpha = \frac{10^{-5}}{0.005} = 0.2\times10^{-2}$$

233. A monoprotic acid in 1.00 M solution is 0.01% ionised. The dissociation constant of this acid is

(a) 1×10^{-8}
(b) 1×10^{-4}
(c) 1×10^{-6}
(d) 1×10^{-5}

BCECE-2006

Ans. (a) : Given, C = 1.00 M, K_a = ?

We use the Ostwald's dilution law for weak electrolytes–

@apna_pdf

$$\alpha = \sqrt{K_a V}$$

Here, $\alpha = 0.001\% \; = 0.0001 = 1\times10^{-4}$

$$V = \frac{1}{C} = \frac{1}{1-0} = 1L$$

$$\therefore \quad K_a = \frac{\alpha^2}{V} = \frac{(1\times10^{-4})^2}{1}$$

$$= 1\times10^{-8}$$

234. A 2.1 aqueous solution of a weak acid is 2% ionised. If the ionic product of water is 1 × 10^{-14} The [OH^-] is;

(a) 5×10^{-12} M (b) 2×10^{-3} M

(c) 1×10^{-14} M (d) None of the above

AP-EAMCET (Medical), 2006

Ans. (a) : Degree of dissociation of weak acid (α) = $\frac{2}{100} = 0.02$

Concentration of H^+ = $C.\alpha = 0.1\times0.02 = 2\times10^{-3}$

Given:- ionic product of water (K_w) = 1×10^{-14}

$\therefore$ [H^+] [OH^-] = K_w

$$[OH^-] = \frac{1\times10^{-14}}{2\times10^{-3}}$$

[OH^-] = 5×10^{-12} M

235. HA is a weak acid. The pH of 0.1M HA solution is 2. What is the degree of dissociation (α) of HA?

(a) 0.5 (b) 0.2

(c) 0.1 (d) 0.301

J & K CET-(2006)

Ans. (c) : Given that- pH = 2

$\therefore \quad [H^+] = 10^{-2}$

For weak acid-

$[H^+] = C\alpha = 0.1 \times \alpha$

$10^{-2} = 0.1 \; \alpha$

$$\alpha = \frac{10^{-2}}{0.1} = 0.1$$

236. Degree of dissociation of 0.1 N CH_3COOH is ($K_{acid} = 1 \times 10^5$)

(a) 10^{-5} (b) 10^{-4}

(c) 10^{-3} (d) 10^{-2}

UP CPMT-2006

Ans. (d) : Given, C = 0.1 N, $K_a = 1 \times 10^5$

Relation between degree of dissociation and dissociation constant–

$$\therefore \quad \alpha = \sqrt{\frac{K_a}{C}} = \sqrt{\frac{1.0\times10^{-5}}{0.1}}$$

$$= \sqrt{1.0\times10^{-4}} = 1.0\times10^{-2}$$

237. If α is the degree of dissociation of Na_2SO_4 , the van't Hoff factor (*i*) used for calculating the molecular mass is

(a) $1-2\alpha$ (b) $1+2\alpha$

(c) $1-\alpha$ (d) $1+\alpha$

AIEEE-2005

Ans. (b) : The dissociation of Na_2SO_4 is given as–

$$Na_2SO_4 \longrightarrow \underbrace{2Na^+ + SO_4^{-2}}_{n=2}$$

$\therefore \quad i = 1 + (n–1)\alpha$

$i = 1 + 2\alpha$

238. The van't Hoff factor of $BaCl_2$ at 0.01M concentration is 1.98. The percentage of dissociation of $BaCl_2$ at this concentration is :

(a) 49 (b) 69

(c) 89 (d) 98

(e) 100

Kerala-CEE-2005

Ans. (a) : Given, i = 1.98, Concentration = 0.01 M

The dissociation of $BaCl_2$ is–

$$BaCl_2 \rightleftharpoons Ba^{2+} + 2Cl^-$$

We know that–

$$\alpha = \frac{i-1}{n-1}$$

Where, i = van't Hoff factor

n = number of dissociated ion

$$\therefore \quad \alpha = \frac{1.98-1}{3-1}$$

$$\alpha = \frac{0.98}{2}$$

$\alpha = 0.49$

$\therefore$ % dissociation = α = 100 = 49%

239. When NH_4Cl is added to NH_4OH solution, the dissociation of ammonium hydroxide is reduced. it is due to

(a) common ion effect (b) hydrolysis

(c) oxidation (d) reduction

CG PET-2004

Ans. (a) : When NH_4Cl is added to NH_4OH solution, concentration of NH_4^+ ions increases so the equilibrium shift towards left.

So, the dissociation of NH_4OH is reduced it is due to common ion effect.

240. At 90°C, pure water has [H_3O^+]= 10^{-6} moles/litre. The value of K_w at 90°C is

(a) 10^{-6} (b) 10^{-8}

(c) 10^{-12} (d) 10^{-14}

J & K CET-(2004)

Ans. (c) : Given,

$[H_3O^+] = 10^{-6}$ mol/L

Ionization reaction of H_2O is-

$$H_2O \rightleftharpoons H^+ + OH^-$$

$$K = \frac{[H^+][OH^-]}{H_2O}$$

$K \times [H_2O] = [H^+] \; [OH^-]$

$\therefore \quad K_w = [H^+] \; [OH^-]$

$[H^+] = [OH^-] = 10^{-6}$ mol/litre

$\therefore$ Mentioned that it is pure water

$K_w = [H^+] \; [OH^-]$

$K_w = 10^{-6} \times 10^{-6}$

$K_w = 10^{-12}$

@apna_pdf

241. The K_a of an acid is 3.2×10^{-5}. The degree of dissociation of the acid at concentration of 0.2 M is

(a) 6.0×10^{-2} (b) 1.26×10^{-2}
(c) 40×10^{-4} (d) 0.04×10^{-3}

JIMPER-2004

Ans. (b) : Given, K_a of an acid = 3.2×10^{-5}
Concentration = 0.2 M
From Ostwald's dilution law –

$$\alpha = \sqrt{\frac{K_a}{C}}$$

$$\alpha = \sqrt{\frac{3.2\times10^{-2}}{0.2}}$$

$$\alpha = 1.26\times10^{-2}$$

242. The degree of hydrolysis in hydrolytic equilibrium $A^- + H_2O \rightleftharpoons HA + OH^-$ at salt concentration of 0.001 M is: ($K_a = 1 \times 10^{-5}$)

(a) 1×10^{-3} (b) 1×10^{-4}
(c) 5×10^{-4} (d) 1×10^{-6}

UPTU/UPSEE-2004

Ans. (a) : We have,
$K_a = 1 \times 10^{-5}$, C = 0.001 M
Degree of hydorolysis is –

$$h = \sqrt{\frac{K_w}{K_a \times C}} = \sqrt{\frac{10^{-14}}{10^{-5}\times0.001}} = \sqrt{10^{-14+5+3}}$$

$$h = 10^{-3}$$

243. The degree of hydrolysis of 0.01 M NH_4Cl is: ($K_h = 2.5\times10^{-9}$)

(a) 5×10^{-5} (b) 5×10^{-4}
(c) 5×10^{-3} (d) 5×10^{-7}

JCECE-2003

Ans. (b): Given, Hydrolysis constant (K_h) = 2.5×10^{-9}
Degree of hydrolysis = ?, Concentration (C) = 0.01 M

$$h = \sqrt{\frac{K_h}{C}}$$

$$h = \sqrt{\frac{2.5\times10^{-9}}{0.01}}$$

$$h = \sqrt{\frac{2.5\times10^{-9}}{10^{-2}}}$$

$$h = \sqrt{\frac{2.5\times10\times10^{-9}}{10^{-2}\times10}}$$

$$h = \sqrt{\frac{25\times10^{-9}}{10^{-1}}}$$

$$h = \sqrt{25\times10^{-8}}$$

$$h = 5 \times 10^{-4}$$

244. Which of the following salt has value of the van't Hoff factor equal to that of $K_3[Fe(CN)_6]$?

(a) $Al_2(SO_4)_3$ (b) NaCl
(c) $Al(NO_3)_3$ (d) Na_2SO_2

J & K CET-(2002)

Ans. (c) : $K_3[Fe(CN)_6]$ on ionisation gives 4 species ($3K^+$ and 1 $[Fe(CN)_6]^{-3}$).

And, $Al(NO_3)_3$ also gives 4 species ($1\ Al^{3+}$ and $3\ NO_3^-$).
∴ van't Hoff factor for $K_3[Fe(CN)_6]$ = 4
And, van't Hoff factor for $Al(NO_3)_3$ = 4

245. The dissociation constant of two acids HA_1 and HA_2 are 3.0×10^{-4} and 1.8×10^{-5} respectively. The relative strengths of the acids is

(a) 1 :16 (b) 1 :4
(c) 4 :1 (d) 16 :1

UP CPMT-2002

Ans. (c) : Given, $K_{a_1} = 3\times10^{-4}$, $K_{a_2} = 1.8\times10^{-5}$
The dissociation of acids are–

$$HA_1 \rightleftharpoons H^+ + A_1$$

$$HA_2 \rightleftharpoons H^+ + A_2$$

Dissociation constant (K_a) = $\frac{c\alpha^2}{1-\alpha}$

∴ Relative acidic strength ⇒ $\frac{HA_1}{HA_2} = \sqrt{\frac{K_{a_1}}{K_{a_2}}}$

$$\frac{HA_1}{HA_2} = \sqrt{\frac{3.0\times10^{-4}}{1.8\times10^{-5}}}$$

or $\frac{HA_1}{HA_2} = \frac{4}{1}$

∴ Relative strength are acids will be 4:1

246. The pH of a 0.1 M aqueous solution of a weak acid (HA) is 3. What is its degree of dissociation?

(a) 1% (b) 10%
(c) 50% (d) 25%

AP-EAMCET (Medical), 2001

Ans. (a) : Given, pH = 3, Concentration (c)=0.1 M
Now, pH = $-\log[H^+]$
or $[H^+] = 10^{-3}$
The dissociation of weak acid is-

$$HA \rightleftharpoons H^+ + A^-$$

We know that,
$[H^+] = C \times \alpha$
Where, C = Concentration
α = Degree of dissociation

or $\alpha = \frac{10^{-3}}{0.1}$
or $\alpha = 0.01$
∴ Percentage of dissociation = $10^{-2} \times 100$ = 1%.

247. Δx = (hydration energy) – (lattice energy), for a salt Δx is found to be –500 kcal mol^{-1}. Then, on increasing the temperature, its solubility in water

(a) increases
(b) decreases
(c) remains same
(d) increases initially and then decreases

AP-EAMCET-1998

Ans. (b) : In this reaction, heat is evolved during the dissolution, so solubility decreases with rise in temperature.

@apna_pdf

248. The hydrogen ion concentration in mol/dm^3, in a 0.2 m solution of a weak acid, HA (K_a= 2 × 10^{-5}) is close to

(a) 2×10^{-5}
(b) 2×10^{-4}
(c) 2×10^{-3}
(d) 2×10^{-2}

J & K CET-(1998)

Ans. (c) : Given, Concentration (C)=0.2 m, K_a=2×10^{-5}
The dissociation of weak acid is –

$$HA \rightleftharpoons H^+ + A^-$$

$$\begin{array}{llll} t=0 & C & 0 & 0 \\ t=t' & C(1-\alpha) & C\alpha & C\alpha \end{array}$$

$$\therefore \quad K_a = \frac{[H^+][A^-]}{[HA]}$$

$$K_a = \frac{C\alpha\cdot C\alpha}{C(1-\alpha)}$$

$$K_a = \frac{C\alpha^2}{(1-\alpha)} \quad (\because \text{ for weak acid } \alpha <<< 1)$$

$$K_a = C\alpha^2 \quad (\because [H^+] = C\alpha)$$

$$\text{or} \quad [H^+] = \sqrt{K_a \times C}$$

$$[H^+] = \sqrt{2\times10^{-5}\times0.2}$$

$$[H^+] = \sqrt{0.4\times10^{-5}}$$

$$[H^+] = 2 \times 10^{-3}$$

249. The degree of dissociation of an acid HA in 0.1 M solution is 0.1%. Its dissociation constant is

(a) 1 × 10^{-3}
(b) 1 × 10^{-7}
(c) 1 × 10^{-10}
(d) 1 × 10^{-14}

AP-EAMCET-1992

Ans. (b) : Given that, degree of dissociation (α) = 0.1% = 10^{-3}

$C = 0.1\text{ M} = 10^{-1}\text{ M}$

According to ostwald dilution law, the dissociation constant (K_a) is equal to the product of molar concentration (C) and the square of the degree of dissociation (α^2).

$\therefore$ Dissociation constant (K) = α^2.C

$= (10^{-3})^2 \times 10^{-1}$

$= 10^{-7}$

250. 100 mL of a solution contains 2g of acetic acid and 3g of sodium acetate providing K_a=1.8×10^{-5}, then choose the correct option

(a) The solution is basic in nature
(b) The solution is acidic in nature
(c) The solution is amphoteric in nature
(d) The solution is neutral in nature

JIMPER-2016

Ans. (b) : According to Henderson's equation–

$$pH = -\log_{10} K_a + \log_{10}\frac{[Salt]}{[Base]}$$

$$[Salt] = \frac{3\times1000}{82\times100}\text{ mol L}^{-1} \quad \left[\begin{array}{l}\text{CH}_3\text{COONa is salt and} \\ \text{molecular mass of this} \\ \text{salt is 82}\end{array}\right]$$

$$[Acid] = \frac{2\times1000}{60\times100}\text{ mol L}^{-1} \quad \left[\begin{array}{l}\text{CH}_3\text{COOH is acid and} \\ \text{molecular mass of this} \\ \text{acid is 60}\end{array}\right]$$

Given, K_a = 1.8 × 10^{-5}

$$\therefore \quad pH = -\log_{10}1.8\times10^{-5} + \log_{10}\left[\frac{\frac{3\times1000}{82\times100}}{\frac{2\times1000}{60\times100}}\right]$$

$$pH = 4.7851$$

The solution is a acidic nature.

251. The van't Hoff factor (i) for a dilute aqueous solution of the strong electrolyte barium hydroxide is

(a) 0
(b) 1
(c) 2
(d) 3

(NEET-II-2016)

Ans. (d) : The dissociation of barium hydroxide is–

$$Ba(OH)_2 \rightarrow Ba^{+2} + 2OH^-$$

$$i = \frac{\text{No. of particle after dissociation}}{\text{No. of particle before dissociation}}$$

$$i = \frac{3}{1}$$

$$i = 3$$

252. The dissociation of water at 25°C is 1.9×10^{-7}% and the density of water is 1.0 g/cm^3 the ionization constant of water is

(a) 3.42×10^{-8}
(b) 3.42×10^{-16}
(c) 1.00×10^{-14}
(d) 2.00×10^{-16}

J & K CET-(1998)

Ans. (d) : Given that,

$\alpha = 1.9 \times 10^{-7}\%$ Density (d) = 1g/cm^3

$\alpha = \dfrac{1.9\times10^{-7}}{100}$ d = 1×1000

$\alpha = 1.9 \times 10^{-9}$ d =1000g/L

Molecular mass of water = 18 g/mol

$$\text{Concentration (C)} = \frac{1000}{18} = 55.55$$

$$\begin{array}{lccc} & H_2O & \rightleftharpoons H^+ & + \ OH^- \\ \text{Initial conc.} & C & 0 & 0 \\ \text{After 't'} & C - C\alpha & C\alpha & C\alpha \end{array}$$

$$K = \frac{[H^+][OH^-]}{[H_2O]}$$

$$K = \frac{[C\alpha][C\alpha]}{C - C\alpha}$$

$$K = \frac{C\alpha^2}{1-\alpha} \quad (\alpha << 1)$$

$$K = C\alpha^2$$

$$K = 55.55 \times (1.9 \times 10^{-9})^2$$

$$K = 55.55\times3.61\times10^{-18}$$

$$K = 2.00 \times 10^{-16}$$

@apna_pdf

5. Vapour Density

253. On increasing temperature, the equilibrium constant of exothermic and endothermic reactions, respectively :

(a) Increases and decreases
(b) Decreases and increases
(c) Increases and increases
(d) Decreases and decreases

AP-EAMCET (Engg.) 2015

Ans. (b) : For $A+B \underset{K_b}{\overset{K_f}{\rightleftharpoons}} C+D$

$$\therefore \quad \text{Equilibrium constant (K)} = \frac{K_f}{K_b}$$

For exothermic reaction K_f decrease with increase of temperature so that K decreases and endothermic reaction (K_f) increases with increase of temperature. So K increases.

254. An oxygen containing organic compound was found to contain 52% carbon and 13% of hydrogen. Its vapour density is 23. The compound reacts with sodium metal to liberate hydrogen. A functional isomer of this compound is

(a) Ethanal
(b) Methoxy methane
(c) Methoxy ethane
(d) Ethanol

Karnataka-CET-2012

Ans. (b) : Molecular mass = 2 × vapour density
Molecular mass = 2 × 23 = 46

Element	Percentage	Atomic mass	Relative number of atoms	Simplest ratio
C	52%	12	$52/12=4.33$	$1.9-2$
H	13%	1	$13/1=13$	$5.9-6$
O	35%	16	$35/16=2.18$	1

Empirical formula = C_2H_6O
Empirical formula mass = 12 × 2 + 6 × 1 + 16 = 46

$$n=\frac{\text{Empirical formula mass}}{\text{Molecular formula mass}}=\frac{46}{46}=1$$

Molecular formula = C_2H_6O
Alcohols liberate hydrogen on reaction with sodium metal.
The functional isomer of ethanol is methoxy methane.

$\underset{\text{Ethanol}}{CH_3CH_2OH} \qquad \underset{\text{Methoxy methane}}{CH_3OCH_3}$

6. Le-Chatelier Principle and It's Application

255. What is the effect of increasing pressure on the dissociation of PCl_5 according to the equation? $PCl_5(g) \rightleftharpoons PCl_3(g) + Cl_2(g)$

(a) Dissociation decreases
(b) Dissociation increases
(c) Dissociation does not change
(d) None of the above

Tripura JEE-2022
UPTU/UPSEE-2004

Ans. (a) : $PCl_5(g) \rightleftharpoons PCl_3(g) + Cl_2(g)$

For this reaction Δn = 2 –1 =1
The dissociation of PCl_5 take forward by decrease in pressure & by increase in pressure the dissociation of PCl_5 decrease because the value of Δn is positive.

256. On doubling P and V with constant temperature the equilibrium constant will

(a) remain constant
(b) become double
(c) become one–fourth
(d) None of the above

UP CPMT-2007
UPTU/UPSEE-2004

Ans. (a) : At constant temperature,
PV = Constant
The equilibrium constant depend on the temperature. On doubling P and V with constant T, the equilibrium constant (K) will remain constant.
Pressure will never affect the value of K. It may result in the shifting of equilibrium, but not the equilibrium constant value. Temperature always changes K because on adding heat to a system in state of equilibrium will always alter the forward reaction rate differently than the reverse reaction rate. Also by doubling the volume, the concentrations of both reactants and products evenly became half. Therefore, overall there is no change in equilibrium constant value (K).

257. Le-Chateliar's principle is not applicable to —

(a) $H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$
(b) $Fe(s) + S(s) \rightleftharpoons Fe(s)$
(c) $N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$
(d) $N_2(g) + O_2(g) \rightleftharpoons 2NO(g)$

AP EAPCET 20.08.2021 Shift-I
AMU-2011

Ans. (b) : Le chartelier's principle state that an equilibrium is subjected to a change of concentration, pressure or temperature, the equilibrium shifts in the direction that trends to undo the effect of the change. It is not explain the solid state compound.
e.g. – $Fe(s) + S(s) \rightleftharpoons FeS(s)$

258. The yield of the products in the reaction,

$$\mathbf{A_2(g)+2B(g) \rightleftharpoons C(g)+Q\,(kJ)}$$

would be higher at

(a) high temperature and high pressure
(b) high temperature and low pressure
(c) low temperature and high pressure
(d) low temperature and low pressure

NEET-2018
Karnataka-CET-2013

Ans. (c) : $A_2(g)+2B(g) \rightleftharpoons C(g)+QkJ$

The forward reaction is exothermic. Thus, according to Le-Chatelier's principal, the lower is temperature, greater would be the yield of ammonia. Also, the forward reaction occurs with decrease in number of gaseous molecules. Thus according to Le-Chatelier's principal an increase in pressure, will shift the equilibrium in a direction in which the number of gaseous molecules decreases. In other word high pressure will favour the formation of products.

@apna_pdf

259. The supply of oxygen to tissues by blood, can be explained by

(a) Le-Chatelier's principle (b) Boyle's law

(c) Charis' law (d) Dalton's law

AP EAMCET (Engg.) 21.09.2020, Shift-II

Ans. (a) : Le-Chatelier's principle drives the following reaction forward as blood passes through the alveoli

$$H^+ + HCO_3 \rightarrow H_2CO_3 \rightarrow CO_2 + H_2O$$

The carbon dioxide produced here continually diffuses into the alveoli and is exhaled, ensuring favorable kinetics for the reaction to proceed. Thus, correct answer is option (a).

260. $CaCO_3(s) \rightarrow CaO(s) + CO_2(g)$ at constant temp, the pressure will increase if:

(a) Vol. of container increase

(b) Temperature increases

(c) Concentration of CaO increases.

(d) Concentration of $CaCO_3$ increases.

AIIMS-27.05.2018-(E)

Ans. (b): $CaCO_3(s) \rightarrow CaO(s) + CO_2(g)$

$$K_p = P_{CO_2}$$

Pressure will increase only be increasing temperature as it will change K_p value.

261. Which statement is incorrect for a catalyst?

(a) It does not affect the equilibrium constant

(b) It increases the proportion of products in less time

(c) It decreases the activation energy of a reaction

(d) It increases the free energy change for the reaction

GUJCET-2018

Ans. (d) : It increases the free energy change for the reaction a catalyst does not affect the energies of reactants and products of the reaction and hence, the energies are same for both catalyzed and non-catalyzed reactions.

262. In a reaction $A + B \rightleftharpoons C + D$, Le Chatelier's principle asserts that an equilibrium between A and B producing C and D can be shifted towards C and D by

(i) increasing the concentration of A or B

(ii) increasing the concentration of C or D

(iii) decreasing the concentration of A or B

(a) (ii) only (b) Both (i) and (ii)

(c) (iii) only (d) (i) only

J & K CET-(2018)

Ans. (d) : $A + B \rightleftharpoons C + D$

Thus, in the given equilibria, if concentration of A and B is increased the reaction will move in forward direction to reduce the effect of increase in concentration of A and B. According to Le-Chatelier's principal, if a system in equilibrium is subjected to a change in any of the factors that determine the equilibrium conditions of a system then the equilibrium will shift in the direction so, as to reduce or to counteract the effects of the change

263. A reaction has both ΔH and ΔS –ve. The rate of reaction

(a) Increases with increases in temperature

(b) Cannot be predicated for change in temperature

(c) Increases with decreases in temperature

(d) Remains unaffected by change in temperature

Karnataka-CET-2017

Ans. (c) : $\Delta G = \Delta H - T\Delta S$

So, ΔG = –ve then the ΔS must be less than ΔH i.e. $\Delta H > T\Delta S$.

Negative value of enthalpy change ΔH corresponds to exothermic reaction with decrease in temperature, the rate of reaction increases, Hence the option (c) is correct.

264. For the reaction, $CO(g) + H_2O(g) \rightleftharpoons CO_2(g) + H_2(g)$ at a given temperature the equilibrium amount of $CO_2(g)$ can be increased by

(a) adding a suitable catalyst

(b) adding an inert gas

(c) increasing the volume of the container

(d) increasing the amount of $CO_{(g)}$.

J & K CET-(2017)

Ans. (d) : $CO(g) + H_2O(g) \rightleftharpoons CO_2(g) + H_2(g)$

Δn_g = No. of moles of product – No. of moles of reactant.

$\therefore \quad \Delta n_g = 2 - 2 = 0$

The amount of CO_2 will increase when the reaction moves to forward direction. This can be achieved by increasing the amount of CO in the reaction mixture as according to Le-Chatelier's principal the reactions moves in a direction where the added substance are consumed.

265. The chemical reaction of a gas phase is given below.

$$2A(g) + B(g) \rightleftharpoons C(g) + D(g)$$

Which one of the following changes will affect the value of K_c?

(a) Addition of inert gas

(b) Increasing in temperature

(c) Addition of reactants

(d) Addition of catalyst

Manipal-2016

Ans. (b) : According to Vant Hoff equation–

$$\log\frac{K_2}{K_1} = \frac{\Delta H}{2.303R}\left(\frac{1}{T_1} - \frac{1}{T_2}\right)$$

If, ΔH is positive then the reaction is endothermic then temperature increase also the K is increases.

ΔH is negative then the reaction is exothermic then temperature increases also K is decreases.

K_c is a function of temperature only.

266. For the chemical equilibrium,

$$2NO_2(g) \rightleftharpoons N_2O_4(g) + 14.6\text{kcal}$$

increase in temperature :

(a) favours the formation of N_2O_4

(b) favours the decomposition of N_2O_4

(c) does not affect equilibrium

(d) stop the reaction

Manipal-2016

@apna_pdf

Ans. (b) : The given reaction is exothermic and according to Le-chatelier's principal, high temperature shifts the equilibrium in backward direction i.e. high temperature favours the decomposition of N_2O_4.

267. Which one of the following is correct?

(a) The equilibrium constant (K_c) is independent of temperature

(b) The value of K_c is independent of initial concentrations of reactants and products

(c) At equilibrium, the rate of the forward reaction is twice the rate of the backward reaction

(d) The equilibrium constant (K_c) for the reaction $Ni(s)+4CO(g) \rightleftharpoons Ni(CO)_4(g)$ is, $\frac{[Ni(CO)_4]}{[CO]}$

TS-EAMCET-2016

Ans. (b) : (a) Equilibrium constant is temperature dependent having one unique value for a particular reaction represented by a balanced equation at a given temperature.

(b) The value of equilibrium constant is independent of initial concentration of the reactants and products.

(c) At equilibrium, the rate of forward reaction is equal to the rate of backward reaction.

(d) For the equilibrium reaction–

$$Ni(s) + 4CO(g) \rightleftharpoons Ni(CO)_4(g)$$

$$\therefore \quad K_c = \frac{[Ni(CO)_4]}{[CO]^4}$$

268. The reaction $SO_2 + O_2 \rightleftharpoons 2SO_3 + Heat$

The equilibrium reaction proceeds in forward direction by

(a) addition of O_2 (b) removal of O_2

(c) addition of inert gas (d) cannot proceed

UPTU/UPSEE-2015

Ans. (a) : According to Le- Chatelier's principle, equilibrium shift towards forward direction by addition of reactant.

269. Which of the following according to Le-Chatelier's principle is correct?

(a) Increase in temperature favours the endothermic reaction

(b) Increase in temperature favours the exothermic reaction

(c) Increase in pressure shifts the equilibrium in that side in which number of gaseous moles increases

(d) All of the above are true

BITSAT 2015

Ans. (a) : According to Le-chatelier's principle increase in temperature favours the endothermic reaction while a decrease in temperature favour the exothermic reaction.

Increase in pressure shifts the equilibrium in that side in which the number of moles of gaseous species decreases.

270. For the reversible reactions,

$N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$ + heat

The equilibrium, shifts is forward direction

(a) by increasing the concentration of $NH_3(g)$

(b) by decreasing the pressure

(c) by decreasing the concentrations of $N_2(g)$ and $H_2(g)$

(d) by increasing pressure and decreasing temperature

NEET-2014

Ans. (d) : By increasing pressure and decreasing temperature the given reaction is exothermic as heat is released during the reaction. For an exothermic reaction, on decreasing the temperature equilibrium will shift in forward direction.

According to Le-Chatelier's principal, on increasing pressure, equilibrium will shift in the direction where leasser number of gaseous moles are present.

Hence, on increasing pressure equilibrium will shift in forward direction for the given system.

271. Consider the following reaction $CaCO_3(s) \rightleftharpoons CaO(s) + CO_2(g)$ in closed container at equilibrium. What would be the effect of addition of $CaCO_3$ on the equilibrium concentration of CO_2?

(a) Increases (b) Decreases

(c) Data is insufficient (d) Remains unaffected

SRMJEEE – 2014

Ans. (d) : $CaCO_3(s) \rightleftharpoons CaO(s) + CO_2(g)$

$$\because \quad K_c = \frac{[CO_2][CaO]}{[CaCO_3]}$$

$$\therefore \quad [CaCO_3] = [CaO] = 1$$

Then, $K_c = [CO_2] = P_{CO_2}$

Hence, the equilibrium constant remain unaffected.

272. Which of the following equilibrium will shift to right side on increasing the temperature?

(a) $CO(g)+H_2O(g) \rightleftharpoons CO_2(g)+H_2(g)$

(b) $2SO_2(g)+O_2(g) \rightleftharpoons +2SO_3(g)$

(c) $H_2O(g) \rightleftharpoons H_2(g)+\frac{1}{2}O_2(g)$

(d) $4HCl(g)+O_2(g) \rightleftharpoons 2H_2O(g)+2Cl_2(g)$

AIIMS-2014

Ans. (c): $H_2O(g) \rightleftharpoons H_2(g)+\frac{1}{2}O_2(g)$

According to Le-chatelier's principle, increasing the temperature shifts the equilibrium to the right side since, volume is increasing in the forward reaction. So on increasing the temperature reaction will proceed in the forward direction.

273. In a reaction, A + B $\rightleftharpoons$ C + D, 40% of B has reacted at equilibrium, when 1 mole of A was heated with 1 mole of B in a 10 L closed vessel. The value of K_c is

(a) 0.44 (b) 0.18

(c) 0.22 (d) 0.36

AP-EAMCET (Engg.) - 2014

Ans. (a) : Given that,

$$A + B \rightleftharpoons C + D$$

@apna_pdf

At t = 0	1	1	0	0
At equi.	(1–0.4)	(1–0.4)	0.4	0.4

$$\therefore K_c = \frac{[C][D]}{[A][B]}$$
$$= \frac{0.4 \times 0.4}{0.6 \times 0.6}$$
$$= 0.44$$

274. $KMnO_4$ can be prepared from K_2MnO_4 as per the reaction,

$$3MnO_4^{2-} + 2H_2O \rightleftharpoons 2MnO_4^- + MnO_2 + 4OH^-$$

The reaction can go to completion by removing OH^- ions by adding

(a) CO_2 (b) SO_2
(c) HCl (d) KOH

NEET-2013

Ans. (a) : The reaction for the oxidation of magnate ion to permagnate ion can go to completion by removing hydroxide ions by adding CO_2.

$$CO_2 + 2OH^- \rightarrow CO_3^{2-} + H_2O$$

275. In which of the following reactions, increase in pressure will favour the forward reaction?

(a) $PCl_5(g) \rightleftharpoons PCl_3(g) + Cl_2(g)$
(b) $2NO(g) + O_2(g) \rightleftharpoons 2NO_2(g)$
(c) $C(s) + H_2O(g) \rightleftharpoons CO(g) + H_2(g)$
(d) $2HI(g) \rightleftharpoons H_2(g) + I_2(g)$

J & K CET-(2013)

Ans. (b) : An increase in pressure favours the reaction in the direction that produced smaller number of moles of gases. As in reaction (b), 3 moles of reactants produces lesser i.e. 2 mole of products. Therefore, the reaction will move in forward direction.

276. In which reaction will an increase in the volume of the container favour the formation of products?

(a) $C(s) + H_2O(g) \rightleftharpoons CO(g) + H_2(g)$
(b) $H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$
(c) $4NH_3(g) + 5O_2(g) \rightleftharpoons 4NO(g) + 6H_2O(l)$
(d) $3O_2(g) \rightleftharpoons 2O_3(g)$

SCRA 2012

Ans. (a) : As we increase the volume of the container the concentration decreases of all the gaseous states in the reaction by Le-Chatelier's principle, the reaction will move in the direction of increasing no. of moles.

277. According to Le-Chartelier's principle, the equilibrium constant of a reversible reaction will not shift by

(a) Increasing the temperature of an exothermic reaction
(b) Increasing the temperature of an endothermic reaction
(c) Charging the concentrations of the reactants
(d) The effect of a catalyst.

J & K CET-(2012)

Ans. (d) : According to Le-Chatelier's principal, the equilibrium state of a reversible reaction will not shift by the effect of a catalyst but equilibrium constant remain unaffected by the effect of catalyst as well as change in concentration of the reactants.

278. For the reaction, $SO_2Cl_2(g) \rightleftharpoons SO_2(g) + Cl_2(g)$ If at equilibrium volume of the reaction vessel is increased then the amount of

(a) SO_2 will decrease
(b) SO_2 Cl_2 will increase
(c) Cl_2 will increase
(d) Cl_2 will remain unchanged.

SRMJEEE – 2012

Ans. (c) : For the given reaction –

$$SO_2Cl_2(g) \rightleftharpoons SO_2(g) + Cl_2(g)$$

As we know that if we increase the vessel of reaction mixture then the equilibrium shifts, where the no. of moles of side is major. Hence, the amount of Cl_2 will be increased.

279. For the reaction $2A + B \rightleftharpoons C, \Delta H = x$ cal, which one of the following conditions-would favour the yield of C on the basis of Le-Chatelier principle?

(a) High pressure, high temperature
(b) Only low temperature
(c) High pressure, low temperature
(d) Only low pressure

VITEEE- 2011

Ans. (a) : The reversible reaction is :

$$2A + B \rightleftharpoons C \quad \Delta H = +x \text{ cal}$$

When pressure is increased in an equilibrium reaction, then the reaction moves towards the less number of moles. So, after increasing the temperature, the reaction move in forward direction. As the reaction is endothermic, high temperature is favorable and low temperature is unfavourable.

280. H_2S gas when passed through a solution of cations containing HCl precipitates the cations of second group of qualitative analysis but not those belonging to the fourth group. It is because

(a) Presence of HCl decreases the sulphide ion concentration.
(b) Solubility product of group II sulphides is more than that of group IV sulphides.
(c) Presence of HCl increases the sulphide ion concentration.
(d) Sulphides of group IV cations are unstable in HCl.

BITSAT 2011

Ans. (a) : H_2S gas is passed in presence of HCl, in qualitative analysis of cation of second group, therefore, due to common ion effect, lower concentration of sulphide ions is obtained which is sufficient for the precipitation of second group cations in form of their sulphides due to lower value of their solubility product (K_{sp}). Here, fourth group cations are not precipitated because they require for exceeding their ionic product to their solubility products and higher sulphide ions concentration due to their higher K_{sp} which is not obtained here due to common ion effect.

@apna_pdf

281. Which of the following comments about the following equilibrium reaction is the most correct?

$$H_2SO_4(aq)+NH_3(aq) \rightleftharpoons HSO_4^-(aq)+NH_4^+(aq)$$

(a) The equilibrium lies mostly to the right
(b) The equilibrium lies mostly to the left
(c) The equilibrium is exactly in between where the concentration of each of the reactants is exactly equal to the concentration of each of the products
(d) The equilibrium depends on the temperature of the equilibrium raction

UPTU/UPSEE-2011

Ans. (a) : H_2SO_4 when dissolves in water dissociate almost completely and produces H^+ ions. These ions are taken by NH_3 and its conjugate acid NH_4^+ forms of NH_3.
Thus, the equilibrium lies mostly to right side or forward reaction.

$$H_2SO_4(aq)+NH_3(aq) \rightleftharpoons HSO_4^-(aq)+NH_4^+(aq)$$

282. The value of ΔH for the reaction

$X_2(g) + 4Y_2(g) \rightleftharpoons 2XY_4(g)$ is less than zero formation of $XY_4(g)$ will favoured at

(a) high temperature and high pressure
(b) low pressure and low temperature
(c) high temperature and low pressure
(d) high pressure and low temperature

NEET-2011

Ans. (d) : The reaction is:

$$X_2(g) + 4Y_2(g) \rightleftharpoons 2XY_4(g)$$

$\Delta n_g = -Ve$

And, $\Delta H = -Ve$

So, formation of $XY_4(g)$ will favoured at high pressure and low temperature.

283. To an equilibrium mixture of

$$2SO_{2(g)} + O_{2(g)} \rightleftharpoons 2SO_{3(g)}$$

Some helium, an inert gas, is added at constant volume. The additiona of helium causes the total pressure to double. Which of the following is true?

(a) The concentration of all three gases is unchanged.
(b) The concentration of sulphur trioxide increases.
(c) The numberof moles of sulphur trioxide increases.
(d) The concentration of sulphur dioxide increases.

J & K CET-(2010)

Ans. (a) : As volume remains constant, the concentration of the three gases will remain unchanged on adding the helium. Since, the inert gas is added at constant volume, i.e. the volume is not allowed to increase, the concentrations of all the free gases remain unchanged.

284. Which of the following is not a physical equilibrium?

(a) Ice $\rightleftharpoons$ Water
(b) $I_2(s) \rightleftharpoons I_2(g)$
(c) $S(l) \rightleftharpoons S(g)$
(d) $3O_2 \rightleftharpoons 2O_3$

UPTU/UPSEE-2009

Ans. (d) : In physical equilibrium there should be a change in the physical state of the compounds involved in the equilibrium.
In $3O_2(g) \rightleftharpoons 2O_3(g)$

there is no change in the physical state, O_2 is gas and O_3 is also in gaseous state.
∴ It is not a physical equilibrium.

285. In which one of the following equilibria, the increase of pressure over the equilibrium will favour the backward reaction?

(a) Decomposition equilibrium of HI
(b) Formation equilibrium of SO_3
(c) Decomposition equilibrium of NH_3
(d) Formation equilibrium of PCl_5

J & K CET-(2009)

Ans. (c) : In the decomposition reaction of NH_3 the number of moles of products formed is greater that of reactant involved.

$$2NH_3 \rightleftharpoons N_2 + 3H_2$$

According to Le-Chatelier's principal, the increase of pressure on a chemical equilibrium shift in that direction in which the number of gaseous molecules decreases and vice-versa thus in this reaction, increase in pressure favours the backward reaction.

286. For the equilibrium,

$2NO_2(g) \rightleftharpoons N_2O_4(g) + 14.6$ kcal,

Increase in temperature

(a) favours the formation of N_2O_4
(b) favours the decomposition of N_2O_4
(c) does not affect equilibrium of N_2O_4
(d) stop the reaction

UP CPMT-2009

Ans. (b): The given reaction is exothermic and according to Le-Chatelier principle high temperature shifts the equilibrium in backward direction. In other words, high temperature favours the decomposition of N_2O_4.

287. According to Le-equilibrium's Principle, the addition of temperature to the following reaction: $CO_2(g) + 2H_2O(g) \rightarrow CH_4(g) + 2O_2(g)$ will cause it to the right. This reaction is therefore,

(a) Exothermic
(b) Unimolecular
(c) Endothermic
(d) Spontaneous

MPPET-2008

Ans. (c) : For the endothermic reaction with increase in temperature rate of forward reaction increases. According to Le-equilibrium's principle when the concentration of a chemical will be shift the equilibrium to the side that would counter the change in concentrating. In this reaction temperature is increased then the process is endothermic.

288. $N_2 + 3H_2 \rightleftharpoons 2NH_3 + \text{heat}$. What is the effect of the increase of temperature on the equilibrium of the reaction?

(a) Equilibrium is shifted to the left
(b) Equilibrium is shifted to the right
(c) Equilibrium is unaltered
(d) Reaction rate does not change

KARNATAKA-CET, 2008

@apna_pdf

Ans. (a) : $N_2 + 3H_2 \rightleftharpoons 2NH_3 + \text{heat}$

It is an exothermic reaction, so high temperature favours backward reaction. Hence, equilibrium is shifted towards the left.

289. What happens to the yield on application of high pressure in the Haber's synthesis of ammonia?

(a) Increases (b) decreases

(c) unaffected (d) reaction stops

J & K CET-(2008)

Ans. (a) : Haber's process of synthesis of ammonia

$$N_2 + 3H_2 \rightleftharpoons 2NH_3$$

High pressure favours the reaction that decrease the number of gas molecules. Since, the number of molecules of gaseous products are less than the number of molecules of gaseous reactants, thus according to Le-chatelier's principal, high pressure favour the forward reaction. i.e more ammonia will be abtained.

290. The basic principle of Cottnell' s precipitation is

(a) Le-Chatelier's principle

(b) Peptisation

(c) Neutralization of charge on colloidal particles

(d) Scattering of light

KARNATAKA-CET, 2008

Ans. (c) : In Cottnell's precipitator, the charged particles are attracted towards the walls of precipitator, here they lose their charge and coagulate. Hence, the basic principle of Cottnell's precipitator is the neutralisation of charge on colloidal particles.

291. For a system in equilibrium, ΔG = 0 under conditions of constant

(a) temperature and pressure

(b) temperature and pressure

(c) energy and volume

(d) pressure and volume

BITSAT 2008

Ans. (a) : When a system is at equilibrium under constant temperature and pressure. Its free energy change is zero ($\Delta G = 0$)

292. When hydrogen molecule decompose into it's atoms which consitions gives maximum yields of H atoms?

(a) High temperature and low pressure

(b) Low temperature and high pressure

(c) High temperature and high pressure

(d) Low temperature and low pressure

BITSAT-2007

Ans. (a) : $H_2 \rightarrow 2H - \Delta H$

The reaction is endothermic accompanied by increase in the number of moles. According to Le-chatelier's principal, to increase the rate of forward reaction. temperature should be increased and pressure should be decrease.

293. Given the equilibrium system:

$NH_4Cl\,(s) \rightarrow NH_4^+(aq) + Cl^-(aq)$

($\Delta H = +3.5$kcal/mol).

What change will shift the equilibrium to the right?

(a) Decreasing the temperature

(b) Increasing the temperature

(c) Dissolving NaCl crystals in the equilibrium mixture

(d) Dissolving NH_4NO_3 crystals in the equilibrium mixture

VITEEE- 2007

Ans. (b) :

$NH_4Cl\,(s) \rightarrow NH_4^+(aq) + Cl^-(aq)$, $\Delta H = +3.5$kcal/mol

Endothermic reactions are favoured at high temperature. Therefore, increasing the temperature will shift equilibrium to the right.

294. The equilibrium reaction that is not influenced by volume change at constant temperature is

(a) $H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$

(b) $N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$

(c) $N_2O_4(g) \rightleftharpoons 2NO_2(g)$

(d) $2NO(g) + O_2 \rightleftharpoons 2NO_2(g)$

J & K CET-(2006)

Ans. (a) : According to Le-Chatelier's principal, when $\Delta n_g = 0$ there is no effect of pressure and volume change on the equilibrium

So,

(a) $H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$, $\Delta n_g = 0$

(b) $N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$, $\Delta n_g = -2$

(c) $N_2O_4(g) \rightleftharpoons 2NO_2(g)$, $\Delta n_g = 1$

(d) $2NO(g) + O_2 \rightleftharpoons 2NO_2(g)$, $\Delta n_g = -1$

Hence, $H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$ is correct answer.

295. For NaC1, the $K_{sp} = 36 mol^2L^{-2}$, the molar concentration of it will be

(a) $\frac{1}{36}$M (b) $\frac{1}{16}$M

(c) 36M (d) 6M

CG PET -2006

Ans. (d) : For NaCl

$K_{sp} = S^2$

Where, S = solubility

$36 = S^2$

$\therefore$ S= 6 $molL^{-1}$

Hence, molarity = 6M

296. For the gaseous reaction

$C_2H_4 + H_2 \rightleftharpoons C_2H_6$, $\Delta H = -130$ kjmol^{-1} carried in a closed vessel, the equilibrium concentration of the C_2H_6 can definitely be increased by:

(a) increasing temperature and decreasing pressure

(b) decreasing temperature and increasing pressure

(c) increasing temperature and pressure both

(d) decreasing temperature and pressure both

UPTU/UPSEE-2005

Ans. (b) : According to Le-Chatelier's principal exothermic reactions are favourable at low temperature. The reaction in which number of moles decrease are favourable at high pressure or low volume.

@apna_pdf

$$C_2H_4 + H_2 \rightleftharpoons C_2H_6 \quad \Delta H = -130 \text{ kJ mol}^{-1}$$

$\because$ The reaction is exothermic and number of moles of reactants are decreasing.

$\therefore$ The reaction rate is increased by decreasing temperature and increasing pressure.

297. According to Le-Chatelier's principle which of the following factors influence a chemical system?

(a) Concentration only
(b) Pressure only
(c) Temperature only
(d) concentration, pressure and termperature

CG PET -2005

Ans. (d) : Le-Chatelier's principal can be used to predict the behaviour of a system duo to change in pressure, temperature, or concentration.

298. If pressure increases then its effect on given equilibrium $2NO \rightleftharpoons N_2(g) + O_2(g)$ is shift in:

(a) Forward direction
(b) Backward direction
(c) No effect
(d) None of the above

BCECE-2005

Ans. (c) : The reaction is-

$$2NO(g) \rightleftharpoons N_2(g) + O_2(g)$$

$$\Delta n_g = 2 - 2 = 0$$

$\because$ There is no change in number of moles of reactant and products.

$\therefore$ The reaction is not effected by change in pressure.

299. A chemical reaction is in equilibrium when

(a) the reactants are completely transformed into products
(b) the rate of forward reaction is equal to the rate of backward reaction
(c) the formation of products is minimised
(d) equal amount of reactants and products are present

CG PET -2005

Ans. (b) : If the rate of forward reaction equals rate of backward reaction, then the reaction is said to be in equilibrium. At the stage, there is no further change in the concentrations of reactants as well as products.

300. If a system is at equilibrium, the rate of forward to the reverse reaction is:

(a) Less
(b) Equal
(c) High
(d) At equilibrium

UPTU/UPSEE-2004

Ans. (b) : If the system at equilibrium, the rate of forward and backward reaction become equal

301. The formation of SO_3 takes place according to the following reaction:

$2SO_2 + O_2 \rightleftharpoons 2SO_3$; $\Delta H = -45.2$ kcal

The formation of SO_3 is favoured by

(a) Increase in temperature
(b) Removal of oxygen
(c) Increase of volume
(d) Increase of pressure

UPTU/UPSEE-2004

Ans. (d) : According to Le-Chatelier's principal, when we increase pressure, reaction proceeds in that direction where volume is decreasing.

302. When pressure is applied to the equilibrium system ice $\rightleftharpoons$ water. Which of the following phenomenon will happen?

(a) More ice will be formed
(b) Water will evaporate
(c) More water will be formed
(d) Equilibrium will not be formed

BCECE-2004

Ans. (c) : When the pressure is applied to the equilibrium system between ice and water, the phase transition temperature of ice reduces. Thus the equilibrium shifts more to right side. Also when pressure is increased the equilibrium shifts in the direction of less volume.

Therefore, more ice will melt into water

303. Of the following which change will shift the reaction towards the product?

$I_2(g) \rightleftharpoons 2I(g), \Delta H_r^0(298K) = +150kJ$

(a) Increase in concentration of I_2
(b) Decrease in concentration of I_2
(c) Increase in temperature
(d) Increase in total pressure

AIIMS-2004

Ans. (c): The reaction is

$$I_2(g) \rightleftharpoons 2I(g)$$

$$\Delta H_r^0(298K) = +150 \text{kJ}.$$

According to Le-chateliers principal, the condition favouring the formation of I are given below.

(i) High concentration of $I_2(g)$
(ii) High temperature
(iii) Low pressure

Hence option (c) is correct.

304. How will increase of pressure affect the equation?

$C(s) + H_2O(g) \rightleftharpoons CO(g) + H_2(g)$

(a) Shift in the forward direction
(b) Shift in the reverse direction
(c) Increase in the yield of hydrogen
(d) No effect.

J & K CET-(2003)

Ans. (b) : Reverse reaction, Le-Chatelier's principal when there is change in number of moles the equilibrium will shift in the direction having smaller number of moles, when the pressure is increased and vice-verssa

305. Equilibrium constant K, for the reaction,

$$2HI(g) \rightleftharpoons H_2(g) + I_2(g)$$

at room temperature is 2.85 and that at 698 K is 1.4×10^{-2}. This implies that the forward reaction is :

(a) exothermic
(b) endothermic
(c) exergonic
(d) unpredictable

BCECE-2003

@apna_pdf

Ans. (a) : For the given reaction–

$$2HI \rightleftharpoons H_2 + I_2$$

Equilibrium constant k = 2.85

At room temperature 698 K, $k' = 1.4 \times 10^{-2}$

The increases of temperature value of k is decreases, so the forward reaction decreases with increases temperature.

Implies that reaction will proceed in forward direction with decrease of temperature i.e. heat is librated and hence forward reaction is exothermic.

306. Reaction $BaO_2(s) \rightleftharpoons BaO(s) + O_2(g); \Delta H =$ + ve. In equilibrium condition pressure of O_2 depends on

(a) Increase mass of BaO_2
(b) Increase mass of BaO
(c) Increase temperature on equilibrium
(d) Increase mall of BaO_2 and BaO both

NEET-2002

Ans. (c) : $BaO_2(s) \rightleftharpoons BaO(s) + O_2$; H = +ve

Since H is +ve for this reaction So, it is endothermic process. On increasing the temperature, by applying Le-Chaterliers principal, we can see that the reaction proceed in a forward direction on increasing temperature, so, the pressure of O_2 will increase on increasing the temperature at equilibrium.

307. In the reaction

$O_2(g) + N_2(g) \rightleftharpoons 2NO(g), \ \Delta H = 180$ KJ.

(a) Increasing concentration of N_2
(b) Increase in pressure
(c) Increase in temperature
(d) Decrease in temperature

J & K CET-(2002)

Ans. (d) : $N_2(g) + O_2(g) \rightleftharpoons 2NO(g)$

$\Delta H = +180$ KJ

Since this is an endothermic reaction, thus according to Le-Chatalier's principal increase in temperature favours the formation of NO and hence decomposition of NO is favoured by decrease in temperature.

308. For any reversible reaction, if we increase concentration of the reactions, then effect in equilibrium constant

(a) depends on amount of concentration
(b) unchange
(c) decrease
(d) increase

NEET-2000

Ans. (b) : Equilibrium constant independent of change in concentration of reactants or products. It depend only on temperature.

309. In an exothermic reaction. 10^0C rise in temperature will

(a) Decrease the value of equilibrium constant
(b) Double the value of K_c
(c) Do not produce any change in K_c
(d) Produce some change in K_c

J & K CET-(2000)

Ans. (a) : In exothermic reaction, increase in temperature favours the backward reaction i.e. decreases the value of equilibrium constant.

310. The equilibrium will be shifted in the opposite direction if

$PCl_3(g) + Cl_2(g) \rightleftharpoons PCl_5(g)$

(a) PCl_3 is added
(b) Helium gas is added
(c) Catalyst is added
(d) Pressure is reduced

J & K CET-(2000)

Ans. (d) : In the reaction

$$PCl_3(g) + Cl_2(g) \rightleftharpoons PCl_5(g)$$

As the backward reaction is accompanied by increase in the number of moles hence, decreasing pressure will favour the backward reaction.

311. In the chemical reaction,

$2SO_2 + O_2 \rightleftharpoons 2SO_3$,

increasing the total pressure leads to

(a) Increase in the amount of SO_3
(b) Increase in the partial pressure of O_2
(c) Increase in the partial pressure of SO_2
(d) Change in the equilibrium constant

J & K CET-(1999)

Ans. (a) : When pressure is increased, at constant temperature the equilibrium will shift in such a way as to reduce this stress on its position. It shift towards product sides. So, the amount of SO_3 increased

312. According to Le Chatelier's principle, adding heat to a solid and liquid in equilibrium will cause the

(a) temperature to increase
(b) temperature to decrease
(c) amount of liquid to decrease
(d) amount of solid to decrease

NEET-1993

Ans. (d) : When we add heat to the equilibrium between solid and liquid, then the equilibrium shifts towards liquid and hence, the amount of solid decreases and amount of liquid increases.

313. Which of the following information can be obtained in the basis of Le Chatelier principle?

(a) dissociation constant of a weak acid
(b) Entropy change in a reaction
(c) Equilibrium constant of a chemical reaction
(d) Shift in equilibrium position of changing value of a constraint

NEET-1992

Ans. (d) : According to Le-Chatelier's principal whenever a constraint is applied to a system in equilibrium, the system tends to readjust so as to reellify the effect of the constraints by bringing a shift in an equilibrium position.

314. The exothermic formation of ClF_3 is represented by the equation :

$Cl_2(g) + 3F_2(g) \rightleftharpoons 2ClF_3(g); \ \Delta H = -329$ kJ

Which of the following will increase the quantity of ClF_3 in an equilibrium mixture of Cl_2, F_2 and ClF_3 ?

@apna_pdf

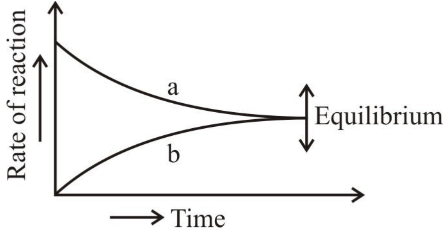
(a) Adding F_2
(b) Increasing the volume of the container
(c) Removing Cl_2
(d) Increasing the temperature

VITEEE-2017

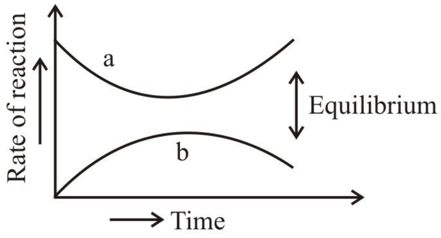
Ans. (a) : The given reaction is exothermic reaction. Thus according to Le Chatelier's principle lowering the temperature F_2 and Cl_2 favour the forward direction and production of ClF_3.

315. For the equilibrium $A \rightleftharpoons B$, the variation of the rate of the forward (a) and reverse (b) reaction with time is given by

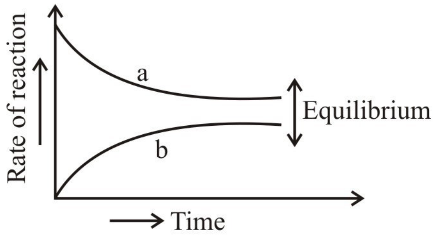
(a)



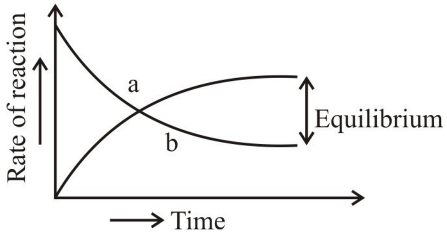
(b)



(c)

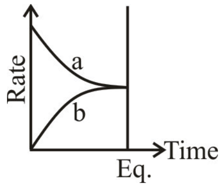


(d)



JEE-Main-11.09.2020

Ans. (a) : At equilibrium rate of forward reaction = rate of backward reaction.
Hence,



7. Application of K_p and K_f

316. $3O_2$ (g) $\rightleftharpoons$ 2 O_3 (g) for thr above reaction at 298 K, K_c is found to be 3.0 × 10^{-59}. If the concentration of O_2 at equilibrium is 0.040 M then concentration of O_3 in M is

(a) 1.2 × 10^{21} (b) 4.38 × 10^{-32}
(c) 1.9 × 10^{-63} (d) 2.4 × 10^{31}

NEET-17.07.2022

Ans. (b) : Given that, $K_c = 3 \times 10^{-59}$
At equilibrium 0.04 M

$$3O_2(g) \rightleftharpoons 2O_3(g)$$

$$K_c = \frac{[O_3]^2}{[O_2]^3} = 3\times10^{-59}$$

$$= \frac{[O_3]^2}{[4\times10^{-2}]^3} = 3\times10^{-59}$$

$$[O_3]^2 = 64 \times 3 \times 10^{-6} \times 10^{-59}$$
$$= 19.2 \times 10^{-64}$$
$$[O_3] = 4.38 \times 10^{-32}$$

The concentration of $O_3 = 4.38 \times 10^{-32}$

317. 4.0 moles of argon and 5.0 moles of PCl_5 are introduced into an evacuated flask of 100 litre capacity at 610 K. The system is allowed to equilibrate. At equilibrium, the total pressure of mixture was found to be 6.0 atm. The K_p for the reaction is [Given:R = 0.082L atm $K^{-1}mol^{-1}$]

(a) 2.25 (b) 6.24
(c) 12.13 (d) 15.24

JEE Main-29.06.2022, Shift-II

Ans. (a) : Given, $n_{Ar} = 4$, $n_{PCl_5} = 5$
V = 100 litre At 600 K, $P_T = 6$ atm
R = 0.082 L atm K^{-1} mol^{-1}, K_p = ?

$$\begin{array}{llll} & PCl_5 & \rightleftharpoons PCl_3(g) & + \ Cl_2(g) \\ t=0 & 5 & 0 & 0 \\ t=eq. & 5-n & n & n \end{array}$$

Total moles = 5-n+n+n = 5+n
We know, PV =nRT
∵ For argon, $n_{Ar} = 4$
Total moles = $n_{Ar} + n_{PCl_5} + n_{PCl_3} + n_{PCl_2}$ = 4+5+n = 9+n
Since, PV = nRT
6 × 100 = (9 + n) × 0.082 × 610
n = 3

$$K_p = \frac{P_{PCl_3} \cdot P_{Cl_2}}{P_{PCl_5}}$$

$$= \frac{\left(\frac{3}{12}\times6\right)\times\left(\frac{3}{12}\times6\right)}{\left(\frac{2}{12}\times6\right)}$$

$$= \frac{9}{4} = 2.25$$

@apna_pdf

318. For the following reaction in gaseous phase

$$\mathbf{CO(g)+\frac{1}{2}O_2(g)\rightarrow CO_2(g), K_p/K_c \text{ is}}$$

(a) $(RT)^{1/2}$ (b) $(RT)^{-1/2}$
(c) (RT) (d) $(RT)^{-}$

(2017)
BITSAT-2013
CGPET-2013
UPTU/UPSEE-2008

Ans. (b): The reaction is-

$$CO(g)+\frac{1}{2}O_2(g)\rightarrow CO_2(g)$$

The relation between K_p and K_c is -

$$K_p=K_c(RT)^{\Delta n_g}$$

Where, Δn_g = no. of mole of gaseous product – no. of mole of gaseous reactant

$$\therefore \quad \Delta n_g=1-\left(1+\frac{1}{2}\right)=1-\frac{3}{2}=\frac{-1}{2}$$

So, $\dfrac{K_p}{K_c}=(RT)^{-1/2}$

319. For the following gaseous reaction, $H_2 + I_2 \rightleftharpoons 2HI$, the equilibrium constant

(a) $K_p > K_c$ (b) $K_p < K_c$
(c) $K_p = K_c$ (d) $K_p = \dfrac{1}{K_c}$

CG PET - 2006, 2005
BCECE - 2006
JCECE - 2005

Ans. (c) : $H_2 + I_2 \rightleftharpoons 2HI$

For the above chemical reaction–

Δn_g = No. of moles of product – No. of moles of reactant.

$\Delta n_g = 2 - 2 = 0$

Then, $K_p = K_c$

320. For which one of the following reactions $K_p = K_c$?

(a) $PCl_5 \rightleftharpoons PCl_3 + Cl_2$ (b) $N_2 + O_2 \rightleftharpoons 2NO$
(c) $N_2 + 3H_2 \rightleftharpoons 2NH_3$ (d) $2SO_3 \rightleftharpoons 2SO_2 + O_2$

JCECE - 2010
J&K CET-2003
UP CPMT-2014

Ans. (b) : $\because \quad K_p = K_c(RT)^{\Delta n_g}$

$K_p = K_c$ only when $(RT)^{\Delta n_g} = 0$

(a) $PCl_5 \rightleftharpoons PCl_3 + Cl_2$

$\Delta n_g = n_p - n_r$
$= 2 - 1$
$= 1$

$\therefore \quad K_p \neq K_c$

(b) $N_2 + O_2 \rightleftharpoons 2NO$

$\Delta n_g = 2 - 2$
$= 0$

$\therefore \quad K_p = K_c$

(c) $N_2 + 3H_2 \rightleftharpoons 2NH_3$

$\Delta n_g = 2 - 4$
$\Delta n_g = -2$

$\therefore \quad K_p \neq K_c$

(d) $2SO_3 \rightleftharpoons 2SO_2 + O_2$

$\Delta n_g = 3 - 2 = 1$

$\therefore \quad K_p \neq K_c$

321. In the reaction, $H_2(g) + Cl_2(g) \rightarrow 2HCl(g)$, relation between K_p and K_c is

(a) $K_p = K_c$ (b) $K_p \neq K_c$
(c) $K_p \geq K_c$ (d) $K_p < K_c$

J&K CET-2008
AP-EAMCET-1992

Ans. (a) : Given the reaction,

$$H_2(g)+Cl_2(g)\rightarrow 2HCl(g)$$

$\therefore$ Δn_g = No. of mole of gaseous product – no. of moles of gaseous reactant

$= 2 - (1 + 1)$
$\Delta n_g = 0$

$\therefore \quad K_p = K_c\ (RT)^{\Delta n_g}$
$K_p = K_c \times (RT)^0$
$K_p = K_c$

322. For the reaction $H_2(g)+I_2(g)\rightarrow 2HI(g)$, the equilibrium constant K_p changes with

(a) total pressure (b) catalyst
(c) the amount H_2 and I_2 (d) temperature

VITEEE- 2007
J & K CET-(2011)

Ans. (d) : The equilibrium constant K_p will change with temperature.

For the reaction-

$H_2(g)+I_2(g) \rightleftharpoons 2HI(g)$.

Catalyst does not alter the state of equilibrium. Equilibrium constant depends only upon temperature. The relation of K with temperature can be shown as-

$$\log\frac{K_2}{K_1}=\frac{\Delta H}{2.303R}\left[\frac{1}{T_1}-\frac{1}{T_2}\right]$$

323. In which of the following equilibrium K_c and K_p are not equal?

(a) $2C(s) + O_2(g) \rightleftharpoons 2CO_2(g)$
(b) $2NO(g) \rightleftharpoons N_2(g) + O_2(g)$
(c) $SO_2(g) + NO_2(g) \rightleftharpoons SO_3(g) + NO(g)$
(d) $H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$

JCECE - 2013
NEET-2010

Ans. (a) : The relation between K_p and K_c is -

$$K_p=K_c(RT)^{\Delta n_g}$$

(a) $\quad 2C(s)+O_2(g) \rightleftharpoons 2CO_2(g)$

$\Delta n_g = n_p - n_r$
$= 2-(2+1)$
$= -1$

@apna_pdf

∴ $K_p \neq K_c$

(b) $2NO(g) \rightleftharpoons N_2(g) + O_2(g)$

$\Delta n_g = 2 - (2) = 0$

∴ $K_p = K_c$

(c) $SO_2(g) + NO_2(g) \rightleftharpoons SO_3(g) + NO(g)$

$\Delta n_g = 2 - (2) = 0$

∴ $K_p = K_c$

(d) $H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$

$\Delta n_g = 2 - (1 + 1) = 0$

∴ $K_p = K_c$

324. Two moles of PCl_5 is heated in a closed vessel of 2L capacity. When the equilibrium is attained 40% of it has been found to be dissociated. What is the K_c in mol/dm^3?

(a) 0.532
(b) 0.266
(c) 0.133
(d) 0.174
(e) 0.25

UPTU/UPSEE-2006, 2004
Kerala-CEE-2005

Ans. (b) : Degree of dissociation = 0.4

$$\begin{array}{lccc} & PCl_5 \rightleftharpoons & PCl_3 & + Cl_2 \\ \text{At equi.} & a(1-x) & ax & ax \end{array}$$

$a = 2, \quad x = 0.4, V = 2$

$$[PCl_5] = \frac{2(1-0.4)}{2} = 0.6 \text{ mol/L}$$

$$[PCl_3] = \frac{2 \times 0.4}{2} = 0.4 \text{ mol/L}$$

$$[Cl_2] = \frac{2 \times 0.4}{2} = 0.4 \text{ mol/L}$$

$$\therefore \quad K_c = \frac{[PCl_3][Cl_2]}{[PCl_5]}$$

$$= \frac{0.4 \times 0.4}{0.6}$$

$= 0.266$

325. 9.2g of $N_2O_4(g)$ is taken in a closed one litre vessel on heated till the following equilibrium is reached.

$$N_2O_4(g) \rightleftharpoons 2NO_2(g)$$

at equilibrium 50% of $N_2O_4(g)$ dissociated. What is the equilibrium constant (in mol L^{-1})? (Molecular weight of N_2O_4 is 92)

(a) 0.1
(b) 0.2
(c) 0.4
(d) 2

JIMPER-2009
UPCPMT-2008
AP-EAMCET (Medical)- 2007, 2001

Ans. (b) : Given the equilibrium reaction–

$$\begin{array}{lcc} & N_2O_4 \rightleftharpoons & 2NO_2 \\ \text{Initially} & 1 & 0 \\ \text{At equil.} & (1-x) & 2x \end{array}$$

At equilibrium molar concentration–

$$[N_2O_4] = \frac{(1-x)}{V}$$

$$[NO_2] = \frac{2x}{V}$$

$$\therefore \text{Moles of } N_2O_4 = \frac{\text{weight}}{\text{Molecular weight}} = \frac{9.2}{92} = 0.1\text{mole}$$

Concentration of $N_2O_4 = \frac{0.1}{1} = 0.1\text{mol/L}$

50% of N_2O_4 is dissociated at equilibrium,

$$= \frac{0.1 \times 50}{100} = 0.05\text{mol/L}$$

$$\therefore \quad K_c = \frac{[NO_2]^2}{(N_2O_4)}$$

$$\text{or} \quad K_c = \frac{\left(\frac{2x}{V}\right)^2}{\frac{1-x}{V}}$$

$$\text{or} \quad K_c = \frac{4(0.05)^2 \times 1}{0.05}$$

$K_c = 0.2$

326. For the reversible reaction:
$A(s) + B(g) \rightleftharpoons C(g) + D(g) : \Delta G° = -350kJ$.
Which one of the following statements is true?

(a) The entropy change is negative.
(b) Equilibrium constant is greater than one.
(c) The reaction should be instantaneous.
(d) The reaction is thermodynamically not feasible.

COMEDK-2020
Karnataka CET-2011

Ans. (b) : ΔG° has a negative value so, the reaction is feasible in forward direction and equilibrium constant will have value greater than one.

The relationship between ΔG° and equilibrium constant (K_p) –

$$\Delta G° = -2.303 \, RT \log K_p$$

When, $K_p > 1$, ΔG° is negative

327. The relation between K_p and K_c is correctly shown as

(a) $K_c = K_p(RT)^{\Delta n_g}$
(b) $K_p = K_c(RT)^{-\Delta n_g}$
(c) $K_p = K_c(RT)^{\Delta n_g}$
(d) $K_c = K_p(RT)^{-\Delta n_g}$

BCECE-2009
CG PET -2004

Ans. (c) : The relation between K_p and K_c is given by

$$K_p = K_c(RT)^{\Delta n_g}$$

Where, Δn_g = no. of mole of gaseous products – no. of mole of gaseous reactants

K_p/K_c = equilibrium constant

328. For the reaction $2NO(g) + Cl_2(g) \rightleftharpoons 2NOCl(g)$ which is true ?

(a) $K_p = K_c \times RT$
(b) $K_p = K_c \, (RT)^2$
(c) $K_p = \frac{K_c}{RT}$
(d) $K_p = \frac{K_c}{(RT)^2}$

MPPET-2013
CGPET-2011

@apna_pdf

Ans. (c) : $2NO(g) + Cl_2(g) \rightleftharpoons 2NOCl(g)$

Δn_g = No. of mole of gaseous product – No. of mole of gaseous reactant

$\because \quad \Delta n_g = 2 - 3 = -1$

$\therefore \quad K_p = K_c(RT)^{\Delta n_g}$

$K_p = K_c(RT)^{-1}$

$K_p = \dfrac{K_c}{RT}$

329. For a reaction $2A \rightleftharpoons B + C$, K_c is 2×10^{-3}. At a given time, the reaction mixture has [A]=[B]=[C]= 3×10^{-4} M. Which of the following options is correct?

(a) The system is at equilibrium
(b) The reaction proceeds to the left
(c) The reaction proceeds to the right
(d) The reaction is complete

TS EAMCET 05.08.2021, Shift-I
JIMPER-2019, 2018

Ans. (b) : Given data:

$K_c = 2 \times 10^{-3}$

$[A] = [B] = [C] = 3 \times 10^{-4}$ M

For the reaction,

$2A \rightleftharpoons B + C$

The reaction quotient is given by

$\therefore \quad Q_c = \dfrac{[B][C]}{[A]^2}$

$Q_c = \dfrac{(3\times10^{-4})(3\times10^{-4})}{(3\times10^{-4})^2} = 1$

here, $Q_c > K_c$

Hence, the reaction will proceed in the direction of reactants (reverse reaction).

330. For the reaction $H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$

(a) $K_p = K_c \neq 0$ (b) $K_p > K_c$
(c) $K_p < K_c$ (d) $K_p = K_c = 0$

TS-EAMCET (Engg.), 06.08.2021
VITEEE-2006

Ans. (a): For the reaction,

$H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$

Δn_g = no. of mole of gaseous product – no. of mole of gaseous reactant

From the given balanced equation, we have 2 mole of product and 1 mole of each reactant.

$\Delta n_g = 2 - (1+1) = 0$

$\therefore \; K_p = K_c(RT)^{\Delta n_g} = K_c \; (\because \Delta n_g = 0)$

So, $K_p = K_c \neq 0$

331. If the equilibrium constant for the reaction $2AB \rightleftharpoons A_2 + B_2$ is 49. What is the value of equilibrium constant for $AB \rightleftharpoons \frac{1}{2}A_2 + \frac{1}{2}B_2$?

(a) 49 (b) 2401
(c) 7 (d) 0.02

AP-EAMCET (Engg.)2011
A.P.EAMCET 1998

Ans. (c) : Given that,

$2AB \rightleftharpoons A_2 + B_2$

We assume that the equilibrium constant for above reaction is K_{c_1}.

$\therefore \quad K_{c_1} = 49 = \dfrac{[A_2][B_2]}{[AB]^2}$ .....(i)

and $\quad AB \rightleftharpoons \frac{1}{2}A_2 + \frac{1}{2}B_2$

Again, we assume that the equilibrium constant for above reaction is K_{c_2}.

$\therefore \quad K_{c_2} = \dfrac{[A_2]^{1/2}[B_2]^{1/2}}{[AB]}$ .....(ii)

From equation (i) & (ii), we get–

$K_{c_2} = \sqrt{K_{c_1}} = \sqrt{49}$

$K_{c_2} = 7$

332. A(g) + 3B(g) $\rightleftharpoons$ 4C(g) is a reversible reaction where all the reactants and product are in gaseous state.

Conditions:

(i) Concentrations of both A and B are equal at the initiation

(ii) Concentration of both A and C are equal at the equilibrium.

Considering the imposed condition, find the value of K_c of this reversible reaction.

(a) 0.08 (b) 0.8
(c) 8.0 (d) 80.0

Tripura JEE-2022

Ans. (c): The reversible reaction is -

$A(g) + 3B(g) \rightleftharpoons 4C(g)$

	A	B	C
Initial conc.	a	a	0
Eq.conc.	(a – x)	(a – 3x)	4x

But [A] = [C]

$\therefore (a - x) = 4x$

$a = 5x$

$K_c = \dfrac{[C]^4}{[A][B]^3} = \dfrac{(4x)^4}{(5x-x)(5x-3x)^3} = \dfrac{(4x)^4}{(4x)(2x)^3} = 8.$

333. The reaction $2SO_2(g) + O_2(g) \rightleftharpoons 2SO_3(g)$ was carried out in a closed vessel of 1L capacity at a suitable temperature. The initial concentrations of SO_2 and O_2 are 2 and 1 moles/L respectively. At equilibrium, 1.6 moles of $SO_3(g)$ was found. The value of K_c at the same temperature is

(a) 10 (b) 40
(c) 60 (d) 80

TS EAMCET 10.08.2021, Shift-I

@apna_pdf

Ans. (d) : The equilibrium reaction is -

$$2SO_2(g)+O_2(g)\rightleftharpoons 2SO_3(g)$$

Initially	2	1	0
At equilibrium	$2-1.6$	$1-0.8$	1.6
Conc.	$0.4/1$	$0.2/1$	$1.6/1$

$$\therefore \quad K_c=\frac{[SO_3]^2}{[SO_2]^2[O_2]}=\frac{(1.6)^2}{(0.4)^2(0.2)}$$

$$=\frac{2.56}{0.16\times0.2}$$

$$=\frac{2560}{16\times2}=\frac{640}{4\times2}=\frac{160}{2}=80$$

334. At 1990K and 1 atm pressure, there are equal number of Cl_2 molecules and Cl atoms in the reaction mixture. The value of K_p for the reaction $Cl_2(g)$ under the above conditions is $x \times 10^{-1}$. The value of x is ____.(Rounded off to the nearest integer)

JEE Mains 24.02.2021, Shift-I

Ans. : Given data :

T = 1990K,

P = 1 atm, $K_p = x \times 10^{-1}$

Given reaction is : $Cl_2(g)\rightleftharpoons 2Cl(g)$

Let mole of both Cl_2 and Cl is x –

Partial pressure of Cl = $p_{Cl} = 1\times\frac{x}{2x}=\frac{1}{2}$

Partial pressure of Cl_2 = $p_{Cl_2} = 1\times\frac{x}{2x}=\frac{1}{2}$

$$\therefore \quad K_p=\frac{(p_{Cl})^2}{p_{Cl_2}}=\frac{\left(\frac{1}{2}\right)^2}{\frac{1}{2}}$$

or $\quad K_p = 5\times10^{-1}$

$\because \quad K_p = x\times10^{-1}$

$\therefore \quad x\times10^{-1}=5\times10^{-1}$

$x = 5$

335. Which among the following denotes the correct relationship between K_p and K_c for the reaction $2A_{(g)} \rightleftharpoons B_{(g)} + C_{(g)}$

(a) $K_p > K_c$

(b) $K_c > K_p$

(c) $K_c = (K_p)^2$

(d) $K_p = K_c$

AP EAPCET 19-08-2021 Shift-I

Ans. (d) : $2A_{(g)} \rightleftharpoons B_{(g)} + C_{(g)}$

From the relation between K_p and K_c we get –

$K_p = K_c (RT)^{\Delta n}$ (Wher Δn = No. of mol in RHS – No. of mol in LHS).

$\therefore \quad \Delta n = 1 + 1 - 2 = 0$

$\therefore \quad K_p = K_c (RT)^0$

$K_p = K_c$

336. Given K_p for the reaction, $\frac{1}{2}C(g)\rightleftharpoons\frac{1}{2}A(g)+\frac{1}{2}B(g)$ at a fixed temperature is 0.25 atm^{-2}. Then find the K_p for the reaction $A(g) + B(g) \rightleftharpoons C(g)$ at the same temperature.

(a) 16

(b) 25

(c) 9

(d) 36

AP EAPCET 25.08.2021, Shift-II

Ans. (a) : Given reaction is –

$$\frac{1}{2}C(g)\rightleftharpoons\frac{1}{2}A(g)+\frac{1}{2}B(g) \qquad K_{p_1}=0.25$$

K_{p_1} for first reaction -

$$K_{p_1}=\frac{(p_A)^{1/2}(p_B)^{1/2}}{(p_C)^{1/2}}$$

$$K_{p_1}^2=\frac{p_Ap_B}{p_C} \qquad .....(i)$$

and

$$A(g)+B(g)\rightleftharpoons C(g)$$

$$\therefore \quad K_{p_2}=\frac{p_C}{p_Ap_B}$$

or

$$K_{p_2}=\frac{1}{\frac{p_Ap_B}{p_C}} \quad \{\text{from equation (i)}\}$$

$$K_{p_2}=\frac{1}{K_{p_1}^2}$$

or $\quad K_{p_2}=\frac{1}{0.25\times0.25}$

or $\quad K_{p_2}=16$

Reverse reaction

$$\frac{1}{2}A(g)+\frac{1}{2}B(g)\rightleftharpoons\frac{1}{2}C(g) \quad K_{p_1}=\frac{1}{K_p}=\frac{1}{0.25}$$

multiplying by 2

$$A(g)+B(g)\rightleftharpoons C(g)$$

$$\text{then}, K_{P_2}=(K_{P_1})^2$$

$$K_{P_2}=\left(\frac{1}{0.25}\right)^2=16$$

337. The equilibrium constant for the reaction is $P_4(s)+5O_2(g)\rightleftharpoons P_4O_{10}(s)$

(a) $K_c=\sqrt{5O_2}$

(b) $K_c=[O_2]^5$

(c) $K_c=[P_4O_{10}]/[P_4][O_2]^5$

(d) $K_c=\frac{1}{[O_2]^5}$

TS-EAMCET (Engg.), 05.08.2021 Shift-II

@apna_pdf

Ans. (d) : The equilibrium reaction is –

$$P_4(s) + 5O_2(g) \rightleftharpoons P_4O_{10}(s)$$

The expression for the equilibrium constant is –

$$K_c = \frac{[P_4O_{10}]}{[P_4][O_2]^5} \Rightarrow \frac{1}{1\times[O_2]^5} \quad [\text{Here, } [P_4O_{10}] = [P_4] = 1]$$

$$\therefore \quad K_c = \frac{1}{[O_2]^5}$$

338. Identify the correct expression for the equilibrium constant of the following reaction: $2X(g) + Y(g) \rightleftharpoons 3Z(g)$

(a) $K = \frac{[X]^2[Y]}{[Z]^3}$ (b) $K = \frac{[Z]^3}{[X]^2[Y]}$

(c) $K = \frac{3[Z]}{2[X][Y]}$ (d) $K = [Z]^3[X]^2[Y]$

AP EAPCET-23-08-2021, Shift-I

Ans. (b) : Equilibrium constant is defined as, the relationship between the amounts of products and reactants present at equilibrium in a reversible chemical reaction.

Given that, $2X(g) + Y(g) \rightleftharpoons 3Z(g)$

$$\text{Equilibrium constant } (K_c) = \frac{[\text{Product}]}{[\text{Reactant}]}$$

$$K_c = \frac{[Z]^3}{[X]^2[Y]}$$

339. For the reaction $NO_2 + CO \rightleftharpoons NO + CO_2$ one mole of NO_2 and 2 moles of CO were kept in a vessel. Calculate the equilibrium constant K_p, if at equilibrium 25% of initial amount CO is consumed.

(a) $\frac{1}{2}$ (b) $\frac{1}{3}$

(c) 1 (d) $\frac{1}{4}$

AP EAMCET (Engg.) 18.9.2020 Shift-I

Ans. (b) : We have to assume that volume of the vessel is 1L.

	$NO_2(g)$ +	$CO(g)$ ⇌	$NO(g)$ +	$CO_2(g)$
t = 0	1	2	0	0
at equilibrium	1-0.5 = 0.5	2-0.5 = 1.5	0.5	0.5
Molar conc. (mol L^{-1})	$\frac{0.5}{1}$	$\frac{1.5}{1}$	$\frac{0.5}{1}$	$\frac{0.5}{1}$

$$\text{Given, } \alpha = 2\times\frac{25}{100} = 0.5$$

$$\Rightarrow \quad K_c = \frac{[NO][CO_2]}{[NO_2][CO]} = \frac{0.5\times0.35}{0.5\times1.5} = \frac{1}{3}$$

$$\because \quad \Delta n_g = (1+1) - (1+1) = 0$$

$$\therefore \quad K_p = K_c(RT)^{\Delta n_g} = K_c(RT)^0 = K_c$$

$$\Rightarrow \quad K_p = \frac{1}{3}$$

340. For a reaction, X +Y→ 2Z 1.0 mol of x, 1.5 mol of y, and 0.5 mol of Z, were taken in a 1L vessel and allowed to react. At equilibrium, the concentration of Z was 1.0 mol L^{-1}.The equilibrium constant of the reaction is .... $\frac{x}{15}$. The value of x is ....

JEE Mains-05-09.2020, Shift-II

Ans. () : 16

	X +	Y ⇌	2Z
At t = 0	1	1.5	0.5
At t = eq	1–x	1.5–x	0.5 + 2x
Molar conc.	$=\frac{3}{4}$	$=\frac{5}{4}$	= 1

$$\because \quad 2x = \frac{1}{2}$$

$$x = \frac{1}{4}$$

$$\therefore \quad K_c = \frac{(1)^2}{\left(\frac{5}{4}\right)\left(\frac{3}{4}\right)} = \frac{16}{15}$$

Hence, the value of x is 16.

341. For the reaction

$$\mathbf{2NO_2(g) \rightleftharpoons 2NO(g) + O_2(g)}$$

$K_c = 1.8\times10^{-6}$ at 184°C

R= $0.0831 kJK^{-1}mol^{-1}$

The relationship between K_p and K_c at 184°C is

(a) $K_p > K_c$

(b) $K_p < K_c$

(c) $K_p = K_c$

(d) K_p is independent of K_c

CG PET -2019

Ans. (a) : Given,

$$K_c = 1.8\times10^{-6} \quad T = 184 + 273 = 467$$

$$R = 0.0831 \text{ kJK}^{-1}\text{ mol}^{-1}$$

For the reaction-

$$2NO_2(g) \rightleftharpoons 2NO(g) + O_2(g)$$

$$\therefore \quad K_p = K_c(RT)^{\Delta n_g}$$

$$\Delta n_g = 3 - 2 = 1$$

When the value of Δn is 1, the term $(RT)^{\Delta n}$ becomes more than 1.

In such case, $K_p > K_c$

342. At a certain temperature, 2 mole of CO and 4 moles of Cl_2 gases were reacted to form $COCl_2$ in a 10L vessel. At equilibrium if one mole of CO is present then equilibrium constant for the reaction is

(a) 4 (b) 3.3

(c) 1 (d) 2.5

(e) 4.5

Kerala-CEE-2019

@apna_pdf

Ans. (b) : Given that,

$$CO + Cl_2 \rightleftharpoons COCl_2$$

Initial moles 2 4 0

At equilibrium $2-x$ $4-x$ x

At equilibrium 1 mole of CO is present then–

$2 - x = 1$

$x = 1$

1 moles of CO in 10L vessel $= \frac{1}{10}$

1 moles of $Cl_2 = \frac{3}{10}$

Conc. of 1 mole of $COCl_2 = \frac{1}{10}$

At equilibrium constant reaction is –

$$K_c = \frac{[COCl_2]}{[CO][Cl_2]} = \frac{\frac{1}{10}}{\frac{1}{10}\times\frac{3}{10}} = \frac{10\times10}{10\times3}$$

$K_c = 3.3$

343. Two solids dissociate as follows: $A(s) \rightleftharpoons B(g) + C(g); K_{p_1} = x\ atm^2$

$D(s) \rightleftharpoons C(g) + E(g); K_{p_2} = y\ atm^2$ The total pressure when both the solids dissociate simultaneously is

(a) $\sqrt{x+y}$ atm (b) $x^2 + y^2\ atm^2$

(c) $(x + y)$ atm (d) $2\sqrt{x+y}$ atm

JEE Mains-2019

Ans. (d) : The dissociation reaction of solid are-

$$A(s) \rightleftharpoons B(g) + C(g)$$
$$\qquad P_1 \quad P_1$$

and $$D(s) \rightleftharpoons C(g) + E(g)$$
$$\qquad P_2 \quad P_2$$

Total pressure of C, $P_C = P_1 + P_2$

$K_{P_1} = x = P_B . P_C$ ....(i)

$x = P_1 (P_1 + P_2)$

$K_{P_2} = y = P_C . P_E$ ....(ii)

$y = (P_1 + P_2)P_2$

Adding (i) and (ii) –

$x + y = (P_1 + P_2)^2$

Now total pressure

$P_T = P_C + P_B + P_E$

$= (P_1 + P_2) + P_1 + P_2$

$= 2 (P_1 + P_2)$

$P_T = 2\left(\sqrt{x+y}\right)$ Ans.

344. $2ICl \rightarrow I_2 + Cl_2; K_c = 0.14$

If initial concentration of ICl is 0.6 M, then equilibrium concentration of I_2 is:

(a) 0.37 M (b) 0.126 M

(c) 0.224 M (d) 0.748 M

(26 May,2018(M))

Ans. (b): $2\ ICl \longrightarrow I_2 + Cl_2$

0.6 0 0

$0.6 - 2x$ x x

$$\therefore \quad K_C = 0.14 = \frac{x^2}{(0.6-2x)^2}$$

or $$\sqrt{0.14} = \left[\frac{x^2}{(0.6-2x)^2}\right]^{1/2}$$

$$0.37 = \frac{x}{0.6-2x}$$

$0.224 - 0.748\ x = x$

$1.748\ x = 0.224$

$x = 0.128$

345. What will be the equilibrium constant of the given reaction carried out in a 5 L vessel and having equilibrium amounts of A_2 and A as 0.5 mole and 2×10^{-6} mole respectively?

The reaction: $A_2 \rightleftharpoons 2A$

(a) 0.16×10^{-11} (b) 0.25×10^{5}

(c) 0.4×10^{-5} (d) 0.2×10^{-11}

J & K CET-(2018)

Ans. (a): Given reaction is– $A_2 \rightleftharpoons 2A$

Concentration of A_2 at equilibrium $= \frac{0.5}{5}$

Concentration of A at equilibrium $= \frac{2\times10^{-6}}{5}$

Equilibrium constant

$$K_c = \frac{[A]^2}{[A_2]} = \frac{\left(\frac{2\times10^{-6}}{5}\right)^2}{\frac{0.5}{5}}$$

$$K_c = \frac{4\times5}{25\times0.5}\times10^{-12}$$

$K_c = 0.16 \times 10^{-11}$

346. K_c for the reaction $N_2(g) + O_2(g) \rightleftharpoons 2NO(g)$ at 300 K is 4×10^{-6}. K_p for the above reaction will be (R = 2 cal $mol^{-1} K^{-1}$)

(a) 2.4×10^{-3} (b) 4×10^{-6}

(c) $4\times10^{-6}(RT)^2$ (d) 16×10^{-12}

AIIMS-[27-May, 2018 (E)]

Ans. (b): The reaction is :–

$$N_2(g) + O_2(g) \rightleftharpoons 2NO(g)$$

$\therefore \quad K_p = K_c (RT)^{\Delta n_g}$

Δn_g = no. of mole of gaseous product–no. of mole of gaseous reactant

$\Delta n_g = 2 - (1+1)$

$\Delta n_g = 0$

So, $K_p = 4\times10^{-6} (RT)^0$

$K_p = 4\times10^{-6}$

@apna_pdf

347. A sample of HI(g) is placed in a flask at a pressure of 0.2 atm. At equilibrium, partial pressure of HI(g) is 0.04 atm. What is K_p for the given equilibrium?

$$2HI(g) \rightleftharpoons H_2(g) + I_2(g)$$

(a) 0.04 (b) 0.4
(c) 40 (d) 4

J & K CET-(2018)

Ans. (d): From equilibrium reaction-

$$\begin{array}{llll} & 2HI(g) \rightleftharpoons & H_2 + & I_2 \\ \text{Initial} & 0.2 & 0 & 0 \\ \text{At equilibrium} & 0.2-2x & x & x \end{array}$$

But pressure of HI is 0.04 atm.
So,

$$0.2 - 2x = 0.04$$
$$2x = 0.2 - 0.04$$
$$x = 0.08$$

So, $$K_p = \frac{p_{H_2}p_{I_2}}{p^2_{HI}} = \frac{0.08 \times 0.08}{(0.04)^2}$$

$$K_p = 4$$

348. What will be the expression of K_p for the given reaction if the total pressure inside the vessel is P and degree of dissociation of the reactant is a ? The reaction : $N_2O_4(g) \rightleftharpoons 2NO_2(g)$

(a) $4a^2P/(1+a^2)$ (b) $4a^2P/(1–a^2)$
(c) $a^2P/(1–a^2)$ (d) $a^2/(1–a)$

J & K CET-(2018)

Ans. (b): The dissociation of N_2O_4 is-

$$\begin{array}{lll} & N_2O_4 \rightleftharpoons & 2NO_2 \\ \text{At } t = 0 & 1 & 0 \\ \text{At equilibrium} & 1-a & 2a \end{array}$$

Total moles at equilibrium = 1 – a + 2a
= 1 + a

$$p_{N_2O_4} = \left(\frac{1-a}{1+a}\right)P$$

$$p_{NO_2} = \left(\frac{2a}{1+a}\right)P$$

$$\therefore \quad K_p = \frac{(p_{NO_2})^2}{p_{N_2O_4}} = \frac{\left(\frac{2a}{1+a}\right)^2 P^2}{\left(\frac{1-a}{1+a}\right)P}$$

$$K_p = \frac{4a^2P}{1-a^2}$$

349. For the reaction taking place at certain temperature
$NH_2COONH_4(s) \rightleftharpoons 2NH_3(g) + CO_2(g)$,
if equilibrium pressure is 3X bar then Δ_rG^0 would be

(a) –RT ln 9 – 3RT ln X
(b) RT ln 4 – 3 RT ln X
(c) –3RT ln 4X
(d) None of these

BITSAT 2018

Ans. (d) : From the relation b/w standard Gibb's free energy and equilibrium constant-

$$\Delta G^o = -RT \ln K_p ; K_p = (2X)^2 X = 4X^3$$

$$\therefore \quad \Delta G^o = -RT \ln (4X^3)$$

$$\Delta G^o = -RT \ln 4 - 3RT \ln X$$

350. The relationship between K_p and K_c is $K_p = K_c (RT)^{\Delta n}$. What would be the value of Δn for the reaction

$$NH_4Cl(s) \rightleftharpoons NH_3(g) + HCl(g)?$$

(a) 1 (b) 0.5
(c) 1.5 (d) 2

Karnataka-CET-2018

Ans. (d) : For the reaction –

$$NH_4Cl(s) \rightleftharpoons NH_3(g) + HCl\,(g)$$

$$\therefore \quad K_p = K_c\,(RT)^{\Delta n_g}$$

So, Δn_g = no. of mole of gaseous product – no of mole of gaseous reaction
= 2 – 0
= 2

351. A + 2B ⇌ 2C; K_c = ?

2 moles of each A and B are present in 10 lit solution. The product C formed 1 mole. Calculate K_c

(a) 1.5 (b) 6.67
(c) 0.15 (d) 2.3

AIIMS-[27-May, 2018 (M)]

Ans. (b): The reaction is -

$$\begin{array}{llll} & A + & 2B \rightleftharpoons & 2C \\ \text{Initial mole} & 2 & 2 & 0 \\ \text{At equilibrium} & 2-x & 2-2x & 2x \\ & =1.5 & =1 & =1 \end{array}$$

As 1 mole of C is formed at equilibrium,

$$2x = 1$$
$$x = 0.5$$

Number of moles of A at equilibrium
= 1.5, B=1, C=1

∴ Equilibrium concentration of A, B and C are -

$$[A] = \frac{1.5}{10}, [B] = \frac{1}{10}, [C] = \frac{1}{10}$$

$$\therefore \quad K_c = \frac{[C]^2}{[A][B]^2} = \frac{[1/10]^2}{[1.5/10][1/10]^2} = 6.67$$

352. For $NH_4HS(s) \rightleftharpoons NH_3(g) + H_2S(g)$, the observed pressure for the reaction mixture in equilibrium is 1.12 atm at 106 °C. What is the value of K_p for the reaction?

(a) 0.56 atm^2 (b) 0.3136 atm^2
(c) 1.25 atm^2 (d) 1.12 atm^2

AMU-2017

@apna_pdf

Ans. (b) : The reaction is-

$$NH_4HS(s) \rightleftharpoons NH_3(g) + H_2S(g)$$

	$NH_4HS(s)$	$NH_3(g)$	$H_2S(g)$
Initially	—	—	—
At equil.	—	p	p

∴ Total pressure (P) = p + p

$$1.12 = 2p$$

or $$p = \frac{1.12}{2} = 0.56$$

$$K_p = \frac{p_{NH_3} \times p_{H_2S}}{1}$$

or $$K_p = 0.56 \times 0.56 = 0.3136\,atm^2$$

$$= 056 \times 0.56$$

$$= 0.3136\,atm^2$$

353. The equilibrium constant K_c value for a gaseous homogeneous equilibrium at 227°C is 2.05×10^{-5} mol L^{-1}. The K_p value in atmosphere for this equilibrium at this same temperature is ($R = 8.2 \times 10^{-2}$ L atm K^{-1} mol^{-1})

(a) 5.0×10^{-6} (b) 8.405×10^{-4}

(c) 5.0×10^{-5} (d) 8.405×10^{-3}

J & K CET-(2016)

Ans. (b) : Given data, $K_c = 2.05 \times 10^{-5}$ mol/L

$T = 227 + 273 = 500$ K, $K_p = ?$

relation between K_p and K_c is-

$$K_p = K_c (RT)^{\Delta n_g}$$

∵ $$(RT)^{\Delta n_g} = 1$$

∴ $$K_p = 2.05 \times 10^{-5} (8.2 \times 10^{-2} \times 500)$$

$$= 8.405 \times 10^{-4}$$

354. At 400K, in a 1.0 L vessel, N_2O_4 is allowed to attain equilibrium, $N_2O_4(g) \rightleftharpoons 2NO_2(g)$. At equilibrium, the total pressure is 600 mm Hg, when 20% of N_2O_4 is dissociated. The value of K_p for the reaction is

(a) 50 (b) 100

(c) 150 (d) 200

AP-EAMCET – 2016

Ans. (b) : Given that, T=400K, V=1 L, P = 600 mm Hg

In reversible reaction -

$$N_2O_4(g) \rightleftharpoons 2NO_2(g)$$

	$N_2O_4(g)$	$2NO_2(g)$
Initial mole	100	0
At equilibrium	(100 - 20) = 80	40

∴ Total number of moles = 40 + 80 = 120

∴ $$K_p = \frac{(p_{NO_2})^2}{p_{N_2O_4}}$$

$$K_p = \frac{\left(\frac{40}{120} \times 600\right)^2}{\frac{80}{120} \times 600}$$

$$K_p = 100$$

355. The equilibrium pressure for the reaction $MSO_4 \cdot 2H_2O(s) \rightleftharpoons MSO_4(s) + 2H_2O(g)$ is π/4 atm at 400 K. The K_p for the given reaction (in atm^2) is

(a) $\pi^2/4$ (b) $\pi/6$

(c) $\pi^2/16$ (d) $\pi/16$

(d) $16/\pi$

Kerala-CEE-2016

Ans. (c) : For the reaction-

$$MSO_4 \cdot 2H_2O(s) \rightleftharpoons MSO_4(s) + 2H_2O(g)$$

$$K_p = \frac{(p)^x_{product}}{(p)^y_{reactant}}$$

(Where x and y are power over gaseous products and reactants respectively)

∴ $$K_p = \frac{(p)^2_{product}}{(p)^0_{reactant}} = (p)^2_{product}$$

$$K_p = \left(\frac{\pi}{4}\right)^2$$

$$K_p = \frac{\pi^2}{16}$$

356. The K_{sp} of Ag_2CrO_4, AgCl, AgBr and AgI are respectively 1.1×10^{-12}, 1.8×10^{-10}, 5.0×10^{-13}, 8.3×10^{-17}. which one of the following salts will precipitate last if $AgNO_3$ solution is added to the solution containing equal moles of NaCl, NaBr, BaI and Na_2CrO_4?

(a) AgBr (b) Ag_2CrO_4

(c) AgI (d) AgCl

NEET-2015, Cancelled

Ans. (b) : For Ag_2CrO_4

$$Ag_2CrO_4 \rightarrow 2Ag^+ + CrO_4^{2-}$$

	Ag_2CrO_4	$2Ag^+$	CrO_4^{2-}
Initially	1	0	0
At time t	1–S	S	S

$$K_{sp} = \frac{(2S)^2 S}{(1-S)} \quad \text{as} \quad S <<< 1$$

So, $$K_{sp} = (2S)^2 S$$

$$1.1 \times 10^{-12} = 4S^3$$

$$S = 6.5 \times 10^{-5}$$

For AgCl :-

$$AgCl \rightarrow Ag^+ + Cl^-$$

$$\quad\quad\quad S \quad\; S$$

$$K_{sp} = S^2$$

$$1.8 \times 10^{-10} = S^2$$

$$S = 1.34 \times 10^{-5}$$

Similarly, for AgBr and AgI is 7.1×10^{-7} and 9.1×10^{-9} respectively. Since, solubility of Ag_2CrO_4 is the highest, it will precipitate last

357. The value of K_c for the dissociation reaction $H_2(g) \rightleftharpoons 2H(g)$ is 2.1×10^{-42} This equilibrium mixture contains mainly

@apna_pdf

(a) $H_2(g)$
(b) H(g) atom
(c) 1 : 1 molar mixture of H_2 and H
(d) 1 : 2 molar mixture of H_2 and H

UPTU/UPSEE-2015

Ans. (a) : For the dissociation reaction -

$$H_2(g) \rightleftharpoons 2H\,(g) \qquad K_c = 2.1 \times 10^{-42}$$

Since, K_c is very small.
Hence, $[H_2]$ is predominant.

358. For a reaction $C(s) + CO_2(g) \rightleftharpoons 2CO(g)$ the partial pressures of CO_2 and CO are 4 and 8 atm, respectively, K_p for the reaction is
(a) 0.5 (b) 2 (c) 16 (d) 4

J & K CET-(2015)

Ans. (c) : Given data: $p_{CO_2} = 4$ atm, $p_{CO} = 8$ atm

For the reaction-

$$C(s) + CO_2(g) \rightleftharpoons 2CO(g)$$

$$\therefore \qquad K_p = \frac{(p_{CO})^2}{p_{CO_2}}$$

$$K_p = \frac{(8)^2}{4}$$

$$K_p = \frac{64}{4}$$

$$K_p = 16$$

359. K_p/K_c for the reaction,

$A(g) + 2B(g) \rightleftharpoons AB_2(g)$ is
(a) RT (b) $(RT)^2$
(c) $1/RT$ (d) $1/(RT)^2$

J & K CET-(2015)

Ans. (d) : For the reaction:

$$A + 2B \rightleftharpoons AB_2$$

$$\therefore \qquad K_p = K_c(RT)^{\Delta n_g}$$

$$\Delta n_g = 1-(1+2) = -2$$

So,

$$K_p = K_c(RT)^{-2}$$

$$\frac{K_p}{K_c} = \frac{1}{(RT)^2}$$

360. If K_c is the equilibrium constant for the formation of NH_3, the dissociation constant of NH_3 under the same condition will be
(a) $\frac{1}{K_c}$ (b) K_c^2 (c) $\sqrt{K_c}$ (d) K_c

CG PET- 2015

Ans. (a) : The equilibrium reaction is-

$$N_2 + 3H_2 \underset{K_c'}{\overset{K_c}{\rightleftharpoons}} 2NH_3$$

If the equation representing equilibrium constant is reversed. The new equilibrium constant is inverse of the first value.

i.e. $$K_c' = \frac{1}{K_c}$$

361. Which of the following statements is correct for a reversible process in a state of equilibrium ?
(a) $\Delta G^o = -2.30\ RT \log K$
(b) $\Delta G^o = 2.30\ RT \log K$
(c) $\Delta G = -2.30\ RT \log K$
(d) $\Delta G = 2.30\ RT \log K$

NEET-2015, Cancelled

Ans.(a): A mathematical expression of this thermodynamic view of equilibrium can be described by the following equation-
$\Delta G = \Delta G^o + RT\ln Q$ …..(i)]
At equilibrium, when $\Delta G = 0$ and $Q = K_c$
equation (i) becomes,
$\Delta G = \Delta G^o + RT\ln K_c = 0$
$\Delta G^o = -RT\ln K$
$\Delta G^o = -2.303RT \log K$

362. What will be the value of $[OH^-]^2$ in the 0.1 M solution of ammonium hydroxide having $K_b = 1.8 \times 10^{-5}$?
(a) 1.8×10^{-7} (b) 1.8×10^{-6}
(c) 1.8×10^{-4} (d) 1.8×10^{-3}

AMU-2015

Ans. (b) : The dissociation reaction of NH_4OH is -

$$NH_4OH \rightleftharpoons NH_4^+ + OH^-$$

Initial conc.	0.1	0	0
At equilibrium	$0.1(1-\alpha)$	0.1α	0.1α

$$\therefore \qquad K_b = \frac{[NH_4^+][OH^-]}{[NH_4OH]}$$

$$1.8\times10^{-5} = \frac{(0.1\alpha)(0.1\alpha)}{0.1(1-\alpha)}$$

$$1.8\times10^{-5} = (0.1)\alpha^2 \qquad ......(i) \quad [\because \alpha <<< 1]$$

Now,

$$[OH^-]^2 = (0.1)^2\alpha^2 = 0.1[(0.1)\alpha^2] \quad ......(ii)$$

From eqn (i) and (ii), we get

$$[OH^-]^2 = 0.1\times1.8\times10^{-5} = 1.8\times10^{-6}\ M$$

363. Consider the following statements with regard to chemical equilibrium –
1. **Equilibrium constant is dependent of initial concentrations of reactants and products.**
2. **Equilibrium constant is independent of initial concentrations of reactants and products.**
3. **Equilibrium constant for the reverse reaction is equal to the inverse of the equilibrium constant for the forward reaction.**

Which of the above statements are correct?
(a) 1 and 2 only (b) 2 and 3 only
(c) 1 and 3 only (d) 1, 2 and 3

SCRA-2015

Ans. (b): Application of equilibrium constant is given as –
(i&ii) The value of equilibrium constant is independent of initial concentration of the reactant and product.

@apna_pdf

(iii) Let us write equilibrium constant for the reaction,

$$H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$$

$$\therefore \quad K_c = \frac{[HI]^2}{[H_2][I_2]} \quad .....(i)$$

The equilibrium constant for the reverse reaction, $2HI(g) \rightleftharpoons H_2(g) + I_2(g)$, at the same temperature is,

$$K'_c = \frac{[H_2][I_2]}{[HI]^2} \quad .....(ii)$$

From equation (i) and (ii)–

$$K'_c = \frac{1}{K_c}$$

Hence, statement is true.

364. In a closed cylinder of capacity 24.6 L, the following reaction occurs at 27° C.

$$\mathbf{A_2(s) \rightleftharpoons B_2(s) + 2C(g)}$$

At equilibrium, 1 g of B_2 (s) (molor mass = 50 g mol^{-1}) is present. The equilibrium constant K_p for the equilibrium in atm^2 unit is
(R = 0.082 L atm K^{-1} mol^{-1})

(a) 1.6×10^{-2} (b) 1.6×10^{-5}
(c) 1.6×10^{-3} (d) 1.6×10^{-4}
(e) 1.6×10^{-1}

Kerala-CEE-2014

Ans. (c) : Given data : V = 24.6 L, T = 27°C amount of B_2 = 1g, K_p = ?

For the reaction,

$$\underset{(a-x)}{A_2(s)} \rightleftharpoons \underset{\substack{0\\x}}{B_2(s)} + \underset{\substack{0\\2x}}{2C(g)}$$

since, at equilibrium, $[B_2] = \frac{\text{mass}}{\text{molor mass} \times \text{volume}}$

$$= \frac{1}{50 \times 24.6}$$

$$= \frac{1}{1230} = 0.000813 = 8.13 \times 10^{-4}$$

$$K_c = [C]^2 = (2 \times 8.13 \times 10^{-4})^2$$
$$= (16.26)^2 \times 10^{-8}$$
$$= 264.38 \times 10^{-8}$$
$$= 2.64 \times 10^{-6}$$

$$K_p = K_c (RT)^{\Delta n_g}$$

$$K_p = 2.64 \times 10^{-6} (0.082 \times 300)^{2-0}$$
$$= 2.64 \times 10^{-6} (24.6)^2$$
$$= 2.64 \times 605.16 \times 10^{-6}$$
$$= 1597.62 \times 10^{-6}$$
$$= 1.59 \times 10^{-3}$$
$$\approx 1.6 \times 10^{-3}$$

365. In which of the following case, does the reaction go farthest to completion if

(a) $K_c = 10^2$ (b) $K_c = 10$
(c) $K_c = 10^{-2}$ (d) $K_c = 1$

COMEDK 2014

Ans. (a) : $K_c = \frac{[\text{Products}]}{[\text{Reactants}]}$

Higher value of K_c, indicates higher concentration of products which means the reaction goes more towards the completion.

366. The equilibrium constant for the reaction, $H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$ is 64. If the volume of the container is reduced to half of the original volume, the value of the quilibrium constant will be

(a) 16 (b) 32
(c) 64 (d) 128

JCECE - 2014

Ans. (c) : $H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$

For this reaction, $\Delta n_g = 0$

∴ The reaction and its equilibrium constant is not affected by change in volume. Moreover, equilibrium constant depends only on temperature.

367. Using the Gibbs energy change, ΔG^o = +63.3 kJ for the following reaction,

$$\mathbf{Ag_2CO_3(s) \rightleftharpoons 2Ag^+(aq) + CO_3^{2-}(aq)}$$

the K_{sp} of $Ag_2CO_3(s)$ is water at 25ºC is
(R = 8.314 J K^{-1} mol^{-1})

(a) 3.2×10^{-26} (b) 8.0×10^{-12}
(c) 2.9×10^{-3} (d) 7.9×10^{-2}

NEET-2014

Ans. (b) : ΔG^o is related to K_{sp} by the equation,

$$\Delta G^o = -2.303 \, RT \log K_{sp}$$

Given,

$$\Delta G^o = +63.3 \text{ kJ}$$
$$= 63.3 \times 10^3 \text{ J}$$

Thus, Substitute $\Delta G^o = 63.3 \times 10^3$ J

R = 8.314 J K^{-1} mol^{-1} and T = 298K

From the above equation we get : -

$$63.3 \times 10^3 = -2.303 \times 8.314 \times 298 \times \log K_{sp}$$

$$\therefore \quad \log K_{sp} = -11.09$$
$$K_{sp} = \text{antilog}(-11.09)$$
$$K_{sp} = 8.0 \times 10^{-12}$$

368. For a given exothermic reaction, K_p and K'_p are the equilibrium constants at temperature T_1 and T_2 respectively. Assuming that heat of reactions is constant if temperature range between T_1 and T_2 it is readily observed that

(a) $K_p > K'_p$ (b) $K_p < K'_p$
(c) $K_p = K'_p$ (d) $K_p = \frac{1}{K'_p}$

NEET-2014

Ans. (a) : For a given exothermic reaction, K_p and K'_p are the equilibrium constants at temperature T_1 and T_2 respectively. Assuming that heat of reactions is constant in temperature range between T_1 and T_2 it is readily observed that $K_p > K'_p$

$$\log \frac{K_2}{K_1} = \frac{\Delta H^o}{2.303R}\left(\frac{1}{T_1} - \frac{1}{T_2}\right)$$

$$T_2 > T_1$$

So, $K_p > K'_p$ (exothermic reaction)

@apna_pdf

369. In a reaction, A + B $\rightleftharpoons$ C + D, 40% of B has reacted at equilibrium; when 1 mole of 'A' was heated with 1 mole of B in a 10 L closed vessel the value of K_c is

(a) 0.44 (b) 0.18
(c) 0.22 (d) 0.36

AP-EAMCET (Engg.) -2014

Ans. (a) : The equilibrium reaction is-

	A	+ B	$\rightleftharpoons$ C	+ D
At t = 0	100	100	0	0
At eqi.	(100 – 40) = 60	(100 – 40) = 60	40	40

$$\therefore \quad K_c = \frac{[C][D]}{[A][B]} = \frac{40\times 40}{60\times 60} = 0.44$$

370. The value of K_{sp} of $CaCO_3$ and CaC_2O_4 are 4.7×10^{-9} and 1.3×10^{-9} respectively at 25ºC. If the mixture of these two is washed with water, what is the concentration of Ca^{2+} ions in water?

(a) 5.831×10^{-5} M (b) 6.856×10^{-5} M
(c) 3.606×10^{-5} M (d) 7.746×10^{-5} M

Karnataka NEET-2013

Ans. (d) : $CaCO_3 \longrightarrow Ca^{2+} + CO_3^{2-}$ 4.7×10^{-9} ….(i)

$S + S_1$ S

$CaC_2O_4 \longrightarrow Ca^{2+} + C_2O_4^{2-}$ 1.3×10^{-9} ….(ii)

$S + S_1$ S_1

On dividing (i) and (ii) –

$$\frac{(S+S_1)\times S}{(S+S_1)\times S_1} = \frac{4.7\times10^{-9}}{1.3\times10^{-9}}$$

$$\frac{S}{S_1} = \frac{47}{13} = 3.61$$

$S = 3.61\ S_1$ …….(iii)

From (i) :-

$(S + S_1) \times S = 4.7 \times 10^{-9}$

From (ii) :-

$(S + S_1) \times S_1 = 1.3 \times 10^{-9}$

Putting the value of S from equation (iii) we get

$4.61\ S_1^2 = 1.3 \times 10^{-9}$

$S_1^2 = 0.281 \times 10^{-9}$

$S_1 = \sqrt{0.281 \times 10^{-9}}$

$S_1 = 1.67 \times 10^{-5}$

From (iii):-

$S = 3.61S_1 = 3.6 \times 1.67 \times 10^{-5}$

$S = 6.02 \times 10^{-5}$

$[Ca^{2+}] = S + S_1$

$= (6.02 + 1.67) \times 10^{-5}$

$= 7.69 \times 10^{-5}$

371. For the equilibrium, A(g) $\rightleftharpoons$ B(g) + C(g); K_p = 0.82 atm at 27°C. At the same temperature, its K_c in mol L^{-1} is (R = 0.082 L atm $mol^{-1}K^{-1}$)

(a) 0.033 (b) 3.3
(c) 1.0 (d) 0.33

AP EAMCET (Medical) - 2013

Ans. (a) : For the equilibrium reaction-

$$A(g) \rightleftharpoons B(g) + C(g)$$

Given values-

$K_p = 0.82$ atm

$T = 27°C + 273 = 300K$

$K_c = ?\ (molL^{-1})$

$R = 0.082\ atm\ mol^{-1}K^{-1}$

Now, from the relation between K_p and K_c - we get

$K_p = K_c(RT)^{\Delta n_g}$

or $0.082 = K_c(0.082\times300)^{1+1-1}$

or $0.082 = K_c \times 0.082 \times 300$

or $K_c = 0.033$

372. At equilibrium, if K_p = 1, then

(a) $\Delta G^o > 1$ (b) $\Delta G^o < 1$
(c) $\Delta G^o = 0$ (d) $\Delta G^o = 1$

UPTU/UPSEE-2013

Ans. (c) : Given, $K_p = 1$

Since, at equilibrium, $\Delta G = 0$

$\Rightarrow$ $\Delta G^o = 0 - RT \ln K_p$

$\Rightarrow$ $\Delta G^o = -RT \ln 1$

$\Delta G^o = 0$

373. In the following equilibrium reaction,

$$2A \rightleftharpoons B + C$$

the equilibrium concentrations of A, B and C are 1 × 10^{-3} M, 2 × 10^{-3} M and 3 × 10^{-3} M respectively at 300 K. The value of K_c for this equilibrium at the same temperature is

(a) $\frac{1}{6}$ (b) 6
(c) $\frac{1}{36}$ (d) 36
(e) $\frac{1}{24}$

Kerala-CEE-2012

Ans. (b) : Given that, $[A] = 1 \times 10^{-3}$ M

$[B] = 2 \times 10^{-3}$ M

$[C] = 3\times10^{-3}$ M

We have the equilibrium reaction is

$$2A \rightleftharpoons B + C$$

Equilibrium constant, $K_c = \frac{[B][C]}{[A]^2}$

By putting all those values, we get

$$K_c = \frac{(2\times10^{-3})(3\times10^{-3})}{(1\times10^{-3})^2}$$

$K_c = 6$

374. Given the reaction between 2 gases represented by A_2 and B_2 to give the compound AB(g).

$$A_2(g) + B_2(g) \rightleftharpoons 2AB(g)$$

At equilibrium the concentration of
$A_2 = 3.0 \times 10^{-3}$ M of $B_2 = 4.2 \times 10^{-3}$ M of
$AB = 2.8 \times 10^{-3}$ M
If the reaction takes place in sealed vessel at 527ºC, then the value of K_c will be

@apna_pdf

(a) 2.0 (b) 1.9
(c) 0.62 (d) 4.5

NEET-Mains 2012

Ans. (c) : Given that,

$A_2 = 3.0 \times 10^{-3}$ M

$B_2 = 4.2 \times 10^{-3}$ M

$AB = 2.8 \times 10^{-3}$ M

The reaction is

$$A_2(g) + B_2(g) \rightleftharpoons 2AB(g)$$

$$\therefore \quad K_c = \frac{[AB]^2}{[A_2][B_2]} = \frac{2.8 \times 2.8 \times 10^{-6}}{3 \times 10^{-3} \times 4.2 \times 10^{-3}}$$

$$= 0.62$$

375. At room temperature, for the reaction

$NH_4SH(s) \rightleftharpoons NH_3(g) + H_2S(g)$

(a) $K_p = K_c$
(b) $K_p > K_c$
(c) $K_p < K_c$
(d) K_p and K_c do not relate.

J & K CET-(2012)

Ans. (b) : The equilibrium reaction is-

$$NH_4SH(s) \rightleftharpoons NH_3(g) + H_2S(g)$$

$$\therefore \quad K_p = K_c\ (RT)^{\Delta n_g}$$

$$\Delta n_g = 2 - 0$$

$$= 2$$

When the value of $\Delta n \geq 1$

In such case $K_p > K_c$

376. On passing H_2S into a solution containing both Zn^{2+} and Cu^{2+} in acidic medium, only CuS gets precipitated. This is because

(a) K_{sp} of CuS < K_{sp} of ZnS
(b) K_{sp} of CuS = K_{sp} of ZnS
(c) K_{sp} of CuS > K_{sp} of ZnS
(d) CuS is more stable than ZnS.

COMEDK-2012

Ans. (a) : $H_2S \rightleftharpoons 2H^+ + S^{2-}$

In acidic medium ionisation of H_2S is suppressed due to common ion effect. This decrease the concentration of S^{2-} ions in solution as such K_{sp} of only CuS is exceeded resolving in the precipitation of CuS. K_{sp} of ZnS is much higher.

Since the solubility product of CuS is less than of ZnS, CuS gets precipitated.

K_{sp} (CuS) < K_{sp} (ZnS)

K_{sp} (CuS) = 8×10^{-37}

K_{sp} (Zns) = 1.2×10^{-23}

377. The equilibrium constant K_c for the reaction

$SO_2(g) + NO_2(g) \rightleftharpoons SO_3(g) + NO(g)$

is 16. If one mole of all four gases is taken in a one litre container, the equilibrium concentration of SO_3 would be:

(a) 0.4 m (b) 0.6 m
(c) 1.4 m (d) 1.6 m

MPPET-2012

Ans. (d) : Given $K_c = 16$, $[SO_3] = ?$

The reaction is–

$$SO_2(g) + NO_2(g) \rightleftharpoons SO_3(g) + NO(g)$$

	$SO_2(g)$	$NO_2(g)$	$SO_3(g)$	$NO(g)$
Initial conc^n.	1	1	1	1
At equi.	1–z	1–z	1+z	1+z
Molar conc.	$\frac{1-z}{1}$	$\frac{1-z}{1}$	$\frac{1+z}{1}$	$\frac{1+z}{1}$

Applying law of mass action-

$$K_c = \frac{[SO_3][NO]}{[SO_2][NO_2]} = 16$$

$$16 = \frac{[1+z][1+z]}{[1-z][1-z]} = \frac{(1+z)^2}{(1-z)^2}$$

$(1 + z)^2 = 16(1 - z)^2$

$1 + z = 4\ (1 - z)$

$1 + z = 4 - 4z$

$5z = 3$

$z = \frac{3}{5}$

$[SO_3]$ at equilibrium is-

$$\therefore \quad (1 + z) = 1 + \frac{3}{5}$$

$$= \frac{5+3}{5}$$

$$= \frac{8}{5} = 1.6\,m$$

378. For the reaction, $2NH_3(g) \rightleftharpoons N_2(g) + 3H_2(g)$ the units of K_p will be

(a) atm (b) $(atm)^3$
(c) $(atm)^{-2}$ (d) $(atm)^2$

UP CPMT-2011

Ans. (d) : For the reaction,

$$2NH_3(g) \rightleftharpoons N_2(g) + 3H_2(g)$$

$$K_p = \frac{p_{N_2} \times p^3_{H_2}}{p^2_{NH_3}} = \frac{(atm)^4}{(atm)^2} = (atm)^2$$

379. A vessel at 1000 K contains CO_2 with a pressure of 0.5 atm. Some of the CO_2 is converted into CO on the addition of graphite. The value of K if the total pressure at equilibrium is 0.8 atm, is

(a) 1.8 atm (b) 3 atm
(c) 0.3 atm (d) 0.18 atm

VITEEE- 2011

Ans. (a) : Given data: T = 1000K, pressure of CO_2 = 0.5 atm, P = 0.8 atm

The equilibrium reaction-

$$CO_2(g) + C(s) \rightleftharpoons 2CO(g)$$

	$CO_2(g)$	$2CO(g)$
Intial	0.5 atm	0
At equi.	0.5–x	2x

Total pressure at equilibrium

= 0.5–x + 2x = 0.5 + x = 0.8

$\therefore$ x = 0.3 atm

$$K_p = \frac{p^2_{CO}}{p_{CO_2}} = \frac{(2x)^2}{(0.5-x)} = \frac{(2 \times 0.3)^2}{0.5 - 0.3} = 1.8\,atm.$$

@apna_pdf

380. For a chemical reaction A + B $\rightleftharpoons$ C, the thermodynamic equilibrium constant K_p is

(a) in atm^{-2} (b) in atm^{-3}
(c) in atm^{-1} (d) dimensionless

JCECE - 2011

Ans. (c) : For the reaction,

$$A + B \rightleftharpoons C$$

$$\Delta n_g = 1 - 2 = -1$$

$$K_p = (\text{atmosphere})^{-1}$$

381. Four moles of PCl_5 are heated in a closed 4 dm^3 container to reach equilibrium at 400 K. At equilibrium 50% of PCl_5 is dissociated. What is the value of K_c for the dissociation of PCl_5 in to PCl_3 and Cl_2 at 400 K?

(a) 0.50 (b) 1.00
(c) 1.25 (d) 0.05
(e) 0.25

Kerala-CEE-2011

Ans. (a) : $PCl_5(s) \rightleftharpoons PCl_3(g) + Cl_2(g)$

At, 400 K, PCl_5 is solid

Vol. 4 0 0
Vol. 2 2 2

$$K_c = \frac{[PCl_3][Cl_2]}{[PCl_5]}$$

At high pressure, the PCl_3 will be a liquid

So, $K_c = \frac{2}{4} \text{mol dm}^{-3}$

$K_c = 0.5 \text{ mol dm}^{-3}$

382. In the preparation of CaCO from $CaCO_3$ using the equilibrium $CaCO_3(s) \rightleftharpoons CaCO(s) + CO_2(s)$ K_p is expressed as:

$$\log K_p = 7.282 - \frac{8500}{T}$$

The complete decomposition of $CaCO_3$, the temperature in Celsius to be used is

(a) 1167 (b) 894
(c) 8500 (d) 850

AMU-2011

Ans. (b) : In the preparation of CaO from $CaCO_3$ using the equilibrium.

$$CaCO_3(s) \rightleftharpoons CaO(s) + CO_2(g)$$

K_p is expressed as

$$\log K_p = 7.282 - \frac{8500}{T}$$

For complete decomposition of $K_p = 1$

$$\log K_p = 0$$

So, $\log K_p = 7.282 - \frac{8500}{T}$

$$0 = 7.282 - \frac{8500}{T}$$

$$7.282 = \frac{8500}{T}$$

$T = 1167.26$ K
$T = 1167.26 - 273.15°C$
$T = 894.11°C$

383. For the equilibrium,

$$2SO_2(g) + O_2(g) \rightleftharpoons 2SO_3(g)$$

(a) $K_p = K_c$ (b) $K_p = \frac{K_c}{RT}$
(c) $K_p = K_cRT$ (d) $K_p = K_c(RT)^2$

COMEDK-2011

Ans. (b) : The given equilibrium reaction,

$$2SO_2(g) + O_2(g) \rightleftharpoons 2SO_3(g)$$

$\therefore$ Δn_g = no. of moles of product – no. of moles of reactant

or $\Delta n_g = n_P - n_R = 2 - 3 = -1$

$$K_p = K_c(RT)^{\Delta n_g}$$

or $K_p = K_c(RT)^{-1}$ or $K_p = \frac{K_c}{RT}$

384. If the equilibrium constant for the reaction, $H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$ is K, what is the equilibrium constant of

$$HI(g) \rightleftharpoons \frac{1}{2}H_2(g) + \frac{1}{2}I_2(g)?$$

(a) $\frac{1}{K}$ (b) $\sqrt{K}$
(c) K (d) $\frac{1}{\sqrt{K}}$

AP-EAMCET- (Engg.) - 2010

Ans. (d) : Given,

$$H_2(g) + I_2(g) \rightleftharpoons 2HI(g).$$

$$K_c = \frac{[HI]^2}{[H_2][I_2]} \quad .....(i)$$

For the reaction

$$HI(g) \rightleftharpoons \frac{1}{2}H_2(g) + \frac{1}{2}I_2(g)$$

$$K'_c = \frac{[H_2]^{1/2}[I]^{1/2}}{[HI]} \quad .....(ii)$$

Multiplying equation (i) and (ii) , we get-

$$K_c \times K'_c = \frac{[HI]^2}{[H_2][I_2]} \times \frac{[H_2]^{1/2}[I_2]^{1/2}}{[HI]}$$

$$K_c \cdot K'_c = \frac{[HI]}{[H_2]^{1/2}[I_2]^{1/2}} \quad \text{[from equation (ii)]}$$

$$K_c \cdot K'_c = \frac{1}{K'_c}$$

$$(K'_c)^2 = \frac{1}{K_c}$$

$$K'_c = \frac{1}{\sqrt{K_c}}$$

385. For the reaction,

$$2A(g) + B_2(g) \rightleftharpoons 2AB_2(g)$$

the equilibrium constant, K_p at 300 K is 16.0. The value of K_p for $AB_2(g) \rightleftharpoons A(g) + 1/2\,B_2(g)$ is

@apna_pdf

(a) 8 (b) 0.25
(c) 0.125 (d) 32

VITEEE- 2010

Ans. (b) : For the given reaction,

$$2A(g)+B_2(g) \rightleftharpoons 2AB_2(g)$$

The equilibrium constant,

$$K_p=\frac{p^2_{AB_2}}{p^2_A.p_{B_2}}=16 \qquad .....(i)$$

For the other given reaction,

$$AB_2(g) \rightleftharpoons A(g)+\frac{1}{2}B_2(g)$$

The equilibrium constant,

$$K'_p=\frac{p_A.p^{1/2}_{B_2}}{p_{AB_2}} \qquad .....(ii)$$

On squaring eq. (ii), we obtain,

$$(K'_p)^2=\frac{p^2_A.p_{B_2}}{p^2_{AB_2}} \qquad ....(iii)$$

Now, from eq. (i) and (iii), we obtain,

$$K_p.(K'_p)^2=1 \Rightarrow 16.(K'_p)^2=1 \qquad (\because K_p=16)$$

$$\Rightarrow \qquad (K'_p)=\left(\frac{1}{16}\right)^{1/2} \Rightarrow K'_p=\frac{1}{4}=0.25$$

386. For the reaction,
$N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$ at 400 K, $K_p = 41$.
Find the value of K_p for the following reaction.

$$\frac{1}{2}N_2(g)+\frac{3}{2}H_2(g) \rightleftharpoons NH_3(g)$$

(a) 6.4 (b) 0.02
(c) 50 (d) 4.6

J & K CET-(2010)

Ans. (a) : Given, T = 400 K, $K_p = 41$

For the first reaction -

$$N_2 + 3H_2 \rightleftharpoons 2NH_3$$

$$\therefore \qquad K_p=\frac{(p_{NH_3})^2}{p_{N_2}(p_{H_2})^3}$$

$$41=\frac{(p_{NH_3})^2}{p_{N_2}(p_{H_2})^3} \qquad ....(i)$$

For the second reaction -

$$\frac{1}{2}N_2+\frac{3}{2}H_2 \rightleftharpoons NH_3$$

$$K'_p=\frac{p_{NH_3}}{(p_{N_2})^{1/2}(p_{H_2})^{3/2}}$$

On squaring both sides –

$$(K'_p)^2=\frac{(p_{NH_3})^2}{(p_{N_2})(p_{H_2})^3} \qquad \text{[from equation (i)]}$$

$$(K'_p)^2=K_p=41$$

$$K'_p=(41)^{1/2}$$

$$=6.4\ atm^{-1}$$

387. For the decomposition reaction of lime stone, the correct expression for rate constant, K_p is

(a) $K_p=\frac{P_{CaO}\cdot P_{CO_2}}{P_{CaCO_3}}$

(b) $K_p=\frac{[CaO][CO_2]}{[CaCO_3]}$

(c) $K_p=\frac{P_{CaO}+P_{CO_2}}{P_{CaCO_3}}$

(d) $K_p=P_{CO_2}$

UPTU/UPSEE-2010

Ans. (d) : The decomposition reaction of $CaCO_3$ is -

$$CaCO_3(s) \rightleftharpoons CaO(s) + CO_2(g)$$

Thus, $K_p = P_{CO_2}$

As concentration of solid remain unchanged it is taken as unity.

388. In which of the following reactions $K_p > K_c$?

(a) $N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$
(b) $H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$
(c) $PCl_3(g) + Cl_2(g) \rightleftharpoons PCl_5(g)$
(d) $2SO_3(g) \rightleftharpoons 2SO_2(g) + O_2(g)$

UP CPMT-2010

Ans. (d): We know that,

$$K_p=K_c\ (RT)^{\Delta n_g}$$

Where, $\Delta n_g=n_p-n_r$

(n_p = number of moles of gaseous products)
(n_r = number of moles of gaseous reactants)

For $K_p > K_c$,
$\Delta n_g \geq +1$
or $n_p > n_r$

In reaction, $2SO_3(g) \rightleftharpoons 2SO_2(g) + O_2(g)$
$n_p = 3$
$n_r = 2$

Thus, for this reaction, $K_p > K_c$.

389. What is the effect of a ten-fold increase in pressure on K_p in the reaction $N_2(g)+3H_2(g) \rightleftharpoons 2NH_3(g)$ at equilibrium?

(a) A ten-fold increase (b) A ten-fold decrease
(c) No change (d) Equal to K_c

AP- EAMCET(Medical) -2010

Ans. (c): For the reaction-

$$N_2(g)+3H_2(g) \rightleftharpoons 2NH_3(g)$$

The relation between K_p and K_c is given as-

$$K_p=K_c(RT)^{\Delta n} \quad \left(\begin{array}{l}\text{where, } \Delta n=\sum n_p-\sum n_r \\ \Delta n=2-4=-2\end{array}\right)$$

or $$K_p=K_c\times(RT)^{-2}$$

or $$K_p=\frac{K_c}{(RT)^2}$$

Thus, the value of K_p is depends upon the temperature of the reaction. Hence, no change occure during the increments of pressure.

@apna_pdf

390. Calculate K_c for the reversible process given below if K_p=167 and T =800^{0}C.

$$CaCO_3(s) \rightleftharpoons CaO(s) + CO_2(g)$$

(a) 1.95 (b) 1.85
(c) 1.89 (d) 1.60

WB-JEE-2010

Ans. (c) : Given, $K_p = 167$, T= 800°, K_c = ?
The decomposition reaction of lime stone is -

$$CaCO_3(s) \rightleftharpoons CaO(s) + CO_2(g)$$

$$\therefore \quad K_p = K_c\,(RT)^{\Delta n_g}$$

$$\Delta n_g = 1 - 0 = 1$$

$$\therefore \quad K_c = \frac{K_p}{[0.0821\times(800+273)]^1}$$

$$K_c = \frac{167}{88.09}$$

$$K_c \approx 1.89$$

391. In an equilibrium reaction, if Δn_g is positive then

(a) $K_c = K_p$ (b) $K_c < K_p$
(c) $K_c > K_p$ (d) $K_c = 0$

SRMJEEE – 2009

Ans. (b) : As we know the relation between K_p and K_c is –

$$K_p = K_c\ (RT)^{\Delta n_g}$$

If, $\Delta n_g = +ve$ (Given)
Then, $K_p > K_c$

392. For the reaction $SO_2 + \frac{1}{2}O_2 \rightleftharpoons SO_3$ if we write $K_p=K_c(RT)^x$, then x becomes

(a) 1 (b) $-\frac{1}{2}$
(c) $\frac{1}{2}$ (d) 1

WB-JEE-2009

Ans. (b) : For the reaction -

$$SO_2 + \frac{1}{2}O_2 \rightleftharpoons SO_3$$

x = no. of mole of gaseous product – no. of mole of gaseous reactant

$$x = 1 - \left(\frac{1}{2}+1\right) = 1 - \frac{3}{2} = -\frac{1}{2}$$

393. If the equilibrium constant of the reaction $2HI \rightleftharpoons H_2 + I_2$ is 0.25, then the equilibrium constant for the reaction $H_2 + I_2 \rightleftharpoons 2HI$ would be

(a) 1 (b) 2
(c) 3 (d) 4

BITSAT 2009

Ans. (d) : $2HI \rightleftharpoons H_2 + I_2$ For this chemical reaction equilibrium constant -

$K_c = 0.25$

Now the reaction is reveres

$$H_2 + I_2 \rightleftharpoons 2HI$$

Hence, new equilibrium constant is -

$$K'_c = \frac{1}{K_c}$$

$$= \frac{1}{0.25}$$

$$= \frac{100}{25}$$

$$K'_c = 4$$

394. For the reaction, $2B + A \rightleftharpoons C$, the equilibrium constant is–

(a) $\frac{[A][B]^3}{[C]}$ (b) $\frac{[C]}{[A][2B]}$
(c) $\frac{[C]}{[A][B]^2}$ (d) $\frac{[A][B]}{[C]}$

BCECE-2009

Ans. (c) : We know equilibrium constant of any reaction is –

$$K_c = \frac{[Product]}{[Reactent]}$$

So, $2B + A \rightleftharpoons C$

$$K_c = \frac{[C]}{[B]^2[A]}$$

395. One mole of N_2O_4 is heated in a flask with a volume of 0.1 dm^3. At equilibrium 1.708 mole of NO_2 and 0.146 mole of N_2O_4 were found at 134^{0}C. The equilibrium constant will be

(a) 250 mol dm^{-3} (b) 300 mol dm^{-3}
(c) 200 mol dm^{-3} (d) 230 mol dm^{-3}

MPPET-2009

Ans. (c) : Given data :
Initially–
Mole of N_2O_4 = 1
Volume = 0.1 dm^3
At equilibrium–
Moles of NO_2 = 1.708
Moles of N_2O_4 = 0.146
For the equilibrium reaction–

$$N_2O_4 \rightleftharpoons 2NO_2$$

$$\therefore \quad K_c = \frac{[NO_2]^2}{[N_2O_4]}$$

$$K_c = \frac{(1.708 mole/0.1 dm^3)^2}{0.146 mole/0.1 dm^3}$$

K_c = 200 mol dm^{-3}

396. Assertion : For reaction
$N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$
Unit of $K_c = L^2mol^{-2}$
Reason : For the reaction
$N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$

Equilibrium constant, $K_c = \frac{[NH_3]^2}{[N_2][H_2]^3}$

@apna_pdf

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) In the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the assertion is incorrect but the Reason is correct.

AIIMS-(2008)

Ans. (a): For the reaction –

$$N_2(g)+3H_2(g)\rightleftharpoons 2NH_3(g)$$

$$K_C=\frac{[NH_3]^2}{[N_2][H_2]^3}=\frac{[\text{mol}\,L^{-1}]^2}{[\text{mol}\,L^{-1}]\,[\text{mol}\,L^{-1}]^3}$$

$$=\text{mol}^{-1}\,L^2$$

397. The value of equilibrium constant of the reaction, $HI(g)\rightleftharpoons\frac{1}{2}H_2(g)+\frac{1}{2}I_2(g)$ is 8.0. the equilibrium constant of the reaction $H_2(g)+I_2(g)\rightleftharpoons 2HI(g)$ will be

(a) 16
(b) 1/8
(c) 1/16
(d) 1/64

NEET-2008

Ans. (d) : $HI(g)\rightleftharpoons\frac{1}{2}H_2(g)+\frac{1}{2}I_2(g)$

$$K_c=\frac{[I_2]^{1/2}[H_2]^{1/2}}{[HI]}=8 \quad .....(i)$$

$$H_2(g)+I_2(g)\rightleftharpoons 2HI(g)$$

$$K_c'=\frac{[HI]^2}{[H_2][I_2]} \quad .....(ii)$$

From eq. (i) & (ii)

$$K_c'=\left(\frac{1}{K_c}\right)^2=\left(\frac{1}{8}\right)^2=\frac{1}{64}$$

398. At constant temperature, the equilibrium constant (K_p) for decomposition reaction N_2O_4 ⇌ $2NO_2$ is expressed by $K_p = (4x^2P)/(1 - x^2)$, where, P = pressure; x = extent of decomposition, which one of the following statement is true?

(a) K_p increases with increase of P?
(b) K_p increases with increase of x.
(c) K_p increases with decrease of x.
(d) K_p remains constant with change in P and x.

SRMJEEE – 2008

Ans. (d) : At constant temperature, the equilibrium constant (K_p) for the decomposition reaction $N_2O_4 \rightleftharpoons 2NO_2$ is expressed by $K_p=\frac{(4x^2P)}{(1-x^2)}$, where P = pressure and x = extent of decomposition. K_p remains constant with change in P and x. The value of the equilibrium constant is independent of the partial pressure or degree of dissociation.

399. For equilibrium $PCl_5(g)\rightleftharpoons PCl_3(g) + Cl_2(g)$ K_p and K_c will hold the following relationship

(a) $K_p = K_c$
(b) $K_p = K_c(RT)$
(c) $K_p = K_c/RT$
(d) $K_c = K_p/RT$.

A.M.U. – 2008

Ans. (b) : For the reaction ,

$$PCl_5(g)\rightleftharpoons PCl_3(g) + Cl_2(g)$$

$$\therefore \quad K_p=K_c\,(RT)^{\Delta n_g}$$

Where, $\Delta n_g = n_p - n_r$ (gaseous moles only)

$$\Delta n_g = 2-1=1$$

So, $K_p = K_c(RT)^{2-1}$

$$K_p = K_c\,RT$$

400. What is the equation for the equilibrium constant (K_c) for the following reaction?

$$\frac{1}{2}A(g)+\frac{1}{3}B(g)\xrightleftharpoons{T(K)}\frac{2}{3}C(g)$$

(a) $K_c=\frac{[A]^{1/2}[B]^{1/3}}{[C]^{3/2}}$
(b) $K_c=\frac{[C]^{3/2}}{[A]^2[B]^3}$
(c) $K_c=\frac{[C]^{2/3}}{[A]^{1/2}[B]^{1/3}}$
(d) $K_c=\frac{[C]^{2/3}}{[A]^{1/2}+[B]^{1/3}}$

UP CPMT-2008

Ans. (c): The equilibrium reaction is-

$$\frac{1}{2}A(g)+\frac{1}{3}B(g)\xrightleftharpoons{T(K)}\frac{2}{3}C(g)$$

$$\text{Equilibrium constant }(K_c)=\frac{\text{concentration of product}}{\text{concentration of reactant}}$$

$$K_c=\frac{[C]^{2/3}}{[A]^{1/2}B^{1/3}}$$

401. 1.1 moles of A and 2.2 moles of B are mixed in a container of one litre volume to obtain the equilibrium A + 2B ⇌ 2C + D.

At equilibrium 0.2 moles of C are formed. The equilibrium constant for the above reaction is

(a) 0.001
(b) 0.002
(c) 0.003
(d) 0.004

CG PET -2007

Ans. (a) : The equilibrium reaction is-

	A	+ 2B ⇌	2C	+ D
t = 0	1.1	2.2	0	0
$t = t_{eq}$	1.1 − 2	2.2 − 2x	2x	x

At equilibrium -

$$0.2 = 2x$$

$$x = 0.1$$

$$\therefore \quad K_c=\frac{[C]^2[D]}{[A][B]^2}$$

$$K_c=\frac{(2x)^2(x)}{1(2)^2}$$

$$K_c=\frac{(0.2)^2(0.1)}{4}$$

@apna_pdf

$$K_c = \frac{0.004}{4}$$
$$K_c = 0.001$$

402. For the reaction, $H_2 + I_2 \rightleftharpoons 2HI$, the equilibrium concentration of H_2, I_2 and HI are 8.0, 3.0 and 28.0 mol/L respectively. The equilibrium constant is–

(a) 28.34 (b) 32.66
(c) 34.78 (d) 38.88

BCECE-2007

Ans. (b) : The reaction is –

$$H_2 + I_2 \rightleftharpoons 2HI$$
$$K_c = \frac{[HI]^2}{[H_2][I_2]}$$
$$K_c = \frac{[28.0]^2}{[8.0][3.0]}$$
$$K_c = \frac{784}{24}$$
$$K_c = 32.66$$

403. The equilibrium constant for the reaction $2NO_2(g) \rightleftharpoons 2NO\ (g) + O_2\ (g)$ is 2×10^{-6} at 185°C. Then the equilibrium constant for the reaction $4NO\ (g) + 2O_2\ (g) \rightleftharpoons 4NO_2\ (g)$ at the same temperature would be

(a) 2.5×10^{-5} (b) 4×10^{-12}
(c) 2.5×10^{11} (d) 2×10^{6}
(e) 5×10^{5}

Kerala-CEE-2007

Ans. (c) : The given reaction is:

$$2NO_2(g) \rightleftharpoons 2NO(g) + O_2(g)$$
$$\therefore \quad K_c = \frac{[NO]^2[O_2]}{[NO_2]^2} = 2\times10^{-6} \quad .....(i)$$

Now, $4NO(g) + 2O_2(g) \rightleftharpoons 4NO_2(g)$

$$K_c' = \frac{[NO_2]^4}{[NO]^4[O_2]^2}$$
$$K_c' = \left(\frac{1}{K_c}\right)^2$$
$$K_c' = \left(\frac{1}{2\times10^{-6}}\right)^2$$
$$K_c' = 2.5\times10^{11}$$

404. For the reaction

$CH_4(g) + 2O_2(g) \rightleftharpoons CO_2(g) + 2H_2O(l)$

$\Delta H_r = -170.8$ kJ mol^{-1}. Which of the following statements is not true ?

(a) The reaction is exothermic
(b) At equilibrium, the concentration of $CO_2(g)$ and $H_2O(l)$ are not equal
(c) The equilibrium constant for the reaction if given by $K_p = \frac{[CO_2]}{[CH_4][O_2]}$
(d) Addition of $CH_4(g)$ or $O_2(g)$ at equilibrium will cause shift to the right

NEET-2006

Ans. (c) : We have the reaction:

$$CH_4 + 2O_2 \rightleftharpoons CO_2 + 2H_2O(l)$$
$$K_c = \frac{[CO_2][H_2O]^2}{[CH_4][O_2]^2}$$

Now, H_2O is pure liquid, so $[H_2O]=1$

$$\Rightarrow \quad K_c = \frac{[CO_2]}{[CH_4][O_2]^2}$$
$$\because \quad \Delta H_r = -170.8 \text{ kJ/mol is negative}$$

So, reaction is exothermic by adding $O_2(g)$ or $CH_4(g)$ at equilibrium, by Le Chartelier's principle, the equilibrium shift towards right side.

405. What is the equation for the equilibrium constant (K_c) for the following reaction?

$$\frac{1}{2}A(g) + \frac{1}{3}B(g) \rightarrow \frac{2}{3}C(g)$$

(a) $K_c = \frac{[A]^{1/2}[B]^{1/3}}{[C]^{3/2}}$

(b) $K_c = \frac{[C]^{3/2}}{[A]^2[B]^3}$

(c) $K_c = \frac{[C]^{2/3}}{[A]^{1/2}[B]^{1/3}}$

(d) $K_c = \frac{[C]^{2/3}}{[A]^{1/2} + [B]^{3/2}}$

AP-EAMCET (Medical), 2006

Ans. (c) : Given that the following reaction:-

$$\frac{1}{2}A(g) + \frac{1}{3}B(g) \rightarrow \frac{2}{3}C(g)$$

Equilibrium constant $(K_c) = \frac{[Products]}{[Reactants]}$

The expression of K_c can be written as-

$$K_c = \frac{[C]^{2/3}}{[A]^{1/2}[B]^{1/3}}$$

406. $N_2O_4 \rightleftharpoons 2NO_2 - Q$

The unit of K_p for the given reaction is

(a) atmosphere (b) $atmosphere^2$
(c) $atmosphere^{-1}$ (d) None of these

CG PET -2006

Ans. (a) : $N_2O_4 \rightleftharpoons 2NO_2 - Q$

Applying law of mass action –

$$K_p = \frac{(p_{NO_2})^2}{(p_{N_2O_4})}$$
$$K_p = \frac{(atmosphere)^2}{atmosphere}$$
$$\therefore \quad \text{Unit of } K_p \text{ is atmosphere.}$$

@apna_pdf

407. The equilibrium constant K_p for the reaction, $H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$ is :

(a) more than one (b) less than one
(c) equal to K_c (d) zero

BCECE-2006

Ans. (c) : $H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$

$$K_p = K_c(RT)^{\Delta n_g}$$

$$\Delta n_g = 2 - 2 = 0$$

$$\therefore \quad K_p = K_c\ (RT)^0 = K_c$$

408. At 550K, the K_c for the following reaction is 10^4 mol L^{-1}.

$X(g) + Y(g) \rightleftharpoons Z(g)$

At equilibrium, it was observed that

$$[X] = \frac{1}{2}[Y] = \frac{1}{2}[Z]$$

What is the value of [Z] (in mol L^{-1}) at equilibrium?

(a) 2×10^{-4} (b) 10^{-4}
(c) 2×10^4 (d) 10^4

A.P.EAMCET 2005

Ans. (a) : For equilibrium -

$$X(g) + Y(g) \rightleftharpoons Z(g)$$

$$K_c = \frac{[Z]}{[X][Y]} \quad \text{....(i)}$$

Given, $[X] = \frac{1}{2}[Y] = \frac{1}{2}[Z]$, $K_c = 10^4$ mol L^{-1}

$\therefore \quad [X] = \frac{1}{2}[Y] = \frac{1}{2}[Z] = v\text{(say)}$

$[Z] = 2v$, $[Y] = 2v$, $[X] = v$

From eqn (i),

$$K_c = \frac{[Z]}{[X][Y]}$$

$$10^4 = \frac{2v}{v.2v} \quad \left[K_c = 10^4\right]$$

$$v = 10^{-4}$$

$$\therefore \quad [Z] = 2v = 2 \times 10^{-4}.$$

409. Which of the following is correct for the reaction? $N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$

(a) $K_p = K_c$
(b) $K_p < K_c$
(c) $K_p > K_c$
(d) Pressure is required to predict the correlation

UPTU/UPSEE-2005

Ans. (b) : We know that – $K_p = K_c\ (RT)^{\Delta n_g}$

For, $K_p > K_c$ and $K_P < K_c$
$\Delta n_g \geq 1$ $\quad \Delta n_g < 1$

In reaction –

$$N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$$

$$\Delta n_g = 2 - (3 + 1) = 2 - 4 = -2$$

So, $K_p < K_c$

410. For reaction, $2NOCl(g) \rightleftharpoons 2NO(g) + Cl_2(g); K_c$ at 427°C is 3×10^{-6}L mol^{-1}. The value of K_p is nearly:

(a) 7.50×10^{-5} (b) 2.50×10^{-5}
(c) 2.50×10^{-4} (d) 1.75×10^{-4}

AIIMS-2005

Ans. (d): Given data: $K_c = 3 \times 10^{-6}$ mol L^{-1}
$T = 427^oC$, $K_p = ?$

The equilibrium reaction is-

$$2NOCl(g) \rightleftharpoons 2NO(g) + Cl_2(g)$$

Now, $\quad K_p = K_c\ (RT)^{\Delta n_g}$

$$\Delta n_g = (2 + 1) - 2 = 1$$

So, $\quad K_p = 3 \times 10^{-6} \times (RT)^1$

$$K_p = 3 \times 10^{-6} \times (0.0821 \times 700)^1$$

$$K_p = 1.722 \times 10^{-4}$$

$$K_p \approx 1.75 \times 10^{-4}$$

411. Which of the following is true for the reaction

$$CO(g) + \frac{1}{2}O_2(g) \rightleftharpoons CO_2(g)$$

(a) $K_p > K_c$ (b) $K_p < K_c$
(c) $K_p = K_c$ (d) $K_p \geq K_c$

JCECE - 2004

Ans. (b) : For the reaction-

$$CO(g) + \frac{1}{2}O_2(g) \rightleftharpoons CO_2(g)$$

$$\therefore \quad K_p = K_c(RT)^{\Delta n_g}$$

$$\Delta n_g = 1 - \left(1 + \frac{1}{2}\right) = 1 - \left(\frac{3}{2}\right) = \frac{-1}{2}$$

Here, Δn_g is < 1

In such case $K_c > K_p$

412. For the reaction, $2NO_2 \rightleftharpoons 2NO + O_2$, the value of K_p is equal to K. What will the value of K_p for reaction.

$$NO + \frac{1}{2}O_2 \longrightarrow NO_2$$

(a) $\sqrt{K}$ (b) $\frac{1}{K}$
(c) $\sqrt{\frac{1}{K}}$ (d) $\frac{1}{K^2}$

JIMPER-2004

Ans. (c) : For the reaction – $2NO_2 \rightleftharpoons 2NO + O_2$

$$\therefore \quad K_p = \frac{(p_{NO})^2 (p_{O_2})}{(p_{NO_2})^2}$$

$$K = \frac{(p_{NO})^2 (p_{O_2})}{(p_{NO_2})^2} \quad \text{.....(1)}$$

And, $\quad NO + \frac{1}{2}O_2 \rightarrow NO_2$

@apna_pdf

$$K_p = \frac{p_{NO_2}}{(p_{NO})(p_{O_2})^{1/2}}$$

Squaring on both sides – we get

$$(K_p)^2 = \frac{(p_{NO_2})^2}{(p_{NO})^2(p_{O_2})}$$

$$(K_p)^2 = \left(\frac{1}{K}\right) \qquad \text{by equation ….(i)}$$

$$K_p = \sqrt{\frac{1}{K}}$$

413. In the reaction, H_2+I_2—— 2HI

In a 1 L flask, 0.4 mole of each H_2 and I_2 are taken. At equilibrium 0.5 mole of HI are formed. What will be the value of equilibrium constant, K_c?

(a) 20.2 (b) 25.4

(c) 0.284 (d) 11.1

UP CPMT-2004

Ans. (d) : For the reaction,

	H_2	+	$I_2 \rightleftharpoons$	2HI
Initial moles	0.4		0.4	0
No, of moles at equilibrium	(0.4 – 0.25) =0.15		(0.4 – 0.25) =0.15	0.50

$$\therefore \qquad K_C = \frac{[HI]^2}{[H_2][I_2]}$$

Given, V = 1 L

∴ [HI] = 0.5/1 = 0.5 mol/L

$[H_2]$ = $[I_2]$ =0.15/1 = 0.15 mol/L

$$\therefore \qquad K_C = \frac{(0.5)^2}{(0.15)\times(0.15)}$$

= 11.11

414. In which of the following reactions, the concentration of product is higher than the concentration of reactant at equilibrium?

(K_c = equilibrium constant)

(a) $A \rightleftharpoons B; K_c = 0.001$

(b) $M \rightleftharpoons N; K_c = 10$

(c) $X \rightleftharpoons Y; K_c = 0.005$

(d) $R \rightleftharpoons P; K_c = 0.01$

A.P.EAMCET 2004

Ans. (b) : For a reaction

$$K_c = \frac{[Product]}{[reactant]}$$

Hence, If $K_c > 1$, then, [Product] > [Reactant].

As per option,

(a) K_c = 0.001 which is <1

(c) K_c = 0.005 which is <1

(d) K_c = 0.01 which is <1

So, in option (b) K_c = 10 which is >1.

Hence, (b) is correct answer.

415. For reaction,

$$PCl_3(g) + Cl_2(g) \rightleftharpoons PCl_5(g)$$

the value of K_c at 250ºC is 26. At the same temperature, the value of K_p is:

(a) 0.46 (b) 0.61

(c) 0.95 (d) 0.73

JCECE - 2003

Ans. (b): Given data: K_c = 26, T = 250ºC = 250 + 273

K_p = ? = 523 K

For the reaction,

$$PCl_3 + Cl_2 \rightleftharpoons PCl_5$$

$$\therefore \qquad K_p = K_c(RT)^{\Delta n_g}$$

$$\Delta n_g = 1 - 2 = -1$$

R = 0.0821, T = 250 + 273.15 = 523.15

$$\text{So,} \qquad K_p = K_c(RT)^{-1}$$

$$K_p = \frac{26}{0.0821\times 523.15}$$

K_p = 0.61

416. Equilibrium constant K_p of following reaction

$MgCO_3(s) \rightleftharpoons MgO(s) + CO_2(g)$

(a) $K_p = p_{CO_2}$

(b) $K_p = p_{CO_2} \times \frac{p_{CO_2} \times p_{MgO}}{p_{MgCO_3}}$

(c) $K_p = \frac{p_{CO_2} \times p_{MgO}}{p_{MgCO_3}}$

(d) $K_p = \frac{p_{MgCO_3}}{p_{CO_2} \times p_{MgO}}$

NEET-2000

Ans. (a) : The given reaction is –

$$MgCO_3(s) \rightleftharpoons MgO(s) + CO_2(g)$$

$$\therefore \qquad K_p = \frac{p_{CO_2} \cdot p_{MgO}}{p_{MgCO_3}}$$

But $MgCO_3$ and MgO are pure solids

So, $K_p = p_{CO_2}$

417. 4.5 moles, each of hydrogen and iodine was heated in a sealed 10 L vessel. At equilibrium, 3 moles of HI were found. The equilibrium constant for $H_2(g) + I_2(g) \rightarrow 2HI(g)$, is

(a) 1 (b) 10

(c) 5 (d) 0.33

A.P.EAMCET 1998

Ans. (a) : The equilibrium reaction is -

	$H_2(g)$	+ $I_2(g) \rightarrow$	2HI (g)
Initially	4.5	4.5	0
At equilibrium	(4.5–x)	(4.5–x)	3 or (2x)

$$\therefore \qquad K_c = \frac{[HI]^2}{[H_2][I_2]}$$

$$\therefore \qquad 2x = 3$$

$$x = \frac{3}{2} = 1.5$$

@apna_pdf

Since, (4.5 –x) ⇒ (4.5 – 1.5) = 3

Hence, $K_c = \dfrac{\left(\dfrac{3}{10}\right)^2}{\left(\dfrac{3}{10}\right)\left(\dfrac{3}{10}\right)}$

$K_c = 1$

418. For the reaction $C(s) + CO_2(g) \rightleftharpoons 2CO(g)$, the partial pressures of CO_2 and CO are 2.0 and 4.0 atm respectively at equilibrium. What is the value of K_p for the reaction?

(a) 0.5 (b) 4.0
(c) 8.0 (d) 32

AP EAMCET (Medical) -1998

Ans. (c): For the reaction–

$$C(s) + CO_2(g) \rightleftharpoons 2CO(g)$$

The concentration of solid and liquid are taken as unity

$C(s) = 1$

Given– $P_{CO_2} = 2.0$ atm

$P_{CO} = 4.0$ atm

$K_p = ?$

$\because \quad K_p = \dfrac{[P_{CO}]^2}{[P_{CO_2}]}$

or $\quad K_p = \dfrac{(4)^2}{2}$

or $\quad K_p = 8$ atm

419. The value of K_p for the reaction $2H_2S(g) \rightleftharpoons 2H_2(g) + S_2(g)$ is 1.2×10^{-2} at 1065 ºC. The value of K_c for this reaction is

(a) 1.2×10^{-2} (b) $<1.2 \times 10^{-2}$
(c) 83 (d) $>1.2 \times 10^{-2}$

AP – EAMCET - (Medical)-1997

Ans. (b) : Given that,

$K_p = 1.2 \times 10^{-2}$

$T = 1065 + 273 = 1338$ K

$\therefore \quad K_p = K_c (RT)^{\Delta n_g}$

Since, Δn_g = no. of mole of gaseous product – no of mole of gaseous reaction

= (2 + 1) – 2 = 1

Putting the value, we get–

$1.2 \times 10^{-2} = K_c [0.082 \times 1338]^1$

$K_c = \dfrac{1.2\times10^{-2}}{109}$

$K_c = 1.1 \times 10^{-4}$

Hence, $K_c < 1.2 \times 10^{-2}$

420. At 80ºC distilled water has $[H_3O^+]$concentration equal to 1×10^{-6} mole/litre. The value of K_p at this temperature will be

(a) 1×10^{-12} (b) 1×10^{-15}
(c) 1×10^{-6} (d) 1×10–9

NEET-1994

Ans. (a) : Given data: $[H^+] = 1 \times 10^{-6}$ mole /L

Now, $K_w = [H^+][OH^-]$

But $[H^+] = [OH^-]$

$\therefore \quad K_w = [H^+]^2$

$= (1 \times 10^{-6})^2$

$= 1 \times 10^{-12}$

421. In the equilibrium reaction, $A(g) + 2B(g) \rightleftharpoons C(g) + D(g)$, the equilibrium constant, K_c is given by the expression

(a) $K_c = \dfrac{[C][D]}{[A][B]}$ (b) $K_c = \dfrac{[C][D]^2}{[A][B]}$

(c) $K_c = \dfrac{[A][B]^2}{[C][D]}$ (d) $K_c = \dfrac{[C][D]}{[A][B]^2}$

AP-EAMCET-1994

Ans. (d) : The equilibrium reaction is given below-

$$A(g) + 2B(g) \rightleftharpoons C(g) + D(g)$$

The expression of equilibrium constant (K_c) for above reaction is-

$$K_c = \frac{[C][D]}{[A][B]^2}$$

422. For the reaction, $CO(g) + Cl_2(g) \rightleftharpoons COCl_2(g)$, the K_p/K_c is equal to

(a) 1/RT (b) RT
(c) √RT (d) 1.0

AIEEE-2004

Ans. (a) : For the reaction -

$$CO(g) + Cl_2(g) \rightleftharpoons COCl_2(g)$$

$\therefore \quad K_p = K_c (RT)^{\Delta n_g}$

$\Delta n_g = 1 - 2 = -1$

$K_p = K_c (RT)^{-1}$

$\dfrac{K_p}{K_c} = \dfrac{1}{RT}$

423. For the reaction equilibrium $N_2O_4(g) \rightleftharpoons 2NO_2(g)$ the concentrations of N_2O_4 and NO_2 at equilibrium are 4.8×10^{-2} and 1.2×10^{-2} mol L^{-1}, respectively. The value of K_c for the reaction is

(a) 3.3×10^2 mol L^{-1} (b) 3×10^{-1} mol L^{-1}
(c) 3×10^{-3} mol L^{-1} (d) 3×10^3 mol L^{-1}

BITSAT-2007

Ans. (c) : Given data: $[N_2O_4] = 4.8\times10^{-2}$ mol/L

$[NO_2] = 1.2\times10^{-2}$ mol/L

$K_c = ?$

For the equilibrium reaction -

$$N_2O_4(g) \rightleftharpoons 2NO_2(g)$$

$\therefore \quad K_c = \dfrac{[NO_2]^2}{[N_2O_4]} = \dfrac{1.2\times10^{-2}\times1.2\times10^{-2}}{4.8\times10^{-2}}$

$K_c = 3 \times 10^{-3}$ mol lit^{-1}

@apna_pdf

424. A vessel at 1000 K contains CO_2 with a pressure of 0.5 atm. Some of the CO_2 is converted into CO on the addition of graphite. If the total pressure at equilibrium is 0.8 atm, the value of K_p is

(a) 1.8 atm (b) 3 atm
(c) 0.3 atm (d) 0.18 atm

AIEEE-2011

Ans. (a) : The reaction is -

$$CO_2(g) + C(s) \longrightarrow 2CO(g)$$

Initial pressure 0.5 0

Final pressure (0.5 –x) 2x

Total pressure at equilibrium = Partial pressure of CO_2 and CO

$$(0.5-x) + 2x = 0.8$$
$$x = 0.3$$
$$\therefore \quad P_{CO} = 2x = 2\times 0.3 = 0.6$$
$$P_{CO_2} = 0.5 - x = 0.5 - 0.3 = 0.2$$

Now, $K_p = \dfrac{P_{CO}^2}{P_{CO_2}} = \dfrac{(0.6)^2}{0.2} = 1.8$ atm

425. The standard Gibbs energy change at 300 K for the reaction, $2A \rightleftharpoons B + C$ is 2494.2 J. At a given time, the composition of the reaction mixture is [A] = ½, [B] = 2 and [C] = ½. The reaction proceeds in the 'R = 8.314 JK/mol, e = 2.718]

(a) forward direction because $Q > k_c$
(b) reverse direction because $Q > k_c$
(c) forward direction because $Q < k_c$
(d) reverse direction because $Q < k_c$

JEE-Main-2015

Ans. (b) : Given data: T = 300 K, $\Delta G^o = 2494.2$ J

$$[A] = \frac{1}{2}, \quad [B] = 2, \quad [C] = \frac{1}{2}$$

For equilibrium reaction -

$$2A \rightleftharpoons B + C$$

$$\therefore \quad Q_c = \frac{[B][C]}{[A]^2} = \frac{2\times\frac{1}{2}}{\left(\frac{1}{2}\right)^2} = 4$$

We know,

$$\Delta G^o = -2.303RT \log K_c$$
$$2494.2 = -2.303 \times 8.314 \times 300 \log K_c$$
$$K_c = 0.37$$

Hence, $Q_c > K_c$ so the equilibrium will shift in the reverse direction.

426. Consider the following reversible chemical reactions,

$$A_2(g) + B_2(g) \overset{K_1}{\rightleftharpoons} 2AB(g) \ldots(I)$$
$$6AB(g) \overset{K_2}{\rightleftharpoons} 3A_2(g) + 3B_2(g) \ldots(II)$$

The relation between K_1 and K_2 is

(a) $K_2 = K_1^3$ (b) $K_1K_2 = 3$
(c) $K_2 = K_1^{-3}$ (d) $K_1K_2 = \dfrac{1}{3}$

JEE-Main-2019

Ans. (c) : $A_2(g) + B_2(g) \rightleftharpoons 2AB(g)$

Multiply by (3) and reverse the reaction -

$$6AB(g) \rightleftharpoons 3A_2(g) + 3B_2(g)$$

$$\Rightarrow \quad \left(\frac{1}{K_1}\right)^3 = K_2$$

$$\Rightarrow \quad K_2 = (K_1)^{-3}$$

427. For the equilibrium, $2H_2O \rightleftharpoons H_3O^+ + OH^-$, the value of ΔG^o at 298 K is approximately

(a) -80kJ mol^{-1} (b) 100kJ mol^{-1}
(c) 80kJ mol^{-1} (d) -100kJ mol^{-1}

JEE-Main-2019

Ans. (c) : Given, $K = 10^{-14}$, T = 298 K

$$2H_2O \rightleftharpoons H_3O^+ + OH^-$$

Standard Gibbs free energy is given by,

$$\Delta G^o = -RT \ln k$$
$$\Delta G^o = -2.303\times 8.314\times 298 \log 10^{-14}$$
$$\Delta G^o = 79.88 \text{ kJ mol}^{-1}$$
$$\Delta G^o \approx 80 \text{ kJ / mole}$$

428. Equivalent amounts of H_2 and I_2 are heated in a closed vessel till equilibrium is obtained. If 80% of the hydrogen can be converted to HI, the K_c at the temperature is

(a) 64 (b) 16 (c) 0.25 (d) 4

VITEEE-2007

Ans. (a) :

	H_2	+	I_2	$\rightleftharpoons$	2HI
Initial moles	1		1		0
At equilibrium	(1 – x)		(1 – x)		(2x)

$$\therefore \quad K_c = \frac{[HI]^2}{[H_2][I_2]} = \frac{(2x)^2}{(1-x)^2}$$

Given, x = 80% = 0.80

$$\therefore \quad K_c = \frac{(2\times 0.80)^2}{(1-0.80)^2} = 64$$

429. For the reaction,

$$Fe_2N(s) + \frac{3}{2}H_2(g) \rightleftharpoons Fe(s) + NH_3(g)$$

(a) $K_c = K_p(RT$ (b) $K_c = K_p(RT)^{-1/2}$
(c) $K_c = K_p(RT)^{1/2}$ (d) $K_c = K_p^p(RT)^{3/2}$

JEE-Main-2020

Ans. (c) : For the reaction –

$$Fe_2N(s) + \frac{3}{2}H_2(g) \rightleftharpoons Fe(s) + NH_3(g)$$

$$\therefore \quad K_p = K_c\,(RT)^{\Delta n_g}$$

$$\Delta n_g = (1 + 0) - \left(\frac{3}{2} + 0\right) = 1 - \frac{3}{2} = -\frac{1}{2}$$

So, $K_p = K_c\,(RT)^{-1/2}$

or $K_c = K_p\,(RT)^{1/2}$

@apna_pdf

430. Value of K_p for the equilibrium reaction

$$N_2O_4(g) \rightleftharpoons 2NO_2(g)$$

at 288 K is 47.9.

The K_c for this reaction at same temperature is ...... (Nearest integer)

($R=0.083$ L bar $K^{-1}mol^{-1}$)

AIEEE-2012

Ans. (2) : Given data: T = 288 K, $K_p = 47.9$, K_c = ?

The reaction is –

$$N_2O_4(g) \rightleftharpoons 2NO_2(g)$$

So, $K_p = K_c (RT)^{\Delta n_g}$

$\because$ $\Delta n_g = 2 - 1 = 1$

$\therefore$ $K_p = K_c (RT)$

$\Rightarrow$ $47.9 = K_c \times 0.083 \times 288$

$\Rightarrow$ $47.9 = K_c \times 23.904$

$K_c = 2.00$

431. In a chemical reaction,

$A + 2B \overset{k}{\rightleftharpoons} 2C + D$, the initial concentration of B was 1.5 times of the concentration of A, but the equilibrium concentrations of A and B were found to be equal. The equilibrium constant (K) for the chemical reaction is

(a) $\frac{1}{4}$ (b) 16 (c) 1 (d) 4

JEE-Main-2013

Ans. (d) : $A + 2B \rightleftharpoons 2C + D$

	A	2B	2C	D
Initial	1	1.5	0	0
Equi.	1-x	1.5–2x	2x	x

At equilibrium [A] = [B]

$1 - x = 1.5 - 2x$

$x = 0.5$

$$\therefore \quad K_c = \frac{[C]^2[D]}{[A][B]^2}$$

$$K_c = \frac{(2x)^2(x)}{(1-x)(1.5-2x)^2}$$

$$K_c = \frac{1\times1\times0.5}{0.5\times0.5\times0.5}$$

$K_c = 4$

432. The gas phase reaction $2A(g) \rightleftharpoons A_2(g)$ at 400 K has $\Delta G^o = +25.2$ kJ mol^{-1} The equilibrium constant K_c for this reaction is ....$\times10^{-2}$. (Round off to the nearest integer). [Use:$R=8.3 J mol^{-1}K^{-1}$, ln 10=2.3] $\log_{10} 2 = 0.30$, 1 atm = 1bar] [antilog (-0.3)=0.501]

JEE-Main-18.03.2021, Shift-I

Ans. (1.66) : Given reaction is,

$$2A(g) \rightleftharpoons A_2(g)$$

Given, $\Delta G° = + 25.2$ kJ

= 25200 joule

T = 400 K

Using the formula,

$\Rightarrow$ $\Delta G° = -RT \ln K_p$

$\Rightarrow$ $25200 = -2.303 \times 8.314 \times 400 \log K_p$

$\Rightarrow$ $K_p = 10^{-3.3} = 10^{-3} \times 0.501$

$= 5.01 \times 10^{-4}$ bar^{-1}

$= 5.01 \times 10^{-9}$ Pa^{-1}

$$= \frac{K_c}{8.3\times400}$$

$K_c = 1.66\times10^{-5}$ m^3/mol

$= 1.66\times10^{-2}$ L/mol

433. Consider the reaction, $N_2O_4(g) \rightleftharpoons 2NO_2(g)$. The temperature at Which K_c=20.4 and K_p =600.1, is ...... K. (Round off to the nearest integer.) [Assume all gases are ideal and R=0.0831L bar, k^{-1} mol^{-1}].

JEE-Main-18.03.2021, Shift-II

Ans. (354) : The reaction is–

$$N_2O_4(g) \rightleftharpoons 2NO_2(g)$$

We have, $K_c = 20.4$, $K_p = 600.1$

Now, $K_p = K_c (RT)^{\Delta n_g}$

$\Delta n_g = 2 - 1 = 1$

So, $K_p = K_c (RT)^1$

$600.1 = 20.4 \times 0.0831 \times T$

$$\Rightarrow \quad \frac{600.1}{1.69524} = T$$

$\Rightarrow$ $T = 353.99$

$\approx$ $T = 354$

434. The value of K_c for the reaction : $A + 3B \rightleftharpoons 2C$ at 400° C is 0.5 Calculate the value of K_p

(a) 1.64×10^{-4} (b) 1.64×10^{-6}

(c) 1.64×10^{-5} (d) 1.64×10^{-3}

VITEEE-2019

Ans. (a) : Given,

$K_c = 0.5$

$T = 400°C = 400+273 = 673$ K

K_p = ?

$A + 3B \rightleftharpoons 2C$

$\Delta n = 2 - 4 = -2$

$K_p = K_c (RT)^{\Delta n}$

$K_p = 0.5 \times (0.082\times673)^{-2}$

$K_p = 1.64 \times 10^{-4}$ atm.

435. For the reaction:

$2BaO_2(s) \rightleftharpoons 2BaO(s) + O_2(g)$;

ΔH = +ve. In equilibrium condition, pressure of O_2 is dependent on

(a) mass of BaO_2

(b) mass of BaO

(c) temperature of equilibrium

(d) mass of BaO_2 and BaO both

VITEEE-2018

Ans. (c) : The given reaction is

$$2BaO_2(s) \rightleftharpoons 2BaO(s) + O_2(g), \Delta H = +Ve$$

Pure solids do not change state of equilibrium.

Hence, at equilibrium–

$K_p = PO_2$

Only, a change in temperature, changes K_P hence PO_2 will be affected by increasing temperature.

@apna_pdf

436. For the rection

$$\mathbf{2NO_2(g) \rightleftharpoons 2NO(g) + O_2(g),}$$

(K_c=1.8×10^{-6} at 184°C) (R = 0.0831 kJ/(mol.K) When K_p and K_c are compared at 184°C, it is found that

(a) Whether K_p is greater than, less than or equal to K_c depends upon the total gas pressure
(b) $K_p = K_c$
(c) K_p is less than K_c
(d) K_p is greater than K_c

VITEEE-2017

Ans. (d) : : Given, $K_c = 1.8\times10^{-6}$, T = 184°C
R = 0.0831 kJ/mol.K

The reaction is-

$$2NO_2(g) \rightleftharpoons 2NO(g) + O_2(g)$$

∵ $\Delta n_g = 2 + 1 - 2 = 1$

So, $K_p = K_c(RT)^{\Delta n_g}$

$$K_p = 1.8\times10^{-6}(0.0831\times457)^1$$

$$K_p = 6.836\times10^{-6}$$

Hence it is clear that $K_p > K_c$

437. A moles of PCl_5 is heated in a closed container to equilibrium $\mathbf{PCl_5(g) \rightleftharpoons PCl_3(g) + Cl_2(g)}$ at a pressure of P atm. If x moles of PCl_5 dissociate at equilibrium, then

(a) $\frac{x}{a} = \frac{K_p}{K_p + P}$
(b) $\frac{x}{a} = \left(\frac{K_p + P}{K_p}\right)^{1/2}$
(c) $\frac{x}{a} = \left(\frac{K_p}{P}\right)^{1/2}$
(d) $\frac{x}{a} = \left(\frac{K_p}{K_p + P}\right)^{1/2}$

VITEEE-2016

Ans. (d) : Given reaction -

$$\underset{1-\alpha}{PCl_5(g)} \rightleftharpoons \underset{\alpha}{PCl_3(g)} + \underset{\alpha}{Cl_2(g)}$$

Moles of PCl_5 dissociated = x
Moles of PCl_5 left = a – x
moles of PCl_3 formed = x
moles of Cl_2 formed = x
Total moles = (a+x)

degree of dissociation $\alpha = \frac{x}{a}$

Pressure due to PCl_5 = $\left(\frac{1-\alpha}{1+\alpha}\right)P$

Pressure due to PCl_3 = $\left(\frac{\alpha}{1+\alpha}\right)P$

Pressure due to Cl_2 = $\left(\frac{\alpha}{1+\alpha}\right)P$

Now, $\frac{X_{PCl_3}.X_{PCl_2}}{X_{PCl_5}}.P = \frac{\alpha^2}{1-\alpha^2}P$

$$K_p(1-\alpha) = \alpha^2 P$$

$$K_p - K_p\alpha^2 = \alpha^2 P$$

$$K_p = (K_p + P)\alpha^2$$

$$\alpha = \sqrt{\frac{K_p}{K_p + P}} = \frac{x}{a} \Rightarrow \frac{x}{a} = \sqrt{\frac{K_p}{K_p + P}}$$

8. Relation Between Equilibrium Constant (K), Reaction Quient (Q) and Gibb's Energy

438. For the process,

$\frac{3}{2}A \rightarrow B$, at 298 K, ΔG^0 is 163 kJ mol^{-1}. The composition of the reaction mixture is [B]= 1 and [A]=10000. Predict the direction of the reaction and the relation between reaction quotient (Q) and he equilibrium constant (K)

(a) Forwards direction because Q>K
(b) Reverse direction because Q>K
(c) Forward direction because Q<K
(d) Reverse direction because Q<K
(e) It is equilibrium as Q=K

Kerala-CEE-2017

Ans. (b) : For the process, $\frac{3}{2}A \rightarrow B$

$$Q = \frac{[\text{conc. of product}]^n}{[\text{conc. of reaction}]^n} = \frac{[B]}{[A]^{3/2}}$$

$$Q = \frac{1}{[10000]^{3/2}} = 10^{-6}$$

Also, $\Delta G = -2.303RT \log K$

$163\times1000 = -2.303\times8.314\times298 \log K$

∴ $\log K = -\frac{163\times1000}{2.303\times8.314\times298} = -\frac{163000}{5705.8}$

$\log K \approx -28.57$

∴ $K = 2.7\times10^{-29}$

i.e., K < Q means

The backward reaction is favoured with Q > K.

439. In the lnK vs. $\frac{1}{T}$ plot of a chemical process having $\Delta S^0 > 0$ and $\Delta H^0 < 0$ the slope is proportional to (where K is equilibrium constant)

(a) $-|\Delta H^0|$
(b) $|\Delta H^0|$
(c) ΔS^0
(d) $-\Delta S^0$
(e) ΔG^0

Kerala-CEE-2017

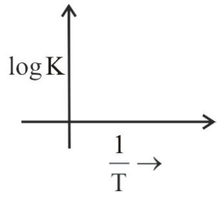
Ans. (b) : We Know that –

$$\log K = \log A - \frac{\Delta H}{2.303R}.\frac{1}{T}$$

And, $\Delta G = \Delta H - T\Delta S = -2.303RT \log K$

On plotting the graph between logK and $\frac{1}{T}$ using straight line equation.

@apna_pdf



$y = mx+c$

$\log K \propto \frac{1}{T}$

If ΔS° > 0 and ΔS° < 0 then the slope is proportional to |ΔH°|

440. For the equilibrium,

$CaCO_3(s) \rightleftharpoons CaO(s) + CO_2(g);$

$K_p = 1.64 \text{ atm at } 1000 \text{ K}$

50g of $CaCO_3$ in a 10 L closed vessel is heated to 1000 K. Percentage of $CaCO_3$ that remains unreacted at equilibrium is

(Given, R = 0.082 L atm K^{-1} mol^{-1})

(a) 40
(b) 50
(c) 60
(d) 20

Karnataka-CET-2014

Ans. (c) : $CaCO_3(s) \rightleftharpoons CaO(s) + CO_2(g)$

Number of moles of $CaCO_3$ present initially = $\frac{50}{100} = 0.5$ moles

K_p of the given reaction can be written as –

$$K_p = P_{CO_2} = 1.64 \text{ atm}$$

Number of moles of $CO_2 = \frac{P_{CO_2}V}{RT}$

$$= \frac{1.64 \times 10}{0.082 \times 1000} = 0.2 \text{ mole}$$

Number of moles of $CaCO_3$ unreacted = (0.5 – 0.2) = 0.3 moles.

Hence, percentage of $CaCO_3$ unreacted = $\frac{0.3}{0.5} \times 100 = 60\%$

441. The equilibrium constant of a reaction is 0.008 at 298 K. The standard free energy change of the reaction at the same temperature is

(a) –11.96 kJ
(b) –5.43 kJ
(c) –8.46kJ
(d) +11.96 kJ

Karnataka-CET-2012

Ans. (d) : Equilibrium constant of a reaction = 0.008

Standard free energy change

$\Delta G° = – RT\log K$

$= –2.303 \times 8.314 \times 298 \log 0.008$

$= –2.303 \times 8.314 \times 298 \times (–2.1)$

$= 11962$ J/mole

$= 11.96$ kJ/mole

442. Assertion: Reaction quotient is defined in the same way as equilibrium constant at any stage of the reaction.

Reason: If Q_c (reaction quotient) < K_c (equilibrium constant) reaction moves in direction of reactants.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both assertion and Reason are correct, but Reason is not the correct explanation of assertion.
(c) If Assertion if correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS-(2011)

Ans. (c): We know that,

$$aA + bB \rightleftharpoons cC + dD$$

$$Q_c = \frac{[C]^c[D]^d}{[A]^a[B]^b}$$

If $Q_c > K_c$, reaction will proceed in the direction of reactants.

If $Q_c < K_c$, reaction will move in direction of products.

If $Q_c = K_c$, the reaction mixture is already at equilibrium.

So, option (c) is correct.

443. Which of the following is a wrong statement about equilibrium state?

(a) Rate of forward reaction= Rate of backward reaction
(b) Equilibrium is dynamic
(c) Catalysts increase value of equilibrium constant
(d) Free energy change is zero

CG PET -2009

Ans. (c) : Chemical equilibrium is dynamic in nature which in other words means that reactions continue to occur in both forward as well as backward direction with the same speed.

Equilibrium constant has definite value for every chemical reaction at a given temperature. It is independent of concentration and catalyst.

Free energy change :

$$\Delta G = \Delta G^o + 2.303 \text{ RT} \log Q$$

So, option (a), (b), (d) follows equilibrium state but (c) not follows.

Hence, option (c) is correct.

444. The equilibrium constant (K) of a reaction may be written as

(a) $K= e^{-\Delta G/RT}$
(b) $K = e^{-\Delta G^0/RT}$
(c) $K=e^{-\Delta H/RT}$
(d) $K = e^{-\Delta H^0/RT}$

WB-JEE-2009

Ans. (b) : We know that:

$$\Delta G° = –nFE°$$

And, $$E° = \frac{RT}{nF}\log K$$

$$\Delta G° = –RT \log K$$

$$K = e^{-\Delta G°/RT}$$

445. The standard emf of a cell, involving one electron change is found to be 0.591 V at 25^0C. The equilibrium constant of the reaction is (F = 96500Cmol^{-1})

(a) 1.0×10^1
(b) 1.0×10^5
(c) 1.0×10^{10}
(d) 1.0×10^{30}

UPTU/UPSEE-2008

@apna_pdf

Ans. (c) : Relation between K_{eq} and E_{cell} us

$$E^{\circ}_{cell} = \frac{2.303RT}{nF}\log K_{eq}$$

$$E^{\circ}_{cell} = \frac{2.303RT}{nF}\log K_{eq} \text{ (at 298 K)}$$

$$E^{\circ}_{cell} = \frac{0.0591}{n}\log K_{eq}$$

$$0.0591 = \frac{0.0591}{n}\log K_{eq}$$

$\log K_{eq} = 10 = K_{eq} = \text{antilog } 10$

$K_{eq} = 1\times10^{10}$

446. The equilibrium constant of the reaction $Cu(s)+2Ag^{+}(aq) \rightarrow Cu^{2+}(aq)+Ag(s)$ [Given : $E^{o} = 0.46$ V] will be

(a) 4×10^{15}

(b) 4×10^{14}

(c) 14×10^{15}

(d) 15.6×10^{5}

AMU-2007

Ans. (a) : The equilibrium constant for the give reaction can be given as, [Given : $E^{o}= 0.46$ V]

$Cu(s)+2Ag^{+}(aq)\rightarrow Cu^{2+}(aq)+Ag(s)$

$$E^{o} = \frac{0.0591}{n}\log K \quad \text{.....(i)}$$

Where, K = Equilibrium constant , n = Number of electrons.

On putting the values in eqn, ….(i) we get

$$0.46 = \frac{0.0591}{n}\log K$$

$$\log K = \frac{0.46\times2}{0.0591}$$

$\therefore \quad K = \text{Antilog } 15.6$

$= 3.688\times10^{15}$ or $= 4\times10^{15}$

447. The standard emf of a cell, involving one electron change is found to be 0.591 V at 25ºC. The equilibrium constant of the reaction is (F = 96500 C mol^{-1})

(a) 1.0×10^{1}

(b) 1.0×10^{5}

(c) 1.0×10^{10}

(d) 1.0×10^{30}

[AIEEE 2004]

Ans. (c) : Equilibrium at 298 K is–

$$E^{o}_{cell} = \frac{0.0591}{n}\log K_c$$

K_c = Equilibrium constant

Given, $E^{o}_{cell} = 0.591$

Now, $$\log K_c = \frac{E^{o}_{cell}\times n}{0.0591} = \frac{0.591\times n}{0.0591}$$

$\log K_c = 10$

Taking antilog both side, we get–

$K_c = 1\times10^{10}$

448. For the equilibrium $H_2O(l) \rightleftharpoons H_2O(g)$ at 1 atm and 298 K:

(a) standard free energy change is equal to zero ($\Delta G^{\circ}=0$).

(b) free energy change is less than zero ($\Delta G<0$).

(c) standard free energy change is less than zero ($\Delta G^{\circ}<0$).

(d) standard free energy change is greater than zero ($\Delta G^{\circ}>0$).

AIIMS-2004

Ans. (b): The process –

$H_2O(l) \rightleftharpoons H_2O(g)$

is an endothermic process, (ΔH = +ve) and entropy increases during this change (ΔS = +ve). Hence this process is spontaneous at all temperatures above $0^{o}C$ ($T\Delta S > \Delta H$), so ΔG^{o} is negative ($\Delta G^{o} = \Delta H - T\Delta S$).

Thus, free energy change (ΔG) will be less than zero (negative) at 1 atm and 298K.

449. The reaction quotient (Q) for the reaction from $N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$ is given by $Q = \frac{[NH_3]^2}{[N_2][H_2]^3}$. The reaction will proceed from right to left if

(a) $Q = K_c$ (b) $Q < K_c$

(c) $Q > K_c$ (d) $Q = 0$

Where K_c is the equilibrium constant.

NEET-2003

Ans. (c) : The reaction quotient for:

$N_2(g)+3H_2(g) \rightleftharpoons 2NH_3(g)$

is given by $Q = \frac{[NH_3]^2}{[N_2][H_2]^3}$

The reaction will proceed in backward direction, when $Q > K_c$. The product concentration is more than equilibrium value.

The reactant concentration is less than the equilibrium value.

450. The equilibrium constant for the reaction, $H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$ is 64 at a certain temperature. The equilibrium concentrations of H_2 and HI are 2 mol/L and 16 mol/L respectively. What is the equilibrium concentration (in mol/L) of I_2?

(a) 16 (b) 4

(c) 8 (d) 2

AP-EAMCET-2000

Ans. (d) : Given that, $K_c = 64$, $[H_2] = 2$ mol/L

[HI] = 16 mol/L

For the equilibrium reaction–

$H_2 + I_2 \rightleftharpoons 2\,HI$

$$\therefore \quad K_C = \frac{[HI]^2}{[H_2][I_2]}$$

@apna_pdf

Substitute values in the above expression–

$$64=\frac{(16)^2}{2\times[I_2]}$$

$$[I_2]=\frac{16\times16}{2\times64}$$

$[I_2]$ = 2 mol/litre

451. For the reaction, $A(g)\rightleftharpoons B(g)$ at 495 k, Δ_rG^0=-9.478 KJ mol^{-1}. If we start the reaction in a closed container at 495 k with 22 millimoles of A, the amount of B is the equilibrium mixture is .... millimoles (Round off to the nearest integer).

[R=8.314 J mol^{-1} K^{-1}, ln10=2.303]

JEE-Main-24.03.2021, Shift-I

Ans. (20) : $\Delta G^0 = -RT\ln K_{eq}$

$-9.478\times10^3 = -495\times8.314\ln K_{eq}$

$\ln K_{eq} = 2.303 = \ln 10$

So, $K_{eq} = 10$

Now, $A(g)\rightleftharpoons B(g)$

t = 0 22 0

t = t 22–x x

$$K_{eq}=\frac{[B]}{[A]}=\frac{x}{(22-x)}$$

$$10=\frac{x}{22-x}$$

x = 20

So, milli moles of B = 20

452. The variation of equilibrium constant with temperature is given below:

Temperature	**Equilibrium constant**
T_1 = 25°C	**K_1=10**
T_2 = 100°C	**K_2 =100**

The values of ΔH^o, ΔG^o at T_1 and ΔG^o at T_2(in KJ Mol^{-1}) respectively are close to [use R= 8.314 JK^{-1} mol^{-1}]

(a) 28.4,-7.14 and -5.71
(b) 0.64,-7.14 and -5.71
(c) 28.4, -5.71and - 14.29
(d) 0.64, - 5.71 and -14.29

JEE-Main-2020

Ans. (c) : T_1 = 298 K, K_1 = 10

T_2 = 373 K, K_2 = 100

For ΔH calculation

$$\log\left(\frac{K_2}{K_1}\right)=\frac{\Delta H}{2.303R}\left(\frac{1}{T_1}-\frac{1}{T_2}\right)$$

$$\log\left(\frac{100}{10}\right)=\frac{\Delta H}{2.303\times\left(\frac{8.314}{1000}\right)}\left(\frac{1}{298}-\frac{1}{373}\right)$$

ΔH = 28.4 kJ/mole

For $\left(\Delta G_1^0\right)$ and $\left(\Delta G_2^0\right)$ calculation

$$\Delta G_1^0 = -2.303\text{ RT}\log K$$

$$\Delta G_1^0 = -2.303\times\frac{8.314}{1000}\times298\times\log 10$$

= –5.71 kJ/mole

$$\Delta G_2^0 = -2.303\times\frac{8.314}{1000}\times373.\times\log 1000$$

= –14.29 kJ/mole

453. For the reaction, $A(g)\longrightarrow B(g)$, The value of the equilibrium constant at 300 k and 1 atm is equal to 100.0. The value of Δ_rG for the reaction at 300 k and 1 atm in J mol^{-1} is - xR, Where x is ....(Rounded off to the nearest integer)

(R=8.31 J mol^{-1} k^{-1} and In10 = 2.3)

JEE-Main-03.03.2021, Shift-I

Ans. 1380 :

$\Delta G^o = -RT\ln k_p$

$= -R(300)\ln(100)$

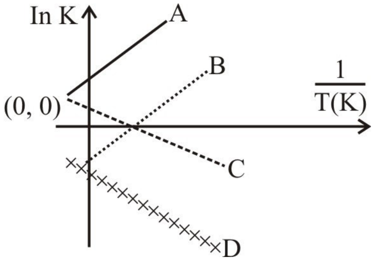
$= -R(300)\,2\ln(10)$

$= -R(300\times2\times2.3)$

$\Delta G^o = -1380R$

∴ x = 1380

454. Which of the following lines correctly show the temperature dependence of equilibrium constant, K, for an exothermic reaction?



(a) A and B
(b) B and C
(c) C and D
(d) A and D

JEE-Main-2018

Ans. (a) : $\Delta G^o = -RT\ln k$

As we know that $\Delta G^o = \Delta H^o - T\Delta S^o$

$\Delta H^o - T\Delta S^o = -RT\ln k$

$$\ln k=\frac{-\Delta H^o}{RT}+\frac{T\Delta S^o}{RT}$$

$$\ln k=\frac{-\Delta H^o}{RT}+\frac{\Delta S^o}{R}$$

For exothermic reaction ΔH^o is negative.

So, In graph of lnk Vs $\frac{1}{T}$ slope is positive.

Hence, line A and B show the correct temperature dependence of equilibrium constant K.

@apna_pdf

08.

Ionic Equilibrium

1. Arrhenius Theory

1. An exothermic reaction $X \rightarrow Y$ has an activation energy 30 kJ mol^{-1}. If energy change ΔE during the reaction is –20 kJ, then the activation energy for the reverse reaction in kJ/mol is ______. (Integer answer)

JEE Main 26.02.2021, Shift-I

Ans. (50) : Given an exothermic reaction -

$X \rightarrow Y,\ \Delta H = -20kJ$

$(E_a)_f = 30kJ\ mol^{-1}$

$\therefore \quad \Delta H = (E_a)_f - (E_a)_b$

Putting the value of these, we get –

$-20 = 30 - (E_a)_b$

$(E_a)_b = 50$ kJ/mole

2. At 527ºC temperature the activation energy is 54.7 KJ/mole. The value of Arrhenius factor is 4 × 10^{10}. The rate constant will be

(a) 12.28 × 10^{-7}
(b) 10.76 × 10^{6}
(c) 10^{7}
(d) 10.76 × 10^{-6}

AIIMS-25.05.2019 (Evening)

Ans. (c): Given that, T= 527°C = 527+273 = 800K

$E_a = 54.7$ kJ/mol, A= 4 × 10^{10}, K = ?

We know that,

$$K = Ae^{-E_a/RT}$$

$$\log K = \log A - \frac{E_a}{2.303RT}$$

Putting the value of these, we get -

$$\log K = \log(4\times10^{10}) - \frac{54.7\times10^{3}}{2.303\times8.314\times800}$$

log K = 10.602–3.57

log K = 7.032

K = 10^{7}

3. Find the correct statement about catalyst.

(a) It changes the value of equilibrium constant K_c or K_p.
(b) It decreases the activation energy of a reaction.
(c) It changes the enthalpy of a reaction.
(d) It is not specific in its function.

SRMJEEE–2013

Ans. (b) : A catalyst is a substance which increase the rate of reaction without itself undergoing any permanent chemical change. Catalyst provides an alternate reaction mechanism by reducing the activation energy between reactants and product. A catalyst does not alter Gibbs energy (ΔG).

4. 20 ml of 0.1 M acetic acid is mixed with 50 mL of potassium acetate. K_a of acetic acid = 1.8 × 10^{-5} at 27°C. Calculate concentration of potassium acetate if pH of the mixture is 4.8.

(a) 0.1 M
(b) 0.04 M
(c) 0.4 M
(d) 0.02 M

VITEEE-2009

Ans. (b) : Given that, pH = 4.8, pK_a = 1.8 × 10^{-5}

Let the concentration of potassium acetate is x.

According to Henderson's equation–

$$pH = pK_a + \log\frac{[salt]}{[acid]}$$

or $$4.8 = -\log\left(1.8\times10^{-5}\right) + \log\frac{x\times50}{20\times0.1M}$$

or 4.8 = 4.74 + log 25x

log 25x = 0.06

25x = 1.148

$\therefore$ x = 0.045M

5. In an endothermic reaction A → B, the activation energy is 10 kcal mol^{-1} and enthalpy of reaction is + 5 kcal mol^{-1}. The activation energy for the backward reaction is

(a) 20 kcal mol^{-1}
(b) 10 kcal mol^{-1}
(c) 5 kcal mol^{-1}
(d) 15 kcal mol^{-1}

Assam CEE-2014

Ans. (c) : Given that, $E_{a(f)}$ = 10 kcal Mol^{-1}

ΔH = +5 k.cal mol^{-1}, $E_{a(b)}$ = ?

$\therefore$ We know that,

$\Delta H = E_{a(f)} - E_{a(b)}$

$5 = 10 - E_{a(b)}$

$E_{a(b)} = 10 - 5 = 5$ kcal Mol^{-1}

6. Arrhenius equation is :

(a) $\Delta H = \Delta E + \Delta n_g RT$
(b) $\Delta G = \Delta H - T.\Delta S$
(c) $K = Ae^{-E_a/RT}$
(d) none of the above

BCECE-2006

Ans. (c) : Arrhenius equation is expressed as

$K = Ae^{-E_a/RT}$

- K denotes the rate constant of the reaction.
- A denotes the pre-exponential factor.
- E_a denotes the activation energy.
- R is the universal gas constent.
- T denotes the absolute temperature associated with the reaction (in Kelvin).

7. In terms of Arrhenius equation, $k = Ae^{-E_a/RT}$ the temperature dependence of rate constant (k) of a chemical reaction is written. Then, the activation energy (E_a) of the reaction can be calculate by plotting.

(a) $\log k \text{ vs } \frac{1}{\log T}$
(b) $\log k \text{ vs } \frac{1}{T}$
(c) k vs T
(d) $k \text{ vs } \frac{1}{\log T}$

BCECE-2015

@apna_pdf

Ans. (b) : According to the Arrhenius equation -

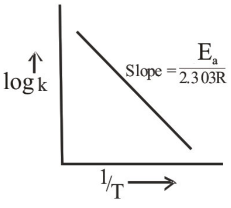
$$K = Ae^{-E_a/RT}$$

Taking 'ln' on both side, we get –

$$\ln k = \ln A + \ln e^{-E_a/RT}$$

$$\ln k = \frac{\ln A}{C} - \frac{E_a}{RT}$$

$$\log k = \frac{\ln A}{2.303} - \frac{E_a}{2.303RT}$$



Thus, log k vs $\frac{1}{T}$

8. The reactivity order of halogenation of alkanes is $F_2 > Cl_2 > Br_2 > I_2$. Choose the correct statements.

(I) Lower the activation energy for the chain initiation step, more reactive is the halogen.
(II) Lower the activation energy for the first chain-propagation step, more reactive is the halogen.
(III) Lower the activation energy for the second chain propagation step, more reactive is the halogen.
(IV) More negative is the overall heat of the reaction (ΔH_r^o of halogenations of alkane) more reactive is the halogen.

(a) I and II
(b) I, II and III
(c) II and IV
(d) II, III and IV

BCECE-2015

Ans. (c) : • Lower the activation energy for the first chain propagation step. More reactive is the halogen.

• More negative is the overall heat of the reaction (ΔH_r^0 of halogenation of alkane) more reactive is the halogen.

Hence, both the statement are correct.

9. The Arrhenius equation gives the dependence of the rate constant of a chemical reaction of the absolute temperature and may be expressed as $K = Ae^{-E_a/RT}$. If the unit of K is s^{-1} the unit of A will be

(a) kJ mol^{-1}
(b) mol^{-1}
(c) s^{-1}
(d) K (kelvin)

CG PET-2019

Ans. (c) : According to the Arrhenius equation–

$$K = Ae^{-E_a/RT}$$

Where, A is the pre-exponential factor.

The unit of the pre-exponential factor A are identical to those of the rate constant and will be vary depending on the order of the reaction. For a first order reaction. it has unit of s^{-1}.

For the reason, it is often called frequency factor.

10. The activation energy for a simple chemical reaction $A \rightarrow B$ is E_a in forward direction. They activation energy for reverse reaction

(a) is negative of E_a
(b) is always less than E_a
(c) can be less than or more than E_a
(d) is always double of E_a

UPTU/UPSEE-2018
CG PET -2007

Ans. (c) : The activation energy of reverse reaction is less than or more than activation energy (E_a) of forward reaction.

∵ $\Delta H = (E_a)_F - (E_a)_R$,

Because it depends. upon the nature of reaction.

If $(E_a)_F < (E_a)_R$ reaction is exothermic

or $(E_a)_F > (E_a)_R$ reaction is endothermic

11. According to Arrhenius equation. The slope of $\log K$ vs $\frac{1}{T}$ plot is…..

(a) $\frac{-E_a}{2.303}$
(b) $\frac{-E_a}{2.303R}$
(c) $\frac{-E_a}{2.303RT}$
(d) $\frac{E_a}{2.303RT}$

MHT CET-2018
JIPMER- 2017
GUJCET-2014

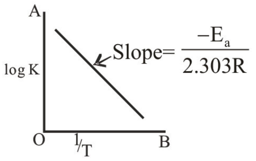
Ans. (b) : According to the Arrhenius equation –

$$K = Ae^{-E_a/RT}$$

Taking log on both sides, we get–

∵ $$\log K = \log A - \frac{E_a}{2.303RT}$$

$$\log K = \frac{-E_a}{2.303R}\frac{1}{T} + \log A$$



When logK is plotted with $\frac{1}{T}$, the slope of will be $\frac{-E_a}{2.303R}$ and intercept given by log A.

12. The activation energy for a reaction at the temperature TK was found to be 2.303 RT J mol^{-1}. The ratio of the rate constant to Arrhenius factor is

(a) 10^{-1}
(b) 10^{-2}
(c) 2×10^{-3}
(d) 2×10^{-2}

Karnataka-CET, 2010

Ans. (a) : Given, that $E_a = 2.303$ RT

According to the Arrhenius equation is –

∵ Rate constant, $k = Ae^{-E_a/RT}$

$$k = Ae^{-2.303\,RT/RT}$$

$$\frac{k}{A} = e^{-2.303}$$

On solving these equation, we get–

$$\frac{k}{A} = 10^{-1}$$

@apna_pdf

13. The activation energy of exothermic reaction A→B is 80 kJ mol^{-1}. The heat of reaction is –200 $kJmol^{-1}$. The activation energy for the reaction B→A (in kJ mol^{-1}) will be

(a) 80 (b) 120
(c) 40 (d) 200
(e) 280

Kerala-CEE-2007

Ans. (e) : The activation energy of exothermic reaction
A→ B = 80 kJ mol^{-1}
$E_{a(f)} = 80$ kJ mol^{-1}, ΔH = –200kJ mol^{-1}, $E_{a(b)}$ = ?
∵ $\Delta H = E_{a(f)} - E_{a(b)}$
Putting the value of these, we get -
$-200 = 80 - E_{a(b)}$
or $E_{a(b)} = 200 + 80 = 280$ kJ mol^{-1}

14. Aqueous solution of which of the following compound is the best conductor of electric current?

(a) Hydrochloric acid, HCl
(b) Ammonia NH_3
(c) Fructose $C_6H_{12}O_6$
(d) Acetic acid, $C_2H_4O_2$

NEET-2015

Ans. (a) : The aqueous solution of hydrochloric acid (HCl) is the best conductor of electric current as it is a strong electrolyte and its completely dissociated into ions.

2. Solubility and Solubility Product Constant

15. The K_{sp} for bismuth sulphide (Bi_2S_3) is 1.08 × 10^{-73}. The solubility of Bi_2S_3 in mol L^{-1} at 298 K is

(a) 1.0 × 10^{-15} (b) 2.7 × 10^{-12}
(c) 3.2 × 10^{-10} (d) 4.2 × 10^{-8}

JEE Main-25.06.2022, Shift-II

Ans. (a) : $Bi_2S_3 \rightleftharpoons \underset{2s}{2Bi^{3+}} + \underset{3s}{3S^{2-}}$

Given that,
$K_{sp} = 1.08 \times 10^{-73}$
$K_{sp} = (2s)^2 (3s)^3$
$= 108(s)^5$
$1.08 \times 10^{-73} = (2s)^2 \times (3s)^3$
$108s^5 = 1.08 \times 10^{-73}$
$s^5 = \dfrac{1.08 \times 10^{-73}}{108}$
$s^5 = 0.01 \times 10^{-73}$
$s^5 = 1 \times 10^{-75}$
$s = 1 \times 10^{-15}$ mol/L

16. The solubility product of a sparingly soluble salt A_2X_3 is 1.1 × 10^{-23}. If specific conductance of the solution is 3 × 10^{-5} S m^{-1}, the limiting molar conductivity of the solution is x × 10^{-3} S m^2 mol^{-1}.
The value of x is ————.

JEE Main-28.06.2022, Shift-I

Ans. (3) : Given that the solubility product of A_2X_3 = 1.1 × 10^{-23}
And specific conductance = 3 × 10^{-5} Sm^{-1}
$A_2X_3(s) \rightleftharpoons \underset{2s}{2A^{+3}(aq)} + \underset{3s}{3X^{-2}(aq)}$
$\therefore K_{sp} = (2s)^2 (3s)^3 = 110 \times 10^{-25}$
or $110 \times 10^{-25} = 4 \times s^2 \times 27 \times s^3$
$110 \times 10^{-25} = 4 \times 27 (s)^5$
or $s = 1 \times 10^{-5}$ = M
$\lambda_m = [x] \times 10^{-3}$ Sm^2 mol^{-1}
$\lambda_m = \dfrac{K \times 10^{-3}}{M}$
$= \dfrac{3 \times 10^{-5} \times 10^{-3}}{1 \times 10^{-5}}$
$= 3 \times 10^{-3}$ Sm^2 mol^{-1}

17. The solubility of AgCl will be maximum in which of the following?

(a) 0.01 M KCl (b) 0.01 M HCl
(c) 0.01 M $AgNO_3$ (d) Deionized water

JEE Main-29.06.2022, Shift-I

Ans. (d) : If similar ion is present already in solution, then the solubility of the salt decreases due to common ion effect.
So we need to dissolve AgCl having Ag^+ and Cl^- ions.
So maximum solubility of AgCl will be in water.

18. The dielectric constants of H_2O and D_2O are 82 and 80.5 respectively. Therefore, the solubility of NaCl in D_2O is ..... than in water:

(a) Equal to (b) Slightly less
(c) Slightly higher (d) Very high

AP-EAMCET (Med.)-1999

Ans. (b) : NaCl is more soluble in H_2O in comparison to D_2O because water is more polar than D_2O. Greater the value of dielectric constant, greater will be the polarity of the solvent.
Hence the solubility of NaCl in D_2O is slightly less then in water

19. The ionic product of water $[H^+]$ $[OH^-]$ is

(a) 10^{-11} (b) 10^{-12}
(c) 10^{-5} (d) 10^{-14}

AIMMS- 25.05.2019, Shift-II
AP-EAMCET-1993

Ans. (d) : The product of concentration of H^+ and OH^- ions in water at a particular temperature is known as ionic product of water. The ionic product of water is 10^{-14}.

20. At 90°C, the concentration of H_3O^+ in pure water is 10^{-6} mol L^{-1}. What is the value of K_w at this temperature?

(a) 10^{-6} (b) 10^{-8}
(c) 10^{-14} (d) 10^{-12}

Manipal-2005, AP-EAMCET 1999

Ans. (d) : Given concentration of H_3O^+ in pure water is 10^{-6} mole L^{-1}
We know that,
∵ $K_w = [H^+] [OH^-]$
∴ $[H_3O^+] = [OH^-]$
or $K_w = 10^{-6} \times 10^{-6}$
$= 10^{-12}$

@apna_pdf

21. 250 mL of a sodium carbonate solution contains 2.65 g of Na_2CO_3. If 10 mL of this solution is diluted to one litre, what is the concentration of resultant solution? (molar mass of Na_2CO_3 = 106 g/mol).

(a) 0.1 M (b) 0.001 M

(c) 0.01 M (d) 10^{-4} M

AP-EAMCET-2001

Ans. (b) : Given that, Molar mass of $Na_2CO_3 = 106\ gmol^{-1}$

Mass of Sodium Carbonate = 2.65 gm, V_1 = 10 mL

$$\therefore \quad M_1 = \frac{2.65}{106}\times\frac{1000}{250} = 0.1\ M$$

Therefore, 10 mL of this solution is diluted to 500 mL

Since, $M_1V_1 = M_2V_2$

$0.1 \times 10 = M_2 \times 1000$

$$\text{or} \quad M_2 = \frac{0.1\times10}{1000} = 0.001\ M$$

22. If the ionic product of water (K_w) is 1.96×10^{-14} at 35°C, what is its value of 10ºC ?

(a) 1.96×10^{-14} (b) 3.92×10^{-14}

(c) 2.95×10^{-15} (d) 1.96×10^{-13}

AP-EAMCET-2003

Ans. (c) : Given that, Initial temperature = 35°C

Ionic product of water (K_w) = 1.96×10^{-14}

Ionic product $\propto$ temperature

According to the question, as the temperature is decreasing (from 35°C to 10ºC) so, the ionic product of water also decreases. So the value of ionic product is 2.95×10^{-15} at 10°C.

23. Magnesium fluoride MgF_2 is a slightly soluble salt whose solubility product $K_{SP} = 3.7 \times 10^{-8}$ What is the approximate solubility of MgF_2 ?

(a) 9.2×10^{-8} M (b) 1.2×10^{-8} M

(c) 1.4×10^{-4} M (d) 2.1×10^{-3} M

SCRA-2012

Ans. (d) : Given that, $K_{sp} = 3.7 \times 10^{-8}$

The dissociation of MgF_2 is

$$MgF_2 \rightleftharpoons Mg^{2+} + 2F^-$$

Let, the solubility product is s.

$K_{sp} = [Mg^{+2}]\,[F^-]^2$

$\therefore \quad K_{sp} = s \times (2s)^2$

$3.7 \times 10^{-8} = 4s^3$

$$\text{or} \quad s^3 = \frac{3.7\times10^{-8}}{4} = 0.925 \times 10^{-8}$$

$s^3 = 9.25 \times 10^{-9}$

or $s = 2.1 \times 10^{-3}$ M

24. Among the following, which is water insoluble?

(a) Sodium fluoride

(b) Potassium fluoride

(c) Beryllium fluoride

(d) Magnesium fluoride

AP-EAMCET-2007

Ans. (d) : The solubility of the fluorides is based on the lattice energy released when there is more attraction and more is the charge density. Magnesium fluoride (MgF_2) is water insoluble because of the fluorides of alkaline earth metal are insoluble in water and beryllium fluoride is slightly soluble in water.

25. The solubility of A_2X_3 is 'y' M. Its solubility product is .... M.

(a) $6y^4$ (b) $64y^4$

(c) $36y^5$ (d) $108y^5$

AP EAMCET (Engg.) 17.09.2020, Shift-II

Ans. (d) : For a sparingly soluble salt of molecular formula A_2X_3, if solubility in pure water is y M at a given temperature,

$$\underset{}{A_2X_3} \rightleftharpoons \underset{2y}{2A^{3+}} + \underset{3y}{3X^{2-}}$$

Solubility product, $K_{sp} = \left[A^{3+}\right]^2\left[X^{2-}\right]^3$

$= (2y)^2 \times (3y)^3$

$= 4y^2 \times 27y^3 = 108\ y^5M$

26. When equal volumes of Ca^{2+} and F^- solutions are mixed, in which of the solutions precipitation will not occur ?

(K_{sp} of $CaF_2 = 1.6 \times 10^{-10}$)

(a) $10^{-2}MCa^{+2} + 10^{-5}MF^-$

(b) $10^{-3}MCa^{+2} + 10^{-3}MF^-$

(c) $10^{-4}MCa^{+2} + 10^{-2}MF^-$

(d) $10^{-2}MCa^{+2} + 10^{-3}MF^-$

AP EAMCET (Engg.) 17.09.2020, Shift-II

Ans. (a) : Ionic product of (CaF_2) = $[Ca^{2+}]$. $[F^-]^2$.

Concentration of ions will be halved after mixing.

Thus, ionic products will be

$$1.\ \frac{10^{-2}}{2}\times\left(\frac{10^{-5}}{2}\right)^2 = \frac{1}{8}\times10^{-12}$$

$$2.\ \frac{10^{-3}}{2}\times\left(\frac{10^{-3}}{2}\right)^2 = \frac{1}{8}\times10^{-9}$$

$$3.\ \frac{10^{-4}}{2}\times\left(\frac{10^{-2}}{2}\right)^2 = \frac{1}{8}\times10^{-8}$$

$$4.\ \frac{10^{-2}}{2}\times\left(\frac{10^{-3}}{2}\right)^2 = \frac{1}{8}\times10^{-8}$$

In option (2), (3) and (4), ionic product > K_{sp}. Hence option (1) of the solution precipitation will not occur.

27. If the solubility product of MgF_2 at a certain temperature is 1.08×10^{-10}, its solubility in mol L^{-1} is

(a) 1.04×10^{-5} (b) 7.3×10^{-4}

(c) 3.0×10^{-5} (d) 3.0×10^{-4}

AP EAMCET (Medical) - 2013

Ans. (d) : The dissociation of MgF_2 is given as -

$$MgF_2 \rightleftharpoons Mg^{2+} + 2F^-$$

Let, the solubility (S) of Mg^{+2} and F^- is then from the formula of solubility product we get–

$K_{sp} = [Mg^{2+}][F^-]^2$

$K_{sp} = S \times (2S)^2$

$$S^3 = \frac{K_{sp}}{4}$$

$$S^3 = \frac{1.08\times10^{-10}}{4}$$

$S = 3\times10^{-4}\ mol\ L^{-1}$

@apna_pdf

28. The ionic product of water .... with increase in temperature.

(a) remains constant
(b) increases
(c) decreases
(d) may increase or decrease

AP EAMCET (Engg.) 21.09.2020, Shift-I

Ans. (b) : With an increase in temperature, there is an increase in dissociation of H_2O which gives rise to an increase ion the concentration of H^+ and OH^- ions. Hence, the ionic product of water increases with an increase in temperature.

29. The solubility of AgBr with solubility product 5.0×10^{-13} at 298 K in 0.1 M NaBr solution would be

(a) 7×10^{-6} M
(b) 5×10^{-12} M
(c) 5×10^{-14} M
(d) 5×10^{-6} M

AP EAMCET (Engg.) 21.09.2020, Shift-I

Ans. (b) : Let, the solubility of AgBr be S mol/L.

$$AgBr \rightleftharpoons Ag^+ + Br^-$$

Hence, $[Ag^+]\,[Br^-] = 5 \times 10^{-13}$

Given that, $[Br^-] = 0.1$

$\because \quad K_{sp} = [Ag^+]\,[Br^-]$

$5.0 \times 10^{-13} = [Ag^+] \times 0.1$

or $\quad [Ag^+] = (5 \times 10^{-13}) / 0.1 = 5 \times 10^{-12}$M

It means solubility in NaBr is 5×10^{-12}.

30. If the molar solubility (in $mol.L^{-1}$) of a sparingly soluble salt AB_4 is 'S', and the corresponding solubility product is 'K_{sp}', then S in terms of K_{sp} is given by the relation ———

(a) $S = \left(\frac{K_{sp}}{256}\right)^{1/4}$
(b) $S = \left(\frac{K_{sp}}{256}\right)^{1/5}$
(c) $S = (256\,K_{sp})^{1/5}$
(d) $S = (128\,K_{sp})^{1/4}$

AP EAPCET 25.08.2021, Shift-II

Ans. (b) : $AB_4(aq) \rightleftharpoons \underset{S}{A^{+4}} + \underset{4S}{4B^-}$

The molar solubility (in mol/lit.) of a sparingly soluble salt AB_4 is 'S'. The corresponding solubility product is K_{sp}

$\because \quad K_{sp} = [A^{+4}]\,[B^-]^4$

$K_{sp} = S\,(4S)^4 = 256\,S^5$

Hence, the molar solubility is

$$S = \left(\frac{K_{sp}}{256}\right)^{1/5}$$

31. The solubility product of $Ni(OH)_2$ at 298 K is $2\times10^{-15} mol^3 dm^{-9}$. The pH value if, its aqueous and saturated solution is

(a) 5
(b) 7.5
(c) 9
(d) 13

AP EAMCET (Engg.) 17.09.2020 Shift-I

Ans. (c) : $Ni(OH)_2 \rightleftharpoons \underset{S}{Ni^{2+}} + \underset{2S}{2OH^-}$

$\because \quad K_{sp} = \left[Ni^{2+}\right]\left[OH^-\right]^2$

$= S \times (2S)^2 = 4S^3$

$2\times10^{-15}\,(mol/L)^3 = 4S^3$

$2\times10^{-15}\,mol^3 dm^{-9} = 4S^3$

or $\quad S = \left(\frac{2}{4}\times10^{-15}\right)^{1/3} \simeq 8\times10^{-6}\,mol/L$

$\left[OH^-\right] = 2S = 2\times8\times10^{-6}\,mol/L$

$= 16 \times 10^{-6}$

$pOH = -\log_{10}\left[OH^-\right]$

$pOH = -\log\left[16\times10^{-6}\right]$

$pOH = 6 - \log 16 = 4.983 \simeq 5$

$pH = 14 - pOH = 14 - 5 = 9$

32. The $[Ag^+]$ in a saturated solution of Ag_2CrO_4 is 1.5×10^{-4} M. What is the solubility product of Ag_2CrO_4 ?

(a) $3.375\times10^{-12}\ M^3$
(b) $1.6875\times10^{-10}\ M^3$
(c) $1.6875\times10^{-11}\ M^3$
(d) $1.6875\times10^{-12}\ M^3$

SCRA - 2009

Ans. (d) : Given that, $[Ag^+]=1.5\times10^{-4}M$

So, $\quad \left[CrO_4^{2-}\right] = \frac{1.5}{2}\times10^{-4}M$

Reaction : $Ag_2CrO_4 \rightleftharpoons 2Ag^+ + CrO_4^{2-}$

$\because \quad K_{sp} = \left[Ag^+\right]^2\left[CrO_4^{2-}\right]$

$K_{sp} = \left(1.5\times10^{-4}\right)^2 \times \frac{1.5}{2}\times10^{-4}$

$= 2.25\times10^{-8}\times0.75\times10^{-4}$

$= 1.6875\times10^{-12} M^3$

33. The Solubility of AgBr(s) having solubility product 5×10^{-10} in 0.2 M NaBr solution equals

(a) 5×10^{-10} M
(b) 25×10^{-10} M
(c) 0.5 M
(d) 0.002 M

AP EAPCET 20.08.2021 Shift-I

Ans. (b) : Given that,

Solubility product K_{sp} of AgBr(s) = 5×10^{-10}

Conc. of NaBr = 0.2 M

$AgBr(s) \rightleftharpoons Ag^+(s) + Br^-$

$\therefore \quad K_{sp} = 5 \times 10^{-10}$

$K_{sp} = [Ag^+]\,[Br^-]$

$S = \frac{5\times10^{-10}}{0.2}$

$S = 25 \times 10^{-10}$ M

34. If the concentration of Ag^+ ions in the saturated solution of Ag_2CO_3 is 1.20×10^{-4} mol. L^{-1}. then find the solubility product of Ag_2CO_3.

(a) 5.30×10^{-12}
(b) 4.50×10^{-11}
(c) 2.66×10^{-12}
(d) 6.90×10^{-12}

AP EAPCET 24.08.2021, Shift-I

Ans. (d) : Given that, $[Ag^+] = 1.20 \times 10^{-4}$ mol. L^{-1}

Silver carbonate dissociates as follows –

$$Ag_2CO_3 \rightarrow 2Ag^+ + CO_3^{2-}$$

Let the solubility is S. The solubility of silver will be 2s as two moles ion are dissociated –

$$K_{sp} = [Ag^+]^2\left[CO_3^{2-}\right]$$

@apna_pdf

$$K_{sp} = (2S)^2 (S)$$
$$K_{sp} = 4S^3$$
$$K_{sp} = 4 \times (1.20 \times 10^{-4})^3$$
$$K_{sp} = 6.91 \times 10^{-12}$$

35. If the solubility of an electrolyte is S, then what is the solubility product of the electrolyte of the type A_3B_2?

(a) $6S^3$ (b) $27S^5$
(c) $108S^5$ (d) $36S^5$

COMEDK-2016

Ans. (c) : $A_3B_2 \rightleftharpoons \underset{3S}{3A^{2+}} + \underset{2S}{2B^{3-}}$

$\because$ $K_{sp}=[A^{2+}]^3 [B^{3-}]^2$ .....(i)

If, S = solubility of A_3B_2, then $[A^{2+}]=3S$; $[B^{3-}]=2S$

Putting the value of these in equation (i), we get–

Therefore, $K_{sp} = (3S)^3 \times (2S)^2$
$= 27S^3 \times 4S^2$
$= 108\ S^5$

36. The solubility of AgCl at 20°C is 1.435×10^{-5} gL^{-1}. The solubility product of AgCl is

(a) 2×10^{-16} (b) 108×10^{-3}
(c) 1.0×10^{-14} (d) 1.035×10^{-5}

COMEDK-2018

Ans. (c) : Solubility of AgCl = 1.435×10^{-5} gL^{-1}

[Molecular weight of AgCl=143.5]

We know that solubility of AgCl in moles

$$AgCl \rightleftharpoons Ag^+ + Cl^-$$
$$K_{sp} = [Ag^+][Cl^-]$$
$$K_{sp} = (s)^2$$
$$\because \quad S = \frac{(1.435 \times 10^{-5})}{143.5} = 1 \times 10^{-7}$$

Therefore solubility product of AgCl = S^2

$K_{sp} = (1 \times 10^{-7})^2 = 1 \times 10^{-14}$.

37. The solubility of AgCN in a buffer solution of pH = 3 is x. The value of x is :
[Assume : No cyano complex is found; K_{sp}(AgCN) = 2.2×10^{-16} and K_a (HCN) = 6.2×10^{-10}]

(a) 0.625×10^{-6} (b) 1.6×10^{-6}
(c) 2.2×10^{-16} (d) 1.9×10^{-5}

JEE Main 25-02-2021, Shift-I

Ans. (d) : Given : K_{sp} (AgCN) = 2.2×10^{-16}
K_a(HCN) = 6.2×10^{-10}

The solubility of AgCN in a buffer solution of pH = 3

Let, solubility is S then,

$$AgCN \rightleftharpoons Ag^+ + CN^-$$
$$K_{sp} = S \times S = S^2 \quad .....(i)$$
$$H^+ + CN^- \rightleftharpoons HCN, \quad K = \frac{1}{K_a} = \frac{1}{6.2 \times 10^{-10}}$$

Therefore, $K_{sp} \times \frac{1}{K_a} = [Ag^+][CN^-]\frac{[HCN]}{[H^+][CN^-]}$

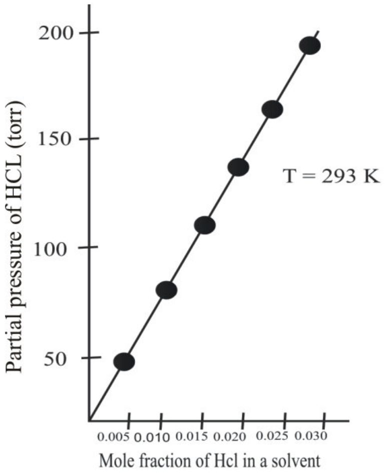
or $2.2 \times 10^{-16} \times \frac{1}{6.2 \times 10^{-10}} = \frac{S \times S}{10^{-3}}$

or $S^2 = \frac{2.2 \times 10^{-16} \times 10^{-3}}{6.2 \times 10^{-10}} = 0.354 \times 10^{-9}$

or $S^2 = 3.54 \times 10^{-10}$

or $S = 1.9 \times 10^{-5}$

38. From the graph, the value of Henry's constant for the solubility of HCl gas in cyclohexane is



(a) 10 k torr (b) 100 torr
(c) 50 torr (d) 2.4×10^2 torr

TS-EAMCET 09.08.2021, Shift-I

Ans. (a) : According to Henry's law, "The partial pressure of the gas in vapour phase (vapour pressure of the solute) is directly proportional to the mole fraction (X) of the gaseous solute in the solution at low concentration. This statement is known as Henry's law.

$P_{solute} \propto X_{solute}$ in solution

$P_{solute} = k_H X_{solute}$ in solution

Where, k_H = Henry's constant

The slope of the straight line gives the value of k_H.

$$\therefore \quad \tan\theta = k_H = \frac{50}{0.005}$$
$$= \frac{50000}{5} = 10000$$
$$\boxed{k_H = 10\text{k torr}}$$

39. Two salts A_2X and MX have the same value of solubility product of 4.0×10^{-12}. The ratio of their molar solubilities i.e. $\frac{S(A_2X)}{S(MX)}$ = ______
(Round off to the Nearest Integer).

JEE Main 16.03.2021, Shift-I

Ans. (50) : Given that, $K_{sp}(A_2X) = K_{sp}(MX) = 4 \times 10^{-12}$

For $A_2X \rightleftharpoons 2A^+ + X^{2-}$

$K_{sp} = (2S)^2 \times (S)$

or $S^3 = \frac{K_{sp}}{4} = \frac{4 \times 10^{-12}}{4} = 10^{-12}$

or $S(A_2X) = 10^{-4}$ .....(i)

Now, for $MX \rightleftharpoons M^+ + X^-$

$\because$ $K_{sp} = S \times S$

@apna_pdf

or $S=\sqrt{4\times10^{-12}}=2\times10^{-6}$

Therefore, $\dfrac{S(A_2X)}{S(MX)}=\dfrac{10^{-4}}{2\times10^{-6}}$

or $\dfrac{S(A_2X)}{S(mX)}=50$

40. The solubility of $Ca(OH)_2$ in water is :
[Given : The solubility product of $Ca(OH)_2$ in water = 5.5×10^{-6}]

(a) 1.11×10^{-2} (b) 1.11×10^{-6}
(c) 1.77×10^{-2} (d) 1.77×10^{-6}

JEE Main 25.02.2021, Shift-II

Ans. (a) : Given: $K_{sp}=5.5\times10^{-6}$
Let, the solubility of $Ca(OH)_2$ in water is S,

$$\underset{}{Ca(OH)_2}\rightleftharpoons\underset{(S)}{Ca^{2+}}+\underset{(2S)}{2OH^-}$$

$$K_{sp}=[Ca^{2+}].[OH^-]^2$$
$$K_{sp}=(S)^1\times(2S)^2$$
$$5.5\times10^{-6}=4S^3$$
$$S=\left(\frac{5.5\times10^{-6}}{4}\right)^{1/3}$$
$$S=1.11\times10^{-2}$$

41. Which of the following has maximum solubility at low pH?

(a) NH_4Cl (b) $NaCl$
(c) Na_3PO_4 (d) $Sr(OH)_2$

AIIMS-25.05.2019 (Morning)

Ans. (d): Maximum solubility at low pH means in acidic solution get dissolve in high amount as OH^-get neutralize by H^+.

So, $Sr(OH)_2\longrightarrow Sr^{2+}+2OH^-$

Hence $Sr(OH)_2$ has maximum solubility at low pH.

42. At 25°C, the solubility product of $Mg(OH)_2$ is 1.0×10^{-11}. At which pH, will Mg^{2+} ions start precipitating in the form of $Mg(OH)_2$ from a solution of 0.001 M Mg^{2+} ions?

(a) 9 (b) 10
(c) 11 (d) 8

AIEEE-2014, 2010

Ans. (b): Given that, K_{sp} of $Mg(OH)_2$ = 1.0×10^{-11}
Solution molarity is = 0.001

$$Mg(OH)_2\longrightarrow Mg^{2+}+2OH^-$$

Moles of $Mg(OH)_2$= Moles of $[Mg^{2+}]$

$\because$ $K_{sp}=[Mg^{2+}]\times[OH^-]^2$

$$1.0\times10^{-11}=0.001\times[OH^{-1}]^2$$
$$[OH^-]^2=\frac{1.0\times10^{-11}}{0.001}=1.0\times10^{-8}\,M$$
$$[OH^-]=10^{-4}\,M$$
$$H^+=\frac{10^{-14}}{[OH^{-1}]}=\frac{10^{-14}}{10^{-4}}=10^{-10}\,M$$
$$pH=-\log[H]^+$$
$$pH=-\log[10]^{-10}$$
$$pH=10$$

43. The solubility product (K_{sp}) of the following compounds are given at 25°C.

Compound	**K_{sp}**
AgCl	**1.1×10^{-10}**
AgI	**1.0×10^{-16}**
$PbCrO_4$	**4.0×10^{-14}**
Ag_2CO_3	**8.0×10^{-12}**

The most soluble and least soluble compounds are respectively.

(a) AgCl and $PbCrO_4$ (b) AgI and Ag_2CO_3
(c) AgCl and Ag_2CO_3 (d) Ag_2CO_3 and AgI

KEAM-2011

Ans. (d): (i) $AgCl\longrightarrow Ag^+(aq)+Cl^-(aq)$

$$K_{Sp}=[Ag^+][Cl^-]$$
$$=S\times S$$

Given, $K_{sp}=1.1\times10^{-10}$

$$1.1\times10^{-10}=S^2$$
$$S=1.04\times10^{-5}\,mol\,L^{-1}$$

(ii) $AgI\longrightarrow Ag^++I^-$

$$K_{sp}=[Ag^+][I^-]$$
$$=S\times S$$
$$K_{sp}=S^2=1\times10^{-16}$$
$$S=1\times10^{-8}\,mol\,L^{-1}$$

(iii) $PbCrO_4\longrightarrow\underset{S}{Pb^{2+}}+\underset{S}{CrO_4^{2-}}$

$$K_{Sp}=[Pb^{2+}][CrO_4^{2-}]$$
$$=\;S\qquad S$$
$$K_{sp}=S^2$$
$$4\times10^{-14}=S^2$$
$$S=2\times10^{-7}\,mol\,L^{-1}$$

(iv) $Ag_2CO_3\longrightarrow2Ag^++CO_3^{2-}$

$$K_{sp}=[Ag^+][CO_3^{2-}]$$
$$=[2S]^2.[S]$$
$$K_{sp}=4S^5$$
$$8\times10^{-12}=4S^5$$
$$S=1.26\times10^{-4}\,mol\,L^{-1}$$

Hence, $Ag_2CO_3$are most soluble end AgI are least Soluble).

44. Why only As^{3+} gets precipitated as As_2S_3 and not Zn^{2+} as ZnS when H_2S is passed through an acidic solution containing $As^{3+}$and Zn^{2+} ?

(a) Solubility product of As_2S_3 is less than that of ZnS.
(b) Enough As^{3+} are present in acidic medium.
(c) Zinc salt does not ionise in acidic medium.
(d) Solubility product changes in presence of an acid.

JIPMER-2018

Ans. (a): Solubility product of As_2S_3 is less than that of ZnS because As^{3+} gets precipitated as As_2S_3 and not Zn^{2+} as ZnS. When H_2S is passed through an acidic solution containing As^{3+} and Zn^{2+} which means for As^{3+}. Solubility product is less than the ionic product. Therefore, only As^{3+} form a precipitate.

@apna_pdf

45. Solubility product of a salt AB is 1×10^{-8} M^2 in a solution in which the concentration of A^+ ions is 10^{-3} M. The salt will precipitate when the concentration of B^- ions is kept

(a) Between 10^{-8} M to 10^{-7} M
(b) Between 10^{-7} M to 10^{-8} M
(c) $> 10^{-5}$ M
(d) $< 10^{-8}$ M

KCET-2006

Ans. (c): Given that, K_{sp} of AB concentration of $A^+ = 10^{-3}$M

$$K_{sp} = 1\times10^{-8}$$

$$AB \rightleftharpoons [A^+][B^-]$$

$$[10^{-3}][B^-]$$

The salt will be precipitated, if ionic product > K_{sp}

$$10^{-3}\ [B^-] > 1\times10^{-8}$$

$$[B^-] > \frac{10^{-8}}{10^{-3}}$$

$$[B^-] > 10^{-5}M$$

46. The solubility of PbF_2 in water at 25°C is $\approx10^{-3}$ M. What is its solubility in 0.05 M NaF solution? Assume the later to be fully ionised.

(a) 1.6×10^{-6}M
(b) 1.2×10^{-6}M
(c) 1.2×10^{-5}M
(d) 1.6×10^{-4}M

AIPMT-2009

Ans. (a): Solubility of $PbF_2 \approx 10^{-3}$M

$$PbF_2 \rightleftharpoons Pb^{2+} + 2F^-$$

$$K_{sp} = [Pb]^{2+} . [F^-]^2$$

$$S \times 2S^2$$

$$K_{sp} = 4S^3$$

$$= 4 \times (10^{-3})^3$$

$$K_{sp} = 4 \times 10^{-9}$$

In 0.05 NaF We have 0.05 of F^- ion contributed by NaF

If the solubility of PbF_2 in this solution is S then total $[F^-] = [2S + 0.05]$M

$$K_{sp} = S[2S + 0.05]^2$$

Assuming 2S<< 0.05

$$4\times10^{-9} = S\times25\times10^{-4}$$

$$S = 0.16\times10^{-5}M = 1.6\times10^{-6}M$$

47. On adding 0.1 M solution each of $[Ag^+]$, $[Ba^{2+}]$, $[Ca^{2+}]$ in a Na_2SO_4 solution, species first precipitated is

$[K_{sp}BaSO_4 = 10^{-11}$, $K_{sp}CaSO_4 = 10^{-6}$, $K_{sp}Ag_2SO_4 = 10^{-5}]$

(a) Ag_2SO_4
(b) $BaSO_4$
(c) $CaSO_4$
(d) All of these

AIPMT-2008

Ans. (b): Given, K_{sp} of $BaSO_4 = 10^{-11}$

K_{sp} of $Ag_2SO_4 = 10^{-5}$

K_{sp} of $CaSO_4 = 10^{-6}$

$$\text{Solubility of } BaSO_4 = \sqrt{K_{sp}} = \sqrt{10^{-11}}$$

$$= 3.16 \times 10^{-6} \text{ mol/L}$$

$$\text{Solubility of } CaSO_4 = \sqrt{K_{sp}} = \sqrt{10^{-6}}$$

$$= 1.0 \times 10^{-3} \text{ mol/L}$$

Dissociation of Ag_2SO_4 occurs as follows :

$$Ag_2SO_4 \rightleftharpoons 2Ag + SO_4^{2-}$$

$$\therefore \quad K_{sp} = (2S)^2(S) = 4S^3$$

$$\therefore \text{ Solubility of } Ag_2SO_4 = \sqrt[3]{\frac{K_{sp}}{4}} = \sqrt[3]{\frac{10^{-5}}{4}}$$

$$= 1.4 \times 10^{-2} \text{ mol/L}$$

Least solubility is of $BaSO_4$, hence it will precipitate first.

48. The solubility of CuBr is 2×10^{-4} mol/L at 25°C. The K_{sp} value of CuBr is

(a) $4\times10^{-8}mol^2L^{-2}$
(b) $4\times10^{-4}mol^2L^{-2}$
(c) $4\times10^{-11}mol^2L^{-2}$
(d) $4\times10^{-15}mol^2L^{-2}$

AIPMT-2000

Ans. (a): $CuBr(S) \rightleftharpoons Cu^+ + Br^-$

t = 0	S	0	0
t' = t		S	S

$$\because \quad K_{sp} = [Cu^+] . [Br^-]$$

$$= [S] . [S]$$

$$K_{sp} = [S]^2$$

$$= (2 \times 10^{-4})^2$$

$$= 4 \times 10^{-8} \text{ mol}^2 \text{ L}^{-2}$$

49. At 80°C, distilled water has (H_3O^+) concentration equal to 1×10^{-6} mol/litre. The value of K_w, at this temperature will be

(a) 1×10^{-6}
(b) 1×10^{-12}
(c) 1×10^{-9}
(d) 1×10^{-15}

AIPMT-1994

Ans. (b): The distilled water is neutral with equal concentrations of hydrogen ion and hydroxide ion.

Whatever the temperature may be water will always dissociate to give equal concentration of H^+ ion and OH^- that it will be always be neutral

$$\text{Hence, } K_w = [H^+][OH^{-1}]$$

$$= [1\times10^{-6}][1\times10^{-6}]$$

$$K_w = 1\times10^{-12}$$

50. If the ionic product of $Ni(OH)_2$ is 1.9×10^{-15}, the molar solubility of $Ni(OH)_2$ in 1.0 M NaOH is

(a) 1.9×10^{-18}M
(b) 1.9×10^{-13}M
(c) 1.9×10^{-15}M
(d) 1.9×10^{-14}M

AP-EAMCET (Engg.) - 2014

Ans. (c) : Given, $[OH^-] = 1M$, $K_{sp} = 1.9 \times 10^{-15}$

Let the molar solubility of $Ni(OH)_2$ = S

$$[Ni(OH)_2] \rightleftharpoons Ni^{2+} + 2OH^-$$

$$\therefore K_{sp} = [Ni^{+2}][OH^-]^2$$

$$1.9\times10^{-15} = S\times(1.0)^2$$

$$S = 1.9\times10^{-15}M$$

51. A saturated solution of H_2S in 0.1 M HCl at 25°C contains S^{2-} ion concentration of 10^{-23} mol L^{-1}. The solubility product of some sulphides are CuS=10^{-44}, FeS = 10^{-14}, MnS = 10^{-15}, CdS = 10^{-25}. If 0.01 M solution of these salts in 1M HCl are saturated with H_2S, which of these will be precipitated?

(a) All
(b) All except MnS
(c) All except MnS and FeS
(d) Only-CuS

VITEEE-2015

@apna_pdf

Ans. (c) : Given $[S^{2-}] = 10^{-23}$ mol L^{-1}

$[M^{2+}] = 10^{-2} M$

Ionic product, $K_w = [M^{2+}][S^{2-}]$

$= 10^{-2} \times 10^{-23}$

$= 10^{-25}$

So, ionic product is greater than K_{sp} of CuS and CdS.

52. The solubility product of Ag_2CrO_4 is 32×10^{-12}. What is the concentration of CrO_4^{-2} ions in that solution?

(a) 2×10^{-4} M
(b) 16×10^{-4} M
(c) 8×10^{-4} M
(d) 8×10^{-8} M

VIEEE-2014

Ans. (a) : Given, K_{sp} of $Ag_2CrO_4 = 32 \times 10^{-12}$

$K_{sp} = [2Ag^{+}] . [CrO_4^{2-}]$

$= [2S]^2 . [S]$

$K_{sp} = 4S^3$

$$\therefore \quad S = \left(\frac{K_{sp}}{4}\right)^{1/3}$$

$$S = \left(\frac{32\times10^{-12}}{4}\right)^{1/3}$$

$$S = \left(8\times10^{-12}\right)^{1/3}$$

$$S = 2\times10^{-4}\ M.$$

53. What will be solubility of $KAl(SO_4)_2$ in water if solubility product (K_{sp}) for $KAl(SO_4)_2$ is 1.6×10^{-11} (unit)?

(a) 6×10^{-5} M
(b) 3×10^{-4} M
(c) 2×10^{-6} M
(d) 1.4×10^{-3} M

AMU-2019

Ans. (d) : Given that, $K_{sp} = 1.6 \times 10^{-11}$

$$KAl(SO_4)_2 \rightleftharpoons \underset{S}{K^+} + \underset{S}{Al^{3+}} + \underset{2S}{2SO_4^{2-}}$$

$$K_{sp} = [K^+][Al^{3+}][SO_4^{\ 2}]^2$$

$$= S \times S \times 2S^2$$

$$K_{sp} = 4S^4$$

$$S = \left(\frac{1.6\times10^{-11}}{4}\right)^{1/4}$$

$$= (4\times10^{-12})^{1/4}$$

$$S = 1.4\times10^{-3}$$

54. The K_{sp} of $PbCO_3$ and $MgCO_3$ are 1.5×10^{-15} and 1×10^{-15} respectively at 298 K. The concentration of Pb^{2+} ions in a saturated solution containing $MgCO_3$ and $PbCO_3$ is

(a) 1.5×10^{-8} M
(b) 3×10^{-8} M
(c) 2×10^{-8} M
(d) 2.5×10^{-8} M

AMU-2018

Ans. (b) :

$$\begin{array}{llll} & PbCO_3 \longrightarrow & Pb^{+2} & + CO_3^{\ -2} \\ t=0 & x & 0 & 0 \\ t'=t & 0 & x & x+y \end{array}$$

$$\begin{array}{llll} & MgCO_3 \longrightarrow & Mg^{2+} & + CO_3^{\ -2} \\ t=0 & y & 0 & 0 \\ t'=t & 0 & y & y+x \end{array}$$

$K_{sp}(PbCO_3) = (x)(x + y)$ .....(i)

$K_{sp}(MgCO_3) = (y)(x + y)$ .....(ii)

$$\frac{K_{sp}(PbCO_3)}{K_{sp}(MgCO_3)} = \frac{(x).(x+y)}{y(x+y)}$$

$$\frac{1.5\times10^{-15}}{1\times10^{-15}} = \frac{x}{y} \Rightarrow \boxed{x = 1.5y}$$

Putting the value of X in equation (i), we get–

$$1.5\times10^{-15} = 1.5y(1.5y + y)$$

$$= 1.5y(2.5y)$$

$$= 3.75y^2$$

$$y = \sqrt{\frac{1.5\times10^{-15}}{3.75}}$$

$$y = 2\times10^{-8}$$

Then, $x = 1.5y$

$$= 1.5\times2\times10^{-8},\ \boxed{x = 3\times10^{-8} m}$$

55. The solubility of pure oxygen in water at 20°C and 1.0 atmosphere pressure is 1.38×10^{-3} mole/litre. What will be the concentration of oxygen at 20°C and partial pressure of 0.21 atmosphere?

(a) 2.9×10^{-4} mole/litre
(b) 5.8×10^{-4} mole/litre
(c) 7.6×10^{-4} mole/litre
(d) 11.6×10^{-4} mole/litre

AMU-2018

Ans. (a) : The solubility of gas in liquid at particular temperature is given by Henrys law is –

$m_a = K_H P_a$ .....(i)

Where m_a = mass of gas dissolved in a unit volume of solvent.

Pa = pressure of the gas in equilibrium

K_H = Henry's Law constant

On putting the given values in above expression.

$$1.38\times10^{-3} \text{mol}/l = K_H \times 1\text{atm}$$

$$K_H = \frac{1.38\times10^{-3}\text{mol/L}}{1\text{atm}}$$

At 0.21 atm m_a will be calculated as

$$m_a = \frac{1.38\times10^{-3}\text{mol/L}}{1\text{atm}} \times 0.21\text{atm}$$

$$m_a = 2.9\times10^{-4}\text{mol/L}.$$

56. What is the value of K_{sp} for Bismuth sulphide (Bi_2S_3), Which has solubility of 1.0×10^{-15} mol/L at 25°C?

(a) 1.08×10^{-73}
(b) 1.08×10^{-74}
(c) 1.08×10^{-72}
(d) 1.08×10^{-75}

AMU-2016

Ans. (a) : Given that, $S = 1 \times 10^{-15}$

$$Bi_2S_3 \rightleftharpoons 2Bi^{3+}(aq) + 3S^{2-}(aq)$$

$$K_{sp} = \underset{2S}{[Bi^{3+}]^2}\ \underset{3S}{[S^{2-}]^3}$$

$$K_{sp} = 2\times(1\times10^{-15})\times3(1\times10^{-15})$$

$$K_{sp} = (2 \times 10^{-15})^2 \times (3 \times 10^{-15})^3$$

$$= (4\times10^{-30})\times\left(27\times10^{-45}\right)$$

$$= 108\times10^{-75}$$

$$K_{sp} = 1.08\times10^{-73}$$

@apna_pdf

57. What is the minimum volume of water required to dissolve 1 g of calcium sulphate at 298 K? K_{sp} for $CaSO_4$ is 9.0×10^{-6} (Molar mass of $CaSO_4$ = 136 g mol^{-1})

(a) 2.45 L	(b) 4.08 L
(c) 4.90 L	(d) 3.00 L

AMU-2015

Ans. (a) : $CaSO_4 \rightarrow Ca^{2+} + SO_4^{2-}$

$$K_{sp} = \left[Ca^{2+}\right]\left[SO_4^{2-}\right]$$
$$K_{sp} = S^2$$
$$9.0 \times 10^{-6} = S^2$$
$$S = \sqrt{9.0 \times 10^{-6}}$$
$$= 3.0 \times 10^{-3} \text{ mol/L}$$

Given, molecular mass = 136 g mol^{-1}

Solubility of $CaSO_4$ = $3.0 \times 10^{-3} \times 136$ g/L = 0. 408 g/L

∴ To dissolve 0.408 of $CaSO_4$, water requires = 1L

∴ To dissolve 1 gm of $CaSO_4$, water requires = $\frac{1}{0.408}$L

= 2.45 L

58. What will be solubility product of $Ca(OH)_2$ if its solubility is $\sqrt{3}$?

(a) 3	(b) $3\sqrt{3}$
(c) $12\sqrt{3}$	(d) 27

AMU-2014

Ans. (c) : $Ca(OH)_2 \rightleftharpoons \underset{S}{Ca^{2+}} + \underset{2S}{2O\bar{H}}$

Given, solubility (S) = $\sqrt{3}$

$$K_{sp} = [Ca^{2+}] . [OH^-]^2$$
$$= [S] . [2S]^2$$
$$= 4S^3$$
$$K_{sp} = 4 \times \left(\sqrt{3}\right)^3$$
$$K_{sp} = 12\sqrt{3}$$

59. If K_{sp} of $Ni(OH)_2$ is 2.0×10^{-15} M, the molar solubility of $Ni(OH)_2$ in 0.10 M NaOH is

(a) 2.0×10^{-15} M	(b) 2.0×10^{-13} M
(c) 2.0×10^{-11} M	(d) 2.0×10^{-9} M

AMU-2013

Ans. (b) : $K_{sp} = 2.0 \times 10^{-15}$M

$$Ni(OH)_2 \rightleftharpoons \underset{S}{Ni^{2+}} + \underset{2S}{2OH^-}$$
$$K_{sp} = [Ni^{2+}]\,[OH^-]^2$$
$$= [s][0.10 + 2s]^2$$

(because total concentration of [OH^-] ions = [0.10 + 2s]

As K_{sp} is small 2s << 0.10

Thus, (0.10 + 2s) ≈ 0.10

Hence, $2.0 \times 10^{-15} = s\,(0.10)^2$

$S = 2.0 \times 10^{-13}$ M = [Ni^{2+}]

60. If the solubility of Pr_2 is S g-mole per litre, its solubility product, considering it to be 80% ionized, is

(a) 2.048 S^2	(b) 20.48 S^3
(c) 2.048 S^3	(d) 2.048 S^4

AMU-2012

Ans. (c) :

$$\begin{array}{llll} & Pr_2 & \rightleftharpoons P^{2+} + & 2r^- \\ \text{Initially} & & 1s & 0 \\ \text{After 80\%} & (1-0.80) & 0.80s & 2\times0.80S \\ \text{Ionization} & = 0.20s & & = 1.60s \end{array}$$

Solubility product,

$$K_{sp} = [P^{2+}]\,[r^-]^2$$
$$= [s] \quad [2s]^2$$
$$K_{sp} = [0.80s] \cdot [2 \times 0.80s]^2$$
$$K_{sp} = 2.048s^3$$

61. The precipitate of calcium fluoride (K_{sp}= 1.7×10^{-10}) is obtained when equal volume of the following are mixed.

(a) 0.001 M Ca^{2+} + 0.00001 M F^-

(b) 10^{-5} M Ca^{2+}+ 10^{-3} M F^-

(c) 10^{-2} M Ca^{2+}+ 10^{-3} M F^-

(d) 10^{-4} M Ca^{2+}+ 10^{-4} M F^-

AMU-2008

Ans. (c) : For precipitation to occur ionic product > solubility product.

$CaF_2 \rightleftharpoons Ca^{2+} + 2F^-$

for (a) $[Ca^{2+}] \times [F^-]^2 = 10^{-3}\ 4\times(10^{-5})^2$

$= 1/4[16 \times 10^{-13}] = 4 \times 10^{-13}$

(b) $[Ca^{2+}][F^-]^2 = 1/4[10^{-5}\times(2\times10^{-3})^2]$

$= 1/4[4\times10^{-11}] = 10^{-11}$

(c) $[Ca^{2+}][F^-]^2 = 1/4[10^{-2}\times(2\times10^{-3})^2]$

$= 1/4[4\times10^{-8}] = 10^{-8}$

(d) $[Ca^{2+}][F^-]^2 = 1/4[10^{-4}\times(2\times10^{-4})^2]$

$= 1/4[4\times10^{-12}] = 10^{-12}$

ionic product (10^{-8}) > Solubility product (1.7×10^{-10})

Hence, precipitation will occur.

62. The molar solubility (s) of the equilibrium, $A_x.B_y$ (solid) $\rightleftharpoons xA^{z+}_{(aq)} + yB^{z-}_{(aq)}$ in terms of the solubility product (K_{sp}) will be

(a) $s=\left(\frac{K_{sp}}{x^x y^y}\right)^{1/x+y}$	(b) $s=\left(\frac{K_{sp}}{x^x - y^y}\right)^{x+y}$
(c) $s=\left(\frac{K_{sp}}{x.y}\right)^{x+y}$	(d) $s=\left(\frac{K_{sp}}{x.y}\right)^{1/x+y}$

AMU-2007

Ans. (a) : Let us consider the molar solubility of a salt A_xB_x is s mol L^{-1}, then,

$$\begin{array}{lll} A_xB_x \text{ (solid)} & \rightleftharpoons xA^{z+}_{(aq)} & + yB^{z-}_{(aq)} \\ s & xs & ys \end{array}$$

$\therefore K_{sp} = (xs)^x.(ys)^y$

Hence, molar solubility can be given as :

$K_{sp} = [A^z]^x . [B^{z-}]$

$= [x.s]^x\ [y.s]^y$

$K_{sp} = x^x.\ s^x.\ y^y.\ s^y.$

$K_{sp} = x^x.\ y^y.\ s^x.\ s^y.$

$s^{x+y} = \frac{K_{sp}}{x^x.y^y}$ Thus $s = \left[\frac{K_{sp}}{x^x.y^y}\right]^{\frac{1}{x+y}}$

@apna_pdf

63. The solubility product of Ag_2CrO_4 in water at 298K is 3.2×10^{-11}. What will be concentration of CrO_4^{2-} ions in the saturated solution of Ag_2CrO_4

(a) $2\times10^{-4}M$ (b) $57\times10^{-5}M$

(c) $5.7\times10^{-6}M$ (d) $3.2\times10^{-11}M$

AMU-2005

Ans. (a) : $Ag_2CrO_4 \longrightarrow 2Ag^+ + CrO_4^{2-}$

S 2S S

$$K_{sp} = [Ag^+]^2[CrO_4^{2-}]$$
$$= (2S)^2.(S)$$
$$K_{sp} = 4S^3$$
$$S^3 = \frac{K_{sp}}{4}$$
$$S = \sqrt[3]{\frac{K_{sp}}{4}} = \sqrt[3]{\frac{3.2\times10^{-11}}{4}}$$
$$S = 2\times10^{-4}\ M$$

64. The solubility product of AgCl is 4.0 10^{-10} at 298 K. The solubility of AgCl in 0.04 M $CaCl_2$ will be

(a) 5.0×10^{-9} M (b) 20×10^{-5} M

(c) 2.2×10^{-4} M (d) 1.0×10^{-4} M

BITSAT-2008

AMU-2002

Ans. (a) : Given that,

$K_{sp}(AgCl) = 4.0 \times 10^{-10}$ 0.04M $CaCl_2$

$$AgCl \rightleftharpoons Ag^+ + Cl^-$$

$K_{sp} = [Ag^+]\ [Cl^-]$ ($\because [Cl]^- = 0.08$)

or $4.0 \times 10^{-10} = s \times 0.08$

or $S = \frac{4.0\times10^{-10}}{0.08}$

or $S = 5 \times 10^{-9}$

65. The solubility of AgCl is 1×10^{-5} mol/litre. Its solubility in 0.1 molar sodium chloride solution is

(a) 1×10^{-10} (b) 1×10^{-5}

(c) 1×10^{-9} (d) 1×10^{-4}

AMU–2001

Ans. (c) : $AgCl \rightleftharpoons [\ Ag^+]\ [\ Cl^-]$

[S] [S]

$$K_{sp}=[Ag^+][Cl^-]$$
$$=10^{-5}\times10^{-5}$$
$$K_{sp} =10^{-10}$$

In 0.1 M NaCl soln. $[Cl^-]=0.1$ M

$[Ag^+][0.1]=10^{-10}$ or $[Ag^+] = 10^{-9}$

66. Three sparingly soluble salts M_2X, MX and MX_3 have same value of solubility product. Their solubilities follow the order

(a) $MX_3 > MX > M_2X$ (b) $MX > MX_3 > M_2X$

(c) $MX > M_2X > MX_3$ (d) $MX_3 > M_2X > MX$

Assam CEE-2014

Ans. (d) : Let solubility of M_2X is S_1, MX is S_2 and MX_3 is S_3

$$S_1 = (K_{sp} / 4)^{-\frac{1}{3}}; S_2 = (K_{sp})^{1/2}$$
$$S_3 = (K_{sp} / 27)^{1/4}$$

As K_{sp} Let solubility of 10^{-12} (say) in that case

$$S_1 = \frac{1}{3}\sqrt{4}\ ,\ S_2 = 10^6 \text{ and } S_3 = \frac{1}{3\sqrt{3}}10^{-3}$$

The correct order of solubilities is $MX_3 > M_2X > MX$

67. If S is the solubility of $Zr_3\ (PO_4)_4$ in Pure water then.

(a) $K_{SP} = S^7$ (b) $K_{SP} = 12S^7$

(c) $K_{SP} = 5184S^7$ (d) $K_{SP} = 6912S^7$

Assam CEE-2021

Ans. (d) : $Zr_3(PO_4)_4 \rightleftharpoons 3Zr^{4+} + 4PO_4^{3-}$

t = 0 1 0 0

t = time 1-S 3S 4S

$$K_{sp} = [\ Zr^{4+}]^3.\ [PO_4^{3-}]^4$$
$$K_{SP} = (3S)^3 \times (4S)^4$$
$$= 27 \times 4^4 \times S^7$$
$$K_{sp} = 6912S^7$$

68. The solubility product of $BaCl_2$ is 4×10^{-9}. Its solubility in mol/L is–

(a) 4×10^{-3} (b) 4×10^{-9}

(c) 1×10^{-3} (d) 1×10^{-9}

BCECE-2007

Ans. (c) : K_{sp} of $BaCl_2$ is 4×10^{-9}

$$BaCl_2 \rightleftharpoons Ba^{2+} + 2Cl^{-1}$$
$$K_{sp} = [Ba^{2+}][Cl^-]^2$$
$$= [x][2x]^2$$
$$K_{sp} = 4x^3$$
$$x^3 = \frac{K_{sp}}{4}$$
$$x = \sqrt[3]{\frac{K_{sp}}{4}} = \sqrt[3]{\frac{4\times10^{-9}}{4}}$$
$$x = 1\times10^{-3}$$

69. The principle involved in the classification of basic radicals, is :

(a) common ion effect (b) solubility product

(c) valency of radicals (d) strength of salt

BCECE-2006

Ans. (b) : Basic radicals have been classified into 6 groups on the Basis of the solubility products of their salt with group reagent The radicals have been grouped in the order increasing solubility product.

70. Some chemists at ISRO wished to prepare a saturated solution of a silver compound and they wanted it to have the highest concentration of silver ion possible. Which of the following compounds, would they use?

$$\mathbf{K_{sp}(AgCl) = 1.8\times10^{-10}}$$
$$\mathbf{K_{sp}(AgBr) = 5.0\times10^{-13}}$$
$$\mathbf{K_{sp}(Ag_2CrO_4) = 2.4\times10^{-12}}$$

(a) AgCl (b) AgBr

(c) Ag_2CrO_4 (d) None of these

BCECE-2006

@apna_pdf

Ans. (c) : For binary salts (like AgCl, AgBr)

$$s = \sqrt{K_{sp}}$$

$$\therefore \text{ Solubility of AgCl} = \sqrt{1.8\times10^{-10}}$$
$$= 1.35 \times 10^{-7} \text{ mol / L}$$

$$\text{Solubility of AgBr} = \sqrt{5.0\times10^{-13}}$$
$$= 7.1 \times 10^{-7} \text{ mol / L}$$

For, Ag_2CrO_4, $K_{sp} = 4s^3$

$$= \sqrt[3]{\frac{2.4\times10^{-12}}{4}}$$
$$= \sqrt[3]{600\times10^{-15}}$$
$$= 8.44 \times 10^{-5} \text{ mol / L}$$

71. The value of Λ^{∞}_{eq} for NH_4Cl, NaOH and NaCl are respectively, 149.74, 248.1 and 126.4 ohm^{-1} cm^{2}eq^{-1}. The value of Λ^{∞}_{eq} of NH_4OH is... Ω cm^2 eq^{-1}.

(a) 371.44
(b) 271.44
(c) 71.44
(d) Cannot be predicted from given data

BCECE-2008

Ans. (b) : Given, $\Lambda^{\infty}_{eq}(NH_4Cl) = 149.74$

$$\Lambda^{\infty}_{eq}(NaOH) = 248.1$$
$$\Lambda^{\infty}_{eq}(NaCl) = 126.4$$

Hence,

$$\Lambda^{\infty}_{eq}(NH_4OH) = \Lambda^{\infty}_{eq}(NH_4Cl) + \Lambda^{\infty}_{eq}(NaOH) - \Lambda^{\infty}_{eq}(NaCL)$$
$$= (149.74 + 248.1 - 126.4)$$
$$\Lambda^{\infty}_{eq}(NH_4OH) = 271.44 \text{ ohm}^{-1} \text{ cm}^2 \text{ eq}^{-1}$$

72. If x mol L^{-1} is the solubility of KA*l* $(SO_4)_2$ then K_{sp} is equal to–

(a) x^3 (b) $4x^4$
(c) x^4 (d) $4x^3$

BCECE-2011

Ans. (b) : $KAl(SO_4)_2 \rightleftharpoons K^+ + Al^{3+} + 2SO_4{}^{2-}$

$$\quad x \qquad\qquad x \quad\; x \qquad 2x$$

$$K_{sp} = [K^+][Al^{3+}][SO_4 2^-]^2$$
$$= x \times x \times (2x)^2$$
$$= x^2 \times 4x^2$$
$$K_{sp} = 4x^4$$

73. A saturated solution of Ag_2SO_4 is 2.5 × 10^{-2} M. The value of its solubility product is–

(a) 62.5 × 10^{-6} (b) 6.25 × 10^{-4}
(c) 15.625 × 10^{-6} (d) 3.125 × 10^{-6}

BCECE-2010

Ans. (a) : $[Ag_2SO_4] = 2.5\times10^{-2}$ m

$$Ag_2SO_4(s) \rightleftharpoons 2Ag^+ + SO_4{}^{2-}$$
$$\qquad\qquad [2S] \qquad [S]$$

Given , S = 2.5 × 10^{-2}

$$K_{sp} = [Ag^+]^2.[SO4^{2-}]$$
$$= [2S]^2 \quad [S]$$
$$= 4S^3$$
$$= 4 \times (2.5 \times 10^{-2})^3$$
$$K_{sp} = 62.5\times10^{-6} \text{ m}$$

74. Ionic product of water at 310K is 2.7×10^{-14}. What is the pH of neutral water at this temperature?

(a) 7.00 (b) 5.98
(c) 6.78 (d) 4.58

BCECE-2017

Ans. (c) : $K_w = [H^+][OH]$

$$2.7\times10^{-14} = [H^+].[OH^-]$$

As in neutral $[H^+] = [OH^-]$

$$[H^+] = \sqrt{2.7\times10^{-14}}$$
$$= 1.6432\times10^{-7}$$
$$pH = -\log[H^+]$$
$$= -\log(1.643\times10^{-7})$$
$$pH = 6.78$$

The pH of Natural water is 6.78

75. When H_2S is passed in acidic medium in solution having CuS and ZnS, only CuS is precipitated because

(a) $K_{sp}ZnS = K_{sp}CuS$
(b) $K_{sp}CuS << K_{sp}ZnS$
(c) $K_{sp}CuS >> K_{sp}ZnS$
(d) ZnS has lower melting point than CuS

BITSAT-2005

Ans. (b) : Precipitation of salt AB will occur when.

$$K_{sp}<[A^+][B^-]$$

ZnS is not precipitated by passing H_2S in acidic medium but CuS precipitated because by analysing above equation it is clear that

$$K_{sp}CuS << K_{sp}\,ZnS.$$

76. The K_{sp} of CuS, Ag_2S and HgS are 10^{-31}, 10^{-44} and 10^{-54} respectively. The solubility of these sulphides are in the order :

(a) Ag_2S > CuS > HgS (b) AgS > HgS > CuS
(c) HgS > Ag_2S > CuS (d) CuS > Ag_2S > HgS

BITSAT-2010

Ans. (a) :

- CuS $\Rightarrow S^2 = 10^{-37}$

$$S = 3.16\times10^{-19}$$

- $Ag_2S \Rightarrow 4S^3 = 10^{-44}$

$$S = 1.357\times10^{-15}$$

- $H_gS \Rightarrow S^2 = 10^{-54}$

$$S = 1\times10^{-27}$$

So, order of solubility is-
Ag_2S > CuS > HgS

77. For a sparingly soluble salt A_pB_q, the relationship of its solubility product Ls → K_{sp} with its solubility (S) is

(a) $Ls \rightarrow K_{sp} = S_{pq}(pq)_{p+q}$
(b) $Ls = S_{p+q}.p_p q_q$
(c) $Ls \rightarrow K_{sp} = S_{p+q}.p_q q_p$
(d) $Ls \rightarrow K_{sp} = s_{pq}.p_p.q_q$

BITSAT-2016

@apna_pdf

Ans. (b) : The dissociation equilibrium of a sparingly soluble salt say ($A_p B_q$) can be represented as follow.

$$A_pB_q \rightleftharpoons \underset{[S]}{pA^{+q}} + \underset{[S]}{qB^{p-}}$$

Let S be the solubility in mol/liter the expression for the solubility product will be as given below.

$$K_{sp} = [A^{+q}]^p.[B^{p-}]^q$$
$$= [p.S]^p.[q.S]^q$$
$$Ls \rightarrow K_{sp} = p^p.q^q(S)^{p+q}$$

78. If K_{sp} of Ag_2S is 10^{-17}, the solubility of Ag_2S in 0.1 M solution of Na_2S will be

(a) 10^{-8} (b) 5×10^{-9}
(c) 10^{-15} (d) 10^{-16}

CG PET-2009

Ans. (b) : $Ag_2\underset{\downarrow}{S} + Na_2\underset{\downarrow}{S}$

$$S^{2-} \longrightarrow \text{common ion}$$

$$\begin{array}{ccc} Na_2S \rightleftharpoons & 2Na^+ & + S^{2-} \\ S & 2S & S \\ 0.1m & 2\times0.1m & 0.1m \end{array}$$

$$\begin{array}{ccc} Ag_2S \rightleftharpoons & 2Ag^+ & + S^{2-} \\ x & 2x & 0.1 \end{array}$$

$$K_{sp} = [Ag^+]^2.\left[S^{2-}\right]$$
$$K_{sp} = [2x]^2\left[x\right]$$
$$K_{sp} = [4x]^2\left[10^{-1}\right]$$
$$10^{-17} = [4x^2].[10^{-1}]$$
$$4x^2 = \frac{10^{-17}}{10^{-1}} = 10^{-16}$$
$$x = \sqrt{\frac{10^{-16}}{4}}$$
$$x = \frac{1}{2}\sqrt{10^{-16}}$$
$$x = \frac{1}{2}\times10^{-8}$$
$$x = 5\times10^{-9}\,m$$

79. If solubility of $M(OH)_3$ is S, its solubility product will be:

(a) $108S^5$ (b) $27S^3$
(c) $4S^4$ (d) $27S^4$

CG PET -2019, 2013

Ans. (d) : $M(OH)_3$ is AB_3 Type salt its solubility product will be-

$$\begin{array}{ccc} M(OH)_3 \rightleftharpoons & M^{3+} & + 3OH^- \\ & S & 3S \end{array}$$

$$K_{sp} = [M^{3+}].[OH^-]^3$$
$$K_{sp} = [S].[3S]^3$$
$$K_{sp} = 27S^4$$

80. The product of H^+ and OH^- of water will be

(a) $K_w = 10^{-12}$ (b) $K_w = 10^{-14}$
(c) $K_w = 10^{-11}$ (d) $K_w = 10^{-10}$

CG PET -2006

Ans. (b) : The product of the molar concentration of H^+ and OH^- ion pure water or an aqueous solution at constant temperature is constant which is called the ionic product of water.

At 298K, For pure water

$$[H^+].[OH^-] = 1\times10^{-7}\,mol/dm^{-3}$$
$$K_w = [H^+][OH^-]$$
$$= [1\times10^{-7}].[1\times10^{-7}]$$
$$K_w = 1\times10^{-14}$$

81. Solubility product of pure $PbC1_2$ will be

(a) $K_{sp} = S^2$ (b) $K_{sp} = 4S^3$
(c) $K_{sp} = 108S^5$ (d) $K_{sp} = S$

CG PET -2006, BCECE-2003

Ans. (b) : Solubility product of pure $pbcl_2$ is -

$$\begin{array}{ccc} PbCl_2 \rightleftharpoons & Pb^{2+} & + 2Cl^- \\ & S & 2S \end{array}$$

$$k_{sp} = [Pb^{2+}][Cl^-]^2$$
$$= [S].[2S]^2$$
$$K_{sp} = 4S^3$$

82. Which of the following inert gas is soluble in water?

(a) He (b) Ne
(c) Ar (d) Xe

CG PET -2006

Ans. (d) : As the molecular weight of Noble gas atoms increases down the group its polarity increases due to which Van der Waals force between then increases. due to increased polarity of havier inert gas, its solubility in water also increases. so most soluble gas will be Xe and least soluble will be He.

83. A metal halide has molar concentration of 0.000011 mol/L in saturated state. If its K_{sp} = 39.5×10^{-20}, then the halide is

(a) M_2X_4 (b) MX_4
(c) M_2X_6 (d) MX_3

CG PET -2018

Ans. (d) : molar concentration

ie solubility (s) =0.000011mol/L

K_{sp}= 39.5× 10^{-20}

(a)

$$M_2X_4 \rightleftharpoons \underset{[2S]}{[2M^+]} + \underset{[4S]}{4X^-}$$
$$K_{sp} = [M^+]^2.[X^-]^4$$
$$K_{sp} = (2S)^2.(4S)^4$$
$$= 1024S^6$$
$$K_{sp} = 18.14\times10^{-26}$$

(b)

$$MX_4 \rightleftharpoons \underset{[S]}{M^+} + \underset{[4S]}{4X^-}$$
$$K_{sp} = [M^+].[X^-]^4$$
$$K_{sp} = [S].[4S]^4$$
$$= 256[S]^5$$
$$= 42.68\times10^{-24}$$

@apna_pdf

(c) $$M_2X_6 \rightleftharpoons \underset{[2S]}{2M^+} + \underset{[6S]}{6X^-}$$

$$K_{sp} = [M^+]^2.[X^-]^6$$

$$K_{sp} = [2S]^2.[6S]^6$$

$$= 106624[S]^8$$

$$= 40 \times 10^{-36}$$

(d) $$MX_3 \rightleftharpoons \underset{[S]}{M^+} + \underset{[3S]}{3X^-}$$

$$K_{sp} = [M^+].[X^-]^3$$

$$K_{sp} = [S].[3S]^3$$

$$= 27[S]^4$$

$$= 39.5 \times 10^{-20}$$

Correct formula of metal halide is MX_3.

84. In which of the following solvents, AgBr will have the highest solubility?

(a) 10^{-3} M NaBr (b) 10^{-3} M NH_4OH

(c) Purewater (d) 10^{-3} M HBr

CG PET- 2010

Ans. (b) : AgBr will form soluble complex with NH_4OH, i.e. $[Ag(NH_3)_2]$ Br.

The key to this problem is something called the " common ion effect" In essence, the solubility of ionic solute is much lower is a solvent that already contains one the ions of the solute.

85. Solubility produces of A1 $(OH)_3$ and Zn $(OH)_2$ are 8.5×10^{-23} and 1.8×10^{-4} respectively. If both $A1^{3+}$ and Zn^{2+} ions are present in a solution, which one will be precipitated first on addition of NH_4OH?

(a) $A1(OH)_3$ (b) Zn $(OH)_2$

(c) Both (a) and (b) (d) None of these

CG PET- 2010

Ans. (a) : The value of solubility product for

$Al(OH)_3$ is 8.5×10^{-23}.

It is much lower than the value of the solubility product for $Zn(OH)_2$ Which is 1.8×10^{-14}.

Hence, when both Al^{3+} and Zn^{2+} ion are present in the solution and as NH_4OH is added, $Al(OH)_3$ will precipitate first as the solubility product of $Al(OH)_3$ is quite low.

Hence, its ionic product will exceed its solubility product of $Al(OH)_3$ is quite low.

Hence, its ionic product will exceed its solubility product at a very low concentration of OH^- ions.

86. The molar solubility of $Cd(OH)_2$ is 1.84×10^{-5} M in water. The molar solubility of $Cd(OH)_2$ is a buffer solution of pH = 12 is

(a) 1.84×10^{-9} M (b) $\frac{2.49}{1.84} \times 10^{-9}$ M

(c) 6.23×10^{-11} M (d) 2.49×10^{-10} M

JEE MAIN-2019

Ans. (d) : $$Cd(OH)_2 \rightleftharpoons \underset{[S]}{Cd^{2+}} + \underset{[2S]}{2OH^-}$$

Now,

$$K_{sp} = [Cd^{2+}].[OH^-]^2$$

$$= [S].[2S]^2$$

$$K_{sp} = 4(S)^3$$

$$= 4 \times (1.84 \times 10^{-5})^3$$

$$Cd(OH)_2 \rightleftharpoons \underset{[S]}{Cd^{+2}} + \underset{[10^{-2}+S']}{2OH^-}$$

$$S'(10^{-2} + 5')$$

$$= 10^{-2}$$

$$S' \times \left(10^{-2}\right)^2 = 4 \times \left(1.84 \times 10^{-5}\right)^3$$

$S' = 4 \times (1.84)^3 \times 10^{-11}$

$S' = 2.491 \times 10^{-10}$m

87. The solubility product of Cr $(OH)_3$ at 298 k is 6.0×10^{-31}. The concentration of hydroxide ions in a saturated solution of Cr $(OH)_3$ will be

(a) $(2.22 \times 10^{-31})^{1/4}$ (b) $(18 \times 10^{-31})^{1/4}$

(c) $(4.86 \times 10^{-29})^{1/4}$ (d) $(18 \times 10^{-31})^{1/2}$

[JEE Main 2020, 9 Jan Shift-II]

Ans. (b) : $$Cr(OH)_3 \rightleftharpoons \underset{S}{Cr^{3+}} + \underset{3S}{3OH^-}$$

$K_{sp} = [Cr^{3+}].[OH^-]^3$

$= [S].[3S]^3$

$K_{sp} = 27S^4$

$6 \times 10^{-31} = 27S^4$

$$S^4 = \frac{6 \times 10^{-31}}{27}$$

$$S = \left(\frac{6 \times 10^{-31}}{27}\right)^{1/4}$$

$[OH^-] = 3S$

$$[OH^-] = 3 \times \left(\frac{6 \times 10^{-31}}{27}\right)^{1/4}$$

$$[OH^-] = \left(18 \times 10^{-31}\right)^{1/4}$$

88. If solubility product of $Zr_3(PO_4)_4$ is denoted by K_{sp} and its molar solubility is denoted by S, then which of the following relation between S and K_{sp} is correct?

(a) $S = \left(\frac{K_{sp}}{144}\right)^{1/6}$ (b) $S = \left(\frac{K_{sp}}{6912}\right)^{1/7}$

(c) $S = \left(\frac{K_{sp}}{929}\right)^{1/9}$ (d) $S = \left(\frac{K_{sp}}{216}\right)^{1/7}$

[JEE Main 2019, 8 April Shift-I]

Ans. (b) : $$Zr_3(PO_4)_4(s) \rightleftharpoons \underset{[3S]}{3Zr^{4+}} + \underset{[4S]}{4PO_4^{3-}}$$

$K_{sp} = [Zr^{4+}]^3[PO_4^{3-}]^4$

$= [3S]^3.[4S]^4$

$$S = \left(\frac{K_{sp}}{6912}\right)^{1/7}$$

@apna_pdf

89. What is the molar solubility of $Al(OH)_3$ in 0.2 M NaOH solution? Given that, solubility product of $Al(OH)_3 = 2.4\times10^{-24}$

(a) 3×10^{-19} (b) 12×10^{-21}

(c) 3×10^{-22} (d) 12×10^{-23}

[JEE Main 2019, 12 April Shift-I]

Ans. (c) : $Al(OH)_3 \rightleftharpoons \underset{[S]}{Al^{+3}} + \underset{[3S]}{3OH^-}$

$K_{sp} = [Al^{3+}].[OH^-]^3$

Now let S be solubility

$[OH^-] = 3(S) + 0.2m \approx 0.2m$

$K_{sp} = S \times (0.2)^3$

$2.4 \times 10^{-24} = S \times [0.2]^3$

$$S = \frac{2.4\times10^{-24}}{0.2\times0.2\times0.2}$$

$S = 3 \times 10^{-22}$ mol/L.

90. If K_{sp} of Ag_2CO_3 is 8×10^{-12}, the molar solubility of Ag_2CO_3 in 0.1M $AgNO_3$ is

(a) 8×10^{-12} M (b) 8×10^{-13} M

(c) 8×10^{-10} M (d) 8×10^{-11} M

[JEE Main 2019, 12 Jan Shift-II]

Ans. (c) : $Ag_2CO_3 \rightleftharpoons \underset{[S]}{2Ag^+} + \underset{[S]}{CO_3^{2-}}$

$K_{sp} = [Ag^+].[CO_3^{2-}]$

$\underset{0.1\,M}{AgNO_3} \rightleftharpoons \underset{0.1\,M}{Ag^+} + \underset{0.1\,M}{NO_3^-}$

Hence, total Ag^+ ion = [0.1 M + S]

[0.1 M >> S]

S is negligible.

$K_{sp} = [Ag^+].[CO_3^{2-}]$

$= [0.1 + S]^2.[S]$

$8 \times 10^{-12} = [0.1]^2.[S]$

$$S = \frac{8\times10^{-12}}{0.1 \times 0.1}$$

$S = 8 \times 10^{-10}$ M

91. An aqueous solution contains 0.10 M H_2S and 0.20 M HCI. If the equilibrium constants for the formation of HS^- from H_2S is 1.0×10^{-7} and that of S^{2-} from HS^- ions is 1.2×10^{-13} then the concentration of s^{2-} ions in aqueous solution is

(a) 5×10^{-8} (b) 3×10^{-20}

(c) 6×10^{-21} (d) 5×10^{-19}

[JEE Main-2018]

Ans. (b) : Formation of $H\bar{S}$ from $H_2\bar{S}$

$H_2S \rightleftharpoons H^+(aq) + HS^-(aq) --- (i)$

from of S^{2-} from H^{S-}

$HS^-aq \rightleftharpoons H^+(aq) + S^{2-}(aq) --- (ii)$

Where in- $Ka_1 = \dfrac{[H^+][HS^-]}{[H_2S]}$

$Ka_2 = \dfrac{[H^+].[S^{2-}]}{[HS^{-1}]}$

Add eq^n (i) & (2), we get -

$H_2S(aq) \rightleftharpoons 2H^+(aq) + S^{2-}(aq), K = Ka_1 \times Ka_2$

$$K = \frac{[H^+][HS^-]}{[H_2S]} \times \frac{[H^+][S^{2-}]}{[HS^-]}$$

$$K = \frac{[H^+]^2[S^{2-}]}{[H_2S]}$$

$= 10^{-7} \times 1.2\times10^{-13}$

$K = 1.2\times10^{-20}$

at. t = 0 0.10m, 0.20m

$$K = \frac{(0.2)^2(x)}{0.1}$$

$$1.2\times10^{-20} = \frac{0.2\times0.2\times x}{0.1}$$

$x = 3 \times 10^{-20}$

92. An aqueous solution contains an unknown concentration of Ba^{2+} When 50 mL of a 1 M solution of Na_2SO_4 is added, $BaSO_4$ just begins to precipitate. The final volume is 500 mL. The solubility product of $BaSO_4$ is 1×10^{-10}. What is the original concentration of Ba^{2+}?

(a) 5×10^{-9} M (b) 2×10^{-9} M

(c) 1.1×10^{-9} M (d) 1.0×10^{-10} M

[JEE Main-2018]

Ans.(c): Final concentration of $[SO_4^-] = \dfrac{50\times1}{500} = 0.1M$

K_{sp} of B_aSO_4

$[Ba^{2+}][SO_4^{2-}] = 1\times10^{-10}$

$[Ba^{2+}][0.1] = 1\times10^{-10}$

$$[Ba^{2+}] = \frac{10^{-10}}{0.1} = 10^{-9}\,M$$

Concentration of Ba^{2+} in final solution = 10^{-9}M

concentration of Ba^{2+} in original

In solution, $M_1.V_1 = M_2.V_2$

$M_1(500 - 50) = 10^{-9}(500)$

$$M_1 = \frac{500\times10^{-9}}{450}$$

$M_1 = 1.11\times 10^{-9}$M

93. The K_{sp} for $Cr(OH)_3$ is 1.6×10^{-30}. The molar solubility of this compound in water is

(a) $\sqrt[2]{1.6\times10^{-30}}$ (b) $\sqrt[4]{1.6\times10^{-30}}$

(c) $\sqrt[4]{\dfrac{1.6\times10^{-30}}{27}}$ (d) $\dfrac{1.6\times10^{-30}}{27}$

[AIEEE-2011]

Ans. (c) : Let's be the molar solubility of $Cr(OH)_3$ then,

$Cr(OH)_3 \rightleftharpoons \underset{S}{Cr^{3+}} + \underset{3S}{3OH^-}$

$K_{sp} = [Cr^{3+}].[OH^-]$

$K_{sp} = S \times (3S)^3$

$= 27S^4$

$$S = \sqrt[4]{\frac{K_{sp}}{27}}$$

$$S = \sqrt[4]{\frac{1.6\times10^{-30}}{27}}$$

94. Solubility product of silver bromide is 5.0×10^{-13}. The quantity of potassium bromide (molar mass taken as 120 g mol^{-1}) to be added to 1 L of 0.05 M solution of silver nitrate of start the precipitation of AgBr is

@apna_pdf

(a) 1.2×10^{-10} g (b) 1.2×10^{-9} g
(c) 6.2×10^{-5} g (d) 5.0×10^{-8} g

AIEEE-2010

Ans. (b) : Given (AgBr) = 5×10^{-13},$[Ag^+] = 0.05$m
Molar mass of KBr = 120gmol^{-1}

$$Ag^+(aq) + Br^-(aq) = AgBr$$

Precipitation starts when ionic product just exceeds solubility product.

$K_{sp} = [Ag^+][Br^-]$ putting the valves -

$$\Rightarrow \quad [Br^-] = \frac{K_{sp}}{[Ag^+]} = \frac{5\times10^{-13}}{0.05} = 10^{-11}$$

Precipitation starts when 10^{-11} moles of KBr is added to $AgNO_3$ of $AgNO_3$ solution.
No. of moles of KBr to be added = 10^{-11}
Weight of KBr = no. of moles × molar mass.
Putting the valves.

$$= 10^{-11}\times120 = 1.2\times10^{-9}\text{g}$$

95. Solid Ba(NO_3) is gradually dissolved in a 1.0×10^{-4} MNa_2CO_3 solution. At what concentration of Ba^{2+} will a precipitate begin to form?
(K_{sp} for $BaCO_3 = 5.1\times10^{-9}$)

(a) 4.1×10^{-5} M (b) 5.1×10^{-5} M
(c) 8.1×10^{-8} M (d) 8.1×10^{-7} M

[AIEEE-2009]

Ans. (b) : according to situation -

$$\underset{1\times10^{-4}\text{m}}{Na_2CO_3} \longrightarrow 2Na^+ + CO_3^{2-}$$

For

$$Ba\,CO_3 \rightarrow Ba^{2+} + CO_3^{2-}$$
$$K_{sp} = [Ba^{2+}].[CO_3^{2-}]$$

Hence. $5.1\times10^{-9} = [Ba^{2+}]\,[1\times10^{-4}]$

$$[Ba^{2+}] = \frac{5.1\times10^{-9}}{1\times10^{-4}}$$

$Ba^{2+} = 5.1\times10^{-5}$m

96. In a saturated solution of the spatingly soluble strong electrolyte $AgIO_3$ (molecular mass = 283) the equilibrium which sets in is

$$AgIO_3\,(s) \rightleftharpoons Ag+(aq) + IO_3^-(aq)$$

If the solubility product constant K_{sp} of $AgIO_3$ at a given temperature is 1.0×10^{-8}, what is the mass of $AgIO_3$ contained in 100 mL of its saturated solution?

(a) 28.3×10^{-2} g (b) 28.3×10^{-4} g
(c) 1.0×10^{-7}g (d) 1.0×10^{-4} g

[AIEEE-2007]

Ans. (b) :

$$\underset{(s)}{AgIO_3} \rightleftharpoons \underset{0}{Ag^+(aq)} + \underset{0}{IO_3^-(aq)}$$
$$0 \qquad s \qquad s$$

(s = Solubility)

$$K_{sp} = x^x \times y^y \times s^{x+y}$$

x = no. of Ag^+ ions and
y = no of IO_3^- ions

$$K_{sp} = S^2 \Rightarrow S = \sqrt{K_{sp}} = \sqrt{10^{-8}} = 10^{-4}\text{M}$$

$$1000\,\text{mL} \rightarrow 10^{-4}\,\text{mL} = 10^{-4}\times283\,\text{g}$$

$$100\,\text{mL} \rightarrow \frac{10^{-4}\times283\times100}{1000} = 28.3\times10^{-4}\,\text{g}$$

97. The solubility product of a salt having general formula MX_2, in water is 4×10^{-12}. The concentration of M^{2+} ions in the aqueous solution of the salt is

(a) 4.0×10^{-10} M (b) 1.6×10^{-4} M
(c) 1.0×10^{-4} M (d) 2.0×10^{-6} M

[AIEEE-2004]

Ans. (c) : Solubility produt = 4×10^{-12}

$$MX_2 \rightleftharpoons \underset{[S]}{M^{2+}} + \underset{[2S]}{2M^-}$$

$$K_{sp} = [M^{2+}]\times[M^-]^2$$
$$K_{sp} = [S].[2S]^2$$
$$K_{sp} = 4S^3$$

The solubility of M^{2+} ion = S

$$S = \left(\frac{K_{sp}}{4}\right)^{1/3} = \left(\frac{4\times10^{-12}}{4}\right)^{1/3}$$

$$S = 1\times10^{-4}\text{ M}$$

98. The molar solubility (in Mol L^{-1}) of a sparingly soluble salt MX_4 is S. The corresponding solubility product is K_{sp}. S is given in terms of K_{sp} by the relation.

(a) $S = (K_{sp}/128)^{1/4}$ (b) $S = (K_{sp}\times128)^{1/4}$
(c) $S = (K_{sp}/256)^{1/5}$ (d) $S = (K_{sp}\times256)^{1/5}$

[AIEEE-2004]

Ans. (c) : The expression for the dissociation of the salt is, $MX_4 \rightleftharpoons \underset{[S]}{M^{4+}} + \underset{[4S]}{4X^-}$

The expression for the solubility product is

$$K_{sp} = [M^{4+}][X^-]^4$$
$$= [S].[4S]^4$$
$$= 256S^5$$

thus, the expression for solubility becomes

$$S^5 = \frac{K_{sp}}{256}$$

$$S = \left(\frac{K_{sp}}{256}\right)^{1/5}$$

99. The solubility in water of a sparingly soluble salt AB_2 is 1.0×10^{-5} mol L^{-1}. Its solubility product will be

(a) 4×10^{-15} (b) 4×10^{-10}
(c) 1×10^{-15} (d) 1×10^{-10}

[AIEEE-2003]

Ans. (a) : Solubility process is :-

$$\underset{1}{AB_2} \longrightarrow \underset{S}{A^{2+}} + \underset{2S}{2B^-}$$

using the relation of solubility and solubility product as:

$$K_{sp} = [A^{2+}][B^-]^2$$
$$K_{sp} = [S.][2S]^2$$

Substituting . $S = 10^{-5}$

$$K_{sp} = 10^{-5}\times(2\times10^{-5})^2$$
$$K_{sp} = 4\times10^{-15}$$

100. Solubility of $Ca(OH)_2$ is S mol L^{-1}. The solubility product (K_{sp}) under the same condition is

(a) $4S^3$ (b) $3S^4$
(c) $4S^2$ (d) S^3

[AIEEE-2002]

@apna_pdf

Ans. (a) : $Ca(OH)_2 \rightleftharpoons Ca^{2+} + 2OH^-$

$K_{sp} = [Ca^{2+}].[OH^-]^2$

$= [S].[2S]^2$

$K_{sp} = [S].4S^2$

$K_{sp} = 4S^3$

101. If the solubiity product of AB_2 is 3.20×10^{-11} M^3, then the solubility of AB_2 in pure water is.......$\times10^{-4}$ Mol L^{-1}

[Assuming that neither kind of ion reacts with water]

[JEE Main-2020, 6 Sept Shift-II]

Ans. (2) : $AB_2 \rightleftharpoons \underset{[S]}{A^{2+}} + \underset{[2S]}{2B^-}$

$K_{sp} = [A^{2+}].[B^-]^2$

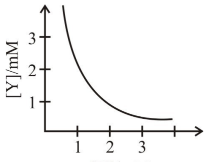
$= [S].[2S]^2$

$K_{sp} = 4S^3$

$$S = \left(\frac{K_{sp}}{4}\right)^{1/3} = \left(\frac{32\times10^{12}}{4}\right)^{1/3}$$

$K_{sp} = 2\times10^{-4}$Mol/liter

102. The stoichiometry and solubility product of a salt with the solubility curve given below is, respectively:



(a) X_2Y, 2×10^{-9} M^3
(b) XY, 2×10^{-6} M^3
(c) XY_2, 1×10^{-9} M^3
(d) XY_2, $4\times10^{-9}M^3$

[JEE Main 2020, 8 Jan Shift-I]

Ans. (d) : $[x] = 1\times10^{-3}$

$[y] = 2\times10^{-3}$

$XY_2 \rightleftharpoons \underset{10^{-3}}{X^{2+}} + \underset{2\times10^{-3}}{2Y^-}$

$K_{sp} = [X^{2+}][Y^-]^2$

$= [10^{-3}][2\times10^{-3}]^2$

$K_{sp} = 4\times10^{-9}$

Corresponding stoichiometry = $4\times10^{-9}M^3$

103. The molar solubility of $Zn(OH)_2$ in 0.1 M NaOH solution is x $\times10^{-18}$ M. The value of x is.......(Nearest integer)

(Given; The solubility product of Zn (OH), is 2 $\times 10^{-20}$)

[JEE Main 2021, 1 Sep Shift-II]

Ans. (2) : $Zn(OH)_2$ is dissolved in 0.1m of NaOH

$Zn(OH)_2(s) \rightleftharpoons \underset{(s)}{Zn^{2+}}(aq) + \underset{(0.1+2s)}{2OH^-}$

$Zn(OH)_2$ is less soluble, so, 2S is negligible compared to 0.1

$K_{sp} = [Zn^{2+}].[OH^-]^2$

$K_{sp} = [S].[0.1]^2$

$K_{sp} = [S].[10^{-2}]$

$2\times10^{-20} = S.10^{-2}$

$S = 2\times10^{-18}$ M

$= x\times10^{-18}$ M

So, x = 2

104. A_3B_2 is a sparingly soluble salt of molar mass M (g mol^{-1}) and solubility x g L^{-1}. The solubility product satisfies $K_{sp} = a\left(\frac{X}{M}\right)^5$. The value of a is ....(Integer answer)

[JEE Main 2021, 13 Aug Shift-I]

Ans. (a = 108) : $A_3B_2(s) \rightleftharpoons \underset{(3S)}{3A^{2+}} + \underset{(2S)}{2B^{-3}}$

$K_{sp} = [A^{2+}]^3[B^{-3}]^2$

$K_{sp} = (3S)^3(2S)^2$

$K_{sp} = 108S^5$ $S = \left(\frac{x}{m}\right)$

$$K_{sp} = 108\left(\frac{x}{m}\right)^5$$

given. $K_{sp} = a\left(\frac{x}{m}\right)^5$

a = 108

105. A solution is 0.1 M in Cl^- and 0.001 M in CrO_4^{2-}. Solid $AgNO_3$ is gradually added to it. Assuming that the addition does not change in volume and

K_{sp} (AgCl) = 1.7×10^{-10} M^2 and

K_{sp} (Ag_2CrO_4) = 1.9×10^{-12} M^3

Select correct statement from the following

(a) AgCl precipitates first because its K_{sp} is high.
(b) Ag_2CrO_4 precipitates first as its K_{sp} is low.
(c) Ag_2CrO_4 precipitates first because the amount of Ag^+ needed is low.
(d) AgCl will precipitate first as the amount of Ag^+ needed to precipitate is low

[JEE Main 2021, 20 July Shift-II]

Ans. (d) : Given data, $K_{sp} = 1.7\times10^{-10}$ M^2

$K_{sp}Ag_2CrO_4 = 1.9\times10^{-12}$ M^3

$[Cl^-] = 0.1$ M, $\left[CrO_4^{2-}\right] = 0.001M$

(i) $[Ag^+]$ required to precipitate AgCl(s)

$\therefore K_{sp} = I.P. = [Ag^+][Cl^-] = 1.7\times10^{-10}$

$$[Ag^+] = \frac{1.7\times10^{-10}}{0.1} = 1.7\times10^{-9}$$

(ii) $[Ag^+]$ required to precipitate $Ag_2CrO_4(s)$

$K_{sp} = I.P. = [Ag^+]^2[CrO_4^{-2}] = 1.9\times10^{-12}$

$[Ag^+] = 4.3\times10^{-5}$

$[Ag^+]$ required to precipitate AgCl is low. So, AgCl will precipitate 1st.

106. The solubility of $CdSO_4$ in water is 8.0×10^{-4} mol L^{-1}. Its solubility in 0.01M H_2SO_4 solution is.......$\times10^{-6}$ mol L^{-1}. (Round off to the nearest integer)

(Assume that, solubility is much less than 0.01 M)

[JEE Main 2021, 18 March Shift-II]

Ans. (64) : Given, Solubility of $CdSO_4$ = 8.0×10^{-4} mol/L^{-1}

Solubility of H_2SO_4 = ?

Solubility of $CdSO_4$ in pure water–

$CdSO_4 \rightleftharpoons \underset{S}{Cd^{2+}} + \underset{S}{SO_4^{2-}}$

@apna_pdf

$$\therefore \quad K_{sp} = [Cd^{2+}][SO_4^{2-}]$$

$$K_{sp} = (S)^2$$

$$K_{sp} = (8 \times 10^{-4})^2$$

In H_2SO_4 solution,

$$\underset{0.01}{H_2SO_4} \rightleftharpoons \underset{2\times0.01}{2H^+} + \underset{0.01}{SO_4^{2-}}$$

$$CdSO_4 \rightleftharpoons \underset{S'}{Cd^{2+}} + \underset{S'+0.01\approx0.01}{SO_4^{2-}}$$

As, $S' << 0.01$

So, $S' + 0.01 \approx 0.01$

$$\therefore \quad K_{sp} = [Cd^{2+}][SO_4^{2-}]$$

$$64 \times 10^{-8} = S' \times 0.01$$

or $S' = 64 \times 10^{-6}$

Hence, the solubility of H_2SO_4 in 0.01 M solution is 64.

107. The oxygen dissolved in water exerts a partial pressure of 20 kPa in the vapour above water. The molar solubility of oxygen in water is ....×10^{-5} mol dm^{-3}.
(Round off the nearest integer). [Given, Henry's law constant (K_H) = 8.0 × 10^4 kPa for O_2, density of water with dissolved oxygen = 1.0 g dm^{-3}]

[JEE Main 2021, 17 March Shift-I]

Ans. (25) : Given, partial pressure = 20 kPa,
K_H = 8.0 × 10^4 kPa

As we know that partial pressure is directly proportional to the solubility.

Partial pressure = K_H × Solubility

Where, K_H = Henry constant

$$\therefore \quad 20 \times 10^3 = 8.0 \times 10^4 \times 10^3 \times \text{Solubility}$$

or $$\text{Solubility} = \frac{20}{8} \times 10^{-4}$$

$$\text{Solubility} = \frac{200}{8} \times 10^{-5}$$

Solubility = 25 × 10^{-5} mole dm^{-3}

108. Two Salts A_2X and MX have the same value of solubility product of 4.0 ×10^{-12}. The ratio of their molar solubilities i.e. $\frac{S(A_2X)}{S(MX)}$ = ...
(Round off to the nearest integer)

[JEE Main 2021, 16 March Shift-II]

Ans. (50) : Given,
Solubility product of A_2X = Solubility product of MX = 4.0 × 10^{-12}

For A_2X salt,

$$A_2X \rightleftharpoons \underset{2x}{2A^+(aq)} + \underset{x}{X^{2-}(aq)}$$

$$\therefore \quad K_{sp} = [A^+]^2[X^{-2}]$$

$$K_{sp} = (2x)^2(x)$$

$$K_{sp} = 4x^3$$

$$x = \left(\frac{K_{sp}}{4}\right)^{\frac{1}{3}}$$

$$x = \left(\frac{4\times10^{-12}}{4}\right)^{1/3}$$

$$x = 10^{-4}$$

or $S(A_2X) = 10^{-4}$

For MX Salt,

$$MX \rightleftharpoons \underset{y}{M^+} + \underset{y}{X^-}$$

$$K_{sp} = y^2$$

$$y = \sqrt{K_{sp}}$$

$$y = \sqrt{4\times10^{-12}}$$

$$y = 2\times10^{-6}$$

$$S(MX) = 2\times10^{-6}$$

Hence, $$\frac{S(A_2X)}{S(MX)} = \frac{10^{-4}}{2\times10^{-6}} = 50$$

109. The solubility of $Ca(OH)_2$ in water is [Given: The solubility product of $Ca(OH)_2$ in water = 5.5 ×10^{-6}]

(a) 1.11 ×10^{-2}
(b) 1.11×10^{-6}
(c) 1.77×10^{-2}
(d) 1.77×10^{-6}

[JEE Main 2021, 25 Feb Shift-II]

Ans. (a) : Given,
Solubility product of $Ca(OH)_2$ in water = 5.5 ×10^{-6}
Solubility of $Ca(OH)_2$ in water = ?

Now, $$Ca(OH)_2 \rightleftharpoons \underset{S}{Ca^{2+}} + \underset{2S}{2OH^-}$$

$$K_{sp} = [Ca^{2+}][OH^-]^2$$

$$5.5 \times10^{-6} = [S][2S]^2$$

$$5.5 \times10^{-6} = 4S^3$$

$$S^3 = \frac{5.5\times10^{-6}}{4}$$

$$S^3 = 1.375 \times10^{-6}$$

$$S = 1.11\times 10^{-2}$$

110. The solubility product of PbI_2 is 8.0×10^{-9}. The solubility of lead iodide in 0.1 molar solution of lead nitrate is x×10^{-6} mol/L. The value of x is........ (Rounded off to the nearest integer).
[Given, : $\sqrt{2} = 1.41$]

[JEE Main 2021, 24 Feb Shift-II]

Ans. (x = 141) : Given, K_{sp} of $PbCl_2$ = 8×10^{-9}

To calculate solubility of $PbCl_2$ in 0.1M solution of Pb $(NO_3)_2$.

(i) $$\underset{0.1m}{Pb(NO_3)(l)} \rightleftharpoons \underset{0.1m}{Pb^{2+}(aq)} + \underset{0.2m}{2NO_3\ (aq)}$$

(ii) $$PbI_2 \rightleftharpoons \underset{S}{Pb^{2+}}(aq) + \underset{2S}{2I^-}\ (aq)$$

total mole of $Pb^{2+} = S + 0.1 \approx 0.1$ ($\therefore S<<0.1$)

Now, $$K_{sp} = [Pb^{2+}] \times [I^-]^2$$

$$K_{sp} = [0.1]\,[2S]^2$$

$$K_{sp} = 0.1\times4S^2$$

$$S = \sqrt{\frac{K_{sp}}{0.1\times4}}$$

$$S = \sqrt{\frac{8\times10^{-9}}{0.1\times4}}$$

$$S = \sqrt{2}\times10^{-4}$$

$$S = 1.41\times10^{-4}$$

$$S = 141\times10^{-6}$$

Hence, the value of x is 141.

@apna_pdf

111. The pH of a 0.1 molar solution of the acid HQ is 3. The value of the ionisation constant, K_a of the acid is

(a) 3×10^{-1} (b) 1×10^{-3}
(c) 1×10^{-5} (d) 1×10^{-7}

[AIEEE-2012]

Ans. (c) : Given, pH = 3

$\therefore$ $pH = -\log[H^+] \Rightarrow [H^+] = 10^{-3}$

Concentrastion of HQ = 0.1 molar, K_a = ?

Now, from ionzation of HQ - we get

$$\underset{\substack{0.1\\0.1-x}}{HQ} \rightleftharpoons \underset{\substack{0\\x}}{H^+} + \underset{\substack{0\\x}}{Q^-}$$

$$K_a = \frac{x \times x}{(0.1-x)}$$

$$K_a = \frac{x^2}{(0.1-x)} \qquad (\because 0.1 <<< x)$$

$$\therefore \quad K_a = \frac{(10^{-3})^2}{0.1}$$

$$K_a = \frac{10^{-6}}{0.1}$$

or $K_a = 1 \times 10^{-5}$

112. The first and second dissociation constants of an acid H_2A are 1.0×10^{-5} and 5.0×10^{-10}, respectively. The overall dissociation constant of the acid will be

(a) 5.0×10^{-5} (b) 5.0×10^{15}
(c) 5.0×10^{-15} (d) 0.2×10^{5}

[AIEEE-2007]

Ans. (c) : Given,

First dissociation constant of $H_2A(K_1) = 1.0 \times 10^{-5}$

Second dissociation constant of $H_2A(K_2) = 5 \times 10^{-10}$

Now, $H_2A \rightleftharpoons HA^- + H^+$

$$K_1 = \frac{[H^+][HA^-]}{[H_2A]} \qquad .....(i)$$

And, $HA^- \longrightarrow H^+ + A^{2-}$

$$K_2 = \frac{[H^+]^2[A^{-2}]}{[HA^-]} \qquad .....(ii)$$

Overall dissociation constant we get–

$K = K_1 \times K_2$

$K = 1 \times 10^{-5} \times 5 \times 10^{-10}$

$K = 5 \times 10^{-15}$

113. The correct equation relating solubility and solubility product for the sparingly soluble salt with the general molecular formula AB_2 is

(a) $S = [4K_{sp}]^{1/3}$ (b) $S = 2^{2/3}[K_{sp}]^{-1/3}$
(c) $S = [4K_{sp}]^{-1/3}$ (d) $S = 2^{-2/3}[K_{sp}]^{1/3}$

J & K CET-(2016)

Ans. (d) : The dissociation of AB_2 salt is–

$$AB_2 \rightleftharpoons \underset{S}{A^{2+}} + \underset{2S}{2B^-}$$

$$K_{sp} = [A^{2+}][B^-]^2$$

$$K_{sp} = (S)(2S)^2$$

$$K_{sp} = 4S^3$$

$$S = 1/2\sqrt{\frac{K_{sp}}{4}}$$

$$S = 2^{-2/3}\,(K_{sp})^{1/3}$$

114. The correct order of solubility of the sulphates of alkaline earth metals in water is

(a) Be > Ca > Mg > Ba > Sr
(b) Mg > Be > Ba > Ca > Sr
(c) Be > Mg > Ca > Sr > Ba
(d) Mg > Ca > Ba > Be > Sr

J & K CET-(2004)

Ans. (c) : Down the group the solutility of sulphates decreases So the sulphates of Be is more soluble and the sulphates of Ba is least soluble. So, the order of solubility of Sulfate is–

Be > Mg > Ca > Sr > Ba

115. If the solubility of a sparingly soluble salt AX_2 is s mol/lit., the solubility product is

(a) $4s^3$ (b) $8s^3$
(c) $4s^2$ (d) s^2

J & K CET-(2015)

Ans. (a) : The dissociation of AX_2 is given as–

$$AX_2 \rightleftharpoons \underset{s}{A^{2+}} + \underset{2s}{2X^-}$$

Now, $K_{sp} = [A^{2+}].[X^-]^2$

$= [s].[2s]^2$

$K_{sp} = 4s^3$

116. The solubility of $Fe(OH)_3$ is x mol L^{-1}. Its K_{sp} would be

(a) $9x^3$ (b) $3x^4$
(c) $27x^4$ (d) $9x^4$

J & K CET-(2013)

Ans. (c) : Given, solubility of $Fe(OH)_3$ = x mol L^{-1}

Now, $Fe(OH)_3 \rightleftharpoons Fe^{3+} + 3OH^-$

$$K_{sp} = \underset{[x]}{[Fe^{3+}]}.\underset{[3x]^3}{[OH^-]^3}$$

$K_{sp} = (x).(3x)^3$

$K_{sp} = 27x^4$

117. An aqueous solution contains Ni^{2+}, Co^{2+} and Pb^{2+} ions at equal concentrations. The solubility product of NiS, PbS and CoS in water at 25^0C are 1.4×10^{-24}, 3.4×10^{-28} and 3×10^{-26} respectively. Indicate which of these ions will be precipitated first and last when sulphide concentration is progressively increased from zero.

(a) NiS and PbS (b) NiS and CoS
(c) CoS and NiS (d) PbS and NiS

J & K CET-(2008)

Ans. (d) : For precipitation,

Ionic product > Solubility product

The metal sulfide with lowest K_{sp}(PbS) will precipitate out first because its ionic product will be exceed its K_{sp} and the metal sulfide with highest K_{sp}(NiS) will precipitate out at last.

118. Which of the following salts is most soluble?

(a) $Bi_2S_3(k_{sp} = 1 \times 10^{-17})$
(b) MnS $(K_{sp} = 7 \times 10^{-16})$
(c) CuS $(k_{sp} = 8 \times 10^{-37})$
(d) Ag_2S $(K_{sp} = 6 \times 10^{-51})$

J & K CET-(2003)

Ans. (b) : In all these compound the MnS is most soluble because its solubility product is maximum. The solubility product is a kind of equilibrium constant and

@apna_pdf

its value depends on temperature. The solubility increases with an increase in K_{sp}. Solubility is stated as a property of a substance called solute to get dissolved in a solvent in order to form a solution.

119. Ostwald dilution law is applicable to
(a) strong electrolytes only
(b) weak electrolytes only
(c) non-electrolytes only
(d) strong as well as weak electrolytes

J & K CET-(2003)

Ans. (b) : Ostwald applied 'law of mass action' to ionic equilibrium. This is called as Ostwald's dilution law. This law is applicable only for weak electrolytes. According to Ostwald dilution law–

$$\underset{\substack{\text{Initially}\\ \text{At equi.}}}{}\ H_2O + \underset{\substack{C\\ C(1-\alpha)}}{HA} \rightleftharpoons \underset{\substack{0\\ C\alpha}}{A^-} + \underset{\substack{0\\ C\alpha}}{H_3O^+}$$

Where, α = degree of ionisation

$$\text{Dissociation constant } (K_a) = \frac{[A^-][H_3O^+]}{[HA]}$$

$$K_a = \frac{C^2\alpha^2}{C(1-\alpha)}$$

$$K_a = \frac{C\alpha^2}{(1-\alpha)} \quad (\because \text{ for weak electrolyte, } \alpha << 1)$$

$\therefore \quad K_a = C\alpha^2$

120. When HCl gas is passed through a saturated solution of NaCl (brine), then the solubility of NaCl
(a) increases (b) decreases
(c) remains same (d) none of these.

J & K CET-(2000)

Ans. (a) : If we take a saturated solution of sodium chloride and pass HCl gas through it, then sodium chloride is precipitated due to increased concentration of chloride ion available from the dissociation of HCl.
The common ion effect is also used for almost complete precipitation of a particular ion as its sparingly soluble salt, with very low value of solubility product for gravimetric estimation.

121. The solubility of CaF_2 in water is 1.30×10^{-5} mol L^{-1}. Its solubility product is
(a) 1.30×10^{-5} (b) 1.69×10^{-10}
(c) 2.20×10^{-15} (d) 8.80×10^{-15}

J & K CET-(1999)

Ans. (d) : Given, Solubility of $CaF_2(S) = 1.30 \times 10^{-5}$

$$\text{Now,} \quad CaF_2 \rightleftharpoons \underset{S}{Ca^{2+}} + \underset{2S}{2F^-}$$

$K_{sp} = [Ca^{2+}][F^-]^2$
$K_{sp} = (S).(2S)^2$
$K_{sp} = 4S^3$
$K_{sp} = 4 \times (1.3 \times 10^{-5})^3$
$K_{sp} = 8.8 \times 10^{-15}$

122. A solution contains 0.05 M NaCl and 0.05 M NaI. The concentration of iodied ion in solution when AgCl just starts precipitating is equal to (K_{sp} AgCl$=1\times10^{-10}$; K_{sp}AgI $= 4 \times 10^{-16}$)
(a) 4.0×10^{-8} M (b) 2.0×10^{-7} M
(c) 8.0×16^{-16} M (d) 2.0×10^{-8} M

J & K CET-(1999)

Ans. (b) : Given, K_{sp} AgCl$=1\times10^{-10}$, K_{sp}AgI $= 4 \times 10^{-16}$
The solution of AgI precipitated first because it has the less value of K_{sp} than the K_{sp} value of AgCl.

K_{sp}AgCl > K_{sp}AgI
$\therefore \quad K_{sp} = [Ag^+][Cl^-]$

$$\text{or} \quad [Ag^+] = \frac{1\times10^{-10}}{0.05} = 2\times10^{-9}\,M$$

And, $\quad K_{sp} = [Ag^+][I^-]$

$$\text{or} \quad [I^-] = \frac{4\times10^{-16}}{2\times10^{-9}} = 2\times10^{-7}\,M$$

123. The solubility product of $PbBr_2$ is 10.8×10^{-5}. It is 70% dissociated in saturated solution. The solubility of salt is:
(a) 4.18×10^{-2} (b) 6.76×10^{-3}
(c) 3.4×10^{-4} (d) 5.44×10^{-2}

JCECE - 2003

Ans. (a): Given, $K_{sp} = 10.8\times10^{-5}$

$$\text{Now,} \quad \underset{\substack{a\\ a-S}}{PbBr_2} \rightleftharpoons \underset{\substack{0\\ S}}{Pb^{2+}} + \underset{\substack{0\\ 2S}}{2Br^-}$$

$\therefore \quad K_{sp} = [Pb^{2+}][Br^-]^2$
$K_{sp} = (S)(2S)^2$
or $\quad 10.8 \times 10^{-5} = 4S^3$
or $\quad S = 3 \times 10^{-2}$

This is the solubility for the 100% dissociation. According to the question, we calculate for 70%.

$$\therefore \text{ For 70\% dissociation } (S) = \frac{100}{70} \times 3\times10^{-2}$$

$S \approx 4.28 \times 10^{-2}$

$$10\% \text{ dissociated} = \frac{70}{100} = .7$$

$$Pb\,Br_2 \rightleftharpoons \underset{.7S}{Pb^{2+}} + \underset{2\times.7S}{2Br^-}$$

$K_{sp} = [Pb^{2+}].[Br^-]^2$
$K_{sp} = [.7S].(2\times.7S)^2$
$10.8\times10^{-5} = (.7)^3.4S^3$
$S = 4.2 \times 10^{-2}$

124. A saturated solution of CaF_2 is 2×10^{-4} mol/L. Its solubility product constant is:
(a) 2.6×10^{-9} (b) 4×10^{-8}
(c) 8×10^{-12} (d) 3.2×10^{-11}

JCECE - 2005

Ans. (d) : Given, Saturated solution of $CaF_2(S) = 2\times10^{-4}$

$$\text{Now,} \quad CaF_2 \rightleftharpoons \underset{S}{Ca^{2+}} + \underset{2S}{2F^-}$$

$K_{sp} = [Ca^{2+}].[F^-]^2$
$= (S).(2S)^2$
$K_{sp} = 4S^3$
$K_{sp} = 4\times(2\times10^{-4})^3$
$K_{sp} = 3.2\times10^{-11}$

125. Solubility product of a salt AB is 1×10^{-8} M^2 in a solution in which the concentration of A^+ ions is 10^{-3} M. The salt will precipitate when the concentration of B^- ions is kept
(a) between 10^{-8} M to 10^{-7} M
(b) between 10^{-7} M to 10^{-8} M
(c) $> 10^{-5}$ M
(d) $< 10^{-8}$ M

JCECE - 2009

@apna_pdf

Ans. (c) Given, $K_{sp}AB = 1\times 10^{-8}\ M^2$, $[A^+] = 10^{-3}$ M
The ionisation of AB salt is -

$$AB \rightleftharpoons A^+ + B^-$$
$$K_{sp} = [A^+][B^-]$$

Salt will precipitate if ionic concentration>K_{sp} therefore

$$[A^+][B^+] > 1\times10^{-8}$$
$$1\times10^{-3}[B^-] > 1\times10^{-8}$$
$$[B^-] > \frac{1\times10^{-8}}{1\times10^{-3}}$$
$$[B^-] > 1\times10^{-5}\ M$$

Hence, salt will precipitate when the concentration of B^- have the value greater than the 10^{-5}M.

126. The solubility product of Ag_2CrO_4 is 32×10^{-12}. What is the concentration of CrO_4^{2-} ions in that solution?
(a) 2×10^{-4} M (b) 16×10^{-4} M
(c) 8×10^{-4} M (d) 8×10^{-8} M

JCECE – 2015
MHT CET-2011

Ans. (a) : Given, $K_{sp} = 32\times10^{-12}$, $[CrO_4^{2-}] = ?$

Now, $\underset{S}{Ag_2CrO_4} \rightarrow \underset{2S}{2Ag^+} + \underset{S}{CrO_4^{2-}}$

$$K_{sp} = [Ag^+]^2.[CrO_4^{2-}]$$
$$K_{sp} = (2S)^2 \times S$$
$$\therefore \quad K_{sp} = 4S^3$$
$$\text{or} \quad S = \left(\frac{K_{sp}}{4}\right)^{1/3} = \left(\frac{32\times10^{-12}}{4}\right)^{1/3}$$
$$S = 2 \times 10^{-4}\ M$$

127. The solubility product of Hg_2I_2 is equal to
(a) $[Hg_2^{2+}]\ [I^-]$ (b) $[Hg^{2+}]\ [I^-]$
(c) $[Hg_2^{2+}]\ [I^-]^2$ (d) $[Hg^{2+}]\ [I^-]^2$

JIPMER-2012

Ans. (c) For Hg_2I_2,

$$Hg_2I_2 \rightleftharpoons Hg_2^{\ 2+} + 2I^-$$

Let, the solubility product be K_{sp}

$$\therefore \quad K_{sp} = [Hg_2^{2+}].[I^-]^2$$

128. The expression for the solubility product of Ag_2CO_3 will be
(a) $K_{sp}=s^2$ (b) $K_{sp}=4s^3$
(c) $K_{sp}=27s^4$ (d) $K_{sp}=s$

JIPMER-2011

Ans. (b) : Let, K_{sp} be the solubility product of Ag_2CO_3. the ionisation of Ag_2CO_3 is -

$$Ag_2CO_3 \rightleftharpoons \underset{2S}{2Ag^+} + \underset{S}{CO_3^{\ 2-}}$$
$$K_{sp} = [Ag^+]^2.[CO_3^{\ 2-}]$$
$$K_{sp} = (2s)^2\ (s)$$
$$K_{sp} = (4s^2).(s)$$
$$K_{sp} = 4s^3$$

129. The solubility of saturated solution of $Ag_2\ CrO_4$ is s mol L^{-1}. What is its solubility product?
(a) $4s^3$ (b) s^3
(c) $2s^3$ (d) $16s^2$

JIPMER-2010

Ans. (a): Given, solubility of Ag_2CrO_4 = s mol L^{-1}
K_{sp} = ?

Now, $Ag_2CrO_4 \rightleftharpoons \underset{2s}{2Ag^+} + \underset{s}{CrO_4^{2-}}$

$$K_{sp} = [Ag^+]^2.[CrO_4^{2-}]$$
$$K_{sp} = (2s)^2 \times s$$
$$K_{sp} = 4s^3$$

130. A 0.1 aqueous solution of a weak acid is 2% ionised. If the ionic product of water is 1×10^{-4}, the $[OH^-]$ is
(a) 5×10^{-12}M (b) 2×10^{-3}M
(c) 1×10^{-14}M (d) None of these

JIPMER-2009

Ans. (a) : Degree of dissociation of weak acid -

$$\alpha = \frac{2}{100} = 0.02$$

Concentration product of water = 1×10^{-14}

$$[H^+].[OH^-] = 1\times10^{-14}$$
$$[OH^-] = \frac{1\times10^{-14}}{0.002}$$
$$[OH^-] = 5\times10^{-12}$$

131. Solubility product of $PbCl_2$ at 298 K is 1×10^{-6}, at this temperature solubility of $PbCl_2$ in mol/L is
(a) $(1 \times 10^{-6})^{1/2}$ (b) $(1 \times 10^{-6})^{1/3}$
(c) $(0.25 \times 10^{-6})^{1/3}$ (d) $(2.5 \times 10^{-6})^{1/2}$

JIPMER-2008
JCECE - 2007

Ans. (c) : Given, Solubility product of $PbCl_2 = 1\times10^{-6}$
S = ?

$$PbCl_2 \rightleftharpoons \underset{S}{Pb^{2+}} + \underset{2S}{2Cl^-}$$
$$K_{sp} = [Pb^{2+}][Cl^-]^2$$
$$K_{sp} = [S]\ [2S]^2$$
$$K_{sp} = 4S^3$$
$$1\times10^{-6} = 4S^3$$
$$S^3 = \frac{1\times10^{-6}}{4}$$
$$S = (.25\times10^{-6})^{1/3}$$
$$S = (0.25\times 10^{-6})^{1/3}$$

132. Solubility of AgCl is least in
(a) 0.1 M NaCl (b) pure water
(c) 0.1 M $BaCl_2$ (d) 0.1 M $AlCl_3$

Karnataka-CET-2019

Ans. (d) : The common ion effect of the chloride ion supresses the dissociation and hence, the solubility of AgCl is least.
This effect is the most pronounced in 0.1M $AlCl_3$ as it has the most Cl^- ion.

133. Conductivity of a saturated solution of a sparingly soluble salt AB at 298 K is 1.85×10^{-6} Sm^{-1}. Solubility product of the salt AB at 298 K is
Given, $\Lambda^o_m(AB) = 140\times10^{-4}\ Sm^2mol^{-1}$

@apna_pdf

(a) 5.7×10^{-12} (b) 1.32×10^{-12}
(c) 7.5×10^{-12} (d) 1.74×10^{-12}

Karnataka-CET-2014

Ans. (d) :
Given, Conductivity of a saturated solution (κ) = 1.85×10^{-6}

$$\Lambda_m^o = 14 \times 10^{-3}\ \text{Sm}^2\text{mol}^{-1}$$

Now, $K_{sp} = ?$

$$K_{sp} = \left(\frac{K\times10^3}{\Lambda_m^o}\right)^2$$

$$K_{sp} = \left(\frac{1.85\times10^{-5}\times10^{-3}}{14\times10^{-3}}\right)^2$$

$$K_{sp} = (0.1321\times10^{-5})^2$$
$$K_{sp} = 0.01745 \times 10^{-10}$$
$$K_{sp} = 1.745 \times 10^{-12}$$

134. H_2S is passed into one nm^3 of a solution containing 0.1 mole of Zn^{2+} and 0.01 mole of Cu^{2+} till the sulphide ion concentration reaches to 8.1×10^{-19} moles. Which one of the following statements is true?
[K_{sp} of ZnS and CuS are 3×10^{-22} and 8×10^{-36} respectively.]

(a) Only ZnS precipitates
(b) Both CuS and ZnS precipitate
(c) Only CuS precipitates
(d) No precipitation occurs

Karnataka-CET-2011

Ans. (b) : The ionic product for ZnS ($0.1 \times 8.1 \times 10^{-19}$) and for CuS ($0.01 \times 8.1 \times 10^{-19}$) exceeds their K_{sp} values. Precipitation of occurs only when ionic product exceeds the value of solubility product. Hence, both CuS and ZnS precipitated.

135. 1 dm^3 solution containing 10^{-5} moles each of Cl^- ions and CrO_4^{2-} ions is treated with 10^{-4} moles of silver nitrate. Which one of the following observations is made?
[K_{sp} of $Ag_2CrO_4 = 4 \times 10^{-12}$]
[K_{sp} of AgCl = 1×10^{-10}]

(a) Precipitation does not occur
(b) Silver chromate gets precipitated first
(c) Silver chloride gets precipitated first
(d) Both silver chromate and silver chloride start precipitating simultaneously

Karnataka-CET, 2009

Ans. (c) : It is very well to know that when the value of ionic product is greater then the compounds precipitated first.
For precipitation–
Ionic product > Solubility product (K_{sp})
For, Ag_2CrO_4

$$\text{Ionic product} = [Ag^+]^2[CrO_4^{2-}]$$
$$= (10^{-4})^2(10^{-5}) = 10^{-13}$$

K_{sp} of $Ag_2CrO_4 = 4 \times 10^{-12}$
Hence, K_{sp} > I.P.
Thus, no precipitate is obtained.
For, AgCl,

$$\text{Ionic product} = [Ag^+][Cl^-]$$
$$= [10^{-4}][10^{-5}]$$
$$= 10^{-9}$$

$K_{sp}AgCl = 1 \times 10^{-10}$
Here, I.P. > K_{sp}
So, precipitate will form.
Thus, silver chloride gets precipitated first.

136. Choose the correct statement.

(a) K_H value is same for a gas in any solution.
(b) Higher the K_H value more the solubility of gas.
(c) K_H value increases on increasing the temperature of the solution.
(d) Easily liquefiable gases usually has lesser K_H values.

Karnataka-CET-2021

Ans. (c) : According to the mathematical expression of Henry's law–

$$p \propto x$$
$$p = K_H.x$$

Where, p = Partial pressure of the gas
K_H = Henry's law constant of the gas
x = Mole fraction of gas.

K_H depends only on the nature of gas, nature of liquid and temperature. As temperature increases, K_H increases.

137. The K_H value (K bar) of Argon (I). carbondioxide (II), formaldehyde (III) and methane (IV) are respectively 40.3, 167, 1.83 $\times10^{-5}$ and 0.413 at 298 K. The increasing order of solubility of gas in liquid is

(a) I<II<IV<III (b) III<IV<II<I
(c) I<III<II<IV (d) I<IV<II<III

Karnataka-CET-2021

Ans. (a) : Higher the value of the K_H, the lower is the solubility of gas in liquid. Hence, the order of increasing solubility will be–

$$Ar < CO_2 < CH_4 < HCHO$$

138. Henry's law constant for the solubility of N_2 gas in water at 298K is 1.0×10^5 atm. The mole fraction of N_2 in air is 0.8. The number of moles of N_2 from air dissolved in 10 moles of water at 298 K and 5 atm pressure is

(a) 4.0×10^{-4} (b) 4.0×10^{-5}
(c) 5.0×10^{-4} (d) 4.0×10^{-6}

Karnataka-CET-2021

Ans. (a) : Given,
Henry's law of constant (K_H) = 1.0×10^5 atm, $X_{N_2} = 0.8$

$$p_{N_2} = \text{Total pressure} \times \text{Mole fraction}$$
$$= 5\times 0.8 = 4\ \text{atm}$$

From Henry's law-

$$p_{N_2} = K_H . X_{N_2}$$

$$X_{N_2} = \frac{4}{1\times10^5} = 4\times10^{-5}$$

$\because$ 1 mole of X_{N_2} contains = 4×10^{-5}
$\therefore$ 10 mole of X_{N_2} contains = $4 \times 10^{-5} \times 10 = 4 \times 10^{-4}$

139. For which of the following sparingly soluble salt, the solubility (s) and solubility product (K_{sp}) are related by the expression s = $(K_{sp}/4)^{1/3}$?

@apna_pdf

(a) $BaSO_4$ (b) $Ca_3(PO_4)_2$
(c) Hg_2Cl_2 (d) Ag_3PO_4
(e) CuS

Kerala-CEE-2006

Ans. (c) : (3) $Hg_2Cl_2 \rightleftharpoons \underset{S}{Hg_2^{2+}} + \underset{2S}{2Cl^-}$

$$K_{sp} = [Hg_2^{2-}].[Cl^-]^2$$
$$K_{sp} = (S).(2S)^2$$
$$K_{sp} = 4S^3$$
$$S = \sqrt[3]{\frac{K_{sp}}{4}}$$

(2) $Ca_3(PO_4)_2$

$$Ca_3(PO_4)_2 \rightleftharpoons \underset{3S}{3Ca^{2+}} + \underset{2S}{2PO_4^{3-}}$$
$$K_{sp} = [Ca^{2+}]^3.[PO_4^{3-}]^2$$
$$K_{sp} = (3S)^3\,(2S)^3$$
$$K_{sp} = 108S^5$$
$$S = \left(\frac{K_{sp}}{108}\right)^{1/5}$$

(1) $BaSO_4$

The ionisation of $BaSO_4$ is–

$$BaSO_4 \rightleftharpoons \underset{S}{Ba^{2+}} + \underset{S}{SO_4^{2-}}$$
$$K_{sp} = [Ba^{2+}]\,.\,[SO_4^{-2}]$$
$$K_{sp} = S.S$$
$$K_{sp} = S^2$$
$$S = \sqrt{K_{sp}}$$

(4) $Ag_3PO_4 \rightleftharpoons 3Ag^+ + PO_4^{3-}$

$$K_{sp} = [Ag^+]^3.[PO_4^{3-}]$$
$$K_{sp} = (3S)^3(S)$$
$$K_{sp} = 27S^4$$
$$S = \sqrt[4]{\frac{K_{sp}}{27}}$$

(5) $CuS \rightleftharpoons \underset{S}{Cu^{2+}} + \underset{S}{S^{2-}}$

$$K_{sp} = [Cu^{2+}]\,[S^{2-}]$$
$$K_{sp} = (S)(S)$$
$$K_{sp} = S^2$$
$$S = \sqrt{K_{sp}}$$

The solubility product and solubility of Hg_2Cl_2 has the relation :

$$S = \left(\frac{K_{sp}}{4}\right)^{1/3}$$

140. The solubility product (K_{sp}) of the following compounds are given at 25°C

Compounds	**K_{sp}**
AgCl	**1.1×10^{-10}**
AgI	**1.0×10^{-16}**
$PbCrO_4$	**4.0×10^{-14}**
Ag_2CO_3	**8.0×10^{-12}**

The most soluble and least soluble compounds are

(a) AgCl and $PbCrO_4$
(b) AgI and Ag_2CO_3
(c) AgCl and Ag_2CO_3
(d) Ag_2CO_3 and AgI
(e) Ag_2CO_3 and $PbCrO_4$

Kerala-CEE-2011

Ans. (d) : The salt AgCl, AgI, $PbCrO_4$ are of example of AB type salt.

Now, $AB \rightarrow \underset{S}{A^+} + \underset{S}{B^-}$

$\therefore$ $K_{sp} = [A^+]\,[B^-]$

$K_{sp} = S \times S$

or $S^2 = K_{sp}$

$S = \sqrt{K_{sp}}$

Solubility of AgCl $= \sqrt{K_{sp}}$

$= \sqrt{1\times10^{-10}} = 1\times10^{-5}$

Solubility of AgI $= \sqrt{K_{sp}}$

$= \sqrt{1\times10^{-16}} = 1\times10^{-8}$

Solubility of $PbCrO_4$ $= \sqrt{K_{sp}}$

$= \sqrt{4\times10^{-4}} = 2\times10^{-7}$

For Ag_2CO_3 –

$Ag_2CO_3 \rightarrow 2Ag^+ + CO_3^{2-}$

$\therefore$ $K_{sp} = [Ag^+]^2\,[CO_3^{2-}]$

$K_{sp} = (2S)^2\,(S)$

or $K_{sp} = 4S^3$

or $S^3 = \frac{K_{sp}}{4}$

$S^3 = \frac{8\times10^{-12}}{4}$

$S^3 = 2 \times 10^{-12}$

Hence, the most soluble salt are Ag_2CO_3 and least soluble salt are AgI because K_{sp} of Ag_2CO_3 is highest and K_{sp} of AgI is lowest.

141. The pH of a saturated solution of a metal hydroxide of formula $X(OH)_2$ is 12.0 at 298 K. What is the solubility product of a metal hydroxide at 298 K (in mol^3 L^{-3})?

(a) 2×10^{-6} (b) 1×10^{-7}
(c) 5×10^{-5} (d) 2×10^{-5}
(e) 5×10^{-7}

Kerala-CEE-2014

Ans. (e) : Give pH = 12

$[H^+] = 1\times10^{-pH} = 1\times10^{-12}$

$= 1 \times 10^{-12}$

We know that

$[H^+][OH^-] = k_w = 1\times10^{-14}$

$$[OH^-] = \frac{1\times10^{-14}}{[H^+]}$$
$$= \frac{1\times10^{-14}}{1\times10^{-12}} = 1\times10^{-2}$$
$$X(OH)_2 \longrightarrow \underset{x}{X^{2+}} + \underset{2x}{2OH^-}$$

@apna_pdf

$$X^{2+} = \frac{[OH^-]}{2} = \frac{1\times10^{-2}}{2} = 5\times10^{-3}$$

$K_{sp} = [X^{2+}].[2OH^-]^2$
$= (5\times10^{-3}).(1\times10^{-2})^2$
$= (5\times10^{-3}).(1\times10^{-4})$
$= 5\times10^{-7} mol^3L^{-3}$

142. If the ionic product of $M(OH)_2$ is 5×10^{-10} then the molar solubility of $M(OH)_2$ in 0.1 M NaOH is

(a) 5×10^{-12} M (b) 5×10^{-8} M
(c) 5×10^{-10} M (d) 5×10^{-9} M
(e) 5×10^{-16} M

Kerala-CEE-2015

Ans. (b) :

K_{sp} of $M(OH)_2$ is $= 5\times10^{-10}$M
$[OH^-] = 10^{-1}$

$$M(OH)_2 \rightleftharpoons [M^{2+}].\ [OH^-]^2$$
$$5\times10^{-10} \qquad [S] \qquad [10^{-1}]^2$$

$$S = \frac{5\times10^{-10}}{10^{-2}}$$

$$S = 5\times10^{-8}$$

Hence, molar solubility = 5×10^{-8} M

143. Solubility product (k_{sp}) of saturated $PbCl_2$ in water is 1.8×10^{-4} mol^3 dm^{-9}. What is the concentration of Pb^{2+} in the solution?

(a) $(0.45\times10^{-4})^{1/3}$ mol dm^{-3}
(b) $(1.8\times10^{-4})^{1/3}$mol dm^{-3}
(c) $(0.9\times10^{-4})^{1/3}$mol dm^{-3}
(d) $(2.0\times10^{-4})^{1/3}$ mol dm^{-3}
(e) $(2.45\times10^{-4})^{1/3}$ mol dm^{-3}

Kerala-CEE-2017

Ans. (a) : Given - $K_{sp}=1.8\times10^{-4}mol^3dm^{-9}$
For the reaction of the AB_2 ie ($PbCl_2$)

$K_{sp} = [Pb^{2+}][Cl^-]^2$
$= [S] \quad [2S]^2$
$K_{sp} = 4S^3$

$$S = \left(\frac{K_{sp}}{4}\right)^{1/3}$$

Solubility of Pb^{2+} ion will be

$$\therefore\ S = \left[\frac{1.8\times10^{-4}}{4}\right]^{1/3}$$

$S = (0.45\times10^{-4})^{1/3}$ mol.dm^{-3}

144. Consider the electrochemical reaction between Ag (s) and Cl_2 (g) electrodes in 1 L of 0.1 M KCl aqueous solution. Solubility product of AgCl is 1.8×10^{-10} and F = 96500 C/mol. At $1 \geq 10^{-6}$ A current, calculate the time required to start observing the AgCl precipitation in the galvanic cell

(a) 173 s (b) 346 s
(c) 125×10^6 s (d) 1.25×10^5 s
(e) 101 s

Kerala-CEE-2018

Ans. (a) : Given, $K_{sp} = 1.8\times10^{-10}$,$[Cl^-]$=0.1M
The electrochemical reaction between.

Ag(S) and Cl_2 (g) is as fallows-

$$AgCl \rightleftharpoons Ag^+ + Cl^-$$

$$\because K_{sp} = [Ag^+].[Cl^-]$$
$$1.8\times10^{-10} = [Ag^+]\times0.1$$
$$\because [Ag^+] = \frac{1.8\times10^{-10}}{0.1}$$

$\because$ 1L of solution contain's
1.8×10^{-9}moles of Ag^+
Quantity of electricity required
$= 1.8\times10^{-9}\times96500$
$= 1.73\times10^{-4}$C

$$\text{time requried (t)} = \left(\frac{1.73\times10^{-4}}{1\times10^{-6}}\right)$$

t = 173s

145. The solubility CaF_2 is s moles/litre. Then solubility product is :

(a) s^2 (b) $4s^3$
(c) $3s^2$ (d) s^3

Manipal-2019

Ans. (b) : $CaF_2 \rightleftharpoons \underset{[s]}{Ca^{2+}} + \underset{[2s]}{2F^-}$

$$K_{sp}\text{for } CaF_2 = [Ca^{2+}].[F^-]^2$$

$K_{sp} = [s].[2s]^2$
$K_{sp} = 4s^3$

146. The solubility product of $Al_2(SO_4)_3$ is given by the expression :

(a) $[Al^{3+}]\ [SO_4^{2-}]$ (b) $[Al^{3+}]^2\ [SO_4^{2-}]$
(c) $[Al^{3+}]^3\ [SO_4^{2-}]^2$ (d) $[Al^{3+}]^2\ [SO_4^{2-}]^3$

Manipal-2018

Ans. (d) : Find K_{sp} of.

$Al_2(SO_4)_3$ -

$$Al_2(SO4)_3 \rightleftharpoons 2Al^{3+} + 3SO_4^{2-}$$
$$K_{sp} = [Al^{3+}]^2[SO_4^{2-}]^3$$

147. Which among the following salts, solubility decreases with increase in temperature?

(a) Na_2SO_4 (b) NaBr
(c) NaCl (d) KCl

MHT CET-03.05.2019, SHIFT-I

Ans. (a) : For Na_2SO_4 salt, Solubility decreases with Increase in temperature because reaction of Na_2SO_4 with water is an exothermic reaction.
As a result solubility decreases.
For NaBr, NaCl, KCl the dissolution process i.e. endothermic

148. Solubility of which among the following solids in water changes slightly with temperature?

(a) KNO_3 (b) $NaNO_3$
(c) KBr (d) NaBr

MHT CET-2017

Ans. (d) : The solubility of NaBr changes slightly with temperature.

149. Solubility of $Ca(OH)_2$ is s mol L^{-1} . The solubility product (K_{sp}) under the same condition is

(a) $4s^3$ (b) $3s^4$
(c) $4s^2$ (d) s^3

MHT CET-2008

@apna_pdf

Ans. (a) : $Ca(OH)_2 \rightleftharpoons \underset{[s]}{Ca^{2+}} + \underset{[2s]}{2OH^-}$

So, solubility product $(K_{sp}) = [Ca^{2+}]\,[OH^-]^2$

$= (s)\,(2s)^2$

$= 4s^3$

150. The solubility of AgCl is 1×10^{-5} mol/L. Its solubility in 0.1 molar sodium chloride solution is

(a) 1×10^{-10} (b) 1×10^{-5}

(c) 1×10^{-9} (d) 1×10^{-4}

MHT CET-2007

Ans. (c) : $AgCl \rightleftharpoons \underset{[S]}{Ag^+} + \underset{[S]}{Cl^-}$

$K_{sp} = [Ag^+][Cl^-]$

$K_{sp} = S^2$

$S = 1\times10^{-5}$

$K_{sp} = (1\times10^{-5})^2 = 1\times10^{-10}$

suppose its solubility in 0.1m NaCl is x mol/L

$AgCl \rightleftharpoons \underset{x}{Ag^+} + \underset{x}{Cl^-}$

$NaCl \rightleftharpoons \underset{0.1m}{Na^+} + \underset{0.1m}{Cl^-}$

K_{sp} of AgCl $= [Ag^+][Cl^-]$

$= [x].\,[x+0.1]$

$1\times10^{-10} = x^2 + 0.1x$

higher power of x are neglected

$0.1x = 1\times10^{-10}$

$$x = \frac{1\times10^{-10}}{0.1}$$

$x = 1\times10^{-9}$

151. In qualitative analysis the metals of group 1 can be separated from other ions by precipitating them as chloride salts. A solutions initially contains Ag^+ and Pb^{2+} at a concentration of 0.10 M. Aqueous HCl is added to this solution until the Cl^- concentrations of Ag^+ and Pb^{2+} be at equilibrium ?

(K_{sp} for AgCl $= 1.8\times10^{-10}$, K_{sp} for $PbCl_2$ $=1.7\times10^{-5}$)

(a) $[Ag^+] = 1.8\times10^{-7}$ M, $[Pb^{2+}] = 1.7\times10^{-6}$ M

(b) $[Ag^+] = 1.8\times10^{-11}$ M, $[Pb^{2+}] = 8.5\times10^{-5}$ M

(c) $[Ag^+] = 1.8\times10^{-9}$ M, $[Pb^{2+}] = 1.7\times10^{-3}$ M

(d) $[Ag^+] = 1.8\times10^{-11}$ M, $[Pb^{2+}] = 1.7\times10^{-4}$ M

NEET-Mains 2011

Ans. (c) : $[Ag^+][Cl^-] = 1.8\times10^{-10}$

$$[Ag^+] = \frac{1.8\times10^{-10}}{0.1} = 1.8\times10^{-9}$$

$Ag^+ = 1.8\times10^{-9}$ M

$[Pb^{2+}].\,[Cl^-]^2 = 1.7\times10^{-5}$

$$Pb^{2+} = \frac{1.7\times10^{-5}}{0.1\times0.1}$$

$Pb^{2+} = 1.7\times10^{-3}$ M

152. H_2S gas when passed through a solutions if cations containing HCl precipitates the cations of second group of qualitative analysis but not those belonging to the fourth group. It is because

(a) Presence of HCl decreases the sulphate ion concentration

(b) Solubility product of group II sulphate is more than that of group IV sulphate

(c) Presence of HCl increase the suphate ion concentration

(d) Sulphate of group IV cations are unstable in HCl

NEET-2005

Ans. (a) : H_2S gas is passed in presence of HCl, in qualitative analysis of cation of second group, Therefor, due to common ion effect, lower concentration of sulphide ion is obtained which is sufficient for the precipitation of second group cation in form of their sulphides due to lower value of their solubility product (K_{sp}).

in presence of HCl decreases the sulphate ion concentration.

153. The solubility product of a sparingly soluble salt AX_2 is 3.2×10^{-11}. Its solubility (in moles L) is

(a) 5.6×10^{-6} (b) 3.1×10^{-4}

(c) 2×10^{-4} (d) 4×10^{-4}

NEET-2004

Ans. (c) : AX_2 is ionised as follow -

$AX_2 \rightleftharpoons A^{2+} + 2X^-$

[S] [2S]

Solubility product of AX_2 is -

$K_{sp} = [A^{2+}][X^-]^2$

$= [S][2S]^2$

$K_{sp} = 4S^3$

$3.2\times10^{-11} = 4S^3$

$S^3 = 0.8\times10^{-11}$

$S^3 = 8\times10^{-12}$

$S = \left(8\times10^{-12}\right)^{1/3}$

Solubility $= 2\times10^{-4}$ mol/L

154. The solubility product of AgI at 25ºC is 1.0×10^{-16} mol^{-1}L^{-1}. The solubility of AgI in 10^{-4} N solution of KI at 25ºC is approximately (in mol L^{-1})

(a) 1.0×10^{-16} (b) 1.0×10^{-12}

(c) 1.0×10^{-10} (d) 1.0×10^{-8}

NEET-2003

Ans. (b) : $AgI \rightleftharpoons Ag^+ + I^-$

$KI \rightleftharpoons \underset{[10^{-4}]}{K^+} + \underset{[10^{-4}]}{I^-}$

$AgI \rightleftharpoons \underset{[x]}{Ag^+} + \underset{[x+10^{-4}]}{I^-}$

K_{sp} of AgI-

$K_{sp} = [Ag^+]\ \ [I^-]$

$= [x]\ \ [x+10^{-4}]$ $(x << 10^{-4})$

Hence, x=neglect

$K_{sp} = [x]\,[10]^{-4}$

$$x = \frac{K_{sp}}{10^{-4}} = \frac{10^{-16}}{10^{-4}} = 1\times10^{-12}$$

Solubility of AgI is 1×10^{-12} mol L^{-1}

155. Solubility of MX_2 type electrolytes is 0.5×10^{-4} mol/lit, then find out K_{sp} of electrolytes.

(a) 5×10^{-12} (b) 25×10^{-10}

(c) 1×10^{-13} (d) 5×10^{-13}

NEET-2002

@apna_pdf

Ans. (d): An electrolyte MX_2 undergoes dissocitation as follows:–

Concentration	MX_2	M^{+2}	X^-
Initial concentration	1	0	0
Concentration at Equilibrium	1-s	s	2s

Thus from the above condition we can say that, $K_{sp}= s\times(2s)^2= 4\times(s)^3$

Here, s (the solubility) is 0.5×10^{-4} mole/lit.

$\therefore K_{sp}=4\times(0.5\times10^{-4})^3$

$K_{sp}=5\times10^{-13}$

156. Solubility of M_2S salt is 3.5×10^{-6} then find out solubility product,

(a) 1.7×10^{-6} (b) 1.7×10^{-16}

(c) 1.7×10^{-18} (d) 1.7×10^{-12}

NEET-2001

Ans. (b) : Let's be the solubility of salt M_2S which undergoes dissociation as fallow:-

	$M_2S \rightleftharpoons$	$2M^+$	$+S^{-2}$
Initial concentration	1	0	0
Concentration at aqulibrium	1-S	2S	S

$K_{sp}=[M^+]^2[S^{-2}]$

$K_{sp} = (2S)^2 (S)$

$K_{sp} = 4S^3$

$K_{sp} = 4 \times (3.5\times10^{-6})^3$

$K_{sp} = 1.7\times10^{-16}$

157. The solubility of a saturated solution of calcium fluoride is 2×10^{-4} moles per litre. Its solubility product is

(a) 22×10^{-11} (b) 14×10^{-14}

(c) 2×10^{-2} (d) 32×10^{-12}

NEET-1999

Ans. (d) : $CaF_2 \rightleftharpoons \underset{[S]}{Ca^{2+}} + \underset{[2S]}{2F^-}$

$K_{sp} = [Ca^{2+}][F^-]^2$

$= [S]\,[2S]^2$

$K_{sp}= 4S^3$

Given, $S=2\times10^{-4}$

$K_{sp}=4\times(2\times10^{-4})^3$

$K_{sp} = 32\times10^{-12}$

158. The solubility product of CuS, Ag_2S and HgS are 10^{-31}, 10^{-44} and 10^{-54} respectively. The solubilities of these sulphides are in the order

(a) HgS > Ag_2S > CuS (b) CuS > Ag_2S > HgS

(c) Ag_2S > CuS > HgS (d) Ag_2S > HgS > CuS

NEET-1997

Ans. (c) : Solubility product (K_{sp}) of CuS = 10^{-31}

$CuS \rightleftharpoons \underset{S}{Cu^{++}} + \underset{S}{S^{--}}$

$\therefore$ Solubility of CuS -

$K_{sp} = S^2$

$S = \sqrt{K_{sp}}$

$= \sqrt{10^{-31}}$

$= 3.16\times10^{-16}$ mol/L

Similarly solubility of Ag_2S-

$Ag_2S \rightleftharpoons \underset{2S}{2Ag} + \underset{2S}{S^{--}}$

$K_{sp} = (2S)^2 \times S$

$K_{sp} = 4S^3$

$$S = \left(\frac{K_{sp}}{4}\right)^{1/3}$$

$$= \left(\frac{10^{-42}}{4}\right)^{1/3} = 10^{-27}\ \text{mol/L}$$

$\therefore$(for Ag_2S, $4S^3=K_{sp}$)

$$\sqrt{\frac{10^{-42}}{4}} = 6\times10^{-15}\text{mol/liter}$$

Solubility of HgS-

$HgS \rightleftharpoons \underset{S}{Hg^{++}} + \underset{S}{S^{--}}$

$K_{sp} = S^2$

$S = \sqrt{K_{sp}}$

$= \sqrt{10^{-54}}$

$= 10^{-27}$ mol/L

Hence, the correct order of solubility is

Ag_2S >CuS >HgS.

159. pH of a saturated solution if $Ba(OH)_2$ is 12. The value of solubility product (K_{sp}) of $Ba(OH)_2$ is

(a) 3.3×10^{-7} (b) 5.0×10^{-7}

(c) 4.0×10^{-6} (d) 5.0×10^{-6}

NEET-2012, 2010

Ans. (b) : $Ba(OH)_2 \rightleftharpoons \underset{S}{Ba^{2+}} + \underset{2S}{2OH^-}$

Given,

pH = 12

p(OH) = 14 – pH

p(OH) = 14 – 12 = 2

$[OH^-] = 10^{-pOH} = 10^{-2}$ or 1×10^{-2}

As conc. of Ba^{2+} is half of OH^-

$Ba^{2+} = 0.5 \times 10^{-2}$

$K_{sp} = (0.5 \times 10^{-2})\,(1 \times 10^{-2})^2$

$K_{sp} = 0.5 \times 10^{-6}$

$K_{sp} = 5 \times 10^{-7}$

160. pH of a saturated solution of $Ca(OH)_2$ is 9. The solubility product (K_{sp}) of $Ca(OH)_2$ is

(a) 0.5×10^{-10} (b) 0.5×10^{-15}

(c) 0.25×10^{-10} (d) 0.125×10^{-15}

NEET-2019

Ans. (b) : $CO(OH)_2 \rightleftharpoons Ca^{2+} + 2OH^-$

pH=9 and pOH = 14 –9=5

$$\text{Hence}[Ca^{2+}] = \frac{10^{-5}}{2}$$

$$\text{Thus}, K_{sp} = [Ca^{2+}][OH^-]^2$$

$$= \left(\frac{10^{-5}}{2}\right)(10^{-5})^2$$

$= 0.5\times10^{-15}$

Solubility product (K_{sp}) of $Ca(OH)_2$ is 0.5×10^{-15}.

@apna_pdf

161. The molar solubility of CaF_2 ($K_{sp} = 5.3\times10^{-11}$) in 0.1 M solution of NaF will be

(a) 5.3×10^{-11} mol L^{-1}
(b) 5.3×10^{-8} mol L^{-1}
(c) 5.3×10^{-9} mol L^{-1}
(d) 5.3×10^{-10} mol L^{-1}

Odisha NEET-2019

Ans. (c) : $CaF_2(s) \rightleftharpoons Ca^{2+}(aq)+2F^-(aq)$

$NaF(aq) \rightarrow Na^+(aq) + F^-(aq)$

In solution –[F]= (2s'+C)

$[F^-] \approx C$ (due to common ion effect)

$K_{sp}(CaF_2)=[Ca+2].[F^-]^2$

$K_{sp}(CaF_2)=s'.C^2$

$$s' = \frac{5.3\times10^{-11}}{(10^{-1})^2}$$

s'= 5.3×10^{-9} mol L^{-1}

162. The solubility of $BaSO_4$ in water is 2.42×10^{-3}g L^{-1} at 298 K. The value of its solubility product (K_{sp}) will be (Given molar mass of $BaSO_4$ = 233 g mol^{-1})

(a) 1.08×10^{-10} mol^2 L^{-2}
(b) 1.08×10^{-12} mol^2 L^{-2}
(c) 1.08×10^{-14} mol^2 L^{-2}
(d) 1.08×10^{-8} mol^2 L^{-2}

NEET-2018

Ans. (a) : The solubility S= $2.42\times10^{-3}gL^{-1}$

$$S = \frac{2.42\times10^{-3}gL\text{-}1}{233g\ mol^{-1}} = 1.04\times10^{-5}molL^{-1}$$

$K_{sp}=[B^{2+}].[SO_4^{2-}]$

$K_{sp}=[S].[S]= S^2$

$K_{sp}= (1.04\times 10^{-5})^2$

Hence, $K_{sp} = 1.08 \times 10^{-10}$ mol^2 L^{-2}

163. Concentration of the Ag^+ ions in a saturated solution of $Ag_2C_2O_4$ is 2.2×10^{-4} mol L^{-1}. Solubility product of $Ag_2C_2O_4$ is

(a) 2.66×10^{-12}
(b) 4.5×10^{-11}
(c) 5.3×10^{-12}
(d) 2.42×10^{-8}

NEET-2017

Ans. (c) :

$$Ag_2C_2O_4(s) \rightleftharpoons \underset{[2S]}{2Ag^+}(aq) + \underset{[S]}{(C_2O_4^{2-})}(aq)$$

$K_{sp} = [Ag]^+ [C_2O_4^{2-}]$

$$Ag^+ = \frac{2.2\times10^{-4}}{2}M = 1.1 \times 10^{-4}M$$

$K_{sp} = (2.2 \times 10^{-4})^2 (1.1 \times 10^{-4})$

$K_{sp} = 5.324 \times 10^{-12}$

164. The solubility of $AgCl_{(s)}$ with solubility product 1.6×10^{-10} in 0.1 M NaCl would be

(a) 1.26×10^{-5} M
(b) 1.6×10^{-9} M
(c) 1.6×10^{-11} M
(d) zero

NEET-2016

Ans. (b) : $AgCl \rightleftharpoons Ag^+ + Cl^-$

a	0	0
a – S	S	S + 0.1

$K_{sp} = [Ag^+].[Cl^-]$

$= [S]. [0.1 + S]$

K_{sp} is value seems to very small so S value can be neglected, with to 0.1m

$K_{sp} = S[0.1]$

$$S = \frac{K_{sp}}{0.1}$$

$$S = \frac{1.6\times10^{-10}}{0.1}$$

$S = 1.6\times10^{-9}M$

165. MY and NY_3 two nearly insoluble salts, have the same K_{sp} values of 6.2×10^{-13} at room temperature. Which statement would be true in regard to MY and NY_3?

(a) The salts MY and NY_3 are more soluble in 0.5 M KY than pure water
(b) The addition of the salt of KY to solution of MY and NY_3 will have no effect on their solubilities
(c) The molar solubilities of MY and NY_3 in water are identical
(d) The molar solubility of MY in water is less than that of NY_3

NEET-I 2016

Ans. (d) : Molar solubility of MY in water is less than that of NY_3

$MY \longrightarrow M^+ + Y^-$

$NY_3 \longrightarrow N^{3+} + 3Y^-$

For MY the molar solubility $= \sqrt{K_{sp}}$

$= \sqrt{6.2\times10^{-13}}$

$= 7.88 \times 10^{-7}$ m.

For NY_3 the molar solubility-

$$S = \left(\frac{K_{sp}}{27}\right)^{1/4} = \left(\frac{1.2\times10^{-13}}{27}\right)^{1/4}$$

$S = 3.9 \times 10^{-4}$ M

Hence molar solubility of MY water is less than that of NY_3.

166. The ionic product of water at 25°C is 10^{-14}. Its product at 90° C will be

(a) 1×10^{-14}
(b) 1×10^{-16}
(c) 1×10^{-20}
(d) 1×10^{-12}

NEET-1996

Ans. (d) : The ionic product of water increases with increases in temperature. This is because of the fact that with increase of temperature the degree of ionization of water increases.

the only one option has a value greater than 10^{-14} ie 10^{-2}

Hence ionic product of water at 90°C = 1×10^{-12}.

167. Find out the solubility of $Ni(OH)_2$ in 0.1 M NaOH. Given that the ionic product if $Ni(OH)_2$ is 2×10^{-15}

(a) 2×10^{-13} M
(b) 2×10^{-8} M
(c) 1×10^{-13} M
(d) 1×10^{8} M

NEET-2020

@apna_pdf

Ans. (a) : α = 1 for NaOH

$$NaOH \rightarrow Na^+ + OH^-(aq)$$

$$\begin{array}{c} (aq) \\ 0.1M \quad 0.1M \end{array}$$

$$Ni(OH)_2 \rightleftharpoons Ni^{2+}(aq) + 2OH^-(aq)$$

$$S \qquad (0.1+2S)$$

ionic product = $[Ni^{+2}][OH^-]^2$

$2 \times 10^{-15} = [Ni^{+2}][10^{-1}]^2$

$2 \times 10^{-13} = [Ni^{2+}]$

$[Ni^{2+}] = 2 \times 10^{-13}$

168. Aqueous solutions of acetic acid contains

(a) CH_3COO^- and H^+

(b) CH_3COO^- and CH_3COOH

(c) CH_3COO^- H_3O^+ and H^+

(d) CH_3COOH, CH_3COO^- and H^+

NEET-1991

Ans. (b) : The aqueous solution fo acetic acid ionize as follows–

$H_2O + CH_3COOH(Base) \Leftrightarrow CH_3COO^-(Acid) + H_3O^+$

So, the aqueous solution of acetic acid contains CH_3COO–, H_3O+ and CH_3COOH.

169. K_{sp} for $Mg(OH)_2$ is 0.4×10^{-11}, then the pH value of the solution is

(a) 5	(b) 8.5
(c) 10.3	(d) 12

UP CPMT-2014

Ans. (c) : $Mg(OH)_2$ dissolves in the following manner.

$$\underset{S\,mol/L}{Mg(OH)_2} \longrightarrow \underset{S\,mol/L}{Mg^{2+}} + \underset{2s\,mol/L\,(s=solubility)}{2OH^-}$$

$$K_{sp} = [Mg^{2+}][OH^-]^2$$

$$= (S)(2S)^2$$

$$= 4S^3$$

$$4S^3 = 0.4 \times 10^{-11}$$

$$S^3 = 10^{-12}$$

$$S = \left(10^{-12}\right)^{1/3}$$

$$S = 10^{-4}$$

Since 1 mol Mg $(OH)_2$ provides 2 moles of $[OH^-]$,

So $[OH^-] = 2 \times 10^{-4}$

pOH = – log $[OH^-]$

= –log (2×10^{-4}) = 3.7

pH = 14 – pOH

= 14 – 3.7

= 10.3

170. K_{sp} and solubility of MX_4 (mol/litre) are related by

(a) $s = [K_{sp}/256]^{1/5}$	(b) $s = [128\ K_{sp}]^{1/4}$
(c) $s = [256\ K_{sp}]^{1/3}$	(d) $s = -[K_{sp}/128]^{1/4}$

UP CPMT-2013

Ans. (a) : MX_4 ionises in the solution as

$$MX_4 \rightleftharpoons M_s^{4+} + 4X_{4s}^-$$

$$K_{sp} = [M^{4+}][X^-]^4 = (s) \times (4s)^4$$

$$= 256\ s^5$$

Or $\quad s = \left(\dfrac{K_{sp}}{256}\right)^{1/5}$

171. The solubility of Sb_2S_3 in water is 10×10^{-5} mol/L at 298K. What will be its solubility product?

(a) 108×10^{-25}	(b) 10×10^{-25}
(c) 144×10^{-25}	(d) 126×10^{-24}

UP CPMT-2004

Ans. (a) : Key Idea Write the equation for dissociation of Sb_2S_3 and find relationship between K_{sp} and solubility. From this relationship, calculate K_{sp}.

Let solubility of Sb_2S_3=x mol/L

$$Sb_2S_3 \rightleftharpoons 2Sb^{3+} + 3S^{2-}$$

∴ solubility $\quad$ x mol/L $\qquad$ 2x $\quad$ 3x

$K_{sp} = [Sb^{3+}]^2 [S^{2-}]^3$

$= (2x)^2 (3x)^3$

$K_{sp} = 108x^5$

Given, $x = 10 \times 10^{-5}$ mol/L

$K_{sp} = 108 \times (10 \times 10^{-5})^5$

$= 108 \times 10^{-25}$

172. If the solubility of $BaSO_4$ (mol. wt. 233) is 2.33 × 10^{-4}g/100 ml, then the solubility product of $BaSO_4$ is

(a) 1×10^{-5} mol/L	(b) 1×10^{-10} mol/L
(c) 1×10^{-4} mol/L	(d) 1×10^{-8} mol/L

UP CPMT-2001

Ans. (b) : Given, solubility of $BaSO_4$

$= 2.33 \times 10^{-4}$ g/100 mL

$= 2.33 \times 10^{-3}$ g/L $= \dfrac{2.33 \times 10^{-3}}{233}$

(∵ mol. wt. of $BaSO_4$ = 233)

∴ Solubility of $BaSO_4 = 1 \times 10^{-5}$ mol/L

$$BaSO_4 \rightleftharpoons Ba^{2+} + SO_4^{2-}$$

$K_{sp} = [Ba^{2+}][SO_4^{2-}]$

$= (1 \times 10^{-5})(1 \times 10^{-5})$

$= 1 \times 10^{-10}$ mol/L

173. The solubility product of calcium fluoride is 3.2 × 10^{-11} M^3. Its solubility in saturated solution is

(a) 8×10^{-12} ML^{-1}	(b) 2×10^{-4} ML^{-1}
(c) 4×10^{-12} ML^{-1}	(d) 1×10^{-4} ML^{-1}

UP CPMT-2001

Ans. (b) : Given, $K_{sp} = 3.2 \times 10^{-11}$

Let the solubility of CaF_2 = x mol/L

$$\underset{\text{moles after dissolution}}{CaF_2} \longrightarrow \underset{x}{Ca^{2+}} + \underset{2x}{2F^-}$$

$K_{sp} = [Ca^{2+}][F^-]^2$

$= x \times (2x)^2$

$= 4x^3$

∴ $\qquad 3.2 \times 10^{-11} = 4x^3$

or $\qquad x = \sqrt[3]{\dfrac{3.2 \times 10^{-11}}{4}}$

$x = \sqrt[3]{8 \times 10^{-12}}$

$x = 2 \times 10^{-4}$ mol/L

174. If the solubility of lithium sodium hexafluoroaluminate is 'a' mol/L, its solubility product is

(a) a^8	(b) $10\ a^3$
(c) $180\ a^3$	(d) $2916\ a^8$

UP CPMT-2001

@apna_pdf

Ans. (d) : Lithium sodium hexafluoro aluminate is chemically $Li_3Na_3(AlF_6)_2$. Write its dissociation reaction and then find K_{sp}

$$Li_3Na_3(AlF_6)_2 \rightleftharpoons 3Li^+ + 3Na^+ + 2AlF_6^{3-}$$

initial conc. a mol/L	0	0	0
conc. at equilibrium	3a	3a	2a

$\therefore$ $K_{sp} = [Li^+]^3\,[Na^+]^3\,[AlF_6{}^{3-}]^2$
$= (3a)^3 \times (3a)^3 \times (2a)^2$
$= 27a^3 \times 27a^3 \times 4a^2$
$= 2916a^8$

175. The solubility in water of a sparingly soluble salt AB_2 is 1.0×10^{-5} mol L^{-1}. Its solubility Product number will be

(a) 4×10^{-15}
(b) 4×10^{-10}
(c) 1×10^{-15}
(d) 1×10^{-10}

UPTU/UPSEE-2007

Ans. (a) :

$$AB_2 \rightleftharpoons A^{2+} + 2B^-$$
$$\quad S \qquad 2S$$

Using the relation of solubility and solubility.

$$AB_2 \rightleftharpoons \left[A^{+2}\right].\left[B^-\right]^2$$

$K_{sp} = [S].[2S]^2$
$K_{sp} = 4s^3$
$= 4\,(1\times 10^{-5})^3$
$K_{sp} = 4 \times 10^{-15}$

176. The value of the ionic product of water depends:

(a) on volume of water
(b) on temperature
(c) changes by adding acid or alkali
(d) always remain constant

UPTU/UPSEE-2006

Ans. (b) : The value of the ionic product of water depends on temperature

177. The solubility of CaF_2in pure water is 2.3×10-^{4} mol dm^{-3} Its solubility product will be:

(a) 4.6×10^{-4}
(b) 4.6×10^{-8}
(c) 6.9×10^{-12}
(d) 4.9×10^{-11}

UPTU/UPSEE-2006, 2005

Ans. (d) : Solubility of CaF_2 in pure water is : 2.3×10^{-4} mol dm^{-3}

$$CaF_2 \rightleftharpoons Ca^{2+} + 2F^-$$
$$[S] \quad [2S]$$
$$K_{sp} = \left[Ca^{2+}\right].\left[F^-\right]^2$$
$$[S] \quad [2S]^2$$

$K_{sp} = 4s^3$
$= 4 \times (2.3 \times 10^{-4})^3$
$K_{sp} = 4.9 \times 10^{-11}$

178. The solubility product of Barium sulphate is 1.5×10^{-9} at 18°C. Its solubility in water at 18°C is:

(a) 1.5×10^{-9}
(b) 1.5×10^{-5}
(c) 3.9×10^{-9}
(d) 3.9×10^{-5}

UPTU/UPSEE-2004

Ans. (d) : K_{sp} of Barium sulphate is = 1.5×10^{-9}

$$BaSO_4 \rightleftharpoons Ba^{2+} + SO_4^{2-}$$
$$[s] \qquad [s]$$

$K_{sp} = [\,Ba^{2+}].\,[SO_4^{2-}\,]$
$K_{sp} = S^2$
$S = \sqrt{K_{SP}}$
$S = \sqrt{1.5\times10^{-9}} = 3.9\times10^{-5}$

179. K_{sp} of $CaSO_4$ is 4×10^{-12}. $CaSO_4$ is precipitated on mixing equal volumes of the following solutions.

(a) 3×10^{-10}M $CaCl_2$ and 3×10^{-6}M $(NH_4)_2SO_4$
(b) 4×10^{-6} M $CaCl_2$ and 3×10^{-6}M $(NH_4)_2SO_4$
(c) 6×10^{-6}M $CaCl_2$ and 3×10^{-16}M $(NH_4)_2SO_4$
(d) In all the above cases

UPTU/UPSEE-2015

Ans. (c) : Super Saturated Solution– It is defined as precipitate, which form by the mixture of two solution, if the product of ions is greater than product of solubility, then it is called super saturated solution.

$$[Ca^{2+}].[SO_4{}^{2-}] > K_{sp}$$

180. The solubility of AgI in NaI solution is less than that in pure water because

(a) AgI forms complex with NaI
(b) Of common ion effect
(c) Solubility product of AgI is less then that of NaI
(d) The temperature of the solution decreases

UPTU/UPSEE-2014
JCECE - 2014

Ans. (b) : The solubility of AgI in NaI Solution is less than in pure water because of common ion effect.

$$AgI \rightleftharpoons Ag^+ + I^-$$
$$NaI \rightleftharpoons Na^+ + I^-$$

181. At a certain temperature, the solubility of the salt, M_mA_n in water is s mol/L. The solubility product of the salt is

(a) M^mA^n
(b) $(m+n)s^{m+n}$
(c) $m^mn^ns^{m+n}$
(d) m^mA^ns

UPTU/UPSEE-2010

Ans. (c) : let us consider solubility of any general salt $M_m\,A_n$.

$$M_mA_n \rightleftharpoons \left[mM^{n+}\right]\left[nA^{m-}\right]$$

The solution which contains maximam possible amount of solute in it are called saturated solution for saturated solution, at equilibrium.

$K_{sp} = [M^{n+}]^m[A^{m+}]^n$
$= [ms]^m[ns]^n$
$K_{sp} = m^m\,n^n\,[S]^{m+n}$

182. Solubility product of $Mg(OH)_2$ at ordinary temp 1.96×10^{-11}. pH of a saturated soln. of Mg $(OH)_2$ will be

(a) 10.53
(b) 8.47
(c) 6.94
(d) 3.47

WB-JEE-2008

@apna_pdf

Ans. (a) :

$$Mg(OH)_2 \rightleftharpoons Mg^{2+} + 2OH^-$$
$$[s] \qquad [2s]$$
$$K_{sp} = [Mg^{2+}].[OH^-]^2$$
$$= [s] \qquad [2s]^2$$
$$1.69 \times 10^{-11} = 4S^3$$
$$S = \left[\frac{1.96\times10^{-11}}{4}\right]^{1/3}$$
$$S = (4.9 \times 10^{-12})^{1/3}$$
$$S = 1.69 \times 10^{-4}$$

So, concentration of $[OH^-] = 2s$

$$[OH^-] = 3.38 \times 10^{-4}$$
$$pOH = -\log[OH^-]$$
$$= -\log[3.38 \times 10^{-4}]$$
$$pOH = 3.471$$
$$pH = 14 - pOH$$
$$= 14 - 3.471$$
$$pH = 10.529.$$

183. The solubility of $Ca_3(PO_4)_2$ in water is y moles/litre. its solubility product is

(a) $6y^4$ (b) $36y^4$

(c) $64y^5$ (d) $108y^5$

WB-JEE-2011

Ans. (d) : $Ca_3(PO_4)_2 \rightleftharpoons 3Ca^{2+} + 2PO_4^{3-}$

$$K_{sp} = [Ca^{2+}]^3[PO_4^{3-}]^2$$
$$= [3y]^3 \qquad [2y]^2$$
$$K_{SP} = 27y^3.\ 4y^2$$
$$K_{SP} = 108y^5$$

184. At 25°C, the solubility product of salt of MX_2 type is 3.2×10^{-8} in water. The solubility (in mol/L) of MX_2 in water at the same temperature will be

(a) 1.2×10^{-3} (b) 2×10^{-3}

(c) 3.2×10^{-3} (d) 1.75×10^{-3}

WB-JEE-2013

Ans. (b): For MX_2 type salt,

$$MX_2 \rightleftharpoons [M^{2+}] + [2X^-]$$
$$[s] \qquad [2s]$$
$$K_{sp} = [M^{2+}][X^-]^2$$
$$= [S] \qquad [2S]^2$$
$$= 4S^3$$
$$3.2 \times 10^{-8} = 4s^3$$
$$S = \sqrt[3]{\frac{3.2\times10^{-8}}{3}}$$
$$S = 2 \times 10^{-3}\ \text{mol/L}$$

185. The molar solubility (in mol L^{-1}) of a sparingly soluble salt MX_4 is 'S'. The corresponding solubility product is K_{sp}. S in terms of 'K_{sp}' is given by the relation

(a) $S = \left(\frac{K_{sp}}{128}\right)^{1/4}$ (b) $S = \left(\frac{K_{sp}}{256}\right)^{1/5}$

(c) $S = (256\ K_{sp})^{1/5}$ (d) $S = (128\ K_{sp})^{1/4}$

WB-JEE-2016

Ans. (b) : For MX_4 type salt -

$$MX_4 \rightleftharpoons [M^{4+}] + [4X^-]$$
$$[S] \qquad [4S]$$
$$K_{sp} = [M^{4+}][4X^-]$$
$$K_{sp} = [S] \qquad [4S]^4$$
$$K_{sp} = [S][256\ S^4]$$
$$K_{sp} = [256\ S^5]$$
$$S = \left(\frac{K_{sp}}{256}\right)^{1/5}$$

186. Which of the following arrangements correct in respect of solubility in water?

(a) $CaSO_4 > BaSO_4 > BeSO_4 > MgSO_4 > SrSO_4$

(b) $BeSO_4 > MgSO_4 > CaSO_4 > SrSO_4 > BaSO_4$

(c) $BaSO_4 > SrSO_4 > CaSO_4 > MgSO_4 > BeSO_4$

(d) $BeSO_4 > CaSO_4 > MgSO_4 > SrSO_4 > BaSO_4$

WB-JEE-2016

Ans. (b) : The solubility of sulphates in water decreases down the group. The magnitude of the lattic enthalpy remains almost constant as the sulphate ion is so big that small increases in size of cation from Be to Ba does not make any difference. The hydration enthalpy decreases from Be^{2+} to Ba^{2+} as the size of the cation increases down the group.

Hence, the solubility of sulphates of alkaline earth metal decreases down the group mainly due to decreasing hydration enthalpy from Be^{2+} to Ba^{2+}. The decreasing order of solubility would be⁻

$BeSO_4 > MgSO_4 > CaSO_4 > SrSO_4 > BaSO_4$

3. Acid, Bases and Salts

187. Given below are the oxides:

Na_2O, As_2O_3, N_2O, NO and Cl_2O_7

Number of amphoteric oxides is:

(a) 0 (b) 1

(c) 2 (d) 3

JEE Main-24.06.2022, Shift-I

Ans. (b) : An amphoteric oxide is an oxide that can act either as an acid or as a base to create oxides and hydroxides are formed when metals have several oxidation states.

$Na_2O \rightarrow$ Basic

$As_2O_3 \rightarrow$ Amphoteric

$N_2O \rightarrow$ Neutral

$Cl_2O_7 \rightarrow$ Acidic

$NO \rightarrow$ Neutral

So, only As_2O_3 shows amphoteric oxides.

188. When 10 ml of 10 M solution of H_2SO_4 and 100 ml of 1 M solution of NaOH are mixed, the resulting solution will be?

(a) Acidic (b) Neutral

(c) Alkaline (d) Can not be predicted

CG PET-22.05.2022

Ans. (a) : For, NaOH:–

$$N_1V_1 = 100\ \text{ml} \times 1N = 100\ \text{ml (N)}$$

For H_2SO_4:–

$$N_2V_2 = 10\ \text{ml} \times 10N = 100\ \text{ml (N)}$$

Hence, The resulting solution will be acidic.

@apna_pdf

189. In case of following Bronsted base, the correct order of basic strength is

(a) $ClO_4^- > ClO_3^- > ClO_2^- > ClO^-$

(b) $ClO^- > ClO_2^- > ClO_3^- > ClO_4^-$

(c) $ClO_3^- > ClO_2^- > ClO_4^- > ClO^-$

(d) $ClO_2^- > ClO_3^- > ClO^- > ClO_4^-$

CG PET-22.05.2022

Ans. (b) : As we know,
More the number of oxygen atoms attached, more is the acidity of the molecule.
So, Order of acidity is:–
$HClO < HClO_2 < HClO_3 < HClO_4$
So, the conjugate base order will be just the reverse:–
$ClO^- > ClO_2^- > ClO_3^- > ClO_4^-$

190. Match List-I with List-II

	List-I(Oxide)	**List-II(Nature**
(A)	**Cl_2O_7**	**(I) Amphoteric**
(B)	**Na_2O**	**(II) Basic**
(C)	**Al_2O_3**	**(III) Neutral**
(D)	**N_2O**	**(IV) Acidic**

Choose the correct answer from the given below:

(a) A-IV, B-III, C-I, D-II
(b) A-IV, B-II, C-I, D-III
(c) A-II, B-IV, C-III, D-I
(d) A-I, B-II, C-III, D-IV

JEE Main-28.06.2022, Shift-II

Ans. (b) :

Oxide		**Nature**
Cl_2O_7	→	Acidic
Na_2O	→	Basic
Al_2O_3	→	Amphoteric
N_2O	→	Neutral

191. Amphoteric oxide among the following:

(a) Ag_2O (b) SnO_2
(c) BeO (d) CO_2

Karnataka CET-17.06.2022, Shift-II

Ans. (b & c) : Amphoteric oxides can be defined that can behave as an acid and a base to produce salt and water. Thus, SnO_2 and BeO both reacts with acid as well as the base. So it is and amphoteric oxide.

192. The conjugate acid of N_3^- (azide ion) is:

(a) NH_3 (b) HN_3
(c) NH_2^- (d) N_2^-

AP-EAMCET (Med.)-1999

Ans. (b) : The species formed by the addition of proton in a base is called conjugate acid.

$$\underset{\text{Base}}{N_3^-} + \underset{\text{Proton}}{H^+} \rightarrow \underset{\text{Conjugate acid}}{HN_3}$$

193. Aqueous solution of $FeCl_3$ is acidic because of

(a) hydrolysis (b) anionic hydrolysis
(c) cationic hydrolysis (d) dissociation

AP-EAMCET-1991

Ans. (c) : Aqueous solution of $FeCl_3$ is acidic because of cationic hydrolysis $FeCl_3$ is a salt of weak base and strong acid.

$$FeCl_3 + 3H_2O \rightarrow Fe(OH)_3 + 3HCl$$
$$Fe^{3+} + 3H_2O \rightarrow Fe(OH)_3 + 3H^+$$

194. The conjugate base of HSO_4^- ion is ....

(a) H_2SO_4 (b) $H_3SO_4^+$
(c) SO_4^{2-} (d) O^{2-}

AP-EAMCET-1991

Ans. (c) : Although it has a negative charge, it will never accept a H^+ to form H_2SO_4(sulfuric acid). That is because sulfuric acid is a strong acid and completely disassociates in water.
Therefore, the sulfate ion (SO_4^{2-}) is the conjugate base of HSO_4^-

$$\underset{\text{Acid}}{HSO_4^-} \xrightarrow{-H^+} \underset{\text{Conjugate base}}{SO_4^{2-}}$$

195. The nature of 0.1 M solution of sodium bisulphate is

(a) acidic (b) basic
(c) neutral (d) can't predict

AP-EAMCET-1993

Ans. (a) : The sodiumbisulphate is the sodium salt of the bisulfate ion with the molecular formula $NaHSO_4$. In aqueous solutions. H releases H^+ ion
The question is shown in fig.

$$NaHSO_4 \rightleftharpoons Na^+ + HSO_4^-$$
$$HSO_3^- \rightleftharpoons \underset{\text{Release } H^+ \text{ion}}{\underset{\downarrow}{H^+}} + SO_4^{2-}$$

So the nature of 0.1 M solutions of Sodiumbisulphate is acidic in Nature.

196. Which one of the following is least likely to act as a Lewis base?

(a) PCl_3 (b) SCl_2
(c) I^- (d) I^+

AP-EAMCET-1995

Ans. (d) : Lewis base are the electron donating species. I^+ being to electron deficient is least likely acts as a lewis base.

197. Which one of the following is not a Lewis acid?

(a) BF_3 (b) $AlCl_3$
(c) $BeCl_2$ (d) $SnCl_2$

AP-EAMCET-1995

Ans. (c) : Lewis Acids are the chemical species that have empty orbital and are able to accept electron pairs from Lewis bases. e.g. boron trifluoride (BF_3) $AlCl_3$, Beryllium chloride ($BeCl_2$).

198. Which of the following can act both as Bronsted acid and Bronsted base?

(i) HCO_3^- (ii) NH_3 (iii) O^{2-} (iv) HCl

(a) (i) and (ii) (b) (ii) and (iii)
(c) None of the above (d) All of the above

AP-EAMCET-1995

Ans. (a) : Those substance which accept the proton are called Bronsted base and which is donate the proton are called Bronsted acid.

$HCO_3^- + H^+ \rightleftharpoons H_2CO_3$ Bronsted base.

$HCO_3^- \rightleftharpoons H^+ + CO_3^{2-}$ Bronsted acid.

@apna_pdf

199. Which of the following is the strongest Lewis acid?

(a) BI_3 (b) BBr_3
(c) BCl_3 (d) BF_3

AP-EAMCET-1998

Ans. (a) : A molecule is said to be a lewis acid if it can accept a loan pair. BI_3 is a strong lewis acid. Due to back bonding in I_3^-, conjugate base of BI_3 is very stable. So, it is most acidic. Lewis acidity increases from fluoride to iodide. The lewis acidity is ameliorated by a π-bonding contribution through overlap of the halogen lone pair and the vacant orbital on boron.

200. The conjugate base of NH_2^- is

(a) NH_3 (b) NH^{2-}
(c) NH_4^+ (d) N_3^-

AP-EAMCET-1998

Ans. (b) : Conjugate base is defined by a substance formed when an acid losses a hydrogen ion. The conjugate base of NH_2^-.

$$NH_2^- \xrightarrow{-H^+} NH^{2-}$$

201. Which one of the following salts gives an acidic solution in water?

(a) CH_3COONa (b) NH_4Cl
(c) $NaCl$ (d) CH_3COONH_4

AP-EAMCET-2007

Ans. (b) : Ammonium chloride when dissolved in water gives hydrochloric acid which makes the solution acidic in nature as HCl is a strong acid.

$$NH_4Cl \rightleftharpoons NH_4^+ + Cl^-$$

$$2H_2O \rightleftharpoons OH^- + H_3O^+$$

$$NH_4^+ + OH^- \rightleftharpoons \underset{\text{Weekly ionised}}{NH_4OH}$$

$$H_3O^+ + Cl^- \rightleftharpoons \underset{\substack{\text{Strongly}\\ \text{ionized}}}{HCl} + H_2O$$

202. Which one of the following is not a conjugate acid base pair?

(a) HPO_3^{2-}, PO_3^{2-} (b) $H_2PO_4^-, HPO_4^{2-}$
(c) $H_2PO_4^-, H_3PO_4$ (d) $H_2PO_4^-, PO_3^{3-}$

AP EAMCET (Engg.) -2007

Ans. (d) : The acid and base which differ by a proton are said to form a conjugate acid–base pair.

$$\text{Acid}_1 + \text{Base}_2 \rightleftharpoons \text{Acid}_2 + \text{Base}_1$$

$$HPO_3^{2-} + H_2O \rightleftharpoons H_3O^+ + PO_3^{2-}$$

$$H_2PO_4^- + H_2O \rightleftharpoons H_3O^+ + HPO_4^{2-}$$

$$H_3PO_4 + H_2O \rightleftharpoons H_3O^+ + H_2PO_4^-$$

In $H_2PO_4^-, PO_3^{3-}$ difference of 2 proton. So, it is not a conjugate base pair.

203. Molten sodium chloride conducts electricity through the following:

(a) free electrons (b) free ions
(c) free molecules (d) free atoms

MPPET - 2012

Ans. (b) : Molten sodium chloride conducts electricity due to presence of free ions. Electrons are bound in bonds by strong electrostatic forces. So sodium chloride does not conduct electricity in a solid-state.

204. The conjugate acid of NH_3 is:

(a) NH_2^- (b) NH_2OH
(c) N_2H_4 (d) NH_4^+

MPPET-2012

Ans. (d) : $\underset{\text{Base}}{NH_3} \xrightarrow{H^+} \underset{\text{Conjugate acid}}{NH_4^+}$

Specie	Conjugate Acid	Conjugate Base
H_2O	H_3O^+	OH^-
HCO_3^-	H_2CO_3	CO_3^{2-}
HSO_4^-	H_2SO_4	SO_4^{2-}
NH_3	NH_4^+	NH_2^-

205. When a particular aqueous solution is diluted by a factor of ten with K_2O, the pH increases by one unit. the solution most likely contains a

(a) Weak acid (b) Strong base
(c) Strong acid (d) Buffer

SCRA-2014

Ans. (c) : The increasing of pH by one unit, that means the solution is more acidic because the pH scale show the acidic character from 1 to 7. Less the value in pH scale, higher acidity of the solution will be.

Weak acid → Acid that don't completely dissociated in solution.

Strong acid → Completely dissociated in solution Exa- Chloric acid hydrobromic acid.

Buffer → A buffer Solution are resist a change in pH when small acid or alkali are added.

206. Consider the following regarding potash alum:

1. It has 24 water molecules.
2. It swells on heating.
3. Its aqueous solution is basic.
4. It is white in colour.

Which of the above statements are correct?

(a) 1 and 2 only (b) 1, 3 and 4
(c) 2, 3 and 4 (d) 1, 2 and 4

SCRA 2010

Ans. (d) : The formula of potash alum is $K_2SO_4Al_2(SO_4)_3.24H_2O$.
It is white in colour.
It has 24 water molecules and it swells on heating.

207. The aqueous solution of which one of the following is not basic?

(a) $Na_2B_4O_7.\ 10H_2O$ (b) HOCl
(c) $NaHCO_3$ (d) CH_3COONa

SCRA 2010

Ans. (d) : CH_3COONa – Na is the most electronegative atom and it is also metal. So, Na react with acetic acid to form sodium acetate. Therefore, CH_3COONa is acidic is nature (Removal of H^+ atom to place Na metal).

208. In the reaction $H_2O + HCl \rightarrow H_3O^+ + Cl^-$, the species that acts as Bronsted base is :

(a) H_2O (b) HCl
(c) H_3O^+ (d) Cl^-

MPPET-2013

@apna_pdf

Ans. (a) : A Bronsted-Lowry base is any species that is capable of accepting a proton, which requires a lone pair of electrons to bond to the H^+. **Ex.** H_2O.

$$\underset{\text{Acid}}{HCl} + \underset{\text{Base}}{H_2O} \rightarrow \underset{\text{Conjugate base}}{Cl^-} + \underset{\text{Conjugate acid}}{H_3O^+}$$

- Bronsted-Lowry acids are proton/H^+ doners (Lose H^+).

209. Which of the following species acts as both Bronsted acid and base?

(a) OH^- (b) NH_3

(c) NaCl (d) HSO_4^-

AP-EAMCET 25-08-2021 Shift - I

Ans. (d) : HSO_4^- acts as both Bronsted acid and base because it receive and also donate H^+ ion.

210. How many compound given below are amphoteric oxides ?

P_2O_5, P_4O_6, As_2O_5, As_4O_6, Sb_2O_5, Sb_4O_6, Bi_2O_3

(a) 2 (b) 3

(c) 4 (d) 6

AP EAMCET (Engg.) 17.09.2020, Shift-II

Ans. (a) : The oxides of the type $\overset{+3}{E}_2O_3$ of N and P, P_2O_3 (P_4O_6, dimer of P_2O_3) are purely acidic, that of As (As_4O_6, dimer of As_2O_3) and Sb (Sb_4O_6, dimer of Sb_2O_3) amphoteric and that of Bi (Bi_2O_3) is predominantly basic.

The oxides of the type $\overset{+3}{E}_2O_3$ are more acidic, e.g. N_2O_3, P_2O_5, As_2O_5, Sb_2O_5

So, in the given set of oxides of group- 15 elements, two oxides are amphoteric, As_4O_6 and Sb_4O_6.

211. Which acid among the following has the highest pK_a value ?

(a) HCℓ (b) HF

(c) Hℓ (d) HBr

AP EAMCET (Engg.) 21.09.2020, Shift-I

Ans. (b) : HF ($pK_a = 3.1$)

HCl ($pK_a = -6.0$)

HBr ($pK_a = -9.0$)

HI ($pK_a = -9.5$)

Therefore, HF has highest pK_a value. Hence, the correct option is (b).

212. Match the following

Acid	**Ionizationconstant, K_a**
A) Formic acid	**I) 4.9×10^{-10}**
B) Niacin	**II) 1.5×10^{-5}**
C) Hypochlorus acid	**III) 1.8×10^{-4}**
D) Hydrocyanic acid	**IV) 3.0×10^{-8}**

The correct match is

	A	**B**	**C**	**D**
(a)	II	III	IV	I
	A	B	C	D
(b)	I	II	III	IV
	A	B	C	D
(c)	III	II	IV	I
	A	B	C	D
(d)	III	IV	I	II

TS EAMCET 10.08.2021, Shift-II

Ans. (c) :

Acid	Ionization Constant – K_a
Formic acid –	1.8×10^{-4}
Niacin –	1.5×10^{-5}
Hypochlorous acid –	3.0×10^{-8}
Hydrocyanic acid –	4.9×10^{-10}

213. Iron sulphide is heated in air to form A, an oxide of sulphur. A is dissolved in water to give an acid. The basicity of this acid is

(a) 2 (b) 3

(c) 1 (d) Zero

AP EAMCET-2002

Ans. (a) : $4FeS + 7O_2 \rightarrow 2Fe_2O_3 + 4SO_2\uparrow$

$SO_2 + H_2O \rightarrow H_2SO_3$

$H_2SO_3 \rightarrow 2H^+ + SO_3^{2-}$

Basicity of sulphrous acid H_2SO_3 is 2.

214. Which of the following is a Lewis acid?

(a) Cl^- (b) H_3O^+

(c) PF_3 (d) C_2H_5OH

MPPET-2008

Ans. (c) : A Lewis acid is a substance that accepts a pair of electrons to form a covalent bond. PF_3 is a lewis acid.

215. Which one of the following salts will produce an alkaline solution on dissolving in water?

(a) NH_4Cl (b) Na_2CO_3

(c) $NaNO_3$ (d) Na_2SO_4

MPPET-2008

Ans. (b) : Na_2CO_3 salt will produce an alkaline solution on dissolving in water.

216. Which is the strongest Bronsted base among the following

(a) ClO_4^- (b) ClO_3^-

(c) ClO_2^- (d) ClO^-

MPPET-2008

Ans. (d) :

$$ClO_4^- \xrightarrow{H^+} HClO_4$$

$$ClO_3^- \xrightarrow{H^+} HClO_3$$

$$ClO_2^- \xrightarrow{H^+} HClO_2$$

$$ClO^- \xrightarrow{H^+} HClO$$

The strength of acid is $HClO_4 > HClO_3 > HClO_2 > HClO$ and strength of conjugate base is

$$ClO_4^- < ClO_3^- < ClO_2^- < ClO^-$$

Hence ClO^- is strongest bronsted base.

217. Using the Lewis concept, which one of the following has the strongest acidic strength ?

(a) H_3PO_4

(b) H_3PO_3

(c) H_3PO_2

(d) All are of equal strength

SCRA-2009

@apna_pdf

Ans. (a) : H_3PO_4 has the strongest acid strength as the no. of O atom is more in case of H_3PO_4. As the no. of O atom increases the strength of the acid increases. Oxygen is highly electronegative element, and so if there are more O atoms present, more will be the electron pulling tendency.
So, O–H bond weakening results more acidic character.

218. $SiCl_4$ on hydrolysis forms 'X' and HCl, compound 'X' losses water at 1000°C and gives 'Y'. Compounds 'X' and 'Y' respectively are

(a) H_2SiCl_6, SiO_2 (b) H_4SiO_4, Si
(c) SiO_2, Si (d) H_4SiO_4, SiO_2

AP EAMCET (Engg.)-2009

Ans. (d): $SiCl_4$ on hydrolysis give H_2SiO_4
$SiCl_4 + 4H_2O \rightarrow H_2SiO_3 + 4HCl$
H_4SiO_4 loses the water at 1000 degree centigrade and produces SiO_2
$H_4SiO_4 \rightarrow SiO_2 + 2H_2O$
So, X and Y are H_4SiO_4 and SiO_2 respectively.

219. Which of the following does not form double salts?

(a) Li_2SO_4 (b) Na_2SO_4
(c) K_2SO_4 (d) Rb_2SO_4

AP EAPCET 20.08.2021 Shift-I

Ans. (a) : Double salt is salt that contains more than one different contains or anion it completely dissociate into simple ions.
Lithium is an electropositive element. It has vary small size. It cannot form double salt.

220. The pk_a of a weak acid is 4.8. What should be the ratio of $\frac{[acid]}{[salt]}$, if a buffer of pH=5.8 is required?

(a) 0.1 (b) 10
(c) 1 (d) 2

AP EAMCET (Engg.) 2001

Ans. (a) : Given the expression for the pH of the acidic buffer solution is as given below

$$pH = Pk_a + \log\frac{[salt]}{[acid]}$$

$$Pk_a = 4.8$$

Substitute value in the above equation

$$5.8 = 4.8 + \log\frac{[salt]}{[acid]}$$

Hence, $\frac{[salt]}{[acid]} = \frac{10}{1} = 10:1$

i.e. $\frac{[acid]}{[salt]} = \frac{1}{10} = 0.1$

221. Which one of the following salts give an acidic solution in water?

(a) CH_3COONa (b) NH_4Cl
(c) NaCl (d) CH_3COONH_4

AP EAMCET (Engg.) -2007

Ans. (b) : $NH_4Cl \rightleftharpoons NH_4 + Cl^-$
$H_2O + H_2O \rightleftharpoons OH^- + H_3O^-$

$$\begin{tikzcd} H_2O+H_2O \arrow[r, shift left] & OH^- \arrow[l, shift left] \arrow[d, shift left] & +H_3O^- \arrow[d, shift left] \\ & NH_4OH \arrow[u, shift left] & HCl+H_2O \arrow[u, shift left] \end{tikzcd}$$

Weakly ionized Strongly ionized

222. Match the following?

Species	Conjugate acid
(a) NH_3	(i) H_2C0_3
(b) HCO_3^-	(ii) H_30^+
(c) H_20	(iii) NH_4^+
(d) HSO_4^-	(iv) H_2SO_4

(a) $(a\rightarrow iii),(b\rightarrow i),(c\rightarrow ii),(d\rightarrow iv)$
(b) $(a\rightarrow i),(b\rightarrow iii),(c\rightarrow ii),(d\rightarrow iv)$
(c) $(a\rightarrow iii),(b\rightarrow ii),(c\rightarrow i),(d\rightarrow iv)$
(d) $(a\rightarrow iii),(b\rightarrow ii),(c\rightarrow iv),(d\rightarrow i)$

AP EAPCET 20.08.2021 Shift-II

Ans. (a): A conjugate acid is formed when a proton is added to a base.

$$NH_3 + H^+ \longrightarrow NH_4^+$$
$$HCO_3^- + H^+ \longrightarrow H_2CO_3$$
$$H_2O + H^+ \longrightarrow H_2O^+$$
$$HSO_4^- + H^+ \longrightarrow H_2SO_4$$

223. Rochelle's salt is

(a) sodium citrate
(b) sodium potassium citrate
(c) potassium tartarate
(d) sodium potassium tartarate.

COMEDK-2011

Ans. (d) : Fehling reagent comprises of two solutions Fehling solution A and Fehling solution B. Fehling solution A is aqueous copper sulptate and Fehling solution B is alkaline sodium potassium tartarate (Rochelle's salt)

224. In the titration of oxalic acid against sodium hydroxide the indicator used is

(a) diphenylamine (b) methyl orange
(c) menthyl red (d) phenolphthalein.

COMEDK-2011

Ans. (d) : Phenolphthalein is used as indicator in the titration of weak acid against strong alkali.

225. The conjugate acid of HCO_3^- is

(a) H_2CO_3 (b) CO_3
(c) CO_2 (d) CO

COMEDK-2011

Ans. (a) : $\underset{\text{Base}}{HCO_3^-} \xrightarrow{H^+} \underset{\text{Conjugate acid}}{H_2CO_3}$

Specie	Conjugate Acid	Conjugate Base
H_2O	H_3O^+	OH^-
HCO_3^-	H_2CO_3	CO_3^{2-}
HSO_4^-	H_2SO_4	SO_4^{2-}
NH_3	NH_4^+	NH_2^-

@apna_pdf

226. According to the Lewis theory an acid is a

(a) proton donor (b) proton acceptor
(c) electron pair donor (d) electron pair acceptor.

COMEDK-2011

Ans. (d) : According to the Lewis theory an acid is a electron pair acceptor.
lewis acids accept an electron pair. Lewis acids are electrophilic meaning that they are electron attracting when bonding with a base the acid uses its lowest unoccupied molecular orbital.

227. The dissociation constant of a weak acid is 1×10^{-4} . In order to prepare a buffer solution with a pH=5, the [Salt]/[Acid] ratio should be

(a) 4 : 5 (b) 10 : 1
(c) 5 : 4 (d) 1 : 10

Karnataka NEET-2013

Ans. (b) : $\text{pH} = \text{pK}_a + \log\dfrac{[\text{Salt}]}{[\text{Acid}]}$ .....(i)

$K_a = 1 \times 10^{-4}$

$[\because \text{pK}_a = -\log K_a]$

$= -20g\,(1 \times 10^{-4})$

$= 4$

From equation (i)–

$$5 = -\log K_a + \log\frac{[\text{Salt}]}{[\text{Acid}]}$$

$$5 = 4 + \log\frac{[\text{Salt}]}{[\text{Acid}]}$$

$$5-4 = \log\frac{[\text{Salt}]}{[\text{Acid}]}$$

$$1 = \log\frac{[\text{Salt}]}{[\text{Acid}]}$$

$$\frac{[\text{Salt}]}{[\text{Acid}]} = 10 = 10:1$$

228. What is the conjugate base of HSO_4^- ?

(a) H_2SO_4 (b) HSO_4^{2-}
(c) SO_4^{2-} (d) H^+

AP-EAMCET (Medical), 2006

Ans. (c) : The acid base reaction can be written as:-

$$\underset{\text{Acid}}{HSO_4^-} + \underset{\text{Base}}{H_2O} \rightarrow \underset{\substack{\text{Conjugate}\\ \text{acid of } H_2O}}{H_3O^+} + \underset{\substack{\text{Conjugate}\\ \text{base of } H_2SO_4}}{SO_4^{2-}}$$

Although it has a negative charge, it will never accept ah$^+$ to form H_2SO_4. That is because H_2SO_4 is a strong acid and completely dissociates in water.

Therefore, the sulfate ion $\left(SO_4^{-2}\right)$ is the conjugate base of HSO_4^-.

229. Identify Bronsted-Lowry acids in the reaction given.

$$\underset{(\mathbf{A})}{[Al(H_2O)_6]^{3+}} + \underset{(\mathbf{B})}{HCO_3^-} \rightleftharpoons \underset{(\mathbf{C})}{[Al(H_2O)_5(OH^-)]^{2+}} + \underset{(\mathbf{D})}{H_2CO_3}$$

The correct answer is

(a) (A), (C) (b) (B), (D)
(c) (A), (D) (d) (B), (C)

AP-EAMCET (Medical), 2008

Ans. (c) : The given reversible reaction is :

$$\underset{\substack{(A)\\ \text{acid}}}{\left[Al(H_2O)_6\right]^{3+}} + \underset{\substack{(B)\\ \text{base}}}{HCO_3^-} \rightleftharpoons \underset{\substack{(C)\\ \text{conjugate base}}}{\left[Al(H_2O)_5(OH^-)\right]^{2+}} + \underset{\substack{(D)\\ \text{conjugate acid}}}{H_2CO_3}$$

A base after gaining a proton (H$^+$) gives conjugate acid. Hence, in the above reaction A and D are the acids.

230. The elements 'X' , 'Y' and 'Z' form oxides which are acidic, basic and amphoteric respectively. The correct order of their electro negativity is

(a) $X > Y > Z$ (b) $Z > Y > X$
(c) $X > Z > Y$ (d) $Y > X > Z$

AP-EAMCET (Medical), 2008

Ans. (c) : As we know , electronegativity is directly proportional to non-metallic character and inversely proportional to metallic character. The element (X) form acidic oxide, so it is a non-metal, while the element (Y) form basic oxide, So (Y) is a metal. Hence the order of electronegativity will be X> Z > Y.

231. Which one of the following salts form is micelle?

(a) Sodium formate (b) Sodium acetate
(c) Sodium stearate (d) Sodium chloride

AP-EAMCET (Medical), 2001

Ans. (c) : A colloidal sized sodium stearate formed in water by association of these molecule each having a hydrophilic and hydrophobic end is known as micelle.

232. Which one of the following statements is not correct.

(a) Cl^- is a Lewis acid
(b) The pH of 10^{-8} molar HCl solution is less than 7
(c) the ionic product of water at 25°C is 10^{-14} mol^{2}L^{-2}
(d) Bronsted-Lowry theory could not explain the acidic character of $AlCl_3$

AP-EAMCET (Medical), 2002

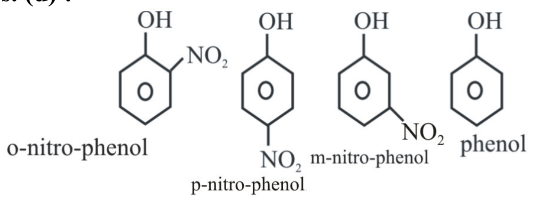
Ans. (a) : Cl^- is not a Lewis acid. It is a Lewis base. Lewis acid is a chemical species that reacts with a Lewis base to form a Lewis adduct. A Lewis base, then, is any species that donates a pair of electrons to a Lewis acid to form a Lewis adduct.
Therefore, Cl^- is a Lewis acid statement is not correct.

233. Which compound having maximum value of pK_a from following?

(a) $O-O_2N-C_6H_4-OH$
(b) $P-O_2N-C_6H_4-OH$
(c) $m-O_2N-C_6H_4-OH$
(d) C_6H_5OH

GUJCET-2021

Ans. (d) :



@apna_pdf

Phenol (C_6H_5OH) has the maximum value of pK_a from the following. The pK_a value is inversely proportional to the acidity of compound. Phenol is least acidic in nature because it has the more pK_a value.
The pK_a order is-
Phenol > m-nitrophenol > p-nitrophenol > o-nitrophenol.

234. Match the following

Column-I **Acid**	**Column-II** **pKa value**
(A) CH_3COOH	**(I) 0.23**
(B) F_3CCOOH	**(II) 3.41**
(C) 	**(III) 4.19**
(D) 	**(IV) 4.76**

	A	**B**	**C**	**D**
(a)	IV	I	III	II
(b)	I	IV	II	III
(c)	IV	I	II	III
(d)	IV	III	II	I

TS EAMCET 04.08.2021, Shift-I

Ans. (a) : Correctly matched :

Acid	**pK_a value**
CH_3COOH	4.76
F_3CCOOH	0.23
	4.19
	3.413

235. If the molar concentrations of base and its conjugate acid are same, the pOH of the buffer solution is

(a) same as pK_b of base (b) same as pK_a of base
(c) same as pK_a of acid (d) same as pK_b of acid

TS EAMCET 04.08.2021, Shift-I

Ans. (a) : If the molar concentration of base and its conjugate acid are same the pOH of the buffer solution is same as pK_b of base.

236. The set of amphoteric oxides among the given oxides are Ga_2O_3, As_4O_{10}, Sb_4O_{10}, B_2O_3, Tl_2O

(a) Tl_2O, B_2O_3
(b) Sb_4O_{10}, B_2O_3, Ga_2O_3
(c) Ga_2O_3, Tl_2O, As_4O_{10}
(d) Ga_2O_3, As_4O_{10}, Sb_4O_{10}

TS EAMCET 04.08.2021, Shift-I

Ans. (d) : Amphoteric oxides–Metaloxide which react with both basic and acidic oxides to produces salt and water.
Ex-Ga_2O_3, As_4O_{10}, Sb_4O_{10} and Al_2O_3, all are amphoteric oxides because they react as acid with base and vice-versa.

237. The conductivity of a 0.05 M solution of a weak monobasic acid is 10^{-3}S cm^{-1}. If λ_m^∞ for weak acid is 500 S cm^2 mol^{-1}, calculate K_a of weak monobasic acid:

(a) 8×10^{-5} (b) 4×10^{-6}
(c) 16×10^{-7} (d) 14×10^{-8}

AIIMS 26 May 2019 (Evening)

Ans. (a): Given that, C = 0.05 M, k = 10^{-3} S cm^{-1}

$$\lambda_m^\infty = 500\,\text{S}\,\text{cm}^2\text{mol}^{-1}$$

$$K_a = C\alpha^2$$

We have to find α.

$$\alpha = \frac{\lambda_m^c}{\lambda_m^\infty}$$

$$\because \quad \lambda_m^c = \frac{1000 \times k}{C}$$

$$= \frac{1000 \times 10^{-3}}{0.05}$$

$$\lambda_m^c = 20 \text{ S cm}^2 \text{ mol}^{-1}$$

$$\alpha = \frac{20\,\text{S}\,\text{cm}^2\text{mol}^{-1}}{500\,\text{S}\,\text{cm}^2\text{mol}^{-1}} = 0.04$$

$K_a = C\alpha^2$
$K_a = 0.05 \times (0.04)^2$
$= 0.00008$
$K_a = 8 \times 10^{-5}$

238. Which of the following is incorrect about $K_2Cr_2O_7$?

(a) It can be prepared from K_2CrO_4.
(b) It is used in redox titrations.
(c) It is stable in both acid & base.
(d) It is orange in colour.

AIIMS 26 May 2019 (Evening)

Ans. (c):
- Colour of $K_2Cr_2O_7$ is orange
- $$\underset{\text{(Chromate ion)}}{2Cr_4^{-2}} \xrightarrow[\text{H+}]{\text{In acidic medium}} \underset{\text{(Dichromate ion)}}{Cr_2O_7^{2-}} + H_2O$$
- $K_2Cr_2O_7$ is used in redox titrations.
- It is stable in both acid & base this statement is incorrect about $K_2Cr_2O_7$.

239. Which of the following is a Lewis-acid?

(a) Br^- (b) Cl^-
(c) S^- (d) Ag^+

AIIMS-1994

Ans. (d): Ag^+ can accept electron pair so it act as Lewis acid and Br^-, Cl^-, S^- are Lewis base because these are donate e^- pair (lone pair).

240. Which of the following is the strongest base?

(a) H_2^+ (b) H
(c) HCO_3^- (d) H^-

AIIMS-1996

Ans. (c) : HCO_3^- is a strongest base.
A stronger base liberates more OH^- when dissolved in an aqueous solution and has a pH value of more than 7. So, HCO_3^- acts as a base when reacting with the compound that is more acidic than it i.e. HCl. This is because a stronge acid has more ability to donate the proton.

@apna_pdf

241. The strongest bronsted base among the following anions is

(a) ClO_3^- (b) ClO^-

(c) ClO_4^- (d) ClO_2^-

AIIMS-1996

Ans. (b): Bronsted base is the substance that can accept H+ ion. With the increase in the number of oxygen atoms in the given conjugate base, the delocalization of the π bond becomes more extended. This results in decrease in electron density. Consequently also decreases in the order $ClO^- > ClO_2^- > ClO_3^- > ClO_4^-$

Hence strongest & bronsted base is ClO^-.

242. Assertion: H_2O shows amphoteric nature.

Reason: According to Bronsted theory, it acts as acid with NH_3 and a base with H_2S.

(a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.

(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.

(c) If Assertion is correct but Reason is incorrect.

(d) If both the Assertion and Reason are incorrect.

AIIMS 26 May 2019 (Morning)

Ans. (a): Water has the ability to act as an acid as well as a base i.e. It behaves as an amphoteric substance.

In Bronsted sense it act as an acid with NH_3 and base with H_2S.

$$H_2O(l) + NH_3(aq) \rightleftharpoons OH^-(aq) + NH_4^+(aq)$$

$$H_2O(l) + H_2S(aq) \rightleftharpoons H_3O^+(aq) + HS^-(aq)$$

243. Assertion : KOH is more soluble in water than NaOH.

Reason : NaOH is a stronger base than KOH.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.

(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.

(c) If Assertion if correct but Reason is incorrect.

(d) If both the Assertion and Reason are incorrect.

AIIMS-(2011)

Ans. (c): KOH is more soluble in water than NaOH. The ionic size of Na^+ is smaller than K^+. Hence attractive force between Na^+ and OH^- is relatively strong and so ionisation of NaOH is lower than KOH which makes NaOH a weaker base than KOH.

244. Assertion : Addition of silver ions to a mixture of aqueous sodium chloride and sodium bromide solution will first precipitate AgBr rather than AgCl.

Reason: K_{sp} of AgCl > K_{sp} of AgBr.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.

(b) If both assertion and Reason are correct, but Reason is not the correct explanation of assertion.

(c) If Assertion is correct but Reason is incorrect.

(d) If both the Assertion and Reason are incorrect.

AIIMS-(2016, 2004)

Ans. (c): We know that,

The solubility product of AgBr = 5×10^{-13} and AgCl = 5×10^{-10}

Hence, K_{sp} of AgCl < K_{sp} of AgBr

Hence, when we add silver ion to a mixture of aqueous sodium chloride and sodium bromide solution, AgBr will percipitate first.

245. Assertion : $[Al(H_2O)_6]^{3+}$ is a stronger acid than $[Mg(H_2O)_6]^{2+}$.

Reason : Size of $[Al(H_2O)_6]^{3+}$ is smaller than $[Mg(H_2O)_6]^{3+}$ and possesses more effective nuclear charge.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.

(b) If both assertion and Reason are correct, but Reason is not the correct explanation of assertion.

(c) If Assertion is correct but Reason is incorrect.

(d) If both the Assertion and Reason are incorrect.

AIIMS-(2010, 2008)

Ans. (a): $[Al(H_2O)_6]^{3+}$ is a stronger Lewis acid than $[Mg(H_2O)_6]^{2+}$ because along the period, size decreases and oxidation no. of metal increases. So, size of $[Al(H_2O)_6]^{3+}$ is smaller than $[Mg(H_2O)_6]^{2+}$ and possesses more effective nuclear charge which stabilizes the conjugate base.

246. In which of the following acid-base titration, pH is greater than 8 at equivalence point.

(a) Acetic acid versus ammonia.

(b) Acetic acid versus sodium hydroxide.

(c) Hydrochloric acid versus ammonia.

(d) Hydrochloric acid versus sodium hydroxide.

AIIMS-(2003)

Ans. (b): Acetic acid is a weak acid and sodium hydroxide is strong base. Salts of the two will Hydrolyse to give basic solution. So at neutral point, pH of the solution will be greater than 8.

247. pK_a value of four acids are given below. The strongest acid is:

(a) 4.0 (b) 3.5

(c) 2.5 (d) 2

BCECE-2004

AIIMS-(2000)

Ans. (d): We know that

$$\text{acidic strength} \propto K_a \propto \frac{1}{pK_a}$$

Hence acid with lowest pKa value will be strongest acid.

In this question minimum pKa value is 2.

Hence, It is a strongest acid.

248. Which is Lewis acid?

(a) C_2H_5OH (b) BF_3

(c) Cl^- (d) NH_3

AIIMS-(1998)

@apna_pdf

Ans. (b) : Lewis acids are those which can accept a pair of non-bonding electron pair. Hence BF_3 is accept electron pair it is Lewis acid.
Lewis base are those which can donate a pair of e^- pair C_2H_5OH, Cl^-, NH_3 all are donate e^- pair. Hence, It is a Lewis base.

249. In the reaction $I_2 + I^- \rightarrow I_3^-$, the Lewis base is:

(a) I_3^- (b) I_2
(c) I^- (d) non of these

BCECE-2005, AIIMS-(1997)

Ans. (c) : I^- ion can act as Lewis base i.e. It can denote electron pair to some species.
Here, I^- is giving electron pair to I_2 molecule. Therefore I_2 is a lewis acid and I^- is a lewis base.

250. Which among the following pairs is not an acidic buffer?

(a) HCOOH & HCOOK
(b) $HClO_4$ & $NaClO_4$
(c) C_6H_5COOH & C_6H_5COONa
(d) HCN & KCN

AP EAPCET 19-08-2021, Shift-II

Ans. (b) : Acidic buffer are solution that have a pH below 7 and contain a weak acid and one of its salts. So, the $HClO_4$ is the strong acid which means that it's conjugate base is extremly weak. As such, the solution of $HClO_4$ and $NaClO_4$ is not a buffer solution.

251. The pK_a values of four carboxylic acids are 4.76, 4.19, 0.23 and 3.41 respectively. The pK_a value of strongest carboxylic acid among them is

(a) 4.19 (b) 3.41
(c) 0.23 (d) 4.76

AP-EAMCET- (Engg.)-2011

Ans. (c) : The value K_a is increase then acid is stronger but smaller pKa value. Hence among the given carboxylic acid the pKa value of strongest acid is 0.23.

252. Which one of the following is correct with respect to basic character?

(a) $P(CH_3)_3 > PH_3$ (b) $PH_3 > P(CH_3)_3$
(c) $PH_3 > NH_3$ (d) $PH_3 = NH_3$

AP-EAMCET (Engg.) 2015

Ans. (a) : $P(CH_3)_3$ is more basic than PH_3 because there is three methyl group attached to phosphorous due to +I effect.

253. Assertion (A) According to Lowry-Bronsted theory, a substance can function as an acid as well as a base.
Reason (R) Acid reacts with a base to produce a salt.
The correct answer is

(a) Both (A) and (R) are true and (R) is the correct explanation of (A)
(b) Both (A) and (R) are true but (R) is not the correct explanation of (A)
(c) (A) is true but (R) is not true
(d) (A) is not true but (R) is true

AP- EAMCET(Medical) -2010

Ans. (b): According to Lowry Bronsted theory, a species can function as an acid as well as a base. e.g.:- H_2O. Water loss his proton and act as a lewis acid if they accept proton then act as a lewis base. Acid reacts with base to produce a salt.

$$\text{Acid} + \text{Base} \longrightarrow \text{Salt}$$

Hence, both (A) and (R) are true but (R) is not the correct explanation of (A).

254. Which one of the following compounds is Lewis acid?

(a) PCl_3 (b) BCl_3
(c) NCl_3 (d) $CHCl_3$

AP – EAMCET - (Medical)-1997

Ans. (b) : In BCl_3, Boron has 6 electrons in it outermost orbital and has a vacant p-orbital. Thus, it is an electron-deficient compound.
Hence, it acts as Lewis acid and accepts a loan pair of electrons.

255. The conjugate acid of NH_2^- ion is:

(a) NH_3 (b) NH_4^+
(c) N_2H_4 (d) NH_2OH

COMEDK 2012
AP-EAMCET 1997
AP-EAMCET - (Medical)-1997

Ans. (a) : According to Bronsted–Lowery theory of acid and base, the species which accepting a proton is called conjugate acid of the base.

$$\underset{\text{Base}}{NH_2^-} + H^+ \longrightarrow \underset{\text{Conjugate acid}}{NH_3}$$

256. Which one of the following is not a base?

(a) N_2H_4 (b) NH_2OH
(c) $(CH_3)_3N$ (d) HN_3

AP – EAMCET - (Medical)-1997

Ans. (d) : Hydrazoic acid or azoimide is a colorless acid whose chemical formula is HN_3. Hydrazoic acid is an important hydride of nitrogen but unlike ammonia and hydrazine, it is acidic in nature.

257. The strongest conjugate base results from':

(a) Formic acid (b) Benzoic acid
(c) Acetic acid (d) Acetylene

AP-EAMCET-1998
AP – EAMCET - (Medical)-1997

Ans. (d) : The compounds which donates a proton are called acid and compounds which accept proton are called base. When an acid donate a proton is called conjugate base of that acid.
The strongest conjugate base results from acetylene since it is the weakest acid among formic acid, benzoic acid, acetic acid and acetylene.
The order of strength of acids is given below–
Acetylene < Acetic acid < Formic acid < Benzoic acid
Weaker an acid, stronger will be its conjugate base. Hence, the order of strength of conjugate bases will be as follows–
Acetylene > Acetic acid > Formic acid > Benzoic acid

258. Which of the following oxide is amphoteric?

(a) SnO_2 (b) CaO
(c) SiO_2 (d) CO_2

VITEEE- 2012

@apna_pdf

Ans. (a) : Amphoteric oxides reacts with both acids and alkalis to form salts and water. Examples of amphoteric oxides are zinc oxide aluminium oxide and tin oxide. Generally in group 14 SiO_2 and CO_2 are acidic where as in second group due to alkali nature of elements it oxide are basic.

Amphoteric → Acidic/Basic

Metals → Basic, Amphoteric

Amphoteric Metals→ Be, Sc, Ti, V, Cr, Fe, Co, Cu, Zn, Al, Ge, Sn, Zn, Ag, Ga, Au, In, Tl, Pb, Sb, Bi

259. The conjugate acid of O^{2-} is

(a) O_2 (b) O_2^-

(c) H_2O (d) OH^-

AMU-2019

Ans. (d) : Adding one H^+ to anything gives you is conjugate acid.

Removing one H^+ gives you its conjugate base.

conjugate acid of O^{2-}

$O^{2-} + H^+ \rightarrow OH^-$

260. Which one of the following acids is used as an oxidizer in rocket fuel?

(a) $HClO_4$ (b) HNO_2

(c) H_3PO_4 (d) HNO_3

AMU-2014

Ans. (d) : Rocket fuels generally contain two substance, one the fuel and other the oxidiser.

Oxidizer is an oxygen rich substance and used to provide oxygen for burning process. Common oxidizers used for this purpose are nitric acid (HNO_3).

261. Pick out the electrophiles from the following species:

BF_3, NH_3, Me_3C^+, HCl

(a) BF_3 and NH_3 (b) Me_3C^+ and HCl

(c) BF_3 and Me_3C^+ (d) NH_3 and HCl

AMU-2013

Ans. (c) : The neutral or positively charged species with deficiency of electron and capable of accepting a pair of electron (Lewis acid) are called electrophiles ex. BF_3 and Me_3C^+ are electrophiles.

262. For a diprotic acid, which of the following is true for 1st and 2nd ionization constants (K_{a_1} and K_{a_2})?

(a) $K_{a_1} = K_{a_2}$ (b) $K_{a_1} > K_{a_2}$

(c) $K_{a_2} > K_{a_1}$ (d) $K_{a_2} \geq K_{a_1}$

AMU-2012

Ans. (b) : K_{a_1} and K_{a_2} are acid constant for polyprotic acids, which may consist of diprotic acids, triprotic acid etc. The first dissociation constant is necessarily greater than the second (i.e. $K_{a_1} > K_{a_2}$); this is because the first proton to dissociate is always the most strongly acidic, followed in order by next most strongly acidic proton.

So, $K_{a_1} > K_{a_2}$

263. The strongest base of the following is

(a) NaOH (b) KOH

(c) LiOH (d) CsOH

AMU-2012

Ans. (d) : The order of basic character of hydroxide of alkali metal is–

CsOH > RbOH > KOH > NaOH > LiOH

The order of basicity appears to be inversely related to the electropositivity. Thus the more electropositive, the more the cation may associate with the OH^-, making it less available to act as a base.

264. Which of the following acids is stronger than benzoic acid (K_a=6.3×10^{-5})?

(a) A (K_a=1.67×10^{-8}) (b) B (pK_a=6.0)

(c) C (pK_a=4.0) (d) D (K_a=1.0×10^{-5})

AMU-2012

Ans. (c) : $pK_a = -\log K_a$

pK_a for bezoic acid $= -\log(6.3 \times 10^{-5})$

$= -\log 6.3 - \log 10^{-5}$

$= -0.799 + 5$

$= 4.201$

(a) pK_a for A $= -\log(1.67 \times 10^{-8})$

$= -0.222 + 8 = 7.778$

(b) pK_a for B = 6.0

(c) pK_a for C = 4.0

(d) pK_a for D $= -\log(1.0 \times 10^{-5})$

$= 0 + 5 = 5$

For a stronger acids, pK_a must be less.

Therefore, acid C will be stronger than benzoic acid.

265. If the salt M_2X,$QY_2$and PZ_3 have the same solubilities, their K_{sp} values are related as

(a) $K_{sp}(M_2X)$=$K_{sp}(QY_2)$< $K_{sp}(PZ_3)$

(b) $K_{sp}(M_2X)$>$K_{sp}(QY_2)$= $K_{sp}(PZ_3)$

(c) $K_{sp}(M_2X)$<$K_{sp}(QY_2)$= $K_{sp}(PZ_3)$

(d) $K_{sp}(M_2X)$>$K_{sp}(QY_2)$> $K_{sp}(PZ_3)$

AMU-2011

Ans. (a) : For M_2X Salt⁻

$M_2X \rightleftharpoons 2M^+ + X^{2-}$

$K_{sp} = (2S)^2\ (S)$

$= 4S^3$

For QY_2 Salt⁻

$QY_2 \rightleftharpoons \underset{(S)}{Q^{2+}} + \underset{(2S)}{2Y^-}$

$K_{sp} = (Q^{2+}) + (Y^-)^2$

$= (S)\ (2S)^2$

$K_{sp} = 4S^3$

For PZ_3 Salt⁻

$PZ_3 \rightleftharpoons \underset{(S)}{P^{3+}} + \underset{(2S)}{3Z^-}$

$K_{sp} = \underset{(S)}{(P^{3+})} + \underset{(3S)^3}{(Z^-)^3}$

$K_{sp} = (S)\ (27S^3)$

$K_{sp} = 27S^4$

Thus K_{sp} in order–

$K_{sp}(M_2X)$=$K_{sp}(QY_2)$< $K_{sp}(PZ_3)$

266. Which of the following conjugate bases will be the most acidic in nature?

(a) NO_3^- (b) Cl^-

(c) HSO_4^- (d) SO_4^{2-}

AMU – 2008

@apna_pdf

Ans. (c) : The strength of an acid depend upon its tendency to lose its proton and the strength of the base depends upon its tendency to gain the proton.

$H_2SO_4 > HCl > HNO_3 > HSO_4^-$ (acidic strength)

$HSO_4^- > Cl^- > NO_3^- > SO_4^{2-}$ (conjugate base strength)

Conjugate base of H_2SO_4 i.e., HSO_4^- is most acidic in nature.

267. A solution of $FeCl_3$ in water acts as acidic solution due to :

(a) hydrolysis of Fe^{3+} (b) acidic impurities

(c) dissociation (d) ionisation

BCECE-2006

Ans. (a) : $FeCl_3 + 3H_2O \rightleftharpoons Fe(OH)_3 + 3HCl$

This is strong acid and weak base.

On hydrolysis $FeCl_3$ gives an acidic solution due to presence of strong acid and weak base in the solution.

268. Arrange NH_4^+, H_2O, H_3O^+, HF and OH^- in increasing order of acidic nature :

(a) $H_3O < NH_4^+ < HF < OH^- < H_2O$

(b) $NH_4^+ < HF < H_3O^+ < H_2O < OH^-$

(c) $OH^- < H_2O < NH_4^+ < HF < H_3O^+$

(d) $H_3O^+ > HF > H_2O > NH_4^+ > OH^-$

BCECE-2006

Ans. (c) : Acid are the species who have tendency to give H^+ ion.

The strongest giving tandency of H^+ ion is H_3O^+. Hence it is strongest acid and Base are the species who have tendency to accept H^+ ion. The strongest accepting H^+ ion is OH^-. Hence it is a base.

So order of acidity is–

$$\underset{\text{base}}{OH^-} < \underset{\text{neutral}}{H_2O} < \underset{\text{weak acid}}{NH_4^+} < \underset{\text{strong acid}}{HF} < \underset{\text{strong acid}}{H_3O^+}$$

269. What amount of water is added in 40 mL of NaOH (0.1N) which is neutralized by 50 mL of HCl (0.2N) ?

(a) 80 mL (b) 60 mL

(c) 40 mL (d) 90 mL

BCECE-2004

Ans. (b) : $N_1V_1 = N_2V_2$

Amount of water to be added= total volume – volume of NaOH.

Given normality of NaOH (N_1) = 0.1N

Volume of NaOH = V_1

Normality of HCl (N_2) = 0.2 N

Volume of HCl V_2 = 50 mL

$$N_1V_1 = N_2V_2$$

$$0.1 \times V_1 = 0.2 \times 50$$

$$V_1 = \frac{0.2 \times 50}{0.1} = 100$$

V of NaOH = 40mL

Amount of water to be added = 100 – 40 = 60mL

270. An acid has pH = 5 and its concentration is 1M. What is the value of K_a for the acid ?

(a) 10^{-7} (b) 10^{-5}

(c) 10^{-10} (d) 10^{-8}

BCECE-2003

Ans. (c) : Given, pH = 5

Concentration (C) = 1M

K_a = ?

By using $pH = -\log\sqrt{K_a.C}$

$$5 = -\log\sqrt{K_a.1}$$

$$5 = -\frac{1}{2}\log K_a$$

$$\log K_a = -10$$

$$K_a = 10^{-10}$$

271. CH_3COO^- ion is a

(a) weak conjugate base

(b) strong conjugate base

(c) weak conjugate acid

(d) strong conjugate acid

BCECE-2011

Ans. (b) : Acetic acid (CH_3COOH) is a weak acid.

In water it dissociates partially into hydrogen ion H^+ and the acetate ion CH_3COO^-. Thus, the acetate ion thus formed is a conjugate base of acetic acid.

Strong acids have a weaker conjugate base whereas weak acid have a strongest conjugate base.

Since acetic acid is weak acid, its conjugate base is strong in nature.

272. Nature of nitride ion is–

(a) acidic (b) basic

(c) amphiprotic (d) cannot predict

BCECE-2013

Ans. (b) : Nitride ion with H_2O it accepts protons from water molecules to form NH_3 and OH^- are released in the solution.

$$N_3 + 3H_2O(l) \xrightarrow{+} NH_3 + 3OH^-(aq)$$

Since nitride ion accepts protons and releases OH^-. It is strong Bronsted Lowry base,

Hence, the nature of nitride ions is basic.

273. 0.45 g of acid molecular weight 90 is neutralized by 20 ml of 0.5N caustic potash. The basicity of acid is

(a) 1 (b) 2

(c) 3 (d) 4

[BITSAT-2012]

Ans. (b) : Acid Base

0.45 g 20 mL of 0.5 N

Mass = 90 g/mole

no. of eq. of acid = gm eq. of base

Moles × basicity = N × V(L)

$$\frac{0.45}{90} \times \text{basicity} = 0.5 \times \frac{20}{1000}$$

$$0.005 \times \text{basicity} = 0.5 \times 0.02$$

$$\text{Basicity} = \frac{0.5 \times 0.02}{0.005}$$

∴ Basicity = 2

274. Which equilibrium can be described as an acid-base reaction using the Lewis acid-base definition but not using the Bronsted-Lowry definition?

(a) $2NH_3 + H_2SO_4 \rightleftharpoons 2NH_4^+ + SO_4^{2-}$

(b) $NH_3 + H_3COOH \rightleftharpoons NH_4^+ + CH_3COO^-$

@apna_pdf

(c) $H_2O + CH_3COOH \rightleftharpoons H_3O^+ + CH_3COO^-$

(d) $[Cu(H_2O)_4]^{2+} + 4NH_3 \rightleftharpoons [Cu(NH_3)_4]^{2+} + 4H_2O$

AIIMS-2013
BITSAT 2006

Ans. (d) :

$[Cu(H_2O)_4]^{2+} + 4NH_3 \rightleftharpoons [Cu(NH_3)_4]^{2+} + 4H_2O$

In the above reaction, no proton transfer but the electron pairs of ammonia is transferred to copper ion and Hence it is Lewis acid base reaction.

While other reaction involve a proton transfer and Hence they are bronsted acid-base reactions.

275. Which of these is least likely to act as Lewis base?

(a) F^- (b) BF_3
(c) PF_3 (d) CO

BITSAT 2010

Ans. (b) : BF_3 has vacant orbital in which it can accept a lone pair of electrons or Pie electron. Hence, it act as a Lewis acid. Thus, it has least tendency to act as Lewis base.
On the other hand CO, F^-, PF_3 can either donate a lone pair of electron or Pi electron. Hence, they act as Lewis base.

276. What is the correct increasing order of Bronsted bases ?

(a) $ClO_4^- < ClO_3^- < ClO_2^- < ClO^-$

(b) $ClO_4^- > ClO_3^- > ClO_2^- > ClO^-$

(c) $ClO_3^- < ClO_4^- < ClO_2^- < ClO^-$

(d) $ClO^- > ClO_3^- > ClO_2^- < ClO_4^-$

BITSAT-2015

Ans. (a) : With the Increase in the number of oxygen atom, the extent of delocalization of negative charge by $p\pi$-$d\pi$ bonding increases.
This stabilizes the ion and decreases the tendency to accept a proton. This decreases the basicity,
So, correct increasing order of bronsted base strength is.

$ClO_4^- < ClO_3^- < ClO_2^- < ClO^-$

277. Which of the following can act as both Bronsted acid and Bronsted base?

(a) Na_2CO_3 (b) OH^-
(c) HCO_3^- (d) NH_3

BITSAT-2017

Ans. (c) :

$HCO_3^- + H^+ \rightleftharpoons H_2CO_3$ (Bronsted base)

$HCO_3^- \rightleftharpoons H^+ + CO_3^-$ (Bronsted acid)

278. Which compound gives saccharin acid when it reacts with conc. HNO_3?

(a) Sucrose (b) Starch
(c) Maltose (d) Glucose

CG PET-2019

Ans. (d) : Glucose and Gluconic acid on oxidation with nitric acid give saccharin acid.

279. Which element from group 15 gives most basic compound with hydrogen?

(a) Nitrogen (b) Bismuth
(c) Arsenic (d) Phosphorus

CG PET-2007

Ans. (a) : Basic character of group 15 hydrides decreases down the group.
Thus, NH_3 is most basic and Bismuth is least basic. order of basic strength is-
$NH_3 > PH_3 > As > Bi$

280. The acid present in vinegar is

(a) CH_3COOH (b) H_2SO_4
(c) HCl (d) HNO_3

CG PET-2004

Ans. (a) : Vinegar is a liquid consisting mainly of acetic acid (CH_3COOH) and water. The acetic acid is produced by the fermentation of ethanol by acetic acid bacteria.
Vinegar is now mainly used as a cooking ingredient.

281. Strongest Bronsted base among the following anions is

(a) ClO^- (b) ClO_2^-
(c) ClO_3^- (d) ClO_4^-

CG PET-2006, 2004

Ans. (a) : Strongest acid among $HClO_4$, $HClO_3$, $HClO_2$ and HClO is $HClO_4$ (due to greater no. of attached O^- atoms) and weakest is HClO. But the corresponding conjugate base of HClO i.e. ClO^- is the strongest Bronsted base.

282. The pH of water decreases with?

(a) Increase in temperature
(b) Increase in pressure
(c) Decrease in temperature
(d) Decrease in pressure

CG PET-2005

Ans. (a) : An Increase in temperature increases K_w and a decreases in temperature decreases K_w.
The neutral pH point depends on the K_w of water where both H and OH ion are equal in number. Hence, pH of water decreases with increase in temperature.

283. The aqueous solution of which one of the following is basic?

(a) HOCl (b) $NaHSO_4$
(c) NH_4NO_3 (d) NaOCl

CG PET-2005

Ans. (d) : The mixture of strong base and weak acid is basic solution.
Hence, NaOCl is a mixture of strong base and weak acid.
So, aqueous solution is basic.

284. The weakest acid among the following is

(a) CH_3COOH (b) $CH_2ClCOOH$
(c) $CHCl_2COOH$ (d) CCl_3COOH

CG PET-2010

Ans. (a) : Among the following acetic acid (CH_3COOH) is the weakest acid.

285. Which of the following ligand is ambidentate ?

$\underset{(P)}{NO_3^-}, \underset{(Q)}{NO_2^-}, \underset{(R)}{CN^-}, \underset{(S)}{SCN^-}$

(a) R and S (b) P and Q
(c) Q and S (d) Q and R

GUJCET-2022

Ans. (a): Ligands which can bind through two different atom present in it are called ambidentate ligands.

@apna_pdf

There are certain ligands which have two or more donor atom but during formation of complexes only one donar atom is attached to metal ion such ligands are called ambidentate ligands.
Such as CN^-, SCN^-, NO_2^-

286. Which of the following salts is the most basic in aqueous solution?
(a) $Al(CN)_3$ (b) CH_3COOK
(c) $FeCl_3$ (d) $Pb(CH_3COO)_2$
JEE Main-2018

Ans. (b) : Basic salt are salts that are product of the neutralization of a strong base and a weak acid.
CH_3COOK is the most basic in aqueous solution since it form strong base (KOH) and weak acid (CH_3COOH).

287. Which of the following are Lewis acids?
(a) PH_3 and BCl_3 (b) $AlCl_3$ and $SiCl_4$
(c) PH_3 and $SiCl_4$ (d) BCl_3 and $AlCl_3$
JEE Main 2018

Ans. (d) : BCl_3 and $AlCl_3$ are Lewis acid because Lewis acids are defined as electron deficient compounds which have the ability to accept at least one lone pair.

288. Three reactions involving $H_2PO_4^{2-}$ are given below

I. $H_3PO_4 + H_2O \rightarrow H_3O^+ + H_2PO_4^{2-}$

II. $H_2PO_4^{2-} + H_2O \rightarrow HPO_4^{2-} + H_3O^+$

III. $H_2PO_4^{2-} + OH^- \rightarrow H_3PO_4 + O^{2-}$

In which of the above does $H_2PO_4^{2-}$ act as an acid?
(a) II only (b) I and II
(c) III only (d) I only
[AIEEE-2010]

Ans. (a) : $H_2PO_4^- + H_2O \rightarrow HPO_4^{2-} + H_3O^+$
Only this reaction $H_2PO_4^-$ give H^+ to H_2O thus In this reaction $H_2PO_4^-$ behave as an acid.

289. Four species are listed below

I. HCO_3^- **II. H_3O^+**

III. HSO_4^- **IV. HSO_3F**

Which one of the following is the correct sequence of their acid strength?
(a) IV < II < III < I (b) II < III < I < IV
(c) I < III < II < IV (d) III < I < IV < II
[AIEEE-2008]

Ans. (c) : $HCO_3^- < HSO_4^- < H_3O^+ < HSO_3F$
HSO_3F is super acid and it is most acidic.
H_3O^+ is more acidic than anions because anions (HCO_3^-, HSO_4^-) do not release H^+ ion easily. HSO_4^- is more acidic than HCO_3^- because sulpher is more electronegative than carbon.

290. What is the conjugate base of OH^-?
(a) O^{2-} (b) O^-
(c) H_2O (d) O_2
[AIEEE-2005]

Ans. (c) : When acid give H^+ then the remaining of its part is called conjugate base.
So, if we remove H^+ from OH^-, we get O^{2-}. Hence, O^{2-} is the conjugate base of OH^-
OH^- is also a conjugate base of H_2O.

291. The conjugate base of $H_2PO_4^-$ is
(a) PO_4^{3-} (b) P_2O_5
(c) H_3PO_4 (d) HPO_4^{2-}
[AIEEE-2003]

Ans. (d) : We know that conjugate base of an acid, any acid is defined as the acid less of proton.
The conjugate acid of a base, any base is defined as the base plus a proton.
Now,
Acid + Base = Conjugate acid + Conjugate base
Acid donates hydrogen ions and the base is an acceptor of protons.
The reaction of hydrogen phosphate ion with a proton to form its conugate acid is given below–

$$HPO_4^{2-} + H^+ \rightarrow H_2PO_4^-$$

Hence, the conjugate acid that is formed is $H_2PO_4^-$, which is dihydrogen phosphate ion.

292. The increasing order of pK_a values for the following carboxylic acids is
(1) Acetic acid **(2) Formic acid**
(3) Benzoic acid **(4) Trichloroacetic acid**
(a) (4) < (2) < (3) < (1) (b) (3) < (1) < (2) < (4)
(c) (2) < (4) < (3) < (1) (d) (3) < (1) < (4) < (2)
J & K CET-(2016)

Ans. (a) : Acidic strength $\propto K_a \propto \dfrac{1}{pK_a}$
The order of acidic strength is– Thirchloracetic acid > Formic acid > Benzoic acid > Acetic acid.
Hence, the increasing order of pKa values is:- Trichloroacetic acid < Formic acid < Benzoic acid < Acetic acid.

293. Which of the following can behave as amphoteric oxide?
(a) Al_2Cl_6 (b) Na_2O
(c) SO_2 (d) Al_2O_3
J & K CET-(2001)

Ans. (d) : Those metal oxides which show basic, as well as acidic behaviour are known as amphoteric oxides. Al_2O_3 is an amphoteric oxide.

294. Which of the following is a Lewis acid?
(a) BF_4^- (b) OH^-
(c) $AlCl_3$ (d) RNH_2
J & K CET-(2013)

Ans. (c) : Lewis acid as a species which accepts electron pair and base which denote an electron pair. In Lewis concept many acid do not have proton.
Electron deficient species can act as Lewis acid.
$AlCl_3$ is e- deficient species. Hence, it is a Lewis acid.

295. Among the following, the one which can act as both Bronsted acid as well as Bronsted base is
(a) H_3PO_4 (b) $AlCl_3$
(c) CH_3COO^- (d) H_2O
J & K CET-(2011)

Ans. (d) : H_2O can behave as both Bronsted acid as well as Bronsted Base.

$$\underset{\text{acid}}{H_2O} + \underset{\text{base}}{H_2O} \rightleftharpoons H_3O^+ + OH^-$$

@apna_pdf

296. Identify the substance whose 0.1 M solution is basic?

(a) Ammonium chloride (b) ammonium acetate
(c) Ammonium sulphate (d) Sodium acetate

J & K CET-(2010)

Ans. (d) : Sodium acetate is a salt of weak acid and strong base. Acetate ion on hydrolysis releases hydroxyl ions to form a basic solution.

In Ammonium acetate, both ammonium and acetate, ions hydrolyse to form ammonium hydroxide and acetic acid such that the solution is neutral in nature.

Ammonium chloride and ammonium sulphate are salt of weak base and strong acid. Ammonium ion hydrolyse to release hydrogen ion making the solution acidic

297. According to Lowry and Bronsted, the strength of an acid depends upon

(a) The dendency to gain protons
(b) The tendency to donate protons
(c) The tendency to accept electrons
(d) The tendency to donate electrons

J & K CET-(2007)

Ans. (b) : Acids are proton donors the strength of an acid will depend upon its ability to donate proton.

298. Which of the following in not a Lewis acid?

(a) BF_3 (b) $AlCl_3$
(c) HCl (d) $LiAlH_4$

J & K CET-(2005)

Ans. (c) : Hydrochloric acid (HCl) cannot be classified as a Lewis acid since it cannot accept an electron pair. However this compound dissociates into its constituents ions, liberating H^+ ion.

299. Which of the following is the strongest Lewis acid?

(a) BF_3 (b) BCl_3
(c) BBr_3 (d) BI_3

J & K CET-(2002)

Ans. (d) : The tendency of the halogen atom to back donate its electron to the boron atom and makes it less electron deficient. Hence, the relative strength of Lewis acids of boron trihalide

Increases in order $BF_3 < BCl_3 < BBr_3 < BI_3$.

Thus, BI_3 is strongest Lewis acid.

300. Which of the following is a Lewis base?

(a) CH_4 (b) $AlCl_3$
(c) Al $(OH)_3$ (d) NH_3

J & K CET-(2002)

Ans. (d) : Ammonia consist of a nitrogen atom as the control atom with a lone pair of electron the lone pair on the nitrogen atom is transferred to the hydrogen ion making the NH_3 a Lewis base.

301. The conjugate acid of NH_2^- is

(a) NH_4^+ (b) NH_3
(c) NH_2OH (d) N_2H_4

J & K CET-(1999)

Ans. (b) : The species formed after adding a proton to the base is known as conjugate acid of the base and the species formed after losing a proton is known as conjugate base of acid. The conjugate acid of amide ion (NH_2^-) is ammonia, NH_3.

$$\underset{\text{Base}}{NH_2^-} + H^+ \rightarrow \underset{\text{Conjugate acid}}{NH_3}$$

302. Mohr's salt is:

(a) $Na_2SO_4.Al_2\ (SO_4).24H_2O$
(b) $CuSO_4.Al_2\ (SO_4)_3.24H_2O$
(c) $FeSO_4.(NH_4)_2SO_4.6H_2O$
(d) $K_2SO_4.\ Fe_2(SO_4)_3.24H_2O$

JCECE - 2004

Ans. (c) : Mohr's salt also referred to as ammonium iron(II) sulfate, is an inorganic compound whose chemical formula is represented as

$$FeSO_4.(NH_4)_2SO_4.6H_2O$$

303. Which one of the following compounds, is not a protonic acid?

(a) $SO(OH)_2$ (b) $SO_2(OH)_2$
(c) $B(OH)_3$ (d) $PO(OH)_3$

JCECE - 2008

Ans. (c) : The acid which gives H^+ when placed in aqueous solution is called protonic acid.

Ortho boric acid does not donate proton like most of the acids but rather it accepts OH^- therefore it is a Lewis acid. $B(OH)_3$ in water gives H^+ ions as follows–

$$B(OH)_3 + 2H_2O \rightleftharpoons H_3O+ + [B(OH)_4]^-$$

$B(OH)_3$ is not a protonic acid because it does not give its hydrogen H^+ ions.

304. The strongest Bronsted base is

(a) ClO_3^- (b) ClO_2^-
(c) ClO_4^- (d) ClO^-

UPTU/UPSEE-2014
JCECE - 2010

Ans. (d) : Strongest Bronsted base is that which has weakest conjugate acid.

Base	**Conjugate acid (base + H^+)**
ClO^-	HClO
ClO_2^-	$HClO_2$
ClO_3^-	$HClO_3$
ClO_4^-	$HClO_4$

Order of basic strength–

$$ClO_4^- < ClO_3^- < ClO_2^- < ClO^-$$

$\therefore$ ClO^- is strongest Bronsted base.

305. Which of the following is not a Lewis base?

(a) CN^- (b) ROH
(c) NH_3 (d) $AlCl_3$

JCECE - 2011

Ans. (d) : Lewis base are the species which have a tendency to donate electrons. These contain either lone pair or negative charge.

$AlCl_3$ being electron deficient behaves as Lewis acid, not as Lewis base.

306. Which of the following salt when dissolved in water gets hydrolysed?

(a) NaCl (b) NH_4Cl
(c) KCl (d) Na_2SO_4

JCECE - 2011

@apna_pdf

Ans. (b) : Only salts of strong acid and strong base are not hydrolysed. All other salts can generally hydrolysed. NH_4Cl is a salt of weak base and strong acid, so it will hydrolyse in water.

$$NH_4Cl \xrightarrow{H_2O} \underset{\text{weak base}}{NH_4OH} + \underset{\text{strong acid}}{HCl}$$

307. Conjugate base of hydrazoic acid is

(a) HN_3^- (b) N_2^-

(c) N_3^- (d) N^{3-}

JCECE - 2011

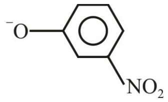
Ans. (c) : Hydrazoic acid is N_3H.

$$\underset{\text{Hydrazoic acid}}{N_3H} \longrightarrow H^+ + \underset{\text{Conjugate base}}{N_3^-}$$

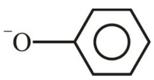
308. Which of the following species can act as the strongest base?

(a) OH^- (b) OR^-

(c)



(d)



JCECE - 2013

Ans. (b) : Weakest acid has the strongest conjugate base. Since, ROH is the weakest acid, therefore RO^- is the strongest base.

309. Species acting both as Bronsted acid and base is

(a) HSO_4^- (b) Na_2CO_3

(c) NH_3 (d) OH^-

JCECE - 2014

Ans. (a) : HSO_4^- can accept proton to form H_2SO_4 and also give a proton to form SO_4^{2-} therefore, it acts both as Bronsted acid as well as base.

$$HSO_4^- + H^+ \rightarrow H_2SO_4$$
$$HSO_4^- \rightarrow H^+ + SO_4^{2-}$$

310. Which of the following is least likely to behave as Lewis base?

(a) NH_3 (b) BF_3

(c) OH^- (d) H_2O

JIPMER-2014

Ans. (b) : Boron trifluoride BF_3 is least likely to behave as Lewis base. Electron rich species are called Lewis base. Among the given BF_3 is an electron deficient species. So have a capacity of electron accepting instead of donating. That's why it is least likely to act as a Lewis base. It is a Lewis acid.

311. The conjugate base of NH_3 is

(a) NH_4^+ (b) NH_4OH

(c) NH_2OH (d) NH_2^-

Karnataka-CET-2020

Ans. (d) : NH_3 can donate a proton & act as an acid,

$$NH_3 \longrightarrow NH_2^- + H^+$$

NH_2^- is the conjugate base of NH_3

312. Which of the following is the strongest base?

(a) CH_3COO^- (b) Cl^-

(c) OH^- (d) CH_3O^-

Karnataka-CET-2020

Ans. (d) : To check the basicity of an ion, the conjugate acid must be weak, the conjugate acid are given below. H_2O, CH_3OH, CH_3COOH and HCl.

We know that methanol is a stronger acid than water, weaker the acid. Stronger is the conjugate base, by the logic OH^- is the stronger base among the given option.

313. Acidity of BF_3 can be explained on which of the following concepts?

(a) Arrhenius concept

(b) Bronsted Lowry concept

(c) Lewis concept

(d) Bronsted Lowry as well as Lewis concept

Karnataka-CET-2018

Ans. (c) : The Lewis theory of acid defines acidic substances to be compounds or ions that have law electron density and look for loan pair supplier. Therefore boron trifluoride (BF_3) is an acid according to Lewis acid theory.

314. Identify a species which is not a Bronsted acid but a Lewis acid.

(a) BF_3 (b) H_3^+O

(c) NH_3 (d) HCl

Karnataka-CET-2013

Ans. (a) : Lewis acid are the acid which accept lone pairs. Bronsted defined an acid as a substance, which has a tendency to give a proton (H^+), on the other hand Lewis proposed an acid as a substance, which is capable of accepting a pair of electrons. As H_3O^+, NH_3 and HCl has H^+ ions, these are Bronsted acid whereas BF_3 is an electron deficient molecule, thus behave like a Lewis acid i.e. electron pair acceptor.

315. The vapour pressure of pure liquids A and B are 450 and 700 mm of Hg at 350 K respectively. If the total vapour pressure of the mixture is 600 mm of Hg, the composition of the mixture in the solution is

(a) $\chi_A = 0.4$ $\chi_B = 0.6$ (b) $\chi_A = 0.6$ $\chi_B = 0.4$

(c) $\chi_A = 0.3$ $\chi_B = 0.7$ (d) $\chi_A = 0.7$ $\chi_B = 0.3$

Karnataka-CET-2021

Ans. (c) : $P_A^\circ = 450mm, P_B^\circ = 700mm, P_{total} = 600mm$

As $P_{total} = P_A + P_B$

$= x_A P_A^\circ + x_B P_B^\circ$ (from raoult's law)

$= x_A P_A^\circ + (1 - x_A) P_B^\circ$

$= P_B^\circ + (P_A^\circ - P_B^\circ) x_A$

$\Rightarrow 600 = 700 + (450 - 700) x_A$

or $x_A = 0.40$

$\therefore x_B = 1 - x_A = 1 - 0.40 = 0.60$

$\therefore P_A = x_A P_A^\circ = 0.40 \times 450 = 180mm$

$\therefore P_B = x_B P_B^\circ = 0.60 \times 700 = 420mm$

$\therefore$ Mole fraction of A in vapoure phase

$$= \frac{P_A}{P_A + P_B} = \frac{180}{180 + 420} = 0.30$$

and, mole fraction of B in vapour phase

$= 1 - 0.30 = 0.70$

316. When conc. H_2SO_4 is heated with P_2O_5, the acid is converted into

(a) sulphur trioxide (b) sulphur dioxide

(c) sulphur

(d) a mixture of sulphur dioxide and sulphur trioxide

Karnataka-CET-2007

@apna_pdf

Ans. (a) : When conc. H_2SO_4 is heated with P_2O_5, the acid is converted into sulphur trioxide.

$$2H_2SO_4 + 2P_2O_5 \longrightarrow \underset{\text{Sulphur trioxide}}{2SO_3} + 4HPO_3$$

317. K_a values for acids H_2SO_3, HNO_2, CH_3COOH and HCN are respectively 1.3×10^{-2}, 4×10^{-4}, 1.8×10^{-5} and 4×10^{-10}, which of the above acids produces stronger conjugate base in aqueous solution ?

(a) HSO_3 (b) HNO_2

(c) CH_3COOH (d) HCN

Kerala-CEE-29.08.2021

Karnataka-CET-2021

Ans. (d) : The given values are :

Acid	K_a values
H_2SO_3	1.3×10^{-2}
HNO_2	4×10^{-4}
CH_3COOH	1.8×10^{-5}
HCN	4×10^{-10}

The species which has lower value of dissociation constant (K_a), having the least acidic behaviour. As we know, the conjugate base of weak acid has strongest conjugate basic character. Hence, the correct option is (d).

318. Which one of the following oxides is amphoteric?

(a) MgO (b) CaO

(c) Na_2O (d) CO_2

(e) ZnO

Kerala-CEE-2004

Ans. (e) : ZnO is a amphoteric oxide because it can act with acid as well as base.

$ZnO + 2NaOH \rightarrow Na_2ZnO_2 + H_2O$

$ZnO + HCl \rightarrow ZnCl_2 + H_2O$

319. Choose the weak monobasic acid, among the following

(a) H_3BO_3 (b) H_3PO_3

(c) H_3PO_4 (d) HNO_3

(e) $H_4P_2O_7$

Kerala-CEE-2012

Ans. (a) : H_3BO_3 is a weak Lewis monobasic acid because it can only accept a pair of electron. None of its hydrogen are ionisable.

H_3PO_3 is a dibasic acid, H_3PO_4 is a tribasic acid,

HNO_3 is a strong monobasic acid, $H_4P_2O_7$ is tetrabasic acid.

320. Which one of the following is the correct statement?

(a) HCO_3^- is the conjugate base of CO_3^{2-}

(b) NH_2^- is the conjugate base of NH_3

(c) H_2SO_4 is the conjugate base of HSO_4^-

(d) NH_3 is the conjugate base of NH_2^-

(e) H_2CO_3 is the conjugate base of HCO_3^-

Kerala-CEE-2012

Ans. (c) : Acid when loses a proton (H^+) gives its conjugate base and base when accepts a proton (H^+) gives conjugate acid.

(a) $\underset{\text{Base}}{CO_3^{2-}} + H^+ \rightarrow \underset{\text{Conjugate acid}}{HCO_3^-}$

(b) $\underset{\text{Base}}{NH_3} \rightarrow \underset{\text{Conjugate acid}}{NH_2^-} + H^+$

(c) $\underset{\text{Base}}{HSO_4^-} + H^+ \rightarrow \underset{\text{Conjugate acid}}{H_2SO_4}$

(d) $\underset{\text{Base}}{NH_2^-} + H^+ \rightarrow \underset{\text{Conjugate acid}}{NH_3}$

(e) $\underset{\text{Base}}{HCO_3^-} + H^+ \rightarrow \underset{\text{Conjugate acid}}{H_2CO_3}$

Hence, H_2SO_4 is the conjugate base of HSO_4^-.

321. Which one of the following is an amphoteric oxide?

(a) Mn_2O_7 (b) CrO

(c) V_2O_4 (d) Cr_2O_3

(e) V_2O_3

Kerala-CEE-2012

Ans. (d) : Cr_2O_3 (Chromic oxide) is an amphoteric oxide.

It has the ability to dissolve in acids. Liberating hydrated chromium ions in the process they hydrated Cr ions can react with base to form complex salt. Cr_3O_3 can show the property of acidic as well as basic oxide both.

322. Hard acids prefer to combine with

(a) Soft bases (b) Soft acids

(c) Hard acids (d) Hard bases

(e) Salts

Kerala-CEE-2019

Ans. (d) : Hard bases contain small, relatively nonpolarisable donor atoms (such as N, O and F).

Hard acids prefer to combine with hard bases.

Hard acids are the cations (electron accepting atom) having high charge and small sizes whereas hard bases are the Lewis bases where the electron are not easily polarised or where the base holds its electron strongly.

323. In hydrolysis of a salt of weak acid and strong base, $A^- + H_2O \rightleftharpoons HA^- + OH^-$, the hydrolysis constant (K_h) is equal to :

(a) $\dfrac{K_w}{K_a}$ (b) $\dfrac{K_w}{K_b}$

(c) $\sqrt{\dfrac{K_a}{C}}$ (d) $\dfrac{K_w}{K_a \times K_b}$

Manipal-2019

Ans. (a) : $A^- + H_2O \rightleftharpoons HA^- + OH^-$

$$K_h = \frac{[HA^-][OH^-]}{[A^-]} \qquad K_w = [H^+][OH^-]$$

$$HA \rightleftharpoons H^+ + A^-$$

$$K_a = \frac{[H^+][A^-]}{[HA]}$$

Also we know that,

$$\frac{K_w}{K_a} = \frac{[H^+][OH^-][HA]}{[H^+][A^-]}$$

@apna_pdf

$$\frac{K_w}{K_a} = \frac{[OH^-][HA]}{[A^-]}$$

$$\frac{K_w}{K_a} = K_h$$

324. The conjugate base of the acid H_2S is :

(a) HS^- (b) S^{2-}
(c) S (d) None of these

Manipal-2017

Ans. (a) : Conjugate base of H_2S is HS^-

When hydrogen sulfide (H_2S) denote a proton. The compound left behind will be the disulfide anion, HS its conjugate base.

$$\underset{\text{acid}}{H_2S} + H_2O \rightleftharpoons \underset{\substack{\text{conjugate}\\\text{base}}}{HS^-} + H_3O^+$$

325. Identify the element that forms amphoteric oxide.

(a) Carbon (b) Zinc
(c) Calcium (d) Sulphur

MHT CET-2018

Ans. (b) : The oxides which can react with both acid and base to give a salt are called amphoteric oxides. Oxides of carbon and sulphur are acidic and the oxide of calcium is basic. Zinc forms an amphoteric oxide. They show characteristics of both acidic as well as basic oxides.

Following reactions are given by ZnO –

$$ZnO + 2HCl \rightarrow ZnCl_2 + H_2O$$

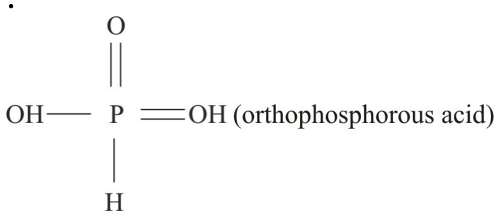
$$ZnO + 2NaOH \rightarrow Na_2ZnO_2 + H_2O$$

326. What is the basicity of orthophosphorous acid?

(a) One (b) Two
(c) Three (d) Four

MHT CET-2015

Ans. (b) :



$$OH-\overset{\overset{O}{||}}{\underset{\underset{H}{|}}{P}}=OH \text{ (orthophosphorous acid)}$$

The number of H atom bonded to the oxygen atoms in the above compound is equal to 2. Therefore the basicity of the orthophosphorous acid is 2.

327. The product of molar concentrations of hydrogen ions and hydroxide ions in a 0.01 M aqueous solution of sodium chloride is known as

(a) Hydrolysis constant of salt
(b) Dissociation constant of acid
(c) Dissociation constant of base
(d) Ionic product of water

MHT CET-2014

Ans. (d) : Sodium chloride is a salt of strong base NaOH and strong acid HCl. In its aqueous solution. Following equilibrium is observed.

$$NaCl + H_2O \rightleftharpoons Na^+ + Cl^- + H_2O$$

Hence, no hydrolysis takes place in this case, and the solution remains neutral.

Thus, here the product of molar concentrations of hydrogen ions and hydroxide ion is ionic product of water. Water is weak electrolyte and undergoes selfionstions to a small extent. The product of concentrations of H^+ and OH^- ions in water at a particular temperature is known as ionic product of water.

328. Which of the following is a weak acid?

(a) C_6H_6 (b) CH_3COOH
(c) $CH_2 = CH_2$ (d) CH_3COCH_3

MHT CET-2012

Ans. (b) : CH_3COOH is a weak acid because acetic acid is not a strong enough proton donor to be entirely converted to hydronium ions in aqueous solution. Therefore the nature of CH_3COO^- is basic, and we call CH_3COO^- the conjugate base of CH_3COOH. It is in equilibrium with its ions in water and its conjugate (CH_3COO^-, a weak base) is also in equilibrium in water.

So, it is called a weak acid.

329. The conjugate acid of HS^- is

(a) S^{2-} (b) H_2S
(c) Both (a) and (b) (d) None of these

MHT CET-2012

Ans. (b) : Conjugate acid of HS is H_2S

$HS^- + H^+ \rightarrow H_2S$ (Conjugate acid)

$HS^- \rightarrow S^{2-} + H^+$ (Conjugate acid)

330. Which of the following salts will not undergo hydrolysis?

(a) NH_4Cl (b) KCN
(c) KNO_3 (d) Na_2CO_3

MHT CET-2011

Ans. (c) : Salt of strong acid and strong base is not undergo hydrolysis.

Potassium nitrate (KNO_3) is a salt of strong base and strong acid hence, It is not hydrolysis.

331. Solutions in test tubes containing H_2O and aqueous NaOH can be differentiated with the help of:

(a) red litmus (b) blue litmus
(c) Na_2CO_3 (d) HCl (aqueous)

NDA (I)-2011

Ans. : (a) Solutions in test tubes containing H_2O and aqueous NaOH can be differentiated with the help of red litmus.

332. When concentrated H_2SO_4 splits of the surface, it should be immediately cleaned:

(a) with a piece of cloth.
(b) by adding cold water.
(c) by adding solid Na_2CO_3.
(d) by adding solid $BaCl_2$

NDA (I)-2011

Ans. : (c) When concentrated H_2SO_4 splits of the surface, it should be cleaned by adding solid Na_2CO_3.

333. A bee-sting leaves an acid which causes pain and irritation. The injected acid is:

(a) acetic acid (b) sulphuric acid
(c) citric acid (d) methanoic acid

NDA (I)-2011

@apna_pdf

Ans. : (d) Bee-sting leaves contains methanoic acid that cause pain and irritation.

- **Methanoic acid:–** It is utilized to deliver insect sprays and for colouring, tanning, and electroplating. It happens normally in different sources.

334. NH_4Cl is acidic due to

(a) Cationic hydrolysis (b) Anionic hydrolysis
(c) Its ionic nature (d) pH > 7

MHT CET-2010

Ans. (a) : NH_4Cl is a salt of strong acid HCl and weak base NH_4OH.

Hydrolysis:-

$$NH_4Cl + H_2O \rightleftharpoons NH_4OH + HCl$$

$$NH_4^+ + Cl^- + H_2O \rightleftharpoons NH_4OH + H^+ + Cl^-$$

$$NH_4^+(aq) + H_2O(l) \rightleftharpoons NH_4OH(aq) + H^+(aq)$$

Only the cation will undergo hydrolysis and the solution will be acidic in nature due to H^+ formation. So here the cation is responsible for the acidic nature of the solution.

335. Conjugate acid-base pair differ by

(a) Electron (b) Proton
(c) Neutron (d) Hydroxyl group

MHT CET-2010

Ans. (b) : Conjugate acid-base pair contains two compounds that differ only by a hydrogen ion H^+ (proton) and a charge of +1.

Acid – $H^+ \rightarrow$ conjugate base
Base + $H^+ \rightarrow$ conjugate acid

336. Reaction for the formation of NaCl is

(a) $Na(g) + Cl_2(g) \longrightarrow NaCl(s)$

(b) $Na(s) + \frac{1}{2}Cl_2(g) \longrightarrow NaCl(s)$

(c) $Na(g) + \frac{1}{2}Cl(g) \longrightarrow NaCl(s)$

(d) $Na(g) + Cl_2(g) \longrightarrow NaCl(g)$

MHT CET-2010

Ans. (b) : In the Born-Haber cycle given reaction for the formation of NaCl is:-

$$Na(s) + \frac{1}{2}Cl_2(g) \longrightarrow NaCl(s)$$

337. If 20 mL of an acidic solution of pH=3 is diluted to 100 mL, the H^+ ion concentration will be

(a) 1×10^{-3} M (b) 2×10^{-3} M
(c) 2×10^{-4} M (d) 0.02×10^{-4} M

MHT CET-2009

Ans. (c) : Given that –

pH = 3
V_1 = 20ml V_2 = 100ml
H^+ = ?
$H^+ = 1 \times 10^{-3}$ m $= 1 \times 10^{-3}$N
$N_1 V_1 = N_2 V_2$
$1 \times 10^{-3} \times 20 = N_2 \times 100$
$N_2 = 2 \times 10^{-4}$
$[H^+] = 2 \times 10^{-4}$M

338. Which of the following is the weakest base?

(a) Ethyl amine (b) Ammonia
(c) Dimethyl amine (d) Methyl amine

MHT CET-2008

Ans. (b) : NH_3 (Ammonia) is a weakest base because the ammonia's nitrogen atom has an electron pair that easily accepts a proton.
Hence, basic nature is Increased.
In Ammonia no Alkyl group is present. So it is least basic.

339. Which one of the following species acts as both Bronsted acid and base?

(a) $H_2PO_2^-$ (b) HPO_3^{2-}
(c) HPO_4^{2-} (d) All of these

UPTU/UPSEE-2015
MHT CET-2008

Ans. (c) : HPO_4^{2-} act as both Bronsted acid and bronsted base.

$$HPO_4^{2-} + H_2O \rightleftharpoons H_2PO_4^- + OH^-$$

$$HPO_4^{2-} + H_2O \rightleftharpoons PO_4^{3-} + H_3O^+$$

$H_2PO_2^-$ is conjugate base of H_3PO_2 (a monobasic acid) and does not give H^+.

HPO_3^{2-} is a conjugate base of $H_2PO_3^-$ and does not ionize further.

H_3PO_3 is a dibasic acid.

340. Lemon gives sour taste because of

(a) Citric acid (b) Tartaric acid
(c) Oxalic acid (d) Acetic acid

MHT CET-2007

Ans. (a): Lemon comes under the category of citrus fruit. Lemon is sour in teste. It is rich in citric acid which makes it sour.

Tartaric acid –It is a white, crystalline organic acid that occurs naturally in many fruits such as grapes.

Oxalic acid – It is the simplest dicarboxlic acid.

Acetic acid – Acetic acid is the second simplest carboxlic acid vinegar is no less than 4% acetic acid by volume, making acetic acid the main component of vinegar apart from water.

341. Which of the following is an amphoteric oxide?

(a) SO_3 (b) Mg
(c) Al_2O_3 (d) P_4O_{10}

MHT CET-2007

Ans. (c):

Amphoteric

- These are the oxides that can react with both acids and as well as bases to form salt and water.
- These possess both acidic and basic properties.
- Al_2O_3, SiO_2 is an example of Amphoteric oxide
- $Al_2O_3 + 2NaOH$ (Base) $\rightarrow 2NaAlO_2 + H_2O$
- $Al_2O_3 + 6HCl$ (acid) $\rightarrow 2AlCl_3 + 3H_2O$

342. The hydrolysis of sodium carbonate involves the reaction between

(a) Sodium ion and water (b) Na^+ and OH^-
(c) CO_3^{2-} and water (d) CO_3^{2-} and H^+

MHT CET-2007

@apna_pdf

Ans. (c) : Reactions of hydrolysis would be the opposite of condensation reaction in which two molecules bind together into a larger one an expel a molecule of water. Hydrolysis thus requires water to breakdown, while condensation occurs by eliminating water and all the other solvents. Any reactions to the hydration are hydrolysis. Now, we will write the reaction of hydrolysis of sodium carbonate–

$$Na_2CO_3 + 2H_2O \rightleftharpoons 2NaOH + H_2CO_3$$

or $$2Na^+ + CO_3^{2-} + 2H_2O \rightleftharpoons 2Na^+ + 2OH^- + H_2CO_3$$

It is anionic is alkaline in nature due to hydrolysis.

343. 0.1 M solution of which one of these substances will act basic ?

(a) Sodium borate (b) Ammonium chloride
(c) Calcium nitrate (d) Sodium sulphate

NEET-1992

Ans. (a) : Salt formed strong base and weak acid act as basic. Sodium borate is a salt formed from strong base (NaOH) and weak acid (H_3PO_3) Hence, sodium borate will act basic.

344. Conjugate base for Bronsted acids H_2O and HF are

(a) H_3O^+ and H_2F^+, respectively
(b) OH^- and H_2F^+, respectively
(c) H_3O^+ and F^-, respectively
(d) OH^- and F^-, respectively

NEET-2019

Ans. (d) : Bronsted acid- Conjugate base

$$H_2O \rightarrow OH^- + H^+$$
$$HF \rightarrow F^- + H^+$$

Hence, OH^- and F^- are conjugate base of Bronsted acid (H_2O) and HF.

345. Which of the following cannot act both as Bronsted acid and as Bronsted base ?

(a) HCO_3^- (b) NH_3
(c) HCl (d) HSO_4^-

Odisha NEET-2019

Ans. (c) : HCl cannot act both as bronsted acid and Bronsted base because HCl can only donate proton. HCl cannot accept H^+ therefore cannot act as Bronsted base.

346. Which of the following fluoro-compound is most likely to behave as a Lewis base ?

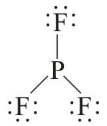
(a) BF_3 (b) PF_3
(c) CF_4 (d) SiF_4

NEET-II 2016

Ans. (b) : Lewis base is substance which contains lone pair on central atom.

Phosphorus is a group VA element so it has 5 valence electron. Fluorine is a group VII A element so it has 7 valence electrons.

So, total valence electrons = 5 + 7 (3)
= 5 + 21 = 26



As there is a lone pair on the central phosphorus atom. So PF_3 tends to donate its lone pair of electrons and behave as Lewis base.

347. Which of these is least likely to act as Lewis base?

(a) BF_3 (b) PF_3
(c) CO (d) F^-

NEET-2016

Ans. (a) : BF_3 has vacant orbital in which it can accent a lone pair of electron or π-electron. Hence, it act as a Lewis acid. BF_3 is an electron deficient species, so have a capacity of electron accepting instead of donating, it has least tendency to act as a Lewis base.

CO, F^- and PF_3 can either donate a lone pair of electron or π-electron. Hence they act as Lewis base.

348. Which of the strongest acid in the following ?

(a) $HClO_4$ (b) H_2SO_3
(c) H_2SO_4 (d) $HClO_3$

NEET-2013

Ans. (a) : Among the given acids, perchloric acid ($HClO_4$) is the strongest acids. This is because the conjugate base ClO_4^- ion is the weakest base.

The $HClO_4$ has the most oxygen atom so it would have to be the strongest acid.

349. Which of the following molecular hydrides acts as Lewis acid ?

(a) NH_3 (b) H_2O
(c) B_2H_6 (d) CH_4

NEET-2010

Ans. (c) : B_2H_6 is a electron deficient molecule so, it acts like an acid.

Electron deficient molecules act as Lewis acid. Among the given molecules only diborane is electron deficient it does not have complete octet. Thus it act as a Lewis acid. NH_3 and H_2O being electron rich molecules behaves as Lewis base.

350. Which of the following molecules acts as a Lewis acid ?

(a) $(CH_3)_2O$ (b) $(CH_3)_3P$
(c) $(CH_3)_3N$ (d) $(CH_3)_3B$

NEET-2009

Ans. (d) : Lewis acids are electron deficient compounds, since $(CH_3)_3$ B is electron deficient (due to incomplete octet of B). It act as a Lewis acid.

351. Which one of the following statement is not true?

(a) Among halide ions, iodide is the most powerful reducing agent
(b) Fluorine is the only halogen that does not show a variable oxidation state
(c) HOCl is a stronger acid than HOBr
(d) HF is a stronger acid than HCl

NEET-2003

Ans. (d) : Due to strong H-F bond H^+ ions are not easily removed due to higher electronegativity (E.N) of F, more bond dissociation energy required.

$$\text{acidic strength} \propto \frac{1}{\text{Bond dissocation energy}}$$

So, HF is not stronger acid than HCl.
Hence, option (d) is correct.

352. Which one of the following compounds is not a protonic acid ?

(a) $B(OH)_3$ (b) $PO(OH)_3$
(c) $SO(OH)_2$ (d) $SO_2(OH)_2$

NEET-2003

@apna_pdf

Ans. (a) : $B(OH)_3$ is not protonic acid because it does not give proton on ionisation directly. While it acts as Lewis acid due to acceptance of OH^- form water and forms a hydrated species.

$$B(OH)_3 + H_2O \rightleftharpoons [B(OH)_4]^- + H^+$$

353. In HS^-, I^-, $R–NH_2$, NH_3 order of proton accepting tendency will be

(a) $I^- > NH_3 > R–NH_2 > HS^-$
(b) $NH_3 > R–NH_2 > HS^- > I^-$
(c) $R–NH_2 > NH_3 > HS^- > I^-$
(d) $HS^- > R–NH_2 > NH_3 > I^-$

UPTU/UPSEE-2007
NEET-2000

Ans. (c) : The order of proton accepting tendency will be.

$$R\text{-}NH_2 > NH_3 > HS^- > I^-$$

Proton accepting tendency is known as strength of basicity. In $R\text{-}NH_2$ has lone pair of electron which intensify due 2 release of R group and increase the tendency to donate lone pair of electron $2H^+$.

354. Conjugate acid of NH_2^- is

(a) NH_2OH
(b) NH_4^+
(c) N_2H_4
(d) NH_3

NEET-2000

Ans. (d) : The species formed after adding a proton to the base is known as conjugate acid of the base and the species formed after losing a proton is known as conjugate base of acid So,

$$\underset{\text{(Base)}}{NH_2^-} + H^+ \rightarrow \underset{\text{(Conjugate acid)}}{NH_3}$$

355. Which compound is electron deficient ?

(a) BCl_3
(b) NH_4^+
(c) NH_2^-
(d) NH_3

COMEDK-2012, NEET-2000

Ans. (a) : In BCl_3 the central atom 'B' is sp^2 hybridised and contains only six electron in its valence shell. Therefore it is electron deficient.

356. The stronger conjugate base is

(a) SO_4^{2-}
(b) Cl^-
(c) NO_3^-
(d) CH_3COO^-

NEET-1999

Ans. (d) : $\underset{\text{weak acid}}{CH_3COOH} \rightleftharpoons \underset{\text{conjugate base}}{CH_3COO^-} + H^+$

As CH_3COOH is the weakest acid, so conjugate base (CH_3COO^-) is the strongest base.
H_2SO_4, HCl, HNO_3 are strong acid, so their conjugate base are weak.

357. Which of the following is not a Lewis acid ?

(a) SiF_4
(b) C_2H_4
(c) BF_3
(d) $FeCl_3$

NEET-1996

Ans. (b) : In BF_3 and $FeCl_3$ molecules, the central atoms have incomplete octet and in SiF_4, the central atom has empty d-orbitals. Hence according to Lewis concept these are Lewis acid. Lewis acid accept electron pair from donors. So, only C_2H_4 can not accept electron pair. Hence, it is not a Lewis acid.

358. Repeated use of which one of the following fertilizers would increase the acidity of the soil ?

(a) Ammonium sulphate
(b) Superphosphate of lime
(c) Urea
(d) Potassium nitrate

NEET-1998

Ans. (a) : Ammonium sulphate is used as an artificial fertilizer for alkaline soils. When introduced into soil, an ammonium ion is released.
It also contributes nitrogen, which aids in plant growth. It dissolves relatively slowly which makes it cheaper than some artificial fertilizer.
This creates a small amount of acid which lower the pH balance of the soil.

359. The species which acts as a Lewis but not a Bronsted acid is

(a) NH_2^-
(b) O^{2-}
(c) BF_3
(d) OH^-

UP CPMT-2014

Ans. (c) : BF_3 being electron deficient acts as a Lewis acid but it is not a Bronsted acid because of the absence of H atoms.

360. Two acids A and B have pK_a 4 and 6, then

(a) A is 4/6 times stronger than B
(b) A is 10 times stronger than B
(c) A is 6/4 times stronnger than B
(d) B is 10 times stronger than A

UP CPMT-2009

Ans. (b) $pK_a = -\log K_a$

$$\therefore \quad (pK_a)_A = -\log(K_a)_A$$

$$(K_a)_A = \text{antilog}(-4) = 10^{-4}$$

$$\text{Similarly,} (K_a)_B = \text{anti}\log(-6) = 10^{-6}$$

$$\frac{\text{Strength of A}}{\text{Strength of B}} = \sqrt{\frac{K_a}{K_b}}$$

$$= \sqrt{\frac{10^{-4}}{10^{-6}}} = 10$$

$\therefore$ Strength of A = 10 × strength of B.

361. Correct order of basic strength is

(a) $Mg(OH)_2 > NaOH > Al(OH)_3$
(b) $Mg(OH)_2 > Al(OH)_3 > NaOH$
(c) $NaOH > Mg(OH)_2 > Al(OH)_3$
(d) $Al(OH)_3 > Mg(OH)_2 > NaOH$

UP CPMT-2009

Ans. (c): Generally, basic strength of oxides/hydroxides decreases, as we move from left to right in a period of Periodic Table. Hence, alkali metal hydroxides are most basic and the order of basic strength is as

$$NaOH > Mg(OH)_2 > AI(OH)_2$$

362. Which of the following is not Lewis acid?

(a) $AlCl_3.6H_2O$
(b) $AlCl_3$
(c) $SnCl_4$
(d) $FeCl_3$

UP CPMT-2006

Ans. (a) : $AlCl_3$ is sp^2 hybridised, when it combines with H_2O molecules, one of the vacant p-orbitals and five d-orbitals are filled by electrons pairs and result of which it cannot accept more electron and so, will not act as electron acceptor of Lewis acid.

@apna_pdf

363. Cationic hydrolysis gives the following solution

(a) Acidic (b) Basic
(c) Neutral (d) Amphoteric

UP CPMT-2005

Ans. (b): $NH_4Cl \rightarrow \overset{+}{N}H4 + Cl^-$

$$\overset{+}{N}H_4 + Cl^- + H_2O \rightleftharpoons \underset{\text{Weak acid}}{NH_4OH} + \underset{\text{Strong acid}}{HCl}$$

$\overset{+}{N}H_4$ ion is a cation which react with water (H_2O) to form ammonium hydroxide (NH_4OH). Which is a basic in nature. The pH value of basic solution is greater than 7.

364. Hydrolysis of sodium acetate gives

(a) Acidic solution (b) Basic solution
(c) Amphoteric solution (d) Neutral sulution

UP CPMT-2005

Ans. (b):

$$CH_3COONa + H_2O \rightleftharpoons \underset{\text{(Weak acid)}}{CH_3COOH} + \underset{\text{(Strong acid)}}{NaOH}$$

Soldium acetate gives weak acid and strong base on hydrolysis. Therefore the aqueous solution of sodium acetate will be basic in nature.

365. Which of the following is amphoteric?

(a) V_2O_3 (b) CuO
(c) V_2O_5 (d) NiO

UPTU/UPSEE-2005

Ans. (c) : V_2O_5 is a amphoteric oxide.

366. Which of the following is not a Lewis base?

(a) NH_3 (b) H_2O
(c) $AlCl_3$ (d) None of these

UPTU/UPSEE-2005

Ans. (c) : $AlCl_3$ is a strong electrophile and has vacant orbital to accept electron lone pair. Thus it is a Lewis acid.

NH_3, H_2O have lone pair of electron and act as Lewis bases.

367. Which one of the following is called amphoteric solvent?

(a) Ammonium hydroxide (b) Chloroform
(c) Benzene (d) Water

UPTU/UPSEE-2004

Ans. (d) :

$H_2O \rightarrow H^+ + OH^-$ (Acid due to donation of proton)

$H_2O + H^+ \rightarrow H_3O^+$ (Basic due to gaining of proton)

$\therefore$ H_2O is amphoteric solvent because it dissolves both acids and basic.

368. Would gaseous HC*l* be considered as an Arrhenius acid?

(a) Yes
(b) No
(c) Not know
(d) Gaseous HC*l* does not exist

UPTU/UPSEE-2004

Ans. (b) : Gaseous HCl does not give H^+ but liquid HCl gives H^+ in aqueous solution there for gaseous HCl is not a Arrhenius acid due to covalent bonding in gaseous condition.

369. Which of the following pair of salt produces odourless gas with dil. H_2SO_4 ?

(a) HCO_3^- and HSO_3^-
(b) HCO_3^- and CO_3^-
(c) $S_2O_3^{2-}$ and $CH_3CO_2^-$
(d) CO_3^{2-} and $CH_3CO_2^-$

UPTU/UPSEE-2018

Ans. (b) : HCO_3 and CO_3^- will produce odourless gas i.e.
Carbon dioxide with dil. H_2SO_4

$$\underset{aq}{NaHCO_3} + H_2SO_4 \rightarrow \underset{aq}{Na_2SO_4} + \underset{g}{2CO_2} + \underset{l}{2H_2O}$$

$$\underset{\text{washing soda}}{Na_2CO_3} + \underset{aq}{H_2SO_4} \rightarrow \underset{aq}{Na_2SO_4} + \underset{l}{H_2O} + \underset{g}{CO_2}$$

370. Identify the Bronsted acid in the following equation

$$PO_4^{3-} + H_2O(l) \longrightarrow HPO_4^{2-}(aq) + OH^-(aq)$$

(a) PO_4^{3-} (b) HPO_4
(c) H_2O (d) OH^-

UPTU/UPSEE-2017

Ans. (c) : In the reaction:

$$PO_4^{3-} + H_2O(l) \longrightarrow HPO_4^{2-}(aq) + OH^-(aq)$$

Only H_2O act as Bronsted acid among the given options as it donate the proton (H^+) to OH^- ions

371. Of the given anions, the strongest Bronsted base is

(a) ClO^- (b) ClO_3^-
(c) ClO_2^- (d) ClO_4^-

UPTU/UPSEE-2014

Ans. (a) : HClO is the weakest acid , hence its conjugate base, i.e.,ClO^- is the strongest Bronsted base.
Conjugate base order–

$$ClO_4^- < ClO_3^- < ClO_2^- < ClO^-$$

372. Which of the following is the weakest acid?

(a) HCl (b) HF
(c) H_2SO_4 (d) HNO_3

UPTU/UPSEE-2009

Ans. (b) : HF (Hydrofluric acid) is thus the weakest acid of the hydrogen halides, because of the strength of the HX bond and the polarizing ability of F^-.

373. Water is well known amphoprotic solvent. In which chemical reaction water is behaving as a base?

(a) $H_2SO_4 + H_2O \longrightarrow H_3O^+ + HSO_4^-$
(b) $H_2O + H_2O \longrightarrow H_3O^+ + OH^-$
(c) $H_2O + NH_2^- \longrightarrow NH_3 + OH^-$
(d) $H_2O + NH_3 \longrightarrow NH_4^+ + OH^-$

UPTU/UPSEE-2009

Ans. (a) : According to Bronsted Lowry concept bases are the substance which have tendency to accept a proton.

$$\underset{\text{(acid)}}{H_2SO_4} + \underset{\text{(base)}}{H_2O} \longrightarrow \underset{\text{(Conjugated acid)}}{H_3O^+} + \underset{\text{(Conjugated base)}}{HSO_4^-}$$

@apna_pdf

374. Which of the following behaves as Lewis acid and not as Bronsted acid?

(a) HCl (b) H_2SO_4

(c) HSO_3^- (d) SO_3

UPTU/UPSEE-2009

Ans. (d) : Lewis acids have a tendency to accept electron while Bronsted acid have a tendency to donate proton.

(a) $HCl \rightarrow H^+ + Cl^-$ (b) $H_2SO_4 \rightarrow H^+ + HSO_4^-$

Bronsted acid Bronsted acid

(c) $HSO_3^- \rightarrow H^+ + SO_3^{2-}$ (d) $SO_3 + O^{2-} \rightarrow SO_4^{2-}$

Bronsted acid Lewis acid

375. Of the following acids the one which has the capability to form complex compound and also possesses oxidizing and reducing properties is

(a) HNO_3 (b) HNO_2

(c) HCOOH (d) HCN

WB-JEE-2009

Ans. (b) : HNO_2 has both oxidizing and reducing properties. It also has the capability to form complex compounds because Nitrogen has the middle valency.

376. The principle use of hydrofluoric acid is

(a) in etching glass

(b) as a bleaching agent

(c) as an extremely strong oxidizing agent

(d) in the preparation of strong organic fluorine compounds

NDA (II)-2017

Ans. (a) The principle use of hydrofluoric acid is a etching glass. It is used in production of chlorides, fertilizers, and dyes, in electroplating, and in photographic, textile, and rubber industries.

377. Of the following compounds, which one is the strongest Bronsted acid in a aqueous solution?

(a) $HClO_3$ (b) $HClO_2$

(c) HOCl (d) HOBr

WB-JEE-2017

Ans. (a) : The central atom in oxoacids, higher oxidation number more strongly it behave bronsted acid.

$HClO_3$

$+1\ x + (-2) \times 3 = 0$

$= 1 + x - 6 = 0$

$x - 5 = 0$

$x = +5$

Oxidation no. for Cl in $HClO_2 \rightarrow +3$

Oxidation no. for Cl in $HClO \rightarrow +1$

Oxidation no. for Br in $HBrO \rightarrow +1$

Hence, HClO3 is the strongest Bronsted acid in aqueous solution

378. Which of the following properties is true for a tooth paste?

(a) It is acidic

(b) It is neutral

(c) It is basic

(d) It is made up of Calcium phosphate, the material of tooth enamel

NDA (I)-2018

Ans. (c) : Toothpastes are basic in nature and prevents tooth decay by neutralizing the excess of acid. They can neither be acidic nor normal.

379. Which of the set of oxides are arranged in the proper order of basic, amphoteric, acidic?

(a) SO_2,P_2O_5,CO (b) BaO,Al_2O_3,SO_2

(c) CaO, SiO_2, Al_2O_3 (d) CO_2, Al_2O_3,CO

WB-JEE-2018

Ans. (b) : Oxides of non-metallic elements are acidic such as SO_2.

Oxides of less electropositive element such as Al_2O_3 are amphoteric i.e. those behaves as acids toward strong bases and as bases towards strong acid oxides of electropositive elements BaO are basic and contains discrete O^{2-} ions.

The correct set of oxides arranged in the proper order of basic, amphoteric, acidic are

BaO, Al_2O_3, SO_2

4. Buffer Solution

380. A student needs to prepare a buffer solution of propanoic acid and its sodium salt with pH 4. The ratio of $\frac{[CH_3CH_2COO^-]}{[CH_3CH_2COOH]}$ required to make buffer is _______.

Given : $K_a(CH_3CH_2COOH) = 1.3 \times 10^{-5}$

(a) 0.03 (b) 0.13

(c) 0.23 (d) 0.33

JEE Main-28.06.2022, Shift-II

Ans. (b) : We know that,

$$pH = pK_a + \log\frac{[Salt]}{[Acid]}$$

$$4 = 5 - \log 1.3 + \log\frac{[CH_3CH_2COO^-]}{[CH_3CH_2COOH]}$$

$$\log\frac{[CH_3CH_2COO^-]}{[CH_3CH_2COOH]} = \log 1.3 - 1 = \log\frac{1.3}{10}$$

$$\frac{[CH_3CH_2COO^-]}{[CH_3CH_2COOH]} = 0.13$$

381. The solution that is made by mixing appropriate amount of a weak acid and salt is called

(a) Basic buffer (b) Acidic buffer

(c) Neutral buffer (d) Both (a) and (b)

AP-EAMCET-1992

Ans. (b) : A buffer solution is one which resists changes in pH when small quantities of an acid or an alkali are added to it. Acid buffer has acidic pH. As the name suggests, these solutions are used to maintain acidic environments.

An acidic buffer solution is simply one which has a pH less than 7. Acidic buffer solutions are commonly made from a weak acid and one of its salts - often a sodium salt.

382. The solutions which tend to keep the concentration of hydrogen ions constant even when small amount of strong acid or strong base are added to them, are known as

(a) Acidic solution (b) Alkaline solution

(c) Buffer solution (d) Ideal solution

AP-EAMCET-1993

@apna_pdf

Ans. (c) : Buffer solution is an aqueous solution consisting of a mixture of a weak acid and its conjugate base. Buffer solution resist the change in its pH value on adding a small amount of an acid or base.

383. Which of the following solutions cannot act as a buffer?

(a) $NaH_2PO_4 + H_3PO_4$
(b) $CH_3COOH + CH_3COONa$
(c) $HCl + NH_4Cl$
(d) $H_3PO_4 + Na_2HPO_4$

AP-EAMCET-1998

Ans. (c) : $HCl + NH_4Cl$ cannot act as a buffer because it is a mixture of strong acid and weak base.

384. Which of the following is correct for acid buffer? [salt = S, acid = A]?

(a) $pK_a = pH + \log\frac{[S]}{[A]}$

(b) $pH = pK_a + \log\frac{[S]}{[A]}$

(c) $pK_a = pH - \frac{[A]}{[S]}$

(d) $pH = pK_a + \log\frac{[A]}{[S]}$

AP-EAMCET-2000

Ans. (b) : According to Henderson equation, pH of an acidic buffer-

$$pH = pK_a + \log\frac{[salt]}{[acid]}$$

or $$pH = pK_a + \log\frac{[S]}{[A]}$$

385. Which of the following would produce a buffer solution when mixed in equal volumes?

(a) 1 M CH_3COOH and 0.5 M NaOH
(b) 1 M CH_3COOH and 0.5 M HCl
(c) 1 M NH_4OH and 0.5 M NaOH
(d) 1 M NH_4OH and 0.5 M HCl

AP EAMCET (Engg.)-2001

Ans. (a) : $CH_3COOH + NaOH \rightarrow CH_3COONa + H_2O$
Hence, weak acid, CH_3COOH and its salt with strong base, CH_3COONa act as acidic buffer.

386. Study the following table

Buffer solution (in mL)	Volume (in mL) of 0.1 M weak acid	Volume (in mL) of 0.1 M sodium salt of weak acid
I	4.0	4.0
II	4.0	40.0
III	40.0	4.0
IV	0.1	10.0

Which of the two sets of buffer solutions have least pH?

(a) I and II (b) I and III
(c) II and III (d) II and IV

AP-EAMCET-2004

Ans. (b) : According to Henderson equation, pH of a buffer solution.

$$pH = pK_a + \log\frac{[salt]}{[acid]}$$

$pH \propto Salt \propto \frac{1}{acid}$

So, if ratio $\frac{[Salt]}{[Acid]}$ is low then the pH will also be low.

(i) $\frac{[Salt]}{[Acid]} = \frac{4.0}{4.0} = 1$

(ii) $\frac{[Salt]}{[Acid]} = \frac{40}{4} = 10$

(iii) $\frac{[Salt]}{[Acid]} = \frac{4}{40} = 0.1$

(iv) $\frac{[Salt]}{[Acid]} = \frac{10.0}{0.1} = 100$

So, min. ratio is in (i) & (iii).

387. An acidic buffer solution could be prepared by mixing the solutions of the following

(a) Sodium acetate and acetic acid
(b) Ammonium sulphate and sulfuric acid
(c) Ammonium chloride and ammonium hydroxide
(d) Sodium chloride and hydrochloric acid

MPPET-2012

Ans. (c) : Buffer solution:- A buffer solution that can resist pH change upon the addition of an acidic or basic components. It is able to neutralize small amounts of added acid or base, thus maintaining the pH of the solution relatively stable.

Acidic buffer solution = Weak acid + Salt of strong base

$= \underset{\text{Acetic acid}}{CH_3COOH} + \underset{\text{sodium acetate}}{CH_3COONa}$

Basic buffer solution = Weak base + salt of strong acid

$\underset{\text{Ammonium hydroxide}}{(NH_4OH)} \quad \underset{\text{Ammonium chloride}}{(NH_4Cl)}$

388. A buffer solution is prepared by mixing 10 mL of 1.0 M acetic acid and 20 mL of 0.5 M sodium acetate and then diluted to 100 mL with distilled water. If the pK_a of acetic acid is 4.76, what is the pH of the buffer solution prepared?

(a) 3.84 (b) 4.76
(c) 4.34 (d) 5.21

AP EAMCET (Medical) -1998

Ans. (b): Given that,
$pK_a = 4.76$, pH = ?
The expression for the pH of the acidic buffer solution is as given below–

$$pH = pK_a + \log\frac{[Salt]}{[Acid]}$$

Now, given data–

$M_1 = 1M, V_1 = 10mL, M_2 = ?\ V_2 = 100\,mL$

$\therefore \quad M_1V_1 = M_2V_2$

@apna_pdf

or $\quad M_2 = \dfrac{M_1V_1}{V_2} = \dfrac{1\times10}{100} = 0.1M$

Similarly, for sodium acetate–

$M_1V_1 = M_2V_2$

or $\quad M_2 = \dfrac{0.5\times20}{100} = \dfrac{1}{10}M = 0.1M$

$\therefore \quad pH = 4.76 + \log\dfrac{0.1}{0.1}$

or $\quad pH = 4.76$

389. Which one of the following will not function as buffer solution ?

(a) Borax + Boric acid
(b) NaH_2PO_4 + Na_2HPO_4
(c) NaCl + NaOH
(d) NH_4Cl + NH_4OH

SCRA - 2009

Ans. (c) : Buffer solution : A buffer solution is a salt of either weak acid and its salt with strong base or strong acid with weak base and its salt.

(i) Borax + Boric acid : Borax and Boric acid is an acid buffer solution. It consist of weak acid (Boric acid) and its salt (borax) with strong base.

(ii) NaH_2PO_4 and Na_2HPO_4 : NaH_2PO_4 and Na_2HPO_4 are acid salts so they canastas acid as well as salt. When one act as acid and other as salt they will form buffer solution.

(iii) NaCl + NaON : consist of salt of strong acid and strong base.

(iv) NH_4Cl+NH_4OH : It consist of weak base and its salt with strong acid.

So, $\boxed{NaCl + NaOH}$ Will not function as buffer solution.

390. Which among the following pairs constitute a buffer ?

(a) LiOH & LiCl (b) HNO_3 & NH_4NO_3
(c) HNO_2 & $NaNO_2$ (d) HBr & KBr

AP EAPCET 24.08.2021, Shift-I

Ans. (c) : As we know that, HNO_2 is a weak acid and $NaNO_2$ is salt of that weak acid and strong base (NaOH). So, both pair of HNO_2 and $NaNO_2$ formed the buffer solution.

391. The Henderson's equation for a basic buffer is

(a) $pOH = pK_b + \log\dfrac{[Salt]}{[Base]}$

(b) $pOH = pK_b - \log\dfrac{[Salt]}{[Base]}$

(c) $pOH = pK_b + \log\dfrac{[Base]}{[Salt]}$

(d) $pOH = pK_b + \dfrac{[Salt]}{[Base]}$

Manipal-2018
COMEDK-2011

Ans. (a) : The Henderson's equation for a basic buffer is

$$pOH = pK_b + \log\frac{[Salt]}{[Base]} \quad \& \ pH = 14 - pOH$$

392. Which of the following is a buffer solution?

(a) K_2SO_4+H_2SO_4 (b) NaOH+Na_2SO_4
(c) NaOH+CH_3COONa (d) NH_4OH+NH_4Cl

COMEDK-2016

Ans. (d) : Buffer solution is made by taking a solution of weak base (NH_4OH) and one of its salt with strong acid (NH_4Cl) [or weak acid and its salt]. It resists a change in pH upon addition of small amount of strong acid or strong base. Therefore (d) is a buffer solution.

393. Which of the following equations give ionic product of water?

(i) $NH_3(aq) + H_2O \rightleftharpoons NH_4^+(aq) + OH^-(aq)$
(ii) $NH_4^+(aq) + H_2O \rightleftharpoons H_3O^+ + NH_3(aq)$
(iii) $NH_2^-(aq) + H_2O \rightleftharpoons NH_3(aq) + OH^-$
(iv) $NH_3(aq) + OH^-(aq) \rightleftharpoons NH_2^-(aq) + H_2O$

(a) (ii) and (iii) (b) (iii) and (iv)
(c) (i) and (ii) (d) (iii) and (i)

COMEDK-2015

Ans. (c) : In the following question:

(i) $NH_3(aq) + H_2O \rightleftharpoons NH_4^+(aq) + OH^-$

Acid-base neutralization reaction will take place above and water will break into H^+ and OH^-.

(ii) $NH_4^+(aq) + H_2O \rightleftharpoons H_3O^+ + NH_3(aq)$

Here also, acid base neutralization will take place.

394. A buffer solution has equal volumes of 0.2 M NH_4OH and 0.02 M NH_4Cl. The pK_b of the base is 5. The pH is

(a) 10 (b) 9
(c) 4 (d) 7

COMEDK-2017

Ans. (a) : Given that–
volume of NH_4OH = 0.2 M and
volume of NH_4Cl = 0.02 M
$pK_b = 5$
According to the Henderson's equation.

$pOH = pK_b + \log\dfrac{[salt]}{[base]}$

$= 5 + \log\dfrac{0.02}{0.2} = 5 + \log\dfrac{1}{10} = 5 + (-1) = 4$

pH=14–pOH=14–4=10

395. When 0.1 mole of an acid is added to 2 L of a buffer solution, the pH of the buffer decreases by 0.5 . The buffer capacity of the solution is

(a) 0.6 (b) 0.4
(c) 0.2 (d) 0.1

AP-EAMCET (Medical), 2008

Ans. (d) : Given data:

Number of moles of acid added = $\dfrac{0.1}{2}$ per litre

Change of pH = 0.5

Now,

$\text{Buffer capacity} = \dfrac{\text{number of moles of acid added/L}}{\text{change in pH}}$

$\text{Buffer capacity} = \dfrac{0.1}{0.5\times2}$

Buffer capacity = 0.1

@apna_pdf

396. $H_2 + CO + \text{alkene} \xrightarrow{\text{catalyst}} 1^{\circ}$ **alcohol**

What is the stable intermediate and the nature of the reaction?

(a) acid reduction (b) aldehyde, oxidation
(c) aldehyde, reduction (d) alcohol, oxidation

TS EAMCET 04.08.2021, Shift-I

Ans. (c) : Alkene combine with carbon monoxide and hydrogen in the presence of octa carbonyl dicobalt as catalyst under high temperature and pressure to form aldehydes.

$H_2 + CO + CH_2 = CH_2 \rightarrow CH_3CH_2OH$

- Stable intermediate aldehyde are from
- Reduction Reaction.

397. Assertion : Mixture of CH_3COOH and CH_3COONH_4 is an example of acidic buffer.

Reason : Acidic buffer contains equimolar mixture of a weak acid and its salt with weak base.

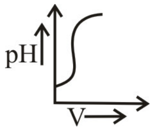
(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) In the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the assertion is incorrect but the Reason is correct.

AIIMS-(2007)

Ans. (d): Acidic buffer contains equimolar mixture of weak acid and its salt with strong base.

CH_3COOH/ CH_3COONH_4 is not an example of acidic buffer.

398. During titration of acetic acid with aq. NaOH solution, the neutralisation graph has a vertical line. This line indicates



(a) alkaline nature of equivalence.
(b) acidic nature of equivalence.
(c) neutral nature of equivalence.
(d) depends on experimental proceeding.

AIIMS- 2007

Ans. (a) : In the titration of a weak acid CH_3COOH with a strong base (NaOH), there is a change in the pH value at the end point. But it is not sharp due to weak ionisation of CH_3COOH. Due to the excess of free base beyond the equivalence point, there is a step rise in pH which is indicated by the vertical line. Hence, the ventical line in the graph indicates alkaline nature of equivalence.

399. Which one of the following in NOT a buffer solution?

(a) $0.8\,M\,H_2S + 0.8\,M\,KHS$

(b) $2M\,C_6H_5NH_2 + 2M\,C_6H_5\overset{+}{N}H_3Br^-$

(c) $3M\,H_2CO_3 + 3M\,KHCO_3$

(d) $0.05\,M\,KClO_4 + 0.05\,M\,HClO_4$

AIIMS-2003

Ans. (b): Buffer solution contains weak base +salt of weak base with strong acid or weak acid +salt of weak acid with a strong base.

In option (d) the used is $HClO_4$ which is strong base . hence,it is not an example of buffer solution.

400. Which one of the following statements is not correct?

(a) The pH of 1.0×10^{-8} M HCl is less than 7
(b) The ionic product of water at 25°C is $1.0\times10^{-14}\,mol^2L^{-2}$
(c) Cl^- is a Lewis acid
(d) Bronsted Lowry theory cannot explain the acidic character of $AlCl_3$

AP EAMCET (Engg.) 2012

Ans. (c) : Chlorine (Cl^-) is a Lewis base because it octet is complete and tendency to give an electros.

401. For a buffer of a mixture of 0.12 mol L^{-1} CH_3COOH and 0.12 mol L^{-1} CH_3COONa, the buffer capacity is

(a) 1.38 (b) 0.130
(c) 0.06 (d) 0.60

AMU-2017

Ans. (b) : Buffer capacity (β) = $\dfrac{\Delta C_a}{\Delta pH}$

Where C_a = concentration of acid for acidic buffer

Concentration of acid = concentration of salt

$\therefore\ \Delta C_a = 0.12\ molL^{-1}$

Hence, we use the following formula for calculating its pH.

$pH = -\log[H^+] = -\log(0.12) = 0.92$

Buffer capacity (β) = $\dfrac{0.12}{0.92} = \dfrac{12}{92} = \dfrac{6}{46} = \dfrac{3}{23} = 0.130$

402. A buffer contains equal concentrations of X^- and HX. The K_a for HX is 10^{-8}. The pH of the buffer is–

(a) 3 (b) 8
(c) 7 (d) 11

BCECE-2009

Ans. (b) : A buffer consist of a weak acid and its conjugate base or a weak base and its conjugate acid.

k_a is given to us it is an indication that the given buffer is an example of an acidic buffer.

Hence, we use the following formula for calculating its pH.

$pH = -\log k_w + \log\dfrac{[\text{conjugate base}]}{[\text{Acid}]}$

$pH = pk_a + \log_{10}\dfrac{[X^-]}{[HX]}$

$pH = -\log_{10}10^{-8} + \log_{10}1 = 8$

As the concentrations of X^- and HX are equal

403. A buffer solution contains 0.1 mole of sodium acetate in 1000 cm^3 of 0.1 M acetic acid. To the above buffer solution, 0.1 mole of sodium acetate is further added and dissolved. The pH of the resulting buffer is equal to–

@apna_pdf

(a) $pK_a - \log 2$ (b) pK_a
(c) $pK_a + 2$ (d) $pK_a + \log 2$

BCECE-2014
Karnataka-CET, 2010

Ans. (d) : Given that–

$[CH_3COONa] = 0.1$ M

$[CH_3COOH] = 0.1$ M

0.1 mol $CH_3COONa \rightarrow$ add

$[CH_3COONa] = 0.1 + 0.1$
$= 0.2$ M

$[CH_3COOH] = 0.1$ M

According to the Henderson's equation

$$pH = pK_a + \log \frac{[Salt]}{[Acid]}$$

$$pK_a + \log \frac{0.2}{0.1}$$

$$pK_a + \log 2$$

404. Which of the following can form buffer solution?

(a) aq.NH_3 + NH_4OH (b) KOH + HNO_3
(c) NaOH + HCl (d) KI + KOH

BITSAT-2017

Ans. (a) : Ammonia is a weak base and a salt containing its conjugate acid, the ammonium cantion ,such as NH_4OH functions as a buffer solution when they are present together in a solutions.

405. Which of the following is not a buffer solution?

(a) 100 mL 0.1 M CH_3COOH + 50 mL 0.1 M CH_3 COONa
(b) 100 mL 0.1 M CH_3COOH + 50 mL 0.1 M NaOH
(c) 50 mL 0.1 M CH_3COOH+100 mL 0.1 M NaOH
(d) 100 mL 0.1 M NH_4OH+50 mL 0.1 M CI

CG PET-2009

Ans. (c) : Acidic buffer is mixture of weak acid and its salt with strong base, similarly, basic buffer is a mixture of weak base and its salt with strong acid.

Hence, 50 mL 0.1 M CH_3COOH+100 mL 0.1 M NaOH does not constitute a buffer solution. Because in this case millimoles of acid are less than that the strong base, which after reaction with strong base gives salt. Now, the solution contains only strong base and salt but no weak acid.

Hence, no buffer is formed.

406. Which solution is buffer?

(a) Acetic acid+ NaOH (equimolar ratio)
(b) Acetic acid+ NaOH (1:2 molar ratio_
(c) Acetic acid+ NaOH (2:1 molar ratio)
(d) HCl +NaOH (equimolar ratio)

CG PET-2013

Ans. (c) : A buffer solution can be described as a solution, which will resist changes in pH when a small amount of a strong acid or base is added.

An acidic buffer is compound of a weak acid and its conjugated base or a weak acid and the salt of the weak acid and a strong base. e.g., (CH_3COOH+CH_3COONa).

$$CH_3COOH \rightleftharpoons CH_3COO^- + H^+$$

(feebly ionised)

$$CH_3COONa \rightleftharpoons CH_3COO^- + Na^+$$

(completely ionised)

How to make a acidic buffer

(i) start with taking weak acid (CH_3COOH) and strong base (NaOH) in 2:1 molar concentration ratio, so that a sufficient number of moles of the CH_3COOH neutralize completely the same number of moles of NaOH.

$$\underset{1\,\text{mol}}{CH_3COOH} + \underset{1\,\text{mol}}{NaOH} \longrightarrow \underset{\substack{\text{Sodium acetate}\\ 1\text{mol}}}{CH_3COONa} + H_2O$$

How to make a acidic buffer.

Now, the resulting solution will contain the salt and acid in equimolar concentration and water.

$$\underset{1\,\text{limiting (mol)}}{OH^-(aq)} + \underset{(\text{excess } 2\,\text{mol})}{H^+(aq)} \longrightarrow \underset{\substack{\text{salt (1mol) buffer}\\ \text{solution}}}{A^+(aq)} + \underset{\text{remaining (mol)}}{H^+(aq)}$$

In the buffer solution, $[HA] = [A^-]$

i.e., equimolar concentrations

(ii) The acidic buffer can also prepared by taking equimolar concentrations and volume of weak acid (CH_3COOH) and the salt of the weak acid and strong base (CH_3COONa).

407. Heat of neutralisation of NH_4OH and HC1 is

(a) equal to 13.7 kcal
(b) more than 13.7 kcal
(c) less than 13.7 kcal
(d) more than one is correct

CG PET-2004

Ans. (c) : The heat of neutralization is the amount of heat evolved when one gram equivalent of an acid is neutralised by one gram equivalent of a base in dilute solution.

NH_4OH is a weak base. Heat of neutralization < 13.7 Kcal.

The heat released in the neutralization of a weak base or a weak acid by a strong acid or a strong base, respectively is less than 13.7 Kcal.

408. In the combustion of 2.0 g of methane, 25 kcal heat is liberated, heat of combustion of methane would be

(a) 100 kcal (b) 200 kcal
(c) 300 kcal (d) 400 kcal

CG PET-2004

Ans. (b) : $CH_4 + 2O_2 \rightarrow CO_2 + 2H_2O$

Molecular weight of $CH_4 = 12 + 4 = 16$

$\therefore$ On the combustion of 2.0 gm of methane = 25.0 kcal.

$\therefore$ On the combustion of 16.0 gm $= \frac{25 \times 16}{2} = 200$ kcal.

409. Which of the following mixtures forms an acid buffer?

(a) NaOH+HCl (b) CH_3COOH+CH_3COONa
(c) NH_4OH+NH_4Cl (d) H_2CO_3+$(NH_4)_2CO_3$

CG PET-2004

Ans. (b) : Acid buffer$\Rightarrow$ Weak Acid + Strong Base

Match in option

$$\text{(a) NaOH + HCl} \begin{pmatrix} \text{NaOH strong Base and} \\ \text{HCl is strong Acid} \end{pmatrix}$$

$$\text{(b) } CH_3COOH + CH_3COONa \begin{pmatrix} CH_3COOH \text{ is weak acid and} \\ CH_3COONa \text{ is a strong base} \end{pmatrix}$$

So, option (b) is correct.

@apna_pdf

410. In a 100 mL of buffer solution of acetic acid and sodium acetate, both are 0.1 mol. In this buffer, 10 mL of 0.01 mole of HCl is added. The pH of the buffer

(a) will be increased by 1
(b) will be decreased by 1
(c) first increases and then decreases
(d) no change

CG PET-2018

Ans. (d) : The solution which resist the change in pH even on small addition of an acid are called buffer solution. As the given solution of acetic acid and sodium acetate is a buffer solution, the addition of 10 ml of 0.01 mol HCL solution will not change the pH of the buffer solution .
hence, option (d) is the correct answer.

411. An aqueous solution of 1M NaCl and 1M HCl is

(a) not a buffer but pH< 7
(b) not a buffer but pH > 7
(c) a buffer with pH < 7
(d) a buffer with pH > 7

[AIEEE-2002]

Ans. (a) : NaCl is not the case of buffer
NaCl is salt of strong acid and strong base.
$NaCl + H_2O \rightleftharpoons NaOH + HCl$
aqueous NaCl, itself exact neutral solution
$HCl + H_2O \rightleftharpoons H_3O^+ + Cl^-$
make solution acidic.
So, not a buffer but pH < 7

412. The pK$_a$ of a weak acid (HA) is 4.5. The pOH of an aqueous buffered solution of HA in which 50% of the acid ionised is

(a) 4.5 (b) 2.5
(c) 9.5 (d) 7.0

[AIEEE-2010]

Ans. (c) : $pH = pk_a + \log \frac{[\text{conjugate base}]}{[\text{acid}]}$

$pk_a = 4.5$
[conjugate base] = [acid], as 50% ionification

$pH = 4.5 + \log \frac{0.5}{0.5}$

$pH = 4.5 + \log 1 \qquad (\because \log_{10} 1 = 0)$

$pH = 4.5$
Then, pOH = 14 – 4.5 = 9.5
(Note:– pH + pOH = 14)

413. The solubility of AgCN in a buffer solution of pH = 3 is x. The value of x is.......
[Assume: No cyano complex is formed; k$_{sp}$ (AgCN) = 2.2×10^{-16} and K$_a$ (HCN) = 6.2 × 10^{-10}]

(a) 0.625×10^{-6} (b) 1.6×10^{-6}
(c) 2.2×10^{-16} (d) 1.9×10^{-5}

[JEE Main 2021, 25 Feb Shift-I]

Ans. (d) : Let Solubility be x

$AgCN \rightleftharpoons Ag^+ + CN^- \qquad K_{sp} = 2.2 \times 10^{-16}$

$H^+ + CN^- \rightleftharpoons HCN$

$K = \frac{1}{K_a} = \frac{1}{6.2\times10^{-10}}$

$K_{sp} \times \frac{1}{K_a} = [Ag^+][CN^-] \times \frac{[HCN]}{[H^+][CN^-]}$

$2.2 \times 10^{-16} \times \frac{1}{6.2\times10^{-10}} = \frac{[S][S]}{10^{-3}}$

$S^2 = \frac{2.2\times10^{-16}\times10^{-3}}{6.2\times10^{-10}}$

$S^2 = 0.3548 \times 10^{-9}$
$S^2 = 3.548 \times 10^{-10}$
$S = \sqrt{3.55\times10^{-10}}$
$S = 1.88 \times 10^{-5}$
$S = 1.9 \times 10^{-5}$

414. An acidic buffer is obtained on mixing

(a) 100 mL of 0.1M CH_3COOH and mLof 0.1 MNaOH
(b) 100 mL of 0.1M HCl and 200 mL of 0.1 M Nacl
(c) 100 mL of 0.1M CH_3COOH and 200 mL of 0.1M NaCl
(d) 100 mL of 0.1M HCl and 200 mL of 0.1M CH_3COONa

[JEE Main 2020, 3 Sep Shift-I]
NEET-2019

Ans. (d) :

$$\begin{array}{cccccc} HCl + & CH_3COONa & \rightarrow & CH_3COOH + & NaCl \\ \text{10 milimole} & \text{20 milimole} & & - & - \\ - & \text{10 milimole} & & \text{10 milimole} & \text{10 milimole} \end{array}$$

So, finally we get mixture of
CH_3COOH + CH_3COONa that will work like Acidic buffer solution.

415. In order to prepare a buffer solution of pH 5.74 sodium acetate is added to acetic acid. If the concentration of acetic acid in the buffer is 1.0 M, the concentration of sodium acetate in the buffer is ....M. (Round off to the nearest integer)
[Given : pK$_a$ acetic acid = 4.74]

[JEE Main 2021, 18 March Shift-I]

Ans. (10) : $pH = pK_a + \log \frac{[CB]}{[WA]}$

$5.74 = 4.74 + \log \frac{[CB]}{1}$

[CB] = 10 M

416. The buffer present in blood plasma is

(a) borax, sodium hydroxide
(b) carbonic acid, bicarbonate ion
(c) acetic acid, sodium acetate
(d) citric acid, potassium dihydrogen phosphate

J & K CET-(2012)

Ans. (b) : The buffer present in blood plasma is carbonic acid bicarbonate ion.
Normal human blood has pH = 7.4.

417. Consider the following solutions of equal concentrations
A = NH_4Cl; B = CH_3COONa
C = NH_4OH; D= CH_3COOH
A buffer solution can be obtained by mixing equal volumes of

(a) C and D (b) A and B
(c) A and C (d) C and D

J & K CET-(2006)

@apna_pdf

Ans. (a) : Buffer

(i) Acidic [weak acid + conjugate base]

(ii) Basic [weak base + conjugate acid]

$$\underset{(D)}{CH_3COO^-H^+} + \underset{(B)}{CH_3COO^-Na}$$

$$\underset{(C)}{NH_4OH} + \underset{(A)}{NH_4^+Cl^-}$$

So, Option (a) is correct.

418. Which of the following is not a buffer solution?

(a) $CH_3COOH + CH_3COONa$

(b) $H_3BO_3 + Na_3BO_3$

(c) $HClO_4 + NaClO_4$

(d) $NH_4OH + (NH_4)_2SO_4$

JCECE - 2004

Ans. (c) : A buffer solution is one which resist changes in pH when small quantities of an acid or an alkali are added to it.

A solution of $HClO_4$ and $NaClO_4$ is not an acid buffer because strong acid with its salt cannot form a buffer solution.

419. Which of the following 1 : 1 mixture will act as buffer solution?

(a) HCl and NaOH

(b) KOH and CH_3COOH

(c) CH_3COOH and NaCl

(d) CH_3COOH and CH_3COONa

JCECE - 2005

Ans. (d) : Buffer is a mixture of weak acid with its salt with strong base or mixture of weak base and its salt with strong acid.

(a) HCl + NaOH is not buffer because both are a strong acid strong base.

(b) KOH + CH_3COOH is not buffer because they do not have common ion.

(c) CH_3COOH + NaCl is not buffer because they do not have common ion.

(d) CH_3COOH + CH_3COONa are buffer because CH_3COONa its salt with strong base (NaOH).

420. A buffer solution is prepared in which the concentration of NH_3 is 0.30 M and the concentration of NH_4^+ is 0.20 M. If the equilibrium constant, K_b for NH_3 equals 1.8×10^{-5}, What is this pH of the solution? (log 2.7 =0.43)

(a) 9.43 (b) 11.72

(c) 8.73 (d) 9.08

JIPMER-2014
NEET-2011

Ans. (a) : According to the Henderson - Hasselbalch equation.

$$\text{pH of acidic buffer} = pK_a + \log\left[\frac{\text{Salt}}{\text{Acid}}\right]$$

$$\text{pH of basic buffer} = pK_b + \log\left[\frac{\text{Salt}}{\text{Base}}\right]$$

$$pk_b = -\log\left[1.8\times10^{-5}\right] = 4.74$$

$$pOH = pK_b + \log\left[\frac{\text{salt}}{\text{base}}\right]$$

$$pOH = 4.74 + \log\frac{0.2}{0.3} = 4.74 - 0.176 = 4.56$$

$$pH = 14 - 4.56$$
$$= 9.44$$

421. Which buffer solution comprising of the following has its pH value greater than 7?

(a) $CH_3COOH+CH_3COONa$

(b) HCOOH+HCOOK

(c) CH_3COONH_4

(d) NH_4OH+NH_4Cl

JIPMER-2012

Ans. (d) : The pH value of basic buffer is always greater than 7.

Among the given options, NH_4OH+NH_4Cl is the only mixture which consists of a mixture of a weak base and its conjugated salt and thus, has a pH greater than 7.

Basic buffer solution: A basic buffer solution consists of a mixture of a weak base and its salt with strong acid. the best known example in a mixture of NH_4OH and NH_4Cl.

422. An example for a neutral buffer is

(a) ammonium hydroxide and ammonium chloride

(b) acetic acid and sodium acetate

(c) acetic acid and ammonium hydroxide

(d) citric acid and sodium citrate

Karnataka-CET-2013

Ans. (c) : Neutral buffer solutions are formed by mixing weak acid or weak base. For example Ammonium Hydroxide or acidic acid is an example of neutral buffer solutions. So, according to the concept, the correct option is (c) acetic acid and ammonium hydroxide.

423. Which will make basic buffer ?

(a) 100 mL of 0.1 M HCl + 100 mL of 0.1 m NaOH

(b) 50 mL of 0.1 M NaOH + 25 mL of 0.1 M CH_3COOH

(c) 100 mL of 0.1 CH_3COOH + 100 mL of 0.1 M NaOH

(d) 100 mL of 0.1 HCl + 200 mL of 0.1 of NH_4OH

NEET-2019

Ans. (d) : Key idea A buffer solution having pH more that 7 is know as basic buffer. It is obtained by mixing weak base and its salt with strong acid in a fixed proportion.

Let us consider all the options,

(a) 100 mL of 0.1 M CH_3COOH + 100 mL of 0.1 M NaOH

$$CH_3COOH + NaOH \longrightarrow CH_3COONa + H_2O$$

	CH_3COOH	NaOH	CH_3COONa
Intial Conc.	100mL× 0.1M = 10 m mol	100mL× 0.1M =10 m mol	0 m mol
Final	0	0	10 m mol

It is not basic buffer because hydrolysis of salt takes place and final solution contains salt of weak acid with strong base only.

Hence, option (a) is incorrect.

@apna_pdf

(b) 100 mL of 0.1 M HCl + 200 mL of 0.1 M NH_4OH

$$HCl + NH_4OH \longrightarrow NH_4Cl + H_2O$$

Intial Conc.	$100mL \times$ $0.1M\,HCl$ $= 10\,m\,mol$	$200mL \times$ $0.1M$ $= 20\,m\,mol$	$0\,m\,mol$
Final	0	10	$10m\,mol$

It is basic buffer because final solution contains weak base and its salt with storng acid. Hence, option (b) is correct.

(c) $HCl + NaOH \longrightarrow NaCl + H_2O$

Intial Conc.	$100mL$ $\times 0.1M$ $= 10\,m\,mol$	$100mL \times$ $0.1M$ $= 10\,m\,mol$	$0\,m\,mol$
Final	0	10	$10m\,mol$

It is a neutral solution. Hence, option (c) is incorrect.

(d) 50 mL of 0.1 M NaOH + 25 mL of 0.1M CH_3COOH

$$CH_3COOH + NaOH \longrightarrow CH_3COONa + H_2O$$

Intial Conc.	$25mL \times$ $0.1M$ $= 2.5\,m\,mol$	$50mL \times$ $0.1M$ $= 5\,m\,mol$	$0\,m\,mol$
Final conc.	0	2.5	$2.5\,m\,mol$

It is basic solution. Hence, option (d) is incorrect.

424. Which of the following pairs of solutions is not an acidic buffer ?

(a) CH_3COOH and CH_3COONa
(b) H_2CO_3 and $NaCO_3$
(c) H_3PO_4 and Na_3PO_4
(d) $HClO_4$ and $NaClO_4$

NEET-2015

Ans. (d) : Strong acid with its salt cannot form buffer solution. Hence, $HClO_4$ and $NaClO_4$ is not an acidic buffer.

425. The dissociation of a weak acid is 1×10^{-4}. In order to prepare a buffer solution with a pH = 5, the [Salt]/[Acid] ration should be

(a) 4 : 5
(b) 10 : 1
(c) 5 : 4
(d) 1 : 10

Karnataka NEET-2013

Ans. (b) : According to the Henderson's equation.

$$pH = pK_a + \log\frac{[salt]}{[Acid]}$$

$$5 = -\log K_a + \log\frac{[Salt]}{[Acid]} \qquad [\because pK_a = -\log K]$$

$$5 = -\log\left[1\times10^{-4}\right] + \log\frac{[Salt]}{[Acid]}$$

$$5 = 4 + \log\frac{[Salt]}{[Acid]}$$

$$5 - 4 = +\log\frac{[Salt]}{[Acid]}$$

$$1 = \log\frac{[Salt]}{[Acid]}$$

$$\frac{[Salt]}{[Acid]} = 10\text{ i.e., }10:1$$

426. Buffer solutions have constant acidity and alkalinity because

(a) These give unionised acid or base on reaction with added acid on alkali
(b) Acids and alkalies in these solution are shielded from attack by other ions
(c) They have large excess of H^+ or OH^- ions
(d) They have fixed value of pH

NEET-2012

Ans. (a) : If small amount of an acid or alkali is added to a buffer solution, it converts them into unionized acid or base. Thus, its pH remains unaffected or in other words its acidity/alkalinity remains constant. e.g.

$$H_3O^+ + A^- \rightleftharpoons H_2O + HA$$

$$^-OH + HA \longrightarrow H_2O + A^-$$

If acid is added, it reacts with A^- to form undissociated HA similarly, if base/alkali is added, OH^- combines with HA to give H_2O and A^- and thus, maintains the acidity/alkalinity of buffer solution.

427. A buffer solution prepared in which the concentration of NH_3 of 0.30 M and the concentration of NH_4^+ is 0.20 M. If the equilibrium constant K_b for NH_3 equals 1.8×10^{-5}, what is the pH of this solution ? (log 2.7 = 0.43)

(a) 9.08
(b) 9.43
(c) 11.72
(d) 8.73

NEET-2011

Ans. (b) $pOH = pK_b + \log\frac{[salt]}{[base]}$

$$= -\log K_b + \log\frac{[salt]}{[base]}$$

$$= -\log 1.8\times10^{-5} + \log\frac{0.20}{0.30}$$

$$= 5 - 0.25 + (-0.176)$$

$$= 4.75 - 0.176 = 4.57$$

$$\therefore \quad pH = 14 - 4.57 = 9.43$$

428. In a buffer solution containing equal concentration of B^- and HB, the K_b for B^- is 10^{-10}. The pH of buffer solution is

(a) 10
(b) 7
(c) 6
(d) 4

NEET-2010

Ans. (d) : Given, K_b for B^- is 10^{-10}

$\therefore$ $pK_b = -\log 10\ K_b = -\log(10^{-10}) = 10$

According to the Henderson's equation

We know that $pOH = pK_b + \log\frac{[salt]}{[Acid]}$

Here, the concentration of the salt and acid is same

$\therefore$ $\log_{10} 1 = 0$

$\therefore$ $pOH = pK_b = 10$

$pH = 14 - pOH = 14 - 10 = 4$

@apna_pdf

429. Which of the following pairs constitutes a buffer?

(a) HCl and KCl
(b) HNO_2 and $NaNO_2$
(c) NaOH and NaCl
(d) HNO_3 and NH_4NO_3

NEET-2006

Ans. (b) : Acid pair constituent with NHO_2 and $NaNO_2$ because HNO_2 is weak acid and $NaNO_2$ is a salt of weak acid (HNO_2) with strong base (NaOH). Hence, it is an example of acidic buffer solution.

430. The rapid change of near the stoichiometric point of an acid base titration is the basis of indicator detection, pH of the solution is related to ratio of the concentration of the conjugate (HIn) and base (In^+) ions of the indicator by the expression

(a) $\log\frac{[In^-]}{[HIn]} = pK_{In} - pH$

(b) $\log\frac{[HIn]}{[In^-]} = pK_{In} - pH$

(c) $\log\frac{[HIn]}{[In^-]} = pH - pK_{In}$

(d) $\log\frac{[In^-]}{[HIn]} = pH - pK_{In}$

NEET-2004

Ans. (d) : $\underset{\text{Weak acid}}{HIn} \rightleftharpoons H^+ + \underset{\text{Base}}{In^-}$

Applying law of mass action

$$KIn = \frac{[H^+][In]}{[HIn]}$$

Taking –log on both side

$$-\log K_{In} = \frac{-\log[H^+][In^-]}{[HIn]}$$

$$PK_{In} = -\log[H^+] + -\log\frac{[In^-]}{[HIn]}$$

$$PK_{In} = pH - \log\frac{[In]}{[H_{In}]}$$

$$PK_{In} + \log\frac{[In^-]}{[HIn]} = pH, \quad \boxed{\log\frac{[In^-]}{[HIn]} = pH - PK_{In}}$$

431. The pH value of blood does not appreciably change by small addition of an acid or a base because the blood

(a) can be easily coagulated
(b) contains iron as a part of the molecule
(c) in a body fluid
(d) contains serum protein which acts as buffers

NEET-1995

Ans. (d) : Blood is an example of buffer solution, which contains serum protein, so its pH does not change appreciably by adding small amount of an acid or a base to it.

432. Solution of 0.1 N NH_4OH and 0.1 M NH_4Cl has pH 9.25. Then find out pK_b of NH_4OH.

(a) 9.25
(b) 4.75
(c) 3.75
(d) 8.25

BCECE-2012, NEET-2002

Ans. (b) : Given that - Normality of NH_4OH = 0.1 N
Molarity of NH_4Cl = 0.1 M
pH = 9.25
According to the Henderson's equation-

$$pOH = pK_b + \log\frac{[Salt]}{[Base]}$$

$$pH + pOH = 14 \ (\text{at } 25\,^\circ C)$$

$$pOH = 14 - 9.5 = 4.75$$

$$4.75 = pK_b + \log\frac{[1]}{[1]}$$

$$pK_b = 4.75$$

433. A physician wishes to prepare a buffer solution at pH = 3.85 that efficiently resists changes in pH yet contains only small concentration of the buffering agents. Which of the following weak acids together with its sodium salt would be best to use ?

(a) 2, 5-Dihydroxybenzoinc acid (pK_a = 2.97)
(b) Acetoacetic acid (pK_a = 3.58)
(c) m-Chlorobenzoic acid (pK_a = 3.98)
(d) p-Chlorocinnamic acid (pK_a = 4.41)

NEET-1997

Ans. (b) : By the use of Henderson's equation

$$pH = pK_a + \log_{10}\frac{[salt]}{[acid]}$$

When, [salt] = [acid]
$\therefore$ pH = pK_a
$\because$ pK_a = 3.58, thus at ths state
pH = 3.58
So, acetoacetic acid (pK_a = 3.58) is best to use.

434. Which one of the following pair shows Buffer's solution?

(a) NaCl+NaOH
(b) $CH_3COONa+CH_3COOH$
(c) $CH_3COOH+CH_3COONH_4$
(d) H_2SO_4+ $CuSO_4$

UP CPMT-2003

Ans. (b) : Buffer solution are those solutions which resist the change in pH on addition of small amount of acid or base.

Buffer solutions are mixture of either weak acid and its salt with strong base or a weak base and its salt with strong acid.

(a) NaCl + NaOH is not buffer solution because NaOH is strong base.
(c) CH_3COOH + CH_3COONH_4 is not buffer solution because CH_3COONH_4 is salt with weak base.
(d) H_2SO_4+$CaSO_4$ is not buffer solution because H_2SO_4 is strong acid.
(b) CH_3COOH+CH_3COONa is buffer solution. Because CH_3COOH is weak acid and CH_3COONa is its salt with strong base.

@apna_pdf

435. Which of the following is not a buffer?

(a) $NH_3 + HCl$ (b) $CH_3COOH + NaOH$
(c) HCOOH + HCOOK (d) $NaOH + NaNO_3$

UPTU/UPSEE-2010

Ans. (d) : Because buffer solutions are mixture of weak acid or weak base their salts.

436. The buffering action of an acidic buffer is maximum when its pH is equal to

(a) 5 (b) 7
(c) 1 (d) pK_a

UPTU/UPSEE-2009

Ans. (d) : Buffer capacity of an acidic buffer is maximum when the ratio of HA to A^- is unity since, pH of acidic buffer ltbr.

$$= pK_a + \log\frac{[A^-]}{[HA]}$$

For maximum buffer capacity $[A^-] = [HA^-]$

$\therefore$ $pH = pK_a$

437. A buffer solution is prepared by mixing- 0.1M ammonia and 1.0 M ammonium chloride. At 298 K the pK_b of NH_4OH is 5.0 . The PH of the buffer is

(a) 10.0 (b) 9.0
(c) 6.0 (d) 8.0

UPTU/UPSEE-2008

Ans. (d) : From Henderson equation :-

$$pOH = pK_b + \log\frac{[Salt]}{[Base]}$$

$$pH + pOH = 14$$

$$pOH = 5.0 + \log\frac{[1.0]}{[0.1]} = 5 + \log 10 = 5 + 1$$

$$pOH = 6$$
$$pH + pOH = 14$$
$$pH + 6 = 14$$
$$pH = 14 - 6 = 8$$

438. The ratio of volumes of CH_3COOH 0.1 (N) to CH_3COONa 0.1 (N) required to prepare a buffer solution of pH 5.74 is
(Given, pK_a of CH_3COOH is 4.74)

(a) 10 : 1 (b) 5 : 1
(c) 1 : 5 (d) 1 : 10

WB-JEE-2015

Ans. (d) : The volumes of acetic acid and sodium acetate be VL and V'L respectively.
Given that normality of CH_3COOH [Acetic acid] = 0.1 N
Normality of CH_3COONa = 0.1 N

$$pH = 5.74$$

According to the Henderson's equation-

$$pH = pK_a + \log\frac{[CH_3COONa]}{[CH_3COOH]}$$

$$5.74 = 4.74 + \log\frac{0.1\times V'}{0.1\times V}$$

$$5.74 - 4.74 = \log\frac{V'}{V}$$

$$1 = \log\frac{V'}{V}$$

$$\frac{V'}{V} = 10^1 \qquad \left(\because \begin{array}{c}\log_b a = x\\ a = b^x\end{array}\right)$$

$$\frac{V'}{V} = 10$$

$$\frac{V}{V'} = 1 : 10$$

5. Hydrogen Ion Concentration pH Scale

439. The pH of the solution containing 50mL each of 0.10 M sodium acetate and 0.01 M acetic acid is [Given pK_a of CH_3COOH = 4.57]

(a) 2.57 (b) 5.57
(c) 3.57 (d) 4.57

NEET-17.07.2022

Ans. (b) : According to Henderson equation,

$$pH = pK_a + \log\frac{[Salt]}{[Acid]}$$

$$= 4.57 + \log\frac{0.10}{0.01}$$

$$= 4.57 + \log(10)$$

$$= 4.57 + 1 = 5.57$$

440. Which among the following has highest pH?

(a) $1M\,H_2SO_4$ (b) 0.1M NaOH
(c) 1 M HCl (d) 1M NaOH

Karnataka CET-17.06.2022, Shift-II

Ans. (d) : For high value of pH we required max conc. of OH^- ion.

$$[OH]\uparrow = pH\uparrow$$

So, H_2SO_4 and HCl are acid.
0.1m NaOH = $[OH^-] = 10^{-1}$ m
1m NaOH = $[OH^-]$ = 1m
So, 1m NaOH has highest pH.

441. 50 mL of 0.1 M CH_3COOH is being titrated against 0.1 M NaOH. When 25 mL of NaOH has been added, the pH of the solution will be____$\times 10^{-2}$ (Nearest integer)
(Given : pK_a (CH_3COOH) = 4.76
log 2 = 0.30
log 3 = 0.48
log 5 = 0.69
log 7 = 0.84
log 11 = 1.04

JEE Main-26.06.2022, Shift-I

Ans. (476) :

$$CH_3COOH(aq) + NaOH(aq) \longrightarrow CH_3OONa(aq) + H_2O(l)$$

	CH_3COOH	$NaOH$	CH_3OONa	H_2O
Milli moles	5	2.5		
After reaction Milli moles	2.5	......	2.5	

Resultant solution is acidic buffer solution with some concentration of acid and salts.
So, pH of solution = 4.76 = 476 × 10^{-2}
Here x = 476
The pH of solution will be 476.

@apna_pdf

442. pH value of 0.001 M NaOH solution is______

JEE Main-27.06.2022, Shift-II

Ans. (11) : Given that,

$[OH^-] = 0.001$ M

$[OH^-] = 10^{-3}$ M

We know,

$pOH = -\log[OH^-]$

$= -\log[10^{-3}]$

$pOH = 3$

So, $pH + pOH = 14$

$pH + 3 = 14$

$pH = 11$

443. pH of a solution is 10. The number of hydrogen ions present per millilitre of solution is:

(a) 6.023×10^{23}
(b) 6.023×10^{13}
(c) 6.023×10^{10}
(d) 6.023×10^{7}

CG PET-22.05.2022

Ans. (c) : Given, pH = 10

$-\log[H^+] = 10$

$\log[H^+] = -10$

$[H^+] = 10^{-10}$ M

$$[H^+] = \frac{10^{-10}}{1000\ m^2} = 10^{-13}\ mL^{-1}$$

$\therefore$ No. of $[H^+]$ ions $= 10^{-13} \times N_A$

$= 10^{-13} \times 6.03 \times 10^{23}$

$= 6.023 \times 10^{10}$ ions

444. The pH of 0.05 M Solution of a strong dibasic acid is

(a) 0.0
(b) 1.0
(c) 0.2
(d) 0.5

CG PET- 2012

Ans. (b) : Given that-

Dibasic acid = H_2SO_4

$[H_2SO_4] = 0.05$

As we know $pH = -\log_{10}[H^+]$

$[H^+] = 2 \times 0.05$

$= 0.10$ or 10^{-1}

$pH = -\log_{10}[H^+]$

$= -\log_{10}[10^{-1}]$

$= +1 \log 10$

$pH = 1$

445. The pH of an aqueous solution of H_2O_2 is 6.0. Some chlorine is bubbled through this solution. The pH of the resultant solution will be.

(a) 6
(b) 7
(c) less than 6
(d) more than 7

AP-EAMCET (Med.)-1999

Ans. (c) : Hydrogen peroxide reacts with chlorine to form hydrochloric acid.

$$H_2O_2 + Cl_2 \rightarrow 2HCl + O_2$$

This increases the hydrogen ion concentration. Hence, pH will be less than 6.

446. 0.1 M HCl solution is diluted by 100 times. The pH of the solution so formed is ……..

(a) 4
(b) 1
(c) 2
(d) 3

AP-EAMCET-1991

Ans. (d) : When 0.1 M HCl solution is diluted 100 times, the molarity of solution will be $\frac{0.1}{100} = 0.001M$

HCl is strong electrolyte. It completely dissociates. Its hydrogen ion concentration will be 0.001 M.

$pH = -\log_{10}\left[H^+\right]$

$pH = -\log_{10}[0.001]$

$pH = 3\log_{10}10$

$pH = 3$

447. The pK_a of a certain weak acid is 4.0. What should be the [salt] to [acid] ratio, if we have to prepare a buffer with a pH = 5 using the acid and one of the salts?

(a) 4 : 5
(b) 5 : 4
(c) 10 : 1
(d) 1 : 10

AP-EAMCET-1991

Ans. (c) : Given that, pH = 5, $pK_a = 4$

According to Henderson equation for pH of an buffer is–

$$pH = pK_a + \log\frac{[salt]}{[acid]}$$

$$5 = 4 + \log\frac{[salt]}{[acid]}$$

$$1 = \log\frac{[salt]}{[acid]}$$

$$\therefore \quad \frac{[salt]}{[acid]} = 10:1$$

448. The pH of 10^{-2} M NaOH solution is ………..

(a) 2
(b) 12
(c) 10
(d) 4

AP-EAMCET-1992

Ans. (b) : Given that, $[OH^-] = 10^{-2}$ M

$$[H^+] = \frac{10^{-14}}{10^{-2}} = 10^{-12}$$

$\therefore$ $pH = -\log_{10}[10^{-12}] = 12$

449. If in 100 ml of an aqueous HCl of pH 1.00, 900 ml of more distilled water are added, the pH of the resultant solution will be

(a) 1.0
(b) 2.0
(c) 4.0
(d) 7.0

AP-EAMCET-1992

Ans. (b) : Given an aqueous HCl of pH = 1

we know that-

$pH = -\log[H^+]$

$pH = 1$

$H^+ = 10^{-1}$

When 900 ml water is added to 100 ml solution, total volume becomes 1000 ml. Thus the solution is diluted to 10 times. Hence the concentration will be one tenth of original concentration.

$[H^+] = 10^{-2}$.

$pH = -\log[H^+] = -\log 10^{-2} = 2.0$

450. The ionic product of water is 10^{-14}. What is the hydrogen ion concentration of a 0.1 M NaOH solution?

(a) 10^{-14}
(b) 14 M
(c) 13 M
(d) 10^{-13} M

AP-EAMCET-1994

@apna_pdf

Ans. (d) : As we know that,
$K_w = [H^+][OH^-]$
Given :-
$K_W = 10^{-14}$
$[OH^-] = 0.1 = 10^{-1}$

$$\therefore [H^+] = \frac{10^{-14}}{10^{-1}} = 10^{-13}\text{ M}$$

451. The pH of a 0.05 M solution of H_2SO_4 is
(a) 5 (b) 1
(c) 3 (d) 0.1

AP-EAMCET-1994

Ans. (b) : Given that,
$[H^+] = 0.05 \times 2 = 0.10$
$pH = -\log[H^+]$
$= -\log[0.1]$
$pH = 1$

452. The pH of a 0.001 M aqueous solution of sodium hydroxide will be
(a) 5.0 (b) 7.5
(c) 9.0 (d) 11.0

AP-EAMCET-1993

Ans. (d) : We know that NaOH is a strong electrolyte. It completely dissociates.
Thus, $[OH^-] = [NaOH] = 0.001$ M.
$pOH = -\log[OH^+] = -\log 10^{-3} = 3.0$
$pH = 14.0 - pOH = 14.0 - 3.0 = 11$

453. Urine normally has a pH of 6. If a patient eliminates 1.3 L of urine per day, how many moles of H^+ ions does he urinate?
(a) 1.3×10^{-3} (b) 1.3×10^{-6}
(c) 1.3×10^{-7} (d) 1.3×10^{6}

AP-EAMCET-1996

Ans. (b) : Given that,
pH of urine is = 6
$\therefore \quad [H^+] = 1 \times 10^{-6}$ mol/L
Volume of urine eliminated = 1.3 litre

$$[H^+] = \frac{\text{no. of moles}}{\text{volume}}$$

no. of moles $= 10^{-6} \times 1.3$
A patient eliminates 1.3L of urine per day then 1.3×10^{-6} mol/lit. of H^+ ions present.

454. The pH of the aqueous solution containing 0.49 g of H_2SO_4 in one litre is
(a) 2 (b) 1 (c) 1.7 (d) 0.3

AP-EAMCET-1997
AP – EAMCET - (Medical)-1997

Ans. (a) : Given that,
Weight of sulphuric acid (H_2SO_4) = 0.49 gm.

$$\therefore \text{ Molar concentration} = \frac{\text{Weight}}{\text{M.weight}}$$
$$= \frac{0.49}{98} = 0.005\text{ moles}$$

Since, H_2SO_4 contain 2 ionisable hydrogen ion,
Thus, $[H^+] = 2 \times 0.005 = 0.01$ M
$pH = -\log[H^+] = -\log(0.01)$
$pH = -\log_{10}[10^{-2}]$
$pH = 2\log 10$
$pH = 2$

455. The pH of a solution is increased from 3 to 6. Its H^+ion concentration will be
(a) Reduced to half
(b) Doubled
(c) Reduced by 1000 times
(d) Increased by 1000 times

AP-EAMCET-1998, 1996

Ans. (c) : Given that, $pH_1 = 3$, $pH_2 = 6$
$\therefore$ Change in pH $= pH_2 - pH_1$
$= 6 - 3 = 3$
Thus, the ratio of hydrogen ion concentration =

$$\frac{[H^+]_2}{[H^+]_1} = 10^{-3} = 0.001$$

Hence, hydrogen ion concentration should be decreased by 1000 times.

456. The pH of a 1 L solution is 2. It is diluted with water till its pH becomes 4. How many litres of water are added?
(a) 99 (b) 9
(c) 999 (d) 9.9

AP-EAMCET-1999

Ans. (a) : Given that,
$pH = 2$, $[H^+] = 10^{-2}$ M, $V_1 = 1$ litre
$pH = 4$, $[H^+] = 10^{-4}$ M, $V_2 = ?$
$\therefore \quad M_1V_1 = M_2V_2$
$10^{-2} \times 1 = 10^{-4} \times V_2$

$$V_2 = \frac{10^{-2}}{10^{-4}} = 100\text{ litre}$$

Therefore, 99 litre of water is added.

457. The pH of an aqueous solution of a salt is 10. The salt is
(a) NaCl (b) NH_4Cl
(c) CH_3COONa (d) $(NH_4)_2SO_4$

AP-EAMCET-1999

Ans. (c) : The pH of an aqueous solution of salt is 10 mean that salt of weak acid and strong base. The salt is CH_3COONa.
$CH_3COOH + NaOH \rightarrow CH_3COONa + H_2O$

458. The pK_a of a weak acid is 4.8. What should be the ratio of $\frac{[\text{acid}]}{[\text{salt}]}$, if a buffer of pH = 5.8 is required?
(a) 0.1 (b) 10
(c) 1 (d) 2

AP-EAMCET-2001

Ans. (a) : Given that, $pk_a = 4.8$, $pH = 5.8$
We know that,

$$pH = pK_a + \log\frac{[\text{salt}]}{[\text{acid}]}$$
$$5.8 = 4.8 + \log\frac{[\text{salt}]}{[\text{acid}]}$$

or $$\log\frac{[\text{salt}]}{[\text{acid}]} = 5.8 - 4.8 = 1.0$$

or $$\frac{[\text{salt}]}{[\text{acid}]} = 10 \Rightarrow \frac{[\text{acid}]}{[\text{salt}]} = \frac{1}{10} = 0.1$$

@apna_pdf

459. Which one of the following statements is correct?

(a) Bronsted-Lowry theory could not explain the acidic nature of BCl_3
(b) The pH of 0.01 M NaOH solution is 2
(c) The ionic product of water at 25ºC is 10^{-10} $mol^2\ L^{-2}$
(d) The pH of a solution can be calculated using the equation $pH = \log[H^+]$

AP-EAMCET-2002

Ans. (a) : According to Bronsted-Lowry theory proton doners are called acid (i.e. a compound from which a proton can be removed)
Bronsted-Lowry theory cannot explain the acidic nature of BCl_3.

460. 75 ml of 0.2 M HCl is mixed with 25 ml of 1 M HCl. To this solution, 300 ml of distilled water is added. What is the pH of the resultant solution?

(a) 1 (b) 2
(c) 4 (d) 0.2

AP-EAMCET-2002

Ans. (a) : Given that,
$V_1 = 75$ ml, $V_2 = 25$ ml, $V_3 = 300$ ml
$M_1 = 0.2$ M, $M_2 = 1$ M, pH = ?
$\therefore\ V = V_1 + V_2 = 75 + 25 = 100$ ml

$$M = \frac{V_1M_1 + V_2M_2}{V_1 + V_2}$$

$$M = \frac{75 \times 0.2 + 25 \times 1}{75 + 25} = 0.4\ M$$

$\therefore$ Total volume (V') = $V_1 + V_2 + V_3$
= 75 + 25 + 300 = 400 ml

Hence,
MV = M'V'
0.4 × 100 = M' × 400

$$M' = \frac{40}{100} = 0.1\ M$$

Concentration of HCl = 0.1 = 10^{-1}
$pH = -\log_{10}[H^+]$
$pH = -\log_{10}[10^{-1}]$
pH = 1

461. The pH of a solution of H_2O_2 is 6.0. Some chlorine gas is bubbled into this solution. Which of the following is correct?

(a) The pH of resultant solution becomes 8.0
(b) Hydrogen gas is liberated from resultant solution
(c) The pH of resultant solution becomes less than 6.0 and oxygen is liberated
(d) Cl_2O is formed in the resultant solution

AP-EAMCET-2005

Ans. (c) : $H_2O_2 + Cl_2 \rightarrow 2\ HCl + O_2$
HCl is formed by the reduction of chlorine by H_2O_2, Hence, pH less than 6.0 and oxygen gas is liberated.

462. Assertion (A) : The pH of a buffer solution containing equal moles of acetic acid and sodium acetate is 4.8 (pK_a of acetic acid is 4.8).
Reason (R) : The ionic product of water at 25ºC is 10^{-14} $mol^2\ L^{-2}$.
The correct answer is

(a) Both (A) and (R) are true and (R) is the correct explanation of (A)
(b) Both (A) and (R) are true and (R) is not correct explanation of (A)
(c) (A) is true but (R) is not true
(d) (A) is not true but (R) is true

AP-EAMCET-2005

Ans. (b) : According to the Henderson-Haselbalch a pH of a buffer solution is given by–

$$pH = pK_a + \log\frac{[salt]}{[acid]}$$

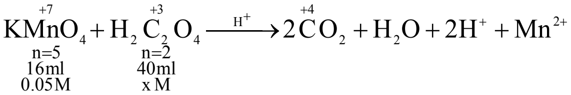
$\therefore\ pH = pK_a$ $\qquad (\because [salt] = [acid])$

463. The concentration of oxalic acid is 'x' mol L^{-1}. 40 mL of this solution reacts with 16 mL of 0.05 M acidified $KMnO_4$. What is the pH of 'x' M oxalic acid solution? (Assume that oxalic acid dissociates completely.)

(a) 1.3 (b) 1.699
(c) 1 (d) 2

AP-EAMCET-2006

Ans. (c) :



$$\underset{\substack{n=5\\16ml\\0.05M}}{K\overset{+7}{Mn}O_4} + \underset{\substack{n=2\\40ml\\x\,M}}{H_2\overset{+3}{C_2}O_4} \xrightarrow{H^+} 2\overset{+4}{C}O_2 + H_2O + 2H^+ + Mn^{2+}$$

$\therefore$ Molar equilibrium of $KMnO_4$ = M.eq. of $H_2C_2O_4$
16 × 0.05 × 5 = 2 × 40 × x

$$x = \frac{80 \times 0.05}{80} = 0.05\ M$$

Since, $[H^+] = 0.05 \times 2 = 0.1 = 10^{-1}$ M
$pH = -\log[H^+]$
$pH = -\log[10^{-1}]$
pH = 1

464. 50 mL of H_2O is added to 50 mL of 1×10^{-3} M barium hydroxide solution. What is the pH of the resulting solution?

(a) 3.0 (b) 3.3
(c) 11.0 (d) 11.7

AP-EAMCET-2008

Ans. (c) : $M_1 = 0.001$, $V_1 = 50$ ml, M_2 = ?
$V_2 = 50 + 50 = 100$ ml
Now, solving for M_2 we get,
$M_2 = 0.0005$
Now we will check the dissociation of $Ba(OH)_2$ –
$Ba(OH)_2 \rightarrow Ba^{2+} + 2OH^-$
1 mole of $Ba(OH)_2$ gives rise to 2 moles of OH^- ions.
Therefore, the concentration of hydroxide ions would be 2 times the concentration of solution of barium hydroxide.
$OH^- = 2 \times (0.0005) = 0.001$
pOH = –log (0.001)
pOH = 3
Therefore pH will be 14 – pOH
= 14 – 3
pH = 11

465. Which of the following is an acid?

(a) $Ca(OH)_2$ (b) $P(OH)_3$
(c) NH_4OH (d) NaOH

AP-EAMCET-2000

@apna_pdf

Ans. (b) : Proton donors are called as **acids**. In H_3PO_3 or $P(OH)_3$ it contains two ionisable proton and behave as acid.

- $Ca(OH)_2$, NH_4OH and NaOH are basic in nature. Sodium hydroxide is the strong base.

466. Among the following the lowest pK_a value is of
(a) 4- Methoxybenzoic acid
(b) Benzoic acid
(c) 4- Nitrobenzoic acid
(d) 4- Methylbenzoic acid

JHARKHAND – 2019

Ans. (c) : When the pK_a value is maximum then the acid is weak. While pK_a value is minimum means the stronger acid. Hence, the 4-Nitrobenzoic is a strong acid so, it has the lowest pK_a value.

467. A 0.20 molar solution of a weak monoprotic acid, HA, has a pH of 3.0. The ionization constant of the acid is
(a) 5.0 x 10^{-7} (b) 2.0 x 10^{-7}
(c) 5.0 x 10^{-6} (d) 5.0 x 10^{-3}

SCRA-2014

Ans. (c) : Let weak monoprotic acid is – CH_3COOH
The dissociation of CH_3COOH is :–

$$CH_3COOH \rightleftharpoons CH_3COO^- + H^+$$

Initial – 0.20 0 0
at equilibrium (0.20 – x) x x

$$HA = \frac{x^2}{(0.20-x)}$$

pH = 3, So, $H^+ = 10^{-3}$
$x = 10^{-3}$

$$K_a = \frac{(10^{-3})^2}{(0.20-10^{-3})} = \frac{10^{-6}}{.20-.001} = \frac{10^{-6}}{.199}$$

$$= \frac{1}{2} \times 10^{-5}$$

$$= .5 \times 10^{-5}$$

$K_a = 5 \times 10^{-6}$

468. pH of water is 7.0 at 25°C. If water is heated to 80°C :
(a) pH will increase
(b) pH will decrease
(c) pH remains 7.0
(d) H^+ ion concentration will increase but OH^- ion concentration will decrease

MPPET-2013

Ans. (b) :
- pH of water 0 is 7 at 25°C as temperature increases ionic product of water increase so pH decreases.

Note-On heating water K_W increases and thus pH scale for neutrality changes from 7 to some lower value.

469. Which of the following gas the highest pH at 25°C?
(a) Distilled H_2O (b) 1 M aq NH_3
(c) 1 M NaOH (d) 1M HCl

AP EAPCET 23-08-2021 Shift-I

Ans. (c) : (i) Distilled H_2O
Pure water has a pH of 7 at 25°C.
(ii) 1M aq NH_3
$pOH = -\log [OH^-]$
$= -\log [2\times10^{-3}]$
$pOH = 2.7$
Now, we know that
$pH + pOH = 14$
$pH = 14 - 2.7 = 11.3$
(iii) 1 M NaOH
$pOH = -\log [1]$
$= 0$
$\therefore pH + pOH = 14$
$pH = 14 - 0 = 14$
(iv) 1 M HCl
$pH = -\log[1]$
$pH = 0$
So, the option (c) has maximum pH at 25°C.

470. pH of an aqueous solution of NH_4Cl is
(a) 7 (b) > 7
(c) < 7 (d) 1

TS-EAMCET-2016

Ans. (c) : Ammonium chloride (NH_4Cl) is a salt of ammonia (NH_3) and HCl.

$$\underset{\text{(Weak base)}}{NH_3} + \underset{\text{(Strong acid)}}{HCl} \longrightarrow NH_4Cl$$

Therefore, the pH of $NH_4Cl < 7$.

471. Which of the following will have the highest pH?
(a) Saturated solution of NaOH
(b) M HCl solution
(c) Human Saliva
(d) Lemon Juice

AP EAMCET (Engg.) 17.09.2020, Shift-II

Ans. (a) :
(a) For saturated solution of NaOH pH = 15
(b) M HCl pH = 0
(c) Human saliva pH = 6.4
(d) Lemon Juice pH = 2.2
Hence, option (a) is correct.

472. The pH of 10^{-8} M HCl solution is
(a) 8 (b) –8
(c) Between 7-8 (d) Between 6-7

AP EAMCET (Engg.) 21.09.2020, Shift-I

Ans. (d) : 10^{-8} M HCl $\longrightarrow 10^{-8}$ M H^+
$K_w = [H^+] \times [OH^-]$
$10^{-14} = (10^{-8} + x) \times x = 10^{-8}x + x^2$
$x = 10^{-7}$
total $[H^+] = 10^{-7} + 10^{-8} = 1.1 \times 10^{-10}$
$pH = -\log (1.1 \times 10^{-7}) = 7 - \log 1.1$
$pH = 6.99$

473. The dissociation constant of a weak monobasic acid K_a is 1×10^{-5}. The pH of 0.1 M of that acid would be:
(a) 3 (b) between 2-3
(c) 1 (d) 5

AP EAMCET (Medical) -1998

Ans. (a): Given values, $K_a = 1 \times 10^{-5}$, pH = ?
Concentration = 0.1 M
Now, $pH = -\log[H^+]$

$$\left[H^+\right] = \sqrt{K_a \times M}$$

or $$\left[H^+\right] = \sqrt{1\times10^{-5} \times 0.1}$$

@apna_pdf

$$\left[H^+\right] = 1\times10^{-3}$$

$\therefore$ $$pH = -\log\left[1\times10^{-3}\right]$$

or $pH = 3$

474. Calculate the pH of a solution containing 0.2 M CH_3COOH and 0.1 M CH_3COONa. The K_4 of $CH_3COOH = 1.8\times10^{-5}$ ($-\log1.8\times10^{-5}$) = 4.74

(a) 4.74 (b) 4.43
(c) 5.01 (d) 5.32

TS EAMCET 10.08.2021, Shift-II

Ans. (b) : pH of acidic buffer solution

$$pH = pK_a + \log\frac{[salt]}{[Acid]}$$

Given that,

$$K_a = 1.8\times10^{-5}$$

$$pH = -\log K_a + \log\frac{[salt]}{Acid}$$

$$pH = -\log1.8\times10^{-5} + \log\frac{[0.1]}{[0.2]}$$

$= 5\log_{10}10 + -\log1.8 + \log0.5$

$= 5 - 0.2552 - 0.3010$

$= 4.74 - 0.3010 = 4.43$

475. Sulphurous acid (H_2SO_3) has $K_{a_1} = 1.7\times10^{-2}$ and $K_{a_2} = 6.4\times10^{-8}$. The pH of 0.588 M H_2SO_3 is ---------. (Round off to the Nearest Integer).

JEE Main 16.03.2021, Shift-II

Ans. (1) : The given data is:

$$K_{a_1} = 1.7\times10^{-2}$$

$$K_{a_2} = 6.4\times10^{-8}$$

and $[H_2SO_3] = 0.588M$

$pH = ?$

The dissociation of H_2SO_3 is:

$$H_2SO_3(aq) \rightleftharpoons H^+(aq) + HSO_3^-(aq)$$

The pH of solution depend upon the first value of dissociation constant i.e. $K_{a_1} >>> K_{a_2}$

$$K_{a_1} = \frac{\alpha^2}{(c-\alpha)}$$

$$\frac{1.7}{100} = \frac{\alpha^2}{(0.58-\alpha)}$$

or $100\alpha^2 + 1.7\alpha - 1 = 0$

or $$\alpha = [H^+] = \frac{-1.7\pm\sqrt{(1.7)^2 + 4\times100\times1}}{2\times100}$$

or $[H^+] = 0.09186$

$\therefore pH = -\log[H^+]$

$pH = -\log0.09186$

$pH = 1.036$

$pH \approx 1$

476. Calculate the molar ratio of a weak acid HA ($K_a = 10^{-6}$) and its salt with strong base, so that the pH of buffer solution is 6.

(a) 10 (b) 1
(c) 6 (d) 0.1

AP EAMCET (Engg.) 21.09.2020, Shift-II

Ans. (d) : $$pH = pK_a + \log\frac{[Salt]}{[Acid]}$$

$$= \frac{pH}{pK_a} = \frac{6}{6} = 1$$

$$\left[K_a = 10^{-6} \therefore pK_a = -\log K_a = \log\left(10^{-6}\right) \Rightarrow 6\right]$$

$$\log\frac{[Salt]}{[Acid]} = 1$$

$\therefore$ $$\frac{[Acid]}{[Salt]} = 10^{-1}$$

$$\frac{[Acid]}{[Salt]} = 0.1$$

Hence, the correct option is (d).

477. 20 ml of 0.1 M acetic acid is mixed with 50 ml of potassium acetate. Ka of acetic acid = 1.8×10^{-5} at 27°C calculate concentration of potassium acetate if pH of the mixture is 4.8

(a) 0.1 M (b) 0.04 M
(c) 0.4 M (d) 0.02 M

AP EAMCET (Engg.)-2009

Ans. (b): Let, the concentration of potassium acetate is x.

According to Henderson's equation,

$$pH = pK_a + \log\frac{[salt]}{[acid]}$$

$$4.8 = -\log(1.8\times10^{-5}) + \log\frac{x\times50}{20\times0.1}$$

$4.8 = 5\log_{10}10 - \log1.8 + \log25x$

$4.8 = 5 - 0.2552 + \log25x$

$4.8 = 4.74 + \log25x$

or $\log25x = 0.06$

$25x = 1.48$

$\therefore x = 0.045$ M

478. pH of a buffer solution decreases by 0.02 units when 0.12 g of acetic acid is added to 250 mL of a buffer solution of acetic acid and potassium acetate at 27°C. The buffer capacity of the solution is

(a) 0.1 (b) 10
(c) 1 (d) 0.4

AP EAMCET (Engg.)-2009
VITEEE-2009

Ans. (d): Buffer capacity, $\beta = \frac{dC_{HA}}{d_{pH}}$

where, dC_{HA} = no. of moles of acid added per litre

d_{pH} = change in pH

@apna_pdf

$$dC_{HA} = \frac{\text{Moles of acetic acid}}{\text{Volume}}$$

$$= \frac{0.12/60}{250/1000} = \frac{0.12\times1000}{60\times250} = \frac{0.12\times4}{60} = \frac{0.12}{15}$$

$$\beta = \frac{0.12}{0.02\times15} = \frac{6}{15} = 0.4$$

479. The pK_a of a weak acid, benzoic acid and pK_b of a weak base, ammonium hydroxide are 4.25 and 4.75 respectively. Then the pH of 0.1 M solution of ammonium benzoate will be

(a) 7.10 (b) 7.50

(c) 6.75 (d) 6.50

AP EAMCET (Engg.) 18.9.2020 Shift-I

Ans. (c) : Ammonium benzoate ($C_6H_5COONH_4$) is the salt weak benzoic acid (C_6H_5COOH pK_a = 4.25) and weak ammonium hydroxide (NH_4 OH, pK_b = 4.75).

So, pH of the solution of C_6H_5COOH will be,

$$pH = 7 + \frac{1}{2}(pK_a - pK_b)$$

$$= 7 + \frac{1}{2}(4.25 - 4.75) = 7 - 0.25 = 6.75$$

480. If hydrogen electrode dipped in two solutions of pH = 3 and pH = 6 are connected by a salt bridge, the emf of the resulting cell is

(a) 0.177 V (b) 0.3 V

(c) 0.052 V (d) 0.104 V

AP EAPCET 20.08.2021 Shift-I

Ans. (a) : Given that.

$pH_1 = 3$

$pH_2 = 6$

We know

$pH = -\log_{10}[H^+]$

$pH_1 = [3] = 10^{-3}$ M

$pH_2 = 10^{-6}$ M

$$\therefore \text{ E cell} = E^o \text{ cell}^\circ + \frac{0.0591}{1}\log\frac{10^{-3}}{10^{-6}}$$

E cell = 0 + 0.0591 × 3

= 0.177 V

481. The pH of acid rain water is ________

(a) Between 6 – 7 (b) Between 5.2 – 5.8

(c) Between 4 – 5 (d) < 4.0

AP EAPCET-6 Sep. 2021, Shift-II

Ans. (b): Due to atmospheric pollution, when the rain fall through this polluted air, it consume oxides of sulphur (SO_x) and oxides of nitrogen (NO_x). Thus make the rain acidic with the pH range 5.2 to 5.8.

482. Two solutions A and B have pH 3 and 6 respectively. Which of the following statement is correct?

(a) Solution A is twice acidic than B

(b) Solution B is twice acidic than A

(c) Solution A is 1000 times more acidic than B

(d) Solution B is 1000 times more acidic than A

AP EAPCET-6 Sep. 2021, Shift-II

Ans. (c): We know that–

$pH = -\log[H^+]$

Solution A: $[H^+] = 10^{-3}$ M

$pH = -\log[10^{-3}]$

$= 3$

Solution B: $[H^+] = 10^{-6}$ M

$pH = -\log[10^{-6}]$

$= 6$

483. In an amino acid, the carboxylic group ionizes at pH = 2.56 (pK_{a_2}) and ammonium ion ionizes at pH = 9.38 (pK_{a_2}) The isoelectric point of the amino acid is at ______

(a) 11.94 (b) 6.82

(c) 5.97 (d) 3.41

AP EAPCET 24.08.2021, Shift-I

Ans. (c) : The isoelectric point is defined as it is halfway between two given values of pKa_1 and pKa_2.

$$\text{i.e. isoelectric point} = \frac{pKa_1 + pKa_2}{2}$$

Given - $pKa_1 = 2.56$, $pKa_2 = 9.38$

$$\therefore \text{ isoelectic point} = \frac{2.56 + 9.38}{2} = 5.97$$

484. The pH of 0.1 M solution of acetic acid will be _____ [degree of dissociation of acetic acid is 0.0132]

(a) 4.32 (b) 3.14

(c) 1.14 (d) 2.88

AP EAPCET 20.08.2021 Shift-II

Ans. (d): Given that

Degree of dissociation of acetic acid = 0.0132

Concentration = 0.1 M

∴ Dissociation of acetic acid

$CH_3COOH + H_2O \rightarrow CH_3COO^- + H_3O^+$

So,

amount of H_3O^+ ions formed

= 0.0132 × 0.1

= 0.00132

So, pH of acetic acid will be,

$pH = -\log[H_3O^+]$

$= -\log[0.00132]$

pH = 2.88

485. The dissociation constant of a weak base is 1×10^{-5} at 25°C. The pH of its 0.1 M solution at the same temperature will be

(a) 11 (b) 3

(c) 6 (d) 13

COMEDK-2011

Ans. (a) : Given,

dissociation constant of weak base = 1×10^{-5}

concentration = 0.1 M

By Ostwald dilution law,

$[OH^-]$ in weak base $= \sqrt{K_bC}$

$$= \sqrt{1\times10^{-5}\times0.1} = 1\times10^{-3} \text{ M}$$

$pOH = -\log[OH^-]$

$= -\log(1\times10^{-3})$

pOH = 3

We know that–

$\Rightarrow pH + pOH = 14$

$\Rightarrow pH = 14 - 3 = 11$

@apna_pdf

486. The pH of a solution of NaOH is 12. The mass of NaOH present in 500 mL of the solution is

(a) 400 mg (b) 200 mg

(c) 20 mg (d) 40 mg

COMEDK-2011

Ans. (b) : Given that,

pH = 12

∵ pH + pOH = 14

pOH= 14–12=2

Hence, NaOH concentration = 10^{-2} M= 10^{-2} N

We know that, $N=\frac{w\times1000}{\text{Eq.wt}\times\text{Volume(mL)}}$

$$\Rightarrow 10^{-2}=\frac{w\times1000}{40\times500}$$

$$\Rightarrow w=\frac{10^{-2}\times40\times500}{1000}=10^{-2}\times20=0.2g=200mg$$

487. The pOH of 0.0005 M sulphuric acid is

(a) 5 (b) 3

(c) 11 (d) 12

COMEDK-2011

Ans. (c) : The equation for ionization is–

$$H_2SO_4 \rightleftharpoons 2H^+ + SO_4^{2-}$$

Each molecule of acid gives 2 molecules of H^+

So, $[H^+]$ = 2 ×0.0005= 1×10^{-3}M

pH= –log $[H^+]$= –log (1×10^{-3})=3

We know that-

∵ pH+pOH=14

3+pOH=14

pOH=14–3

pOH=11

488. The pH of HCl is 5. If 10 mL of this solution is diluted to 100 mL, the pH of the resultant solution is

(a) 5.1 (b) 6.9

(c) 11 (d) 12

COMEDK-2011

Ans. (b) : Given that,

pH of HCl=5

So, Concentration of $[H^+] = 10^{-5}$ mol/L

Concentration of H^+ ions in 10 ml of the solution

$$=\frac{10^{-5}\times10}{1000}$$

= 10^{-7} mol

We know that, solution is diluted to 100 ml i.e. 10 times

No. of H^+ ions = $\frac{10^{-7}}{10}=10^{-8}$

Total $[H^+]$= $10^{-8}+10^{-7}$

($[H^+]$ from water cannot be neglected.)

= 10^{-8} (1+10) = 11×10^{-8} M

pH= – log (11×10^{-8})= – (1.0413–8)=6.95

489. The pH of a mixture of 10 ml of 0.1 M H_2SO_4, 5 ml of 0.2 M HCl and 5 ml of 0.1 M $Ca(OH)_2$ is

(a) 1 (b) 0.5

(c) 0 (d) 1.5

COMEDK-2012

Ans. (a) : Molarity of mixture of 10 ml H_2SO_4 = 0.1M

= 1 millimole of H_2SO_4

= 2 millimole of H^+ ions

5 ml of 0.2 M HCl = 1 millimole of H^+ ions

5 ml of 0.1 M $Ca(OH)_2$ = 0.5 millimole of $Ca(OH)_2$

= 1 millimole of OH^- ions

1 millimole of OH^- ions will neutralize the 1 millimole of H^+ ions.

So, 2 millimoles of H^+ ions will remain in solution.

$[H^+]\ \frac{2}{20}$ = 0.1=10^{-1} mol/L

Hence, pH= –log $[H^+]$ = –log (10^{-1}) =1

490. The pH of boiling water is 6.4. This implies that boiling water is

(a) slightly basic (b) slightly acidic

(c) neutral (d) amphoteric.

COMEDK-2012

Ans. (c) : The pH of boiling water is 6.4. This implies that boiling water is neutral. When water is boiled, the dissociation of water increases with temperature. So, both hydrogen ion and hydroxide ion concentration increases with same extent. Therefore, it is neutral.

491. At 100°C the K_w of water is 55 times its value at 25°C, What will be the pH of neutral solution? (log 55=1.74)

(a) 7.00 (b) 7.87

(c) 5.13 (d) 6.13

Karnataka NEET-2013

Ans. (d) : We know that, at 25°C, $K_w = 1\times10^{-14}$

At 100°C, $K_w = 55\times10^{-14}$

$H^+ = \sqrt{55\times10^{-14}}$

pH= –log $[H^+]$

pH of neutral solution.

$$pH = -\log\left[\sqrt{55\times10^{-14}}\right]=\frac{1}{2}[-\log(55\times10^{-14})]$$

$$=\frac{1}{2}[-\log55+14\log10] \qquad (\log55=1.74)$$

$$=\frac{1}{2}[-1.74+14]$$

$$=\frac{1}{2}[12.26]=6.13$$

492. The numbers of H^+ ions present in 1 ml of a solution whose pH is 13

(a) 6.022×10^{10} (b) 6.022×10^{7}

(c) 6.022×10^{20} (d) 6.022×10^{23}

COMEDK-2015

Ans. (b) : Given that-

pH=13

$\Rightarrow [H]^+ = 10^{-13}$ mol/L

⇒ 1000 mL solution contains

$10^{-13}\times6.022\times10^{23}$ H^+ ions

= 6.022×10^{10} H^+ ions

∴ 1ml solution contains

$$\frac{6.022\times10^{10}}{1000}=6.022\times10^{7}\ H^+\ \text{ions.}$$

@apna_pdf

493. In the hydrolysis of a salt of weak acid and weak base, the hydrolysis constant (K_t) is equal to

(a) $\frac{K_w}{K_b}$ (b) $\frac{K_w}{K_a}$

(c) $\frac{K_w}{K_a.K_b}$ (d) $K_a.K_b$

COMEDK-2016

Ans. (c) : $K_h = \frac{K_w}{K_a.K_b}$

where, K_w= ionic product of water, K_a and K_b are dissociation constants of the weak acid and base respectively.

494. K_p for the following reaction will be equal to
$$Fe(s) + H_2O(g) \rightleftharpoons Fe_3O_4(s) + H_2(f)$$

(a) $\frac{(p_{H_2})^4 (p_{Fe_3O_4})}{(p_{Fe})^3 (p_{H_2O})^4}$ (b) $\frac{(p_{H_2})}{(p_{H_2O})}$

(c) $\frac{(p_{H_2})^4}{(p_{H_2O})^4}$ (d) $\frac{(p_{H_2})(p_{Fe_3O_4})}{(p_{Fe})}$

COMEDK-2016

Ans. (c) : The balanced equation is
$$3Fe(s) + 4H_2O(g) \rightleftharpoons Fe_3O_4(s) + 4H_2$$
Take [solid]=1 $\therefore K_p = \frac{(p_{H_2})^4}{(p_{H_2O})^4}$

495. The highest pH is exhibited by

(a) 0.001 M KOH (b) 0.01 M KOH

(c) 0.1 M HCl (d) 0.01 M HCl

COMEDK-2017

Ans. (b) : We know that,
pH + pOH = 14
pOH = –log[OH^-]
For 0.001 M KOH,
pOH = –log (0.001) = –log (10^{-3}) = 3
pH = 14 – pOH = 14 – 3 = 11
For 0.01M KOH,
pOH = – log (0.01) = –log(10^{-2}) = 2
pH = 14 – pOH = 14 – 2 = 12
For 0.1 M HCl
pH = – log (0.1) = – log (10^{-1}) = 1
pOH= –log(0.001)= –log(10^{-3}) =3
pH=14–pOH=14–3=11
For 0.01 M HCl,
pH= –log(0.01) = –log(10^{-2}) =2

496. 5 L of NaOH solution of pH 12 contains

(a) 200 g (b) 0.2 g

(c) 20 g (d) 2 g

COMEDK-2020

Ans. (d) : Given that,
pH of solution =12
We know, (pH + pOH = 14)
$\Rightarrow [OH^-] = 10^{-2}$ mol / L
pOH= 14 – 12 = 2
1 L contains 10^{-2} moles of OH^- ions.
$\therefore$ 5 L will contain 5×10^{-2} moles of OH^- ions.
We know that, no. of moles = $\frac{\text{weight}}{\text{mol} \times \text{mass}}$
$w = 5\times10^{-2}\times40 = 2g$

497. The pH of a solution having hydronium ion conc $H_3O^+; 6.2\times10^{-9}$ will be

(a) 9.0 (b) 8.9

(c) 5.0 (d) 8.21

COMEDK-2019

Ans. (d) : pH = –log[H^+]
[H^+] = [H_3O^+]
pH= –log [H_3O^+]
= – log (6.2×10^{-9})
$pH = 9\log_{10}10 + -\log 6.2$
$pH = 9 - 0.7925$
pH = 8.21

498. When solid potassium cyanide is added in water then

(a) pH will increase

(b) pH will remain the same

(c) pH will decrease

(d) electrical conductivity will not change.

COMEDK-2019

Ans. (a) : $\underset{\text{(Potassium cyanide)}}{KCN(aq)} \rightleftharpoons \underset{\text{(Potassium ion)}}{K^+} + \underset{\text{(Cyanide ion)}}{CN^-}$

$$\underset{\text{(Cyanide ion)}}{CN^-} + \underset{\text{(Water)}}{HOH} \rightleftharpoons \underset{\text{(Hydrogen cyanide)}}{HCN} + \underset{\text{(Hydroxyl ion)}}{OH^-}$$

In the process, the pH will increase due to increase in OH^- ion concentration.

499. The four acids A_1, A_2, A_3 and A_4 have the pK_a values of 3.75, 4.75, 4.20, 5.72 respectively. The weakest acid is

(a) A_1 (b) A_2

(c) A_3 (d) A_4

COMEDK-2018

Ans. (d) : Higher the pK_a value, weaker is the acid.
Hence pK_a values is maximum in A_4 So, It is the weakest acid.

500. The pH range of methyl red indicator is:

(a) 4.2 to 6.3 (b) 8.3 to 10.0

(c) 8.0 to 9.6 (d) 6.8 to 8.4

AP-EAMCET (Medical), 2001

Ans. (a) : In the titration of weak base-strong acid, methyl red indicator is used. In this titration, methyl red indicator gives red colour in acidic medium and yellow colour in alkaline medium. Thus, the pH range of methyl red indicator is 4.2 to 6.3

501. What will be pH of aqueous solution of electrolyte in electrolytic cell during electrolysis of $CuSO_4$(aq) between graphite electrodes?

(a) pH = 14.0 (b) pH > 7.0

(c) pH < 7.0 (d) pH = 7.0

GUJCET-2011

Ans. (c): The pH of aqueous solution of electrolyte in electrolytic cell during electrolysis of $CuSO_4$(aq) between graphite electrodes is pH < 7.0
At cathode

@apna_pdf

$Cu^{2+} + 2e^- \rightarrow Cu(s)$

At anode: $2H_2O \rightarrow O_2 + 4H^+ + 4e^-$

It can be seen that OH^- ions from the solution are converted to O_2 which left out the solution acidic.

502. The pH of ammonium phosphate solution, if pK_a of phosphoric acid and pK_b of ammonium hydroxide are 5.23 and 4.75 respectively, is _____.

JEE Main 26.02.2021,Shift-II

Ans.: Given that

$pK_a = 5.23$

$pK_b = 4.75$

$$(NH_4)_3PO_4 \rightleftharpoons 3NH_4^+ + PO_4^{3-}$$

$$\left[H^+\right] = K_a \times \sqrt{\frac{K_w}{K_a \times K_b}}$$

$$\therefore pH = pK_a + \frac{1}{2}\{pK_w - pK_a - pK_b\}$$

$$pH = 5.23 + \frac{1}{2}\{14 - 5.23 - 4.75\}$$

$$pH = 5.23 + \frac{1}{2} \times 4.02$$

$pH = 7.24$

$pH \approx 7$

504. Acetylsalicylic acid has pK_a value 3.5. The pH of gastric juice in human stomach is 2 – 3 and the pH in the small intestine is approximately 7. 4 then acetylsalicylic acid will be

(a) Unionized in the stomach and ionized in the small intestine

(b) Unionized in the small intestine and in the stomach

(c) Completely get ionized in both small intestine and stomach

(d) Ionized in the stomach and almost unionized in the small intestine

TS-EAMCET 09.08.2021, Shift-I

Ans. (a) : The pH of gastric juice in human stomach is about 2-3 (highly acidic) and acetyl salicylic acid is a weak acid, as such its ionization will be suppressed in the presence of a strong acid. Thus it will be weak acid, as such its ionization will be suppressed in the presence of a strong acid.

pH in small intestine is 8, basic, aspirin will be neutralized here.

505. Given below are two statements :

Statements I :

The pH if rain water is normally ~5.6.

Statements II :

If the pH of rain water drops below 5.6, it is called acid rain.

In the light of the above statements, choose the correct answer from the options given below :

(a) Both Statement I and Statement II are true.

(b) Both Statement I and Statement II are false.

(c) Statement I is true but Statement II is false.

(d) Statement I is false but Statement II is true.

JEE Main 25.02.2021, Shift-II

Ans. (a) : Normal rain has pH of about 5.6:

It is slightly acidic because carbon dioxide (CO_2) dissolves into it forming weak carbonic acid. Acid rain usually has pH between 4.2 and 4.4.

Acid rain results when sulphur oxide (SO_2) and nitrogen oxides (NO_x) emitted into the atmosphere react with rain water and oxygen.

506. pH of a salt solution of weak acid (pK_a = 4) & weak base (pK_b = 5) at 25 ºC is:

(a) 6.5
(b) 6
(c) 7
(d) 7.5

AIIMS 26 May 2019 (Evening)

Ans. (a): Given that,

$pK_a = 4, pK_b = 5$

then,

$$pH = \frac{1}{2}(pK_w + pK_a - pK_b)$$

$$= \frac{1}{2}(14 + 4 - 5)$$

$= 6.5$

507. The aqueous solution of which of the following salt will have the lowest pH?

(a) $NaClO_3$
(b) $NaClO$
(c) $NaClO_4$
(d) $NaClO_2$

AIIMS-1996

Ans. (c): Salt of SA + SB : pH will remain neutral at 7

Salt of SA + WB : pH < 7 (acidic)

Salt of WA +SB : pH > 7 (basic)

$NaClO_4 \Rightarrow$ Neutral (pH = 7)

$HClO_4 + NaOH \rightarrow NaClO_4 + H_2O$

(SA) (SB)

Where,

SA = strong acid

SB = strong base

WB = weak base

WA = weak acid

$NaClO_4$, on hydrolysis gives strongest acid $HClO_4$ as compared to other salt. This is strongly ionized and gives highest concentration of H^+ therefore, aqueous solution of $NaCl_4$ will have lowest pH value.

508. The pH value of human blood is about

(a) 4.5 to 5.6
(b) 2.3 to 3.4
(c) 7.3 to 7.5
(d) 3.5 to 4.3

AIIMS-1996

Ans. (c): Human blood is slightly basic i.e. pH 7.3 to 7.5 usually the body maintains the pH of blood close to 7.4 (pH = 7 is neutral)

509. The pH of 0.001 (N) acetic acid solution, which is 10% dissociated, is

(a) 3
(b) 1
(c) 4
(d) 2

AIIMS-1996

Ans. (c): Given that,

Concentration of acetic acid = 0.001 N for 10% dissociation,

the effective concentration of H^+ is 1/10th of total concentration.

@apna_pdf

Hence, effective concentration

$= \frac{1}{10} \times 0.001 = 0.0001\,N = 1 \times 10^{-4}N$

$pH = -\log[H^+]$
$pH = -\log[1\times10^{-4}]$
$= 4$

510. Assertion : In a titration of weak acid and NaOH, the pH at half equivalence point is pK_a.
Reason : At half equivalence point, it forms an acidic buffer and the buffer capacity is maximum where [acid] =[salt]

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both assertion and Reason are correct, but Reason is not the correct explanation of assertion.
(c) If Assertion if correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS-2009, 26 May,2018(M)

Ans. (a): $pH = pK_a + \log\frac{[A^-]}{[HA]}$

At the half-equivalence point say we have 10 moles of weak acid, and so there will be 5 moles of strong base as the name suggests (half equivalence).

$HA + OH^- \rightarrow A^- + H_2O$

for the half equivalent point, $[H.A] = [A^-]$

So, $pH = pK_a$

511. 20 mL of 0.1 M acetic acid is mixed in a solution of NaOH. If 10 mL of 0.1 M NaOH is present then H^+ concentration in resulting solution is (K_a of acetic acid = 1.7×10^{-5})

(a) 3.4×10^{-5} (b) 1.7×10^{-2}
(c) 1.7×10^{-5} (d) 1.7×10^{-7}

AIIMS-27 May,2018(M)

Ans. (c): Given, $K_a = 1.7 \times 10^{-5}$

Solution of NaOH = 20 ml

$CH_3COOH + NaOH \rightarrow CH_3COONa + H_2O$
20 × 0.1   10 × 0.1
2M mole   1M mole
1M mole   0   1M mole

We know that,

$$pOH = pK_b + \log\frac{salt}{acid}$$

Therefore,

$pH = pK_a$
$(H^+) = K_a = 1.7 \times 10^{-5}$ M

512. Which of the following have maximum pH?

(a) Black coffee (b) Blood
(c) Gastric juice (d) Saliva

AIIMS-26 May,2018(M)

Ans. (b): Material	**pH**
i. Black coffee	- 5.0
ii. Blood	- 7.4
iii. Gastric Juicev	- 1.8–2.0
iv. Saliva	- 6.8

513. K_{sp} of $M(OH)_2$ is 3.2×10^{-11}. The pH of saturated solution in water is

(a) 3.40 (b) 10.30
(c) 10.60 (d) 3.70

AP-EAMCET-(2014)

Ans. (c): $M(OH)_2 \rightarrow M^{2+} + 2OH^-$
[x]   [2x]

$K_{sp} = [x]\,[2x]^2$
$= 4x^3$
$3.2 \times 10^{-11} = 4x^3$
$0.8\times10^{-11} = x^3$
$x^3 = 8 \times 10^{-12}$
$x = 2 \times 10^{-4}$
$[OH] = 4 \times 10^{-4}M$
$pOH = -\log[OH^-]$
$= 4 - 2\log 2$
$= 4 - 2 \times 0.03$
$= 3.4$

We know,

$pH + pOH = 14$
$pH = 14 - 3.4$
$= 10.60$

514. The pH of blood does not appreciably change by a small addition of acid or a base because blood

(a) contains serum protein which acts as buffer.
(b) contains iron as a part of the molecule.
(c) can be easily coagulated.
(d) is body fluid.

AP-EAMCET-(2012)

Ans. (a): Blood is an example of buffer solution, which contains serum protein, its pH does not change appreciably by adding small amount of an acid or base to it. The Buffer System present in serum is H_2CO_3 + $NaHCO_3$

515. The pH of the solution obtained on neutralisation of 40 mL 0.1M NaOH with 40 mL 0.1 M CH_3COOH is

(a) 7 (b) 8
(c) 6 (d) 3

AP-EAMCET-(2007)

Ans. (b) : NaOH is a strong Base and CH_3COOH is a weak acid on neutralisation of 40 mL of 0.1 M NaOH with 40 mL of 0.1 M

$NaOH + CH_3COOH \rightarrow CH_3COONa + H_2O$

By above reaction CH_3COOH Na forms with give basic solutioh with pH > 7.

516. What is the pH value of 1 M H_2SO_4?

(a) 0 (b) –0.213
(c) –2 (d) –0.3010

AP-EAMCET-(2008)

Ans. (d) : $H_2SO_4 \rightarrow 2H^+ + SO_4^{2-}$
1M   2M   1M

By above reaction we get, $[H^+] = 2$

So, $pH = -\log[H^+] = -\log 2 = -0.3010$

517. 40 mL of 0.1 M ammonia solution is mixed with 40 mL of 0.1 MHCl. What is the pH of the mixture? (pK_b of ammonia solution is 4.74).

(a) 4.74 (b) 2.26
(c) 9.26 (d) 5.00

AP-EAMCET-(2006)

@apna_pdf

Ans. (c): Henderson - Haselbalch equation

$$\mathrm{pOH} = \mathrm{p}K_b + \log\left(\frac{\text{salt}}{\text{base}}\right)$$

$$\mathrm{pOH} = \mathrm{p}K_b + \log\left(\frac{NH_4Cl}{NH_3}\right)$$

At half stage of titration salt = Base

as $\mathrm{pOH} = \mathrm{p}K_b = 4.74$

So, $\mathrm{pH} = 14 - \mathrm{pOH} = 14 - 4.74 = 9.26$

518. When 10 mL of 0.1 M acetic acid ($\mathrm{p}K_a = 5.0$), is titrated against 10 mL of 0.1 M ammonia solution ($\mathrm{p}K_b = 5.0$), the equivalence point occurs at pH:

(a) 5.0 (b) 6.0 (c) 7.0 (d) 9.0

AP-EAMCET-(2005)

Ans. (c): $CH_3COOH + NH_4OH \rightarrow CH_3COONH_4 + H_2O$

Here, given that

$\mathrm{p}K_a = 5$

$\mathrm{p}K_b = 5$

$\mathrm{p}K_a = -\log K_a$ and $\mathrm{p}K_b = -\log K_b$

$$\mathrm{pH} = -\frac{1}{2}[\log K_a + \log K_w - \log K_b]$$

$$= -\frac{1}{2}[-5 + \log 10^{-14} - (-5)]$$

$$= -\frac{1}{2}[-5 - 14 + 5]$$

$$= -\frac{1}{2}\times(-14)$$

$$= 7$$

Thus, the end point or equivalence point is obtained at pH = 7 in neutral medium.

519. The pH value of N/10 NaOH is:

(a) 9 (b) 10 (c) 12 (d) 13

AP-EAMCET-(2001)

Ans. (d): $NaOH \rightarrow Na^+ + OH^-$

Normality of NaOH = molarity of NaOH = 0.1 M

$[OH^-] = 10^{-1}M$

$[H^+][OH^-] = 10^{-14}$

$\therefore$ $[H^+] = \dfrac{10^{-14}}{10^{-1}} = 10^{-13}m$

$\mathrm{pH} = -\log[H^+]$

$\therefore$ $\mathrm{pH} = -\log 10^{-13}$

$\therefore$ $\mathrm{pH} = 13$

520. A solution having hydrogen ion concentration 0.0005 g eqvt./litre, its pOH is:

(a) 8.2798 (b) 10.6990

(c) 12.7854 (d) 13.3344

AP-EAMCET-(2001)

Ans. (b): We know that $\mathrm{pH} = -\log[H^+] = -\log[5 \times 10^{-4}]$

$4 - \log 5 = 4 - [\log 10 - \log 2]$

$= 3 + \log 2 = 3.3010$

$\mathrm{pOH} = 14 - \mathrm{pH} = 14 - 3.3$

$= 10.6990$

Hence, pOH = 10.7

521. The pH of a solution containing 0.10 M sodium acetate and 0.03 M acetic acid is ($\mathrm{p}K_a$ for $CH_3COOH = 4.57$)

(a) 4.09 (b) 6.09

(c) 5.09 (d) 7.09

AP-EAMCET-(2000)

Ans. (c): According to Henderson's equation

$$\mathrm{pH} = \mathrm{p}K_a + \log\left(\frac{\text{salt}}{\text{acid}}\right)$$

$CH_3COOH + NaOH \rightarrow CH_3COONa + H_2O$

Given value,

$\mathrm{p}K_a = 4.57$

Sodium acetate concentration = 0.10 M

acetic acid concentration = 0.03 M

Putting the value we get

$$\mathrm{pH} = 4.57 + \log\frac{0.10}{0.03}$$

$\mathrm{pH} = 5.09$

522. Calculate the pOH of 0.10 M HC*l* solution.

(a) 13 (b) 1

(c) 7 (d) 14

AP EAPCET 19-08-2021, Shift-II

Ans. (a) : Given,

$[H^+] = 0.10M$

pOH =?

Formula $\mathrm{pH} = -\log[H^+]$

$$\mathrm{pH} = -\log\left[\frac{0.10}{100}\right]$$

$$\mathrm{pH} = -\log 1 + \log 10$$

$$\mathrm{pH} = 1$$

$\because \mathrm{pH} + \mathrm{pOH} = 14 \Rightarrow 1 + \mathrm{pOH} = 14 \Rightarrow \mathrm{pOH} = 13$

523. One litre of an aqueous solution has 3.65 g of HCl. If it is desired to increase the pH of the solution to 2 then H_3O^+ ion concentration present initially should be

(a) also doubled

(b) reduced to half

(c) increased by 10 times

(d) reduced by 10 times.

SRMJEEE – 2012

Ans. (d) : Given –

amount of aqueous solution = 1L

amount of HCl = 3.65g

Molar mass of HCl = 36.5

$$\therefore \text{ Molarity} = \frac{3.65}{36.5\times 1} = \frac{1}{10}\,M \qquad \text{....(i)}$$

$$\mathrm{pH} = -\log\left[\frac{1}{10}\right] = 1$$

Given – pH = 2

$= -\log_{10}[H^+] = 2$

$$\frac{1}{[H]^+} = 100$$

$$\text{or} \quad [H^+] = \frac{1}{100}\,M \qquad \text{....(ii)}$$

From equation (i) and (ii), it is clear that initially concentration reduced by 10 times.

@apna_pdf

524. Dissociation constant of a weak acid is 1×10^{-6} at 25°C. Find the pOH of 0.01 M of its aqueous solution.

(a) 4 (b) 3
(c) 10 (d) 12

SRMJEEE – 2012

Ans. (c) : Let HA be the weak acid. So the dissociation of weak acid HA is written as :

$$\begin{array}{lccc} & HA & \rightleftharpoons H^+ + & A^- \\ \text{Initial} & 0.01 & 0 & 0 \\ \text{equi.conc} & 0.01-0.01\alpha & 0.0 & 0.01\alpha \end{array}$$

Given :- $Ka = 1 \times 10^{-6}$

$pOH = ?$

$$\therefore \quad Ka = \frac{\left[H^+\right]\left[A^-\right]}{[HA]}$$

or

$$1\times10^{-6} = \frac{0.01\alpha\times0.01\alpha}{0.01(1-\alpha)} \qquad (\because \alpha <<<<1)$$

$$1\times10^{-6} = 0.01\times\alpha^2$$

or $\alpha^2 = 10^{-4}$

$\alpha = \sqrt{10^{-4}}$

or $\alpha = 10^{-2}$

$\therefore \quad [H^+] = \alpha \times 0.01 = 10^{-2} \times 0.01 = 10^{-4}$

Now, $pH = -\log [H^+]$

$pH = -\log [10^{-4}]$

$pH = 4$

$\because pH + pOH = 14$

$4 + pOH = 14$

$pOH = 14 - 4$

Hence, $pOH = 10$

525. A solution which is resistant to change of pH on addition of small amount of an acid or base is known as

(a) buffer solution (b) true solution
(c) isohydric solution (d) ideal solution.

SRMJEEE – 2016

Ans. (a) : A buffer solution is such type of solution in which after adding the small amount of acid or bases but no change in pH of the solution i.e. pH remains constant of solution. There is two type of buffer solution, acidic and alkaline buffers.

526. Calculate the pH of 0.1 M CH_3COOH solution. Dissociation constant of acetic acid is 1.8×10^{-5} M.

(a) 2.87 (b) 3.52
(c) 2.62 (d) 6.54

SRMJEEE – 2015

Ans. (a) : The dissociation of CH_3COOH is :

$$\begin{array}{lccc} & CH_3COOH & \rightleftharpoons CH_3COO^- & + H^+ \\ \text{Initially} & 0.1\ M & 0 & 0 \\ \text{Equili.Conc.} & 0.1-0.1\alpha & 0.1\alpha & 0.1\alpha \end{array}$$

$$\text{Now, } K_a = \frac{[CH_3COO^-][H^+]}{[CH_3COOH]}$$

$$1.8 \times 10^{-5} = \frac{0.1\alpha\times0.1\alpha}{0.1(1-\alpha)}$$

$$\text{or} \quad 1.8 \times 10^{-5} = \frac{0.1\times\alpha^2}{(1-\alpha)} \quad (\because \alpha<<<1)$$

$\therefore \quad \alpha^2 = 1.8 \times 10^{-4}$

$\alpha = \sqrt{1.8\times10^{-4}}$

$\alpha = 1.34 \times 10^{-2}$

Concentration of $H^+ = \alpha \times 0.1$

$[H^+] = 1.34 \times 10^{-2} \times 0.1$

$[H^+] = 1.34 \times 10^{-3}$

$\therefore \quad pH = -\log\left[1.34\times10^{-3}\right]$

$pH = -\left[\log 1.34 - 3\right]$

$pH = -\left[0.12 - 3\right]$

$pH = 2.87$

527. The pH of 0.05 M acetic acid is $\left(K_a = 2\times10^{-5}\right)$

(a) 2 (b) 11 (c) 10^{-3} (d) 3

AP-EAMCET- (Engg.)-2011

Ans. (d) : $CH_3COOH \rightleftharpoons H^+ + CH_3COO^-$

Given that, $K_a = 2\times10^{-5}$

$[CH_3COOH] = 0.05$ M

$$K_a = \frac{[H^+][CH_3COO^-]}{[CH_3COOH]} = \frac{[H^+]^2}{[CH_3COOH]}$$

$$[H^+] = \sqrt{K_a[CH_3COOH]}$$

$$= \sqrt{2\times10^{-5}\times0.05}$$

$$= \sqrt{10^{-6}}$$

$[H^+] = 10^{-3}$

$\because pH = -\log[H^+]$

$pH = -\log[10^{-3}]$

$\therefore pH = 3$

528. What is the pH of the NaOH solution when 0.04 g of it dissolved in water and made to 100 mL solution?

(a) 2 (b) 1
(c) 13 (d) 12

AP-EAMCET (Engg.) 2015

Ans. (d) : Given that, mass of solute = 0.04 gm

$$\text{Molarity} = \frac{\text{Mass of solute}}{\text{M. weight of solute}\times\text{Volume}}$$

$$= \frac{0.04\times1000}{40\times100}$$

$= 10^{-2}$

$\therefore \quad OH^- = 10^{-2}$ mol/litre

So, $pOH = -\log [OH^-]$

$pOH = -\log [10^{-2}] = 2$

We know that :

$pOH + pH = 14$

$pH = 14 - pOH$

$pH = 14 - 2 = 12$

@apna_pdf

529. The pH of 0.01 M solution of acetic acid is 5.0. What are the values of $[H^+]$ and K_a respectively?

(a) $1\times10^{-5}M, 1\times10^{-8}$ (b) $1\times10^{-5}M,\ 1\times10^{-9}$

(c) $1\times10^{-4}M, 1\times10^{-8}$ (d) $1\times10^{-3}M, 1\times10^{-8}$

AP-EAMCET- (Engg.) - 2010

Ans. (a) : Given,

pH of 0.01 M CH_3COOH solution =5

C= 0.01 M

$$\therefore \quad [H^+]=1\times10^{-pH}$$

$$=1\times10^{-5}\ \text{mol/L}$$

Since, acetic acid is a weak acid and for weak acid.

$$[H^+]=\sqrt{K_a\cdot C}$$

$$K_a=\frac{[H^+]^2}{C}=\frac{(1\times10^{-5})^2}{0.01}$$

$$K_a=1\times10^{-8}$$

Hence, the value of $[H^+]$ is 1×10^{-5} M and $K_a = 1\times10^{-8}$

530. The pK_a values of four carboxylic acids are given below. Identify the weakest carboxylic acid.

(a) 4.89 (b) 1.28

(c) 4.76 (d) 2.56

AP-EAMCET (Engg.) 2013

Ans. (a) : The more the value of pK_a compound will be less acidic indicating the less value of K_a. The weakest carboxylic acid is the carboxylic acid with $pK_a = 4.89$.

531. The pH of a buffer solution made by mixing 25 mL of 0.02 M NH_4OH and 25 mL of 0.2 mL NH_4Cl at 25°C is (pK_b of NH_4OH = 4.8)

(a) 5.8 (b) 8.2

(c) 4.8 (d) 3.8

AP-EAMCET (Engg.) 2013

Ans. (b) : Given that, $pK_b = 4.8$

As a mixture of weak base ammonium hydroxide and salt of ammonium chloride $pOH=pK_b+\log\frac{[NH_4Cl]}{[NH_3OH]}$

$$pOH=4.8+\log\frac{25\times0.2}{25\times0.02}$$

$$pOH=4.8+\log10=4.8+1=5.8$$

$$\therefore\ pH=14-pOH=14-5.8=8.2\ \text{(Base)}$$

532. 100 ml of 0.1 M H_2SO_4 is added to 200 ml of 0.1 M NaOH. What is the pH of the resulting mixture ?

(a) 2 (b) 7

(c) 10 (d) 12

AP - EAMCET (Medical) - 2007

Ans. (b) : Given data,

For H_2SO_4	For NaOH
V_1 = 100 mL	V_2 = 200 mL
Molarity = 0.1 M	Molarity = 0.1 M

$\therefore$ 0.1 M H_2SO_4 can be written as 0.2M H_2SO_4.

And 0.1 M NaOH can be written as 0.1 M NaOH.

Milliequivalent of acid = N_1V_1 = 0.2 × 100 = 20

Milliequivalent of base = $N_2 \times V_2$ = 0.1 × 200 = 20

Hence, both mixture is neutral and its pH is 7.

533. Calculate pH of a buffer prepared by adding 10 mL of 0.10 M acetic acid to 20mL of 0.1 M sodium acetate [pK_a (CH_3COOH) = 4.47]

(a) 3.00 (b) 4.44

(c) 4.74 (d) 5.04

VITEEE-2013

Ans. (d) : Given that

CH_3COOH = 0.1 M in 10 ml = 0.1×10 = 1.0

CH_3COONa = 0.1M in 20 ml = 0.1×20 = 2.0

pK_a = 4.47

From, Henderson Hassel balch equation,

$$pH=pK_a+\log\frac{[Salt]}{[acid]}$$

$$pH=4.74+\log\frac{2}{1}$$

$$pH=4.74+0.3010$$

pH = 5.04

534. 20 mL of 0.2 M NaOH is added to 50 mL of 0.2 M acetic acid. The pH of this solution after mixing is ($K_a = 1.8 \times 10^{-5}$)

(a) 4.5 (b) 2.3

(c) 3.8 (d) 4

VITEEE- 2011

Ans. (a) :

$$NaOH+CH_3COOH \rightleftharpoons CH_3COONa + H_2O$$

	NaOH	CH_3COOH	CH_3COONa	H_2O
Initial conc–	20 × 0.2 = 4	50 × 0.2 =10	0	0
After time –	(4–4) = 0	(10–4) = 6	4	4

Volume of solution (V) = 20+50 = 70 ml

$$[CH_3COONa]=\frac{n}{v}=\frac{4}{70}$$

Similarly

$$[CH_3COOH]=\frac{n}{v}=\frac{6}{70}$$

$$pH=\ PK_a+\log_{10}\frac{[Salt]}{[Acid]}$$

$$pH=-\log_{10}K_a+\log_{10}\frac{[CH_3COONa]}{[CH_3COOH]}$$

$$pH=-\log_{10}\left[1.8\times10^{-5}\right]+\log_{10}\left[\frac{4/70}{6/70}\right]$$

$$pH=5\log_{10}10+-\log_{10}1.8+\log_{10}\left[\frac{2}{3}\right]$$

$$pH=5\times1-0.2552+\log_{10}2-\log_{10}3$$

$$pH=5-0.2552+0.3010-0.4771$$

$$pH=5-0.2552-0.1761$$

$$pH=5-0.4313$$

$$pH=4.5$$

535. Which of the following is pH of solution formed by mixing 0.2 M NH_4Cl and 0.1 M NH_3? The pOH of ammonia solution is 4.75.

(a) 9.85 (b) 7.05

(c) 6.95 (d) 8.95

AMU-2019

@apna_pdf

Ans. (d) : It is pK_b of ammonia solution, $pK_b = 4.75$. It is a buffer solution.

$$pOH = pK_b + \log\left(\frac{\text{salt}}{\text{base}}\right)$$

$$pOH = 4.75 + \log\frac{0.2}{0.1}$$

$$pOH = 4.75 + \log 2$$
$$pOH = 4.75 + 0.30$$
$$pOH = 5.05$$
$$pH = 14 - pOH$$
$$pH = 14 - 5.05$$
$$pH = 8.95$$

536. The pH of a solution having the H^+ ion concentration of 1×10^{-4} ions/litre is

(a) 2 (b) 3
(c) 4 (d) 5

AP-EAMCET-(1999)

Ans. (c): As we know

$pH = -\log[H^+]$

Here, $pH = -\log 10^{-4}$

$pH = -(-4)\log 10$

$pH = 4$

537. The following cell has a potential of 0.27 V at 25^oC:

$$Pt_{(s)}|H_2(atm)|H^+(?M)||Ni^{2+}(1M)|Ni$$

What is the pH of the solution in anodic compartment?

(a) 2.6 (b) 5.9
(c) 8.9 (d) 5.3

AMU-2019

Ans. (c) : $E_{cell} = E^0_{cell} - \frac{0.0591}{2}\log\frac{[H^+]^2}{[Ni^{2+}]}$

$$0.27 = -0.25 - \frac{0.0591}{2}\log\frac{[H^+]^2}{1}$$

$$[\because E°Ni^{2+}/Ni = -0.25V]$$

$$0.52 = -0.0591\log[H^+]$$

$$-\log[H^+] = \frac{0.52}{0.0591}$$
$$= 8.7986$$
$$= 8.9$$

538. 0.0002 M solution of a weak acid has an equivalent conductance (Λ) 60 ohm^{-1} cm^2 eq^{-1}. What will be the pH? (Given $\overset{o}{\Lambda} = 400$ ohm^{-1} cm^2 eq^{-1}]

(a) 3.52 (b) 2.52
(c) 1.87 (d) 2.7

AMU-2018

Ans. (a) : C = 0.002 M

equivalent conductance, $\wedge = 60$ ohm^{-1} cm^2 equation, pH = 0

Molar conductance, $\overset{o}{\wedge} = 400$ ohm^{-1} cm^2 equation

Degree of dissociation, $\alpha = \frac{\wedge}{\overset{o}{\wedge}} = \frac{60}{400} = 0.15$

$$\alpha = \sqrt{\frac{K_a}{C}} = K_a = \alpha^2C = (0.15)^2 \times 0.002$$
$$= 4.5\times10^{-5}$$

$$[H^+] = \sqrt{Ka\times C} = \sqrt{4.5\times10^{-5}\times0.002}$$
$$= 3\times10^{-4}$$
$$pH = -\log[H^+] = -\log(3\times10^{-4})$$
$$= 3.52$$

539. What shall be the pH of a solution formed by mixing 10 mL of 0.1 M H_2SO_4 and 10 mL of $\frac{N}{10}$ KOH?

(a) 11.40 (b) 8.64
(c) 3.00 (d) 7.00

AMU-2014

Ans. (d) : Molar mass of KOH = 56g

Equivalent mass of KOH = 56g

Since there is no replaceable hydrogen hence molar mass is equal to equivalent of mass.

So, 1M KOH = 1N KOH

0.1M KOH = 0.1N KOH

Now given that 10ml of 0.1M H_2SO_4 and 10ml of 0.1N (0.1M) KOH is mixed.

No. of Milli moles of H_2SO_4 present = 10×0.1 = 1

No. of Milli moles of KOH present = 10×0.1 = 1

Since the no. of millimoles of both H_2SO_4 and KOH are equal, they neutralize each other.

Hence pH of the solution is 7.

Note : Official answer is (c).

540. A ten fold increase in the $[H^+]$ of a solution

(a) increases its pH by one unit
(b) decreases its pH by one unit
(c) increases its pH by 10 unit
(d) decreases its pH by 10 unit

AMU-2012

Ans. (b) : $pH_1 = -\log[H_1^+]$

$pH_2 = -\log[10H_1^+]$

$= -\log[H^+] - \log 10$

$= -\log[H^+] - 1$

$= pH_1 - 1$

541. The number of moles of $Ca(OH)_2$ that must be dissolved to make 250 mL solution in water of pH =10.65 is

(a) 5.6×10^{-5} (b) 6.5×10^{-5}
(c) 4.5×10^{-5} (d) 5.4×10^{-5}

AMU-2012

Ans. (a) : Given that,

pH = 10.65

We know that,

pH+pOH = 14

pOH = 14–pH

pOH = 14–10.65

pOH=3.35

$pOH = -\log_{10}[OH^-]$

$[OH^-]$= Antilog[–3.35]

$[OH^-] = 0.0004467$

$[OH^-] = 4.46\times10^{-4}$

@apna_pdf

We know that,

$Ca(OH)_2$ is diabasic acid

$$Ca(OH)_2 \to C\overset{++}{a} + 2OH^-$$

Normality (N) = $= \frac{[OH^-]}{2}$

$$[N] = \frac{4.46\times10^{-6}}{2}$$

$$[N] = 2.23\times10^{-4}$$

$$N = \frac{W}{E\times V}\times1000$$

$$W = \frac{NEV}{1000}$$

Number of moles $\left(\frac{W}{E}\right) = \frac{NV}{1000}$

Number of moles $\left(\frac{W}{E}\right) = \frac{2.23\times10^{-4}\times250}{1000}$

Number of moles $\left(\frac{W}{E}\right) = 0.5575\times10^{-4}$

$$\frac{W}{E} = 5.6\times10^{-5}$$

542. What shall be the pH of a weak acid of 10^{-3} M concentration which is only 10% ionized?

(a) 3	(b) 4
(c) 5	(d) 6

AMU-2010

Ans. (b) : Assuming that the acid is monobasic, for a weak acid,

$$pH = -\log\left(\frac{Ka}{\alpha}\right)$$

But $\left(\frac{Ka}{\alpha}\right) = C\alpha$

$\Rightarrow pH = -\log(C\alpha)$

Where, α= degree of dissociation.

Given, $C = 10^{-3}$ M and $\alpha = 0.1$

$\therefore\ pH = -\log(10^{-4}) = 4$

543. The pH of the solution produced by mixing equal volume of 2.0×10^{-3} M $HClO_4$ and 1.0×10^{-2} M $KClO_4$ is

(a) 2.7	(b) 2.3
(c) 3.0	(d) 1.0

AMU-2010

Ans. (c) : Given that initial concentration = 2×10^{-3}M

$$\underset{\text{Strong Acid}}{HClO_4} \to H^+ + ClO4^-$$

$$\underset{\text{Salt}}{KClO_4} \to K^+ + ClO4^-$$

Mixing of equal volume then concentration decreases.

$$[HClO_4]_{\text{initial conc.}} = 2\times10^{-3}$$

Volume = 2L

Number of moles of $HClO_4$ (n) = 2×10^{-3}

$$(HClO_4)_{\text{new conc.}} = \frac{\text{number of moles of } HClO_4}{\text{Volume}}$$

$$(HClO_4)_{\text{new conc.}} = \frac{2\times10^{-3}}{2}$$

$$[H^+] = 10^{-3}$$

$$pH = -\log_{10}[H^+]$$

$$pH = -\log_{10}[10^{-3}]$$

$$pH = 3\log_{10}10 \qquad [\because \log_{10}10 = 1]$$

$$pH = 3\times1$$

$$pH = 3$$

544. An aqueous solution whose pH is zero will be called as

(a) acidic	(b) basic
(c) netural	(d) amphoteric

AMU-2009

Ans. (a) : pH = 0, $[H^+] = 10^0$

It means the solution is strongly acidic.

Note: pH scale 0 to 14

- pH < 7 → solution is acidic
- pH > 7 → solution is basic
- pH = 7 → solution is netural

545. Which of the following solution has pH = 7 ?

(a) $NaNO_2 + H_2O$	(b) $Na_2CO_3 + H_2O$
(c) $NaCl + H_2O$	(d) $CH_3COONa + H_2O$

AMU-2008

Ans. (c) : The reaction between an acid and a base to from salt and water is termed neutralisation. A strong acid plus a strong base give a neutral solution because both are completely ionised and the reaction goes to completion.

$$H^+ + Cl^- + Na^+ + OH^- \to H_2O + Na^+ + Cl^-$$

for neutral salt the pH is given 7.

546. The pK_b value of NH_3 is 5. Calculate the pH of the buffer solution, 1L of which contains 0.01 M NH_4Cl and 0.10M NH_4OH.

(a) 4	(b) 6
(c) 8	(d) 10

AMU-2005

Ans. (d) : $pOH = pK_b + \log\frac{[\text{salt}]}{[\text{base}]}$

$$pOH = 5 + \log\ \frac{0.01}{0.1}$$

$= 5 + \log(0.1)$

$= 5 + \log_{10} 10^{-1}$

$= 5 + (-1) = 4$

$pH = 14 - pOH = 14 - 4 = 10$

547. The OH^- ion concentration of as solution having pH 2 is

(a) 1×10^{-2} M	(b) 1×10^{-9} M
(c) 1×10^{-12} M	(d) 1×10^{-7} M

AMU-2004

Ans. (c) : pH=2

$\therefore\quad [H^+]=10^{-2} \qquad (pH = -\log[H^+])$

Also, $\quad [H^+][OH^-]=10^{-14}$

[Ionic product of water $=10^{-14}$]

$$[OH^-] = \frac{10^{-14}}{[H^+]} = \frac{10^{-14}}{10^{-2}} = 1\times10^{-12}\,M$$

@apna_pdf

548. The term pH comes from

(a) "pure voiv hydrogen" which implies potential of hydrogen
(b) pure hydrogen content
(c) purity of hydrogen ions in solution
(d) name of the scientist associated.

AMU-2002

Ans. (a) : pH stands for potential of hydrogen. It represents the ratio of hydronium ions (H_3O) to hydroxide ions (OH). It is a measure of acidity and alkalinity of a solution. The pH scale usually ranges from 0 to 14.

549. Which of the following will have largest pH?

(a) $\frac{M}{100}$ NaOH (b) $\frac{M}{10}$ NaOH
(c) $\frac{M}{100}$ HCl (d) $\frac{M}{10}$ HCl

AMU–2001, BCECE-2003

Ans. (b) : $\frac{M}{10}$ NaOH Or $\frac{1}{10}$ NaOH

$pOH = -\log 10\left[OH^-\right]$

$pOH = -\log_{10}\left[\frac{1}{10}\right]$

$pOH = -\log 10\left[10^{-1}\right]$

$pOH = 1\log_{10} 10 \quad [\because \log_{10} 10 = 1]$

$pOH = 1 \times 1$

pOH = 1
pH + pOH = 14
pH +1 = 14
pH = 14–1
pH = 13

550. A certain buffer solution contains equal concentration of X^- and HX. The K_a for HX is 10^{-8}. The pH of the buffer is

(a) 3 (b) 8
(c) 11 (d) 14

Assam CEE-2014

Ans. (b) : We know that,

$K_a \times K_b = 10^{-14} \Rightarrow 10^{-8} \times K_b = 10^{-14}$

$K_b = 10^{-6}$

Where,

K_a = acid dissociation constant
K_b = base dissociation constant

$pH = -\log K_a + \log\frac{[salt]}{[acid]} \quad [\because [salt] = [acid]]$

$= -\log 10^{-8} + \log 1 = -\log 10^{-8} = 8$

$\boxed{pH = 8}$

551. The pH of a solution at 25 °C is 2. If the pH is to be doubled, then hydronium ion concentration should be

(a) doubled
(b) halved
(c) decreased by 100 times
(d) increased by 100 times

Assam CEE-2014

Ans. (c) : pH = 2

$pH = -\log [H^+]$

$2 = -\log [H^+] \Rightarrow [H^+] = 10^{-2}$ …..(i)

For pH = 4

$4 = -\log [H^+] \Rightarrow H^+ = 10^{-4}$ …..(ii)

From equation (i) and (ii), this $[H^+]$ conc. should decrease from 100 times.

552. An acid solution of pH = 6 is diluted 1000 times. The pH of the final solution becomes

(a) 6.99 (b) 6
(c) 3 (d) 9

Assam CEE-2018

Ans. (a) : $pH = 6 \Rightarrow pH = -\log [H^+]$

$H^+ = 10^{-6}$

After dilution $[H^+] = \frac{10^{-6}}{1000} = 10^{-9}$

$\therefore [H^+]$ from H_2O cannot be neglected

Total $[H^+] = 10^{-9} + 10^{-7}$

$= 10^{-7}(10^{-2} + 1)$

$= 10^{-7}(1.01)$

$pH = -\log(1.01 \times 10^{-7})$

$= 7 - 0.0043$

$= 6.9957$

553. pH of 10^{-8} M HCI solution is :

(a) 8 (b) between 7 and 8
(c) between 6 and 7 (d) between 8 and 9

Karnataka-CET-2013

JCECE - 2009, BCECE-2005

Ans. (c) : $[H^+][OH^-] = 10^{-14}$

$(10^{-8} + x) \times x = 10^{-14} \Rightarrow x \simeq 10^{-7}$

Total $[H^+] = 10^{-7} + 10^{-8} = 10^{-7}(1+0.4) = 1.1 \times 10^{-7}$

$pH = -\log [H^+] = -\log(1.1 \times 10^{-7}) = 7 - \log(1.1)$

pH = 6.98

554. Degree of dissociation of NH_4OH in water is 1.8×10^{-5}, then hydrolysis constant of NH_4Cl is :

(a) 1.8×10^{-5} (b) 1.8×10^{-10}
(c) 5.55×10^{-5} (d) 5.55×10^{-10}

BCECE-2004

Ans. (d) : $K_h =$

$K_b = 10^{-14}$

$K_w = 1.8 \times 10^{-5}$

$K_h = \frac{K_w}{K_b} = \frac{10^{-14}}{1.8 \times 10^{-5}}$

$= 0.555 \times 10^{-9}$

$= 5.55 \times 10^{-10}$

555. What is the pH of 0.01 m glycine solution ? For glycine,

$K_{a_1} = 4.5 \times 10^{-3}$ and $K_{a_2} = 1.7 \times 10^{-10}$

at 298 K?

(a) 3.0 (b) 10.0
(c) 6.1 (d) 7.1

AP-EAMCET-(2004)

Ans. (d): For glycine solution

$K = K_{a_1} \times K_{a_2} = 4.5 \times 10^{-3} \times 1.7 \times 10^{-10} = 7.74 \times 10^{-13}$

$[H^+] = \sqrt{K.C.}$

@apna_pdf

$= \sqrt{7.74\times10^{-13}\times0.01} = 8.79\times10^{-8}$

$pH = -\log[H^+]$

$pH = -\log[8.79\times10^{-8}]$

$pH = -[\log 10^{-8} + \log 8.7]$

$pH = 8 - 0.93 = 7.07 \approx 7.1$

556. Which of the following solutions will have pH = 9 at 298 K?

(a) 1×10^{-9}M HCI solution

(b) 1×10^{-5}M NaOH solution

(c) 1×10^{-9}M KOH solution

(d) Both (a) and (b)

BCECE-2008

Ans. (b) : 10^{-5} M NaOH $\rightarrow$ 10^{-5} M $[OH^-]$

$pOH = -\log[OH^-] = -\log(10^{-5}) = 5$

$pH = 14 - pOH = 14 - 5 = 9$

557. The pH of buffer of NH_4Cl type is given by

(a) $pH = pK_b$

(b) $pH = 1/2pK_b - 1/2 \log [salt]/[base]$

(c) $pH = 14 - pK_b - \log [salt]/[base]$

(d) $pH = pOH - pK_b + \log [salt]/[base]$

BCECE-2011

Ans. (c) : For basic buffer

$$pOH = pK_b + \log\frac{[salt]}{[base]}$$

$pH + pOH = 14$

$pOH = 14 - pH$

or $pH = 14 - pOH$

$$\therefore \quad pH = 14 - pK_b - \log\frac{[salt]}{[base]}$$

558. The pH value for 1/1000 N-KOH solution is

(a) 3 (b) 10^{-11}

(c) 2 (d) 11

BCECE-2010

Ans. (d) Normality = $\dfrac{1}{1000}$

Normality = molarity × valency factor

$\because$ valency factor = 1

Molarity = 10^{-3}

$[OH^-] = 10^{-3}$

$pOH = -\log[OH^-] = -\log(10^{-3}) = 3$

$pH = 14 - pOH = 14 - 3 = 11$

559. In the sample of soft drink, the concentration of H^+ ion is 3.8×10^{-3}M. Its pH is

(a) 2 (b) 2.42

(c) 3 (d) 3.42

BCECE-2012

Ans. (b) : $pH = -\log[H^+]$

$pH = -\log(3.8\times10^{-3})$

$pH = -\log 3.8 - \log 10^{-3}$

$pH = -0.5798 + 3$

$pH = 2.4202$

560. Calculate pH change when 0.01 mol CH_3COONa solution is added to 1L of 0.01 M CH_3COOH solution.

K_a (CH_3COOH) = 1.8×10^{-5}, pK_a=4.74)

(a) 3.37 (b) 1.37

(c) 4.74 (d) 8.01

BCECE-2013

Ans. (b)

$[H^+] = \sqrt{K_a\times c}$

$$pH = -\log[H^+] = \frac{1}{2}pK_a - \frac{1}{2}\log(c)$$

$$= \frac{1}{2}\times4.74 - \frac{1}{2}\log(0.01) = 3.37$$

$$pH = pK_a + \log\frac{[salt]}{[base]} = 4.74 + \log\frac{0.01}{0.01} = 4.74$$

$\Delta pH = 4.74 - 3.37 = 1.37$

561. pK_b of NH_3 is 4.74 and pK_b of A^-, B^- and C^- are 4, 5 and 6 respectively. Aqueous solution of 0.01 M has pH in the increasing order–

(a) $NH_4A < NH_4B < NH_4C$

(b) $NH_4C < NH_4B < NH_4A$

(c) $NH_4C < NH_4A < NH_4B$

(d) All have equal pH

BCECE-2013

Ans. (a)

$pK_a = -\log K_a$

Note: K_a → increases, pK_a → decreases

acidity → increases, pH → decreases

$$\boxed{K = c\alpha^2, \alpha = \sqrt{\frac{K}{c}}}$$

For NH_4A,

$$\alpha = \sqrt{\frac{10^{-4}}{0.01}} = 0.01$$

$[H^+] = 0.01\times0.1 = 10^{-3}$

$pH = -\log[H^+] = -\log(10^{-3}) = 3$

For NH_4B,

$$\alpha = \sqrt{\frac{10^{-5}}{0.01}} = 0.032$$

$[H^+] = 0.01\times0.032 = 3.2\times10^{-4}$

$pH = -\log(3.2\times10^{-4}) = 4 - 0.505 = 3.495$

For NH_4C,

$$\alpha = \sqrt{\frac{10^{-6}}{0.01}} = 0.01$$

$[H^+] = 0.01\times0.01 = 10^{-4}$

$pH = -\log(10^{-4}) = 4$

Increases order of pH values,

$$\boxed{NH_4A < NH_4B < NH_4C}$$

562. If the pK_a of a weak acid HA is 4.80 and the pK_b of a weak base BOH is 4.78. Then, the pH of an aqueous solution of the corresponding salt, BA will be–

(a) 8.23 (b) 9.41

(c) 7.01 (d) 5.91

BCECE-2015, [AIEEE-2010]

Ans. (c) : For weak acid & weak base

$$pH = 7 + \frac{1}{2}(pK_a - pK_b)$$

$$pH = 7 + \frac{1}{2}(4.8 - 4.78) = 7 + \frac{1}{2}\times0.02 = 7 + 0.01 = 7.01$$

@apna_pdf

563. 0.005 mol of $Ba(OH)_2$ is dissolved in 100 mL of water. Assuming complete ionisation of $Ba(OH)_2$ the pOH of the solution will be–

(a) 1	(b) 5
(c) 2	(d) 14

BCECE-2017

Ans. (a) : $Ba(OH)_2 \to Ba^{2+} + 2OH^-$

$$M = \frac{mol}{liter} = \frac{0.005}{100\times10^{-3}} = 0.05M$$

$[OH^-] = 2 \times 0.05 = 0.1$ M

pOH = –log [0.1]

pOH = –log $[10^{-1}]$

pOH = 1

564. What will be the pH of a solution by mixing 40 mL of 0.1M HCl with 10 mL of 0.45M NaOH?

(a) 12	(b) 10
(c) 8	(d) 6

BCECE-2018

Ans. (a) :

$$[OH^-] = \frac{M_{NaOH}\cdot V_{NaOH} - M_{HCl}\cdot V_{HCl}}{V_{NaOH}+V_{HCl}}$$

$$= \frac{(0.45\times10)-(0.1\times40)}{40+10}$$

$$= \frac{4.5-4}{50} = \frac{0.5}{50} = 10^{-2}$$

pOH = –log$[OH^-]$ = –log(10^{-2}) = 2

pH = 14 – pOH = 14 – 2 = 12

565. The correct method of finding the pH of a solution is to

(a) heat the solution in a test tube and expose the pH paper to the vapours formed.

(b) pour few drops of the solution from the test tube on the pH paper.

(c) drop the pH paper in the solution.

(d) put a drop of the solution on the pH paper using a dropper.

[BITSAT-2005]

Ans. (d) : For find the pH of a substance using pH paper. Dip the end of the pH strip into chemical or substance which is going to test, after a couple of second, remove the paper and compare the color of the pH strip to the color chart.

566. A little dilute hydrochloric acid is dropped on a pH paper. The colour of the pH paper turns to

(a) dark pink	(b) light green
(c) light blue	(d) bright yellow

[BITSAT-2008]

Ans. (c) : Dilute sodium bicarbonate is basic in nature and will show a change in color corresponding to the basic pH range in the standard litmus paper chart. The color of the pH paper turns blue. Blue color indicates that the solution is faintly basic in nature and as the solution is dilute it will not be a strongly basic solution. yellow and red color corresponds to the acidic range whereas violet corresponds to a strongly basic solution.

567. The pH of a solution is increased from 3 to 6; its H^+ ion concentration will be

(a) reduced to half

(b) doubled

(c) reduced by 1000 times

(d) increased by 1000 times

BITSAT 2011

Ans. (c) : Change in pH is $\Delta pH = pH_2 - pH_1 = 6 - 3 = 3$

Thus, the ratio of hydrogen ion concentration

$$\frac{[H^+]_2}{[H^+]_1} = 10^{-3} = 0.001$$

Hence, hydrogen ion concentration should be decreased by 1000 times.

568. The pOH value of a solution whose hydroxide ion concentration is 6.2×10^{-9} mol/liter is

(a) 8.21	(b) 6.21
(c) 7.75	(d) 7.21

BITSAT-2012

Ans. (a) : $[H^+] = 6.2 \times 10^{-9}$ mol/liter

pH = –log$[H^+]$ = – log(6.2×10^{-9}) = 9 – 0.81 = 8.19

569. The pH of 0.1 M solution of the following salts increases in the order :

(a) $NaCl < NH_4Cl < NaCN < HCl$

(b) $HCl < NH_4Cl < NaCl < NaCN$

(c) $NaCN < NH_4Cl < NaCl < HCl$

(d) $HCl < NaCl < NaCN < NH_4Cl$

BITSAT 2018

Ans. (b) : (i) $HCl \to \underset{0.1M}{H^+} + \underset{0.1M}{Cl^-}$

$\therefore [H^+] = 0.1M$

$pH = -\log[H^+] = -\log 0.1 = 1$

(ii) NaCl is a salt of strong acid and strong base so it is not hydrolysed and hence its pH is 7.

(iii) $NH_4Cl + H_2O \rightleftharpoons NH_4OH + HCl$

$\therefore$ The solution is acidic and its pH is less than that of 0.1 M HCl.

(iv) $NaCN + H_2O \rightleftharpoons NaOH + HCN$

$\therefore$ The solution is basic and its pH is more than that of 0.1 M HCl.

$\therefore$ Correct order for increase in pH is

$HCl < NH_4Cl < NaCl < NaCN.$

570. The degree of ionisation of decinormal solution of CH_3 COOH is 1.3%. If the log of 1.3 is 0.11, the pH of this solution is

(a) 2.89	(b) 3.89
(c) 4.89	(d) 0.89

CG PET-2008

Ans. (a) : Decinormal mean = $\frac{1}{10}$N

= 0.1 N

Degree of dissociation, $\alpha = 1.3\% = 1.3\times10^{-2}$

N = M × n-factor [$\because$ n-factor = 1]

$0.1 = M \times 1 \Rightarrow M = 0.1$ M

$[H^+] = \alpha C$

$= 0.1\times 1.3 \times 10^{-2} = 1.3 \times 10^{-3}$

pH = –log$[H^+]$ = –log(1.3×10^{-3}) = 3 – 0.11

pH = 2.89

@apna_pdf

571. A buffer solution is obtained by mixing 10 mL of 1.0M CH_3COOH and 20 mL of 0.5M CH_3COONa and it is diluted to 100 mL using distilled water. pK_a of CH_3 COOH is 4.76. The pH of this buffer solution is

(a) 2.76 (b) 3.76
(c) 4.76 (d) 0.76

CG PET-2008

Ans. (c) : The expression for the pH of the acidic buffer solution is as given below

$$pH = pK_a + \log\frac{[salt]}{[acid]}$$

$$pK_a = 47.6$$

$$[salt] = \frac{20\times0.5}{100} = 0.1M$$

$$[acid] = \frac{10\times1}{100} = 0.1\ M$$

Substitute value in the above equation

$$pH = 4.76 + \log\frac{0.1}{0.1} = 4.76$$

572. The pH values of 0.1 M solution of HCl, CH_3 COOH,NH_4Cl and CH_3COONa will have the order

(a) HCl<CH_3COOH<NH_4Cl<CH_3COONa
(b) CH_3COONa<NH_4Cl<CH_3COOH<HCl
(c) NH_4Cl<CH_3COONa<CH_3COON<HCl
(d) All will have same pH value

CG PET-2009

Ans. (a) : pH (0.1M CH_3COOH) = $\frac{1}{2}(pK_a - \log C)$

pH (0.1 M NH_4Cl) = $7 - \frac{1}{2}(pK_a - \log C)$

CH_3COONa solution is basic.

pH value increase,

Hence, (HCl)<(CH_3COOH)< (NH_4Cl) < (CH_3COONa).

573. A weak acid HX has dissociation constant 10^{-5}. The pH of 0.1 M solution of this acid will be

(a) 2 (b) 3
(c) 4 (d) 5

CG PET-2009

Ans. (b) : $[H^+] = \sqrt{K_a\times C} = \sqrt{10^{-5}\times0.1}$

$= \sqrt{10^{-6}} = 10^{-3}$

$pH = -\log[H^+] = -\log 10^{-3} = 3$

574. The number of moles of sodium acetate to be added to 0.1 M acetic acid for the buffer to have a pH= 4.7 is
[pK_a for acetic acid is 4.7]

(a) 0.2M (b) 0.4M
(c) 0.1M (d) None of these

CG PET-2016

Ans. (c) : ∵ $pH = pK_a + \log\frac{[salt]}{[acid]}$

Given,

pH = 4.7

pK_a = 4.7

$$4.7 = 4.7 + \log\left[\frac{salt}{0.1}\right]$$

∴ $\log[CH_3COONa] - \log(0.1) = 0$

$\log[CH_3COONa] - \log(10^{-1}) = 0$

$\log[CH_3COONa] + 1 = 0$

$\log[CH_3COONa] = -1$

∴ On taking antilog on both sides–

$[CH_3COONa]$ =0.1M

575. pH of a solution is 4. The hydroxide ion concentration of the solution would be

(a) 10^{-4} (b) 10^{-10}
(c) 10^{-2} (d) 10^{-12}

CG PET-2004

Ans. (b) : $pH = -\log[H^+] = 4$

Hence, $[H^+] = 10^{-4}$ M

But, $[H^+][OH^-] = 10^{-14}$

$10^{-4}\times[OH^-] = 10^{-14}$

$[OH^-] = 10^{-10}$

576. The pH of 10^{-7} M NaOH is

(a) 7.01 (b) between 7 and 8
(c) between 9 and 10 (d) greater than 10

CG PET-2005

Ans. (a) : The concentration of $[OH^-]$ ion in the NaOH 10^{-7}.

The formula is used as-

$pOH = -\log[OH^-]$

$pOH = -\log(10^{-7}) = 7$

pH = 14 – pOH = 14 – 7 = 7

577. Which of the following statement is correct?

(a) Basic nature increases on increasing pH
(b) Basic nature decreases on increasing pH
(c) Acidic nature increases on increasing pH
(d) None of the above

CG PET-2006

Ans. (a) : $pH = -\log[H^+]$

$pOH = -\log[OH^-]$ and pH +pOH = 14

As pH of solution decreases it mean concentration of H^+ increase, hence acidic nature increase. On the other hand if pH of solution increases concentration of OH^- also increases, so basic nature increases.

578. The pH of a soft drink is 3.92. The hydrogen ion concentration will be(given antilog 0.08=1.2)

(a) 1.96×10^{-2} mol L^{-1} (b) 1.96×10^{-3} mol L^{-1}
(c) 1.2×10^{-4} mol L^{-1} (d) 1.2×10^{-3} mol L^{-1}

CG PET-2015

Ans. (c) : pH = 3.92

∵ $pH = -\log[H^+]$

$3.92 = -\log[H^+] \Rightarrow [H^+] = 10^{-3.92} = 10^{(-4+0.08)}$

$[H^+] = 10^{-4}\times10^{0.08}$

$[H^+] = 10^{-4}\times1.2 = 1.2\times10^{-4}$ mol L^{-1}

579. The pOH of a solution is 6.0. its pH will be

(a) 6 (b) 8
(c) 0 (d) 14

CG PET-2010

Ans. (b) : We know that,

pH + pOH = 14

pH = 14 – pOH

pH = 14 – 6 = 8

@apna_pdf

580. The pH of the solution _________ during the electrolysis of dilute aqueous solution of $CuSO_4$

(a) First increases then decreases
(b) Decreases
(c) Remains constant
(d) Increases

GUJCET-2017

Ans. (b) : At anode : $2H_2O \rightarrow O_2 + 4H^+ + 4e^-$
At cathode : $Cu^{2+}(aq) + 2e^- \rightarrow Cu(s)$
Production of H^+ ions will decrease pH.

581. pH of 0.005 M calcium acetate (pK_a of $CH_3COOH = 4.74$) is

(a) 7.04 (b) 9.37
(c) 9.26 (d) 8.37

[AIEEE-2002]

Ans. (a) : $\underset{0.005M}{Ca(CH_3COOH)_2} \rightarrow Ca^{2+} + \underset{2 \times 0.005 = 0.01}{\underset{\downarrow}{2CH_3COO^-}}$

For weak acid & weak base,

$$pH = 7 + \frac{pK_a}{2} + \frac{\log c}{2}$$

$$pH = 7 + 2.37 + \log \frac{0.01}{2}$$

$$pH = 7 + 2.37 - 2 = 7.37 \approx 7.04$$

582. The pH of a 0.02 M NH_4Cl solution will be [Given K_b (NH_4OH) = 10^{-5} and log2 = 0.301]

(a) 4.65 (b) 2.65
(c) 5.35 (d) 4.35

[JEE Main-2019, 10 April shift-II]

Ans. (c) : Given, K_b (NH_4OH) = 10^{-5}
$pK_b = -\log K_b = -\log(10^{-5}) = 5$
C = concentration of salt solution = 0.02 M = 2×10^{-2} M
Now,

$$pH = 7 - \frac{1}{2}(pK_b + \log C)$$

On substituting the given values in above equation, we get,

$$= 7 - \frac{1}{2}\left[5 + \log(2 \times 10^{-2})\right]$$

$$= 7 - \frac{1}{2}\left[5 + \log 2 - 2\right]$$

$$= 7 - \frac{1}{2}\left[5 + 0.301 - 2\right] = 7 - 1.65 = 5.35$$

583. Hydrogen ion concentration in mol/L in a solution of pH = 5.4 will be

(a) 3.98×10^{-6} (b) 3.68×10^{-6}
(c) 3.88×10^{6} (d) 3.98×10^{8}

[AIEEE-2005]

Ans. (a) : pH = $-\log[H^+]$
$5.4 = -\log[H^+]$
H^+ = antilog $(-5.4) = 3.98 \times 10^{-6}$

584. Which one of the following Statements is not true?

(a) The conjugate base of $H_2PO_4^-$ is HPO_4^{2-}
(b) pH + pOH = 14 for all aqueous solutions at 25ºC
(c) The pH of 1×10^{-8} M HCl is 8
(d) 96,500 C of electricity when passed through a $CuSO_4$ solution deposits 1gm equivalent of copper at the cathode

[AIEEE-2003]

Ans. (c) : HCl is an acid so, its pH should be < 7
from acid $[H^+] = 10^{-8}$ M
from H_2O $[H^+] = 10^{-7}$ M
$\therefore$ Total $[H^+] = 10^{-8} + 10^{-7}$
So, pH = $-\log[H^+]$ = 6.95
Hence, the pH of 10^{-8} M HCl is not 8. It is 6.95. So, the correct options is c.

585. At 25ºC, the solubility product of $Mg(OH)_2$ is 1.0×10^{-11}. At which pH, will Mg^{2+} ions start precipitating in the form of $Mg(OH)_2$ from a solution of 0.001 M Mg^{2+} ions?

(a) 9 (b) 10
(c) 11 (d) 8

[AIEEE-2010]

Ans. (b) : Given, $K_{sp} = 1.0 \times 10^{-11}$
$[Mg^{2+}] = 0.001M$
$Mg^{2+} + 2OH^- \rightleftharpoons Mg(OH)_2$
$K_{sp} = [Mg^{2+}][OH^-]^2$

$$[OH^-] = \sqrt{\frac{K_{sp}}{[Mg^{2+}]}} = 10^{-4}$$

$\therefore$ pOH = 4 and pH = 10

586. pK_a of a weak acid (HA) and pK_b of a weak base (BOH) are 3.2 and 3.4 respectively. The pH of their salt (AB) solution is

(a) 7.2 (b) 6.9
(c) 7.0 (d) 1.0

[JEE Main-2017]

Ans. (b) : $pH = \frac{1}{2}(pK_w + pK_a - pK_b)$

$$pH = \frac{1}{2}(14 + 3.2 - 3.4)$$

$$pH = \frac{1}{2}(13.8)$$

pH = 6.9

587. How many litres of water must be added to 1 L of an aqueous solution of HCl with a pH of 1 to create an aqueous solution with pH of 2?

(a) 0.1L (b) 0.9L
(c) 2.0L (d) 9.0L

[JEE Main-2014]

Ans. (d) : At pH = 1
Concentration of $[H^+] = 10^{-2}M = 0.1$ M
at pH = 2
Concentration of $[H^+] = 10^{-2}$ M = 0.1 M
Now, Dilution formula
$M_1V_1 = M_2V_2$
0.1 M × 1L = 0.01 M × V_2
V_2 = 10 L
Volume of water = 10 – 1 = 9L

588. Consider the following statements.

I. The pH of a mixture containing 400 mL of 0.1M H_2SO_4 and 400 mL of 0.1M NaOH will be approximately 1.3.

@apna_pdf

II. Ionic product of water is temperature dependent.

III. A monobasic acid with $K_a = 10^{-5}$ has a pH = 5. The degree of dissociation of this acid is 50%.

IV. The Le-Chatelier's principle is not applicable to common-ion effect.

The correct statements are

(a) I, II and IV (b) II and III
(c) I and II (d) I, II and III

[JEE Main-2019, 10 April Shift-I]

Ans. (d) : (I) $H_2SO_4 + 2NaOH \rightarrow Na_2SO_4 + 2H_2O$

$400 \times 0.1 = 40 \quad 400 \times 0.1 = 40$

$20 \quad\quad 0$

$$\therefore [H^+] = \frac{20 \times 2}{800} = \frac{1}{20} \Rightarrow pH = -\log\left(\frac{1}{20}\right)$$

$\therefore$ pH = 1.3

So (I) is correct.

$$\text{(II)} \log\left(\frac{K_{w_2}}{K_{w_1}}\right) = \frac{\Delta H}{2.303R}\left[\frac{1}{T_1} - \frac{1}{T_2}\right]$$

So, ionic product of water is temperature dependent hence (II) is correct.

(III) $K_a = 10^{-5}$, pH $\Rightarrow [H^+] = 10^{-5}$

$$10^{-5} = \frac{10^{-5}.x}{(1-x)} \Rightarrow 1 - x = x \Rightarrow x = \frac{1}{2} = 50\%$$

So, (III) is correct.

(IV) Le-chatelier's principle is applicable to common-ion effect so option (IV) is wrong.

589. 20 mL of 0.1 M H_2SO_4 solution is added to 30 mL of 0.2 M NH_4OH solution. The pH of the resultant mixture is [pK_b of NH_4OH = 4.7]

(a) 9.3 (b) 5.0
(c) 9.0 (d) 5.2

[JEE Main-2019, 9 Jan Shift-I]

Ans. (c) : 20 ml 0.1 M $H_2SO_4 \Rightarrow \eta_{H^+} = 4$ M mol

30 ml 0.2 M $NH_4OH \Rightarrow \eta_{NH_4OH} = 6$ M mol

$$\begin{array}{lcccc} & NH_4OH + & H^+ \rightleftharpoons & NH_4^+ + & H_2O \\ \Rightarrow & 6 & 4 & 0 & 0 \\ \Rightarrow & 2 & 0 & 4 & 4 \end{array}$$

So, solution is a basic buffer

$$pOH = pK_b + \log\frac{NH_4^+}{NH_4OH}$$

$pOH = pK_b + \log 4/2$

$pOH = 4.7 + \log 2$

$pOH = 4.7 + 0.3 = 5$

$pH + pOH = 14$

$pH = 14 - 5 = 9$

590. For the following Assertion and Reason, the correct option is

Assertion (A) The pH of water increases with increase in temperature.

Reason (R) The dissociation of water into H^+ and OH^- is an exothermic reaction.

(a) Assertion is not true, but Reason is true.
(b) Both assertion and Reason are true and the Reason is the correct
(c) Both Assertion and Reason are false.
(d) Both Assertion and Reason are true, but the Reason is not the correct explanation for the Assertion.

[JEE Main-2020, 8 Jan Shift-II]

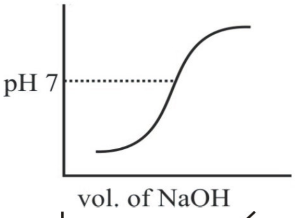
Ans. (c) : $H_2O \longrightarrow H^+ + OH^-$

Dissociation of H_2O is an endothermic reaction.

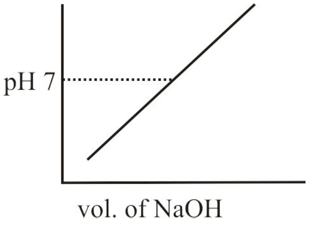
On increasing temperature $[H^+]$ ion concentration increase pH decrease.

591. 100 ml of 0.1M HCl is taken is a beaker and to it 100 mL of 0.1M NaOH is added in steps of 2 mL and the pH continuously measured. Which of the following graphs correctly depicts the change in pH?

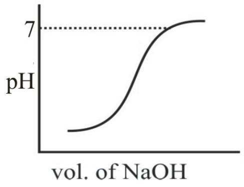
(a)



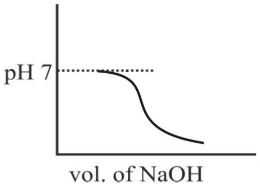
(b)



(c)

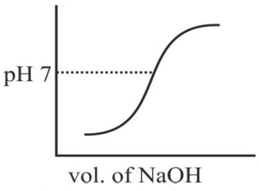


(d)



[JEE Main-2020, 3 Sep Shift-II]

Ans. (a) :



Rise in pH around the equivalence point for titration so strong acid with strong base.

592. A soft drink was bottled with a partial pressure of CO_2 of 3 bar over the liquid at room temperature. The partial pressure CO_2 over the solution approaches a value of 30 bar when 44 g of CO_2 is dissolved in 1 kg of water at room temperature. The approximate pH of the soft drink is ....$\times 10^{-1}$

@apna_pdf

(First dissociation constant of H_2CO_3=4.0×10^{-7}) log2 = 0.3; density of the soft drink = 1g mL^{-1}

[JEE Main-2020, 6 Sep Shift-I]

Ans. (37) : $CO_2 + H_2O \rightarrow H_2CO_3$

30 bar = 1 m/lit

3 bar = 0.1 m/lit

$H_2CO_3 \rightleftharpoons H^+ + HCO_3^-$

t = 0 0.1 0 0

eq. 0.1(1–α) 0.1α 0.1α

$$4\times10^{-7} = \frac{0.1\alpha^2}{1-\alpha}$$

∵ (1–α) = 1

$\alpha^2 = 4 \times 10^{-6}$

$\alpha = 2 \times 10^{-3}$

$[H^+] = 2 \times 10^{-4}M$

pH = –[–4 × log(2)] = 3.7 = 37 × 10^{-1}

593. Arrange the following solutions in the decreasing order of pOH.

(A) 0.01 M HCl (B) 0.01 M NaOH

(C) 0.01 M CH_3COONa (D) 0.01 M NaCl

(a) (A) > (C) > (D) > (B)

(b) (A) > (D) > (C) > (B)

(c) (B) > (C) > (D) > (A)

(d) (B) > (D) > (C) > (A)

[JEE Main-2020, 6 Sep Shift-I]

Ans. (b) : (i) 10^{-2}M HCl → $[H^+] = 10^{-2}$M → P^H = 2

(ii) 10^{-2}M NaOH → $[OH^-] = 10^{-2}$M → P^{OH} = 2

(iii) 10^{-2}M $CH_3COO^-Na^+$ → $[OH^+] > 10^{-7}$ → P^{OH} < 7

(iv) 10^{-2}M NaCl Neutral poH = 7

594. Two solutions, A and B, each of 100 L was made by dissolving 4 g of NaOH and 9.8 g of H_2SO_4 in water, respectively. The pH of the resultant solution obtained from mixing 40 L of solution A and 10 L of solution B is............

[JEE Main-2020, 7 Jan Shift-I]

Ans. (10.60) : Molarity of NaOH (4g in 100L) = 10^{-3}M

Molarity of H_2SO_4 (9.8g in 100L) = 10^{-3}M

Equivalent of

NaOH = M×V×n_f = 10^{-3}×40×1=0.04

Equivalent of

H_2SO_4 = M×V×n_f = 10^{-3}×10×2=0.02

$M_{NaOH}\times(n_f)_{NaOH}\times V_{NaOH} - M_{H_2SO_4}\times V_{H_2SO_4}\times(n_f)_{H_2SO_4} = M.V_{total}$

10^{-3}×40×1–10^{-3}×10×2=M.50

M=4×10^{-4}

pOH = –logM

= –log [4 × 10^{-4}]

= 4 – 2 log 2

= 3.4

pH = 14 – 3.4 = 10.6

595. Sulphurous acid (H_2SO_3) has K_{a_1} = 1.7 ×10^{-2} and K_{a_2} = 6.4 × 10^{-8}. The pH of 0.588 M is........(Round off to the nearest integer)

[JEE Main-2021, 16 March Shift-II]

Ans. (1)

$$\left.\begin{array}{ll} H_2SO_3 \rightleftharpoons H^+ + HSO_3^- & K_1 = 1.7\times10^{-2} \\ HSO_3^- \rightleftharpoons H^+ + SO_3^- & K_2 = 6.4\times10^{-8} \end{array}\right\} K_1 >> K_2$$

When we consider first ionization is dominating

$H_2SO_3 \rightleftharpoons H^+ + HSO_3^-$

At equilibrium C–Cα Cα Cα

Hence,

$[H^+] = C\alpha = \sqrt{K_1 \times C} = \sqrt{1.7\times10^{-2}\times0.588} = 0.9998\times10^{-1}$

∴ pH = 1 (Rounded figure)

596. The pH of ammonium phosphate solution, if Pk_a of phosphoric acid and pK_b of ammonium hydroxide are 5.23 and 4.75 respectively, is.......

[JEE Main-2021, 26 Feb Shift-II]

Ans. (7) : $pH = 7 + \frac{1}{2}(pK_a - pK_b)$

$= 7 + \frac{1}{2}(5.23 - 4.75)$

$= 7.24 \approx 7$

597. The pH of a solution obtained by mixing 50 mL of 1 M HCl and 30 mL of 1 M NaOH is x ×10^{-4}. The value of x is......... (Nearest integer) [log 2.5 = 0.3979]

[JEE Main-2021, 31 Aug Shift-II]

Ans. (6021) :

$HCl(aq.) + NaOH(aq.) \rightarrow NaCl(aq.) + H_2O(l)$

50ml,1M 30ml, 1M

t = 0 50ml 30ml

t = ∞ 20ml –

$[HCl] = \frac{20}{80} = \frac{1}{4}M = 2.5\times10^{-1}M$

pH = –log (2.5×10^{-1}) = 1–0.3979 = 0.6021

pH = 6021 × 10^{-4}

598. The pH of a solution containing 100 mg of sodium hydroxide in 250 mL of water is

(a) 12 (b) 13

(c) 14 (d) 11

J & K CET-(2016)

Ans. (a) : Molarity of solution

$= \frac{100\times10^{-3}\times1000}{40\times250}$

= 0.01 M = 10^{-2}M

pOH = –log[10^{-2}] = 2

pH + pOH = 14

∴ pH = 14 – 2 = 12

599. How much is the pH of human blood?

(a) 5.2 (b) 8.3

(c) 6.3 (d) 7.4

J & K CET-(2014)

Ans. (d) : pH range of human blood is 7.36 – 7.42.

600. The concentration of hydrogen ion in a sample of soft drink is 3.8 × 10^{-3}M. What is its pH?

(a) 3.84 (b) 2.42

(c) 4.44 (d) 1.42

J & K CET-(2014)

Ans. (b) : Given, $[H^+]$ = 3.8 × 10^{-3} m

pH= – log$[H^+]$

pH = –log [3.8 × 10^{-3}]

pH = –log3.8 + 3$\log_{10}$10

pH = – 0.5797 + 3

pH = 2.42 (pH value of soft drink)

@apna_pdf

601. What will be the pH at which precipitation of Zn $(OH)_2$ will take place from a solution containing 0.3 M Zn^{2+} ion? K_{sp} of Zn $(OH)_2$ = 1.2×10^{-12}

(a) 5.7 (b) 8.3
(c) 11.4 (d) 6.2

J & K CET-(2017)

Ans. (b) pH + pOH = 14

$Zn(OH)_2 \rightleftharpoons Zn^{2+} + 2\,OH^-$

$K_{sp} = [Zn^{2+}]\,[OH^-]^2$

$1.2 \times 10^{-12} = [0.3M]\,[OH^-]^2$

$[OH^-] = 2 \times 10^{-6}$

$pOH = -\log[OH^-] = -\log(2\times10^{-6}) = 5.699$

$pH = 14 - pOH = 14 - 5.699 = 8.3$

602. The hydroxyl ion concentration in a solution having pH value 3 will be.

(a) 10^{-11} (b) 10^{-7}
(c) 10^{-3} (d) 10^{-14}

J & K CET-(2019)

Ans. (a) :

pH = 3

pOH = 14 – pH = 14 – 3 = 11

$pOH = -\log[OH^-] \Rightarrow 11 = -\log[OH^-]$

$[OH^-] = 10^{-11}$

603. The pH of pure water at 90°C will be

(a) less than 7 (b) more than 7
(c) Equal to 7 (d) Cannot be predicted

J & K CET-(2019)

Ans. (a) : pH of water is 7 at 298 K temperature. At higher Temperature, H_2O dissociates more to give larger concentration of H^+ ions pH will be less than 7.

604. CH_3COOH is 1% ionised in its aqueous solution of 0.1M strength. Its pOH will be

(a) 11 (b) 3
(c) 13 (d) 2

J & K CET-(2019)

Ans. (a) : $CH_3COOH + H_2O \rightleftharpoons CH_3COO^- + H_3O^+$

Initial conc.	C	0	0
conc. at equi.	C–Cα	Cα	Cα

Thus, $[H^+] = C\alpha = 0.1\times0.01 = 0.001$ [α = 1%]

$= 10^{-3}M$

$= [OH^-]$

$= \frac{10^{-14}}{10^{-3}} = 10^{-11}$

= pOH = 11

605. 30 mL of 0.02 M ammonium hydroxide is mixed with 15 mL of 0.02 M HCl, what will be the pH of the solution (pK_b = 4.0)?

(a) 4 (b) 8
(c) 7 (d) 10

J & K CET-(2015)

Ans. (d) :

$$[OH^-] = \frac{M_{NaOH}\cdot V_{NaOH} - M_{HCl}\cdot V_{HCl}}{V_{NaOH} + V_{HCl}}$$

$$= \frac{(0.02\times30)-(15\times0.02)}{30+15}$$

$$= \frac{0.6-0.3}{45} = 0.0067$$

$pOH = -\log[OH^-] = -\log(0.0067) \simeq 2$

$pH = 14 - pOH = 14 - 2 = 12$

606 The $[OH]^-$ in a solution is 1 mol L^{-1}. The pH of the solution is

(a) 1 (b) 0
(c) 14 (d) 10^{-14}

J & K CET-(2013)

Ans. (c) :

$pOH = -\log[H^+] = -\log(1) = 0$

$pH = 14 - pOH = 14 - 0 = 14$

607. The pH of the solution formed by mixing 20 mL of 0.05 M H_2SO_4 with 5.0 mL of 0.45 M NaOH at 298 K is

(a) 6 (b) 2
(c) 12 (d) 7

J & K CET-(2011)

Ans. (c) : $H_2SO_4 = N_1 = M \times V_f = .05 \times 2 = .1N$

$NaOH = N_2 = 0.45\times1 = 0.45N$

$N_1V_1 = 0.1\times20 = 2$

$N_2V_2 = 0.45\times5 = 2.25$

$N_2V_2 - N_1V_1 = N(V_1+V_2)$

$2.25 - 2 = 0.25 = N\,(25)$

$N = 0.25/25 = 10^{-2}$

$[OH] = 10^{-2}$

$[H^+] = 10^{-14}/10^{-2} = 10^{-12}$

$pH = \log\,[H^+]$

pH= 12

608. What will be the resultant pH when 200 mL of an aqueous solution of HCl (pH=2.0) is mixed with 300 mL of an aqueous solution of NaOH (pH=12)?

(a) 2.699 (b) 13.30
(c) 11.3010 (d) 1.330

J & K CET-(2010)

Ans. (c) : For HCl,

$pH = 2, [H^+] = 10^{-2}$

mEq of HCl = $200\times10^{-2} = 2$

For NaOH,

$pH = 12, pOH = 2, [OH] = 10^{-2}$

mEq of NaOH = $300 \times 10^{-2} = 3$

After neutralization,

mEq of NaOH left = 3 – 2 = 1

$[OH^-] = \frac{1}{500} = 2\times10^{-3}$

$pOH = -\log[OH^-] = 3 - \log2 = 3 - 0.3010 = 2.699$

$pH = 14 - pOH = 14 - 2.699 = 11.301$

609. The solubility product of a sparingly soluble metal hydroxide $M(OH)_2$ at 298 K is 5×10^{-16} mole dm^{-9} The pH value of its aqueous and saturated solution is

(a) 5 (b) 9
(c) 11.5 (d) 2.5

J & K CET-(2009)

Ans. (b) : Given,

$K_{sp} = 5 \times 10^{-16}$

$M(OH)_2 \rightleftharpoons M^{2+} + 2\,0H^-$

@apna_pdf

We know that,

$K_{sp} = [A^+][B^-] = (S\ mol\ dm^{-3})(S\ mol\ dm^{-3})$

$= (S^2\ mol^2\ dm^{-6})$

$K_{sp} = (s)(2s)^2 = 4s^3 = 5 \times 10^{-16}$

$$\therefore s = \sqrt[3]{\frac{5\times10^{-16}}{4}} = \sqrt[3]{\frac{500\times10^{-18}}{4}} = 5 \times 10^{-6}$$

Concentration of OH^- = 2S = $2 \times 5 \times 10^{-6} = 10^{-5}$ mol dm^{-3} and pOH = $-\log[OH^-]$

$= -\log 10^{-5} = 5$

$\therefore$ pH = 14 – pOH = 14 – 5 = 9

610. Which one of the following aqueous solutions of salts has the lowest pH value?

(a) CH_3COONa (b) NaCl

(c) NH_4OOCCH_3 (d) NH_4Cl

J & K CET-(2009)

Ans. (d) : NH_4Cl is a salt of weak base (NH_4OH) and strong acid (HCl) thus undergoes cationic hydrolysis and provides H^+ ions that make the solution acidic i.e. pH is very less or less than 7.

$$NH4Cl + H2O\ \ \underset{\text{Weak base}}{NH4OH} + \underset{\text{Strong acid}}{HCl}$$

"or"

We know that,

pH = – log $[H^+]$

Strong acid will give more $[H^+]$

$$NH_4^+ + H_2O \longrightarrow NH_4OH + H^+$$

611. pH of an aqueous solution containing 10^{-8} mol/L of HCl is

(a) 8 (b) 10

(c) 6.96 (d) 12

J & K CET-(2008)

Ans. (c) : HCl is strong acid. All acids have a pH in the acid range that is to say below 7.

pH = $-\log[H^+] = -\log[10^{-8}] = 8$

Assuming an aqueous solution, have to factor in the pH of neutral water which is 7, since $[H^+]$ is 10^{-7}, as a source of protons as well.

Total proton molarity is $10^{-7} + 10^{-8} = 1.1\times10^{-7}$

pH = $-\log(1.1\times10^{-7}) = 6.96$

612. Calculate the pH of a solution in which hydrogen ion concentration is 0.005 gm equivalent/litre

(a) 2.3 (b) 2.8

(c) 2.9 (d) 2.6

J & K CET-(2007)

Ans. (a) : Given that $[H^+] = 0.005$

$$pH = -\log_{10}\left[H^+\right]$$

$$pH = -\log_{10}\left[0.005\right]$$

$$pH = -\log_{10}\left[5\times10^{-3}\right]$$

$$pH = -\log_{10}5 + 3\log_{10}10 \qquad [\because \log_{10}10 = 1]$$

$$pH = -0.6989 + 3\times1$$

$$pH = -0.6989 + 3$$

pH = 2.3

613. The pH of an aqueous solution having hydroxide ion concentration as 1×10^{-5} is

(a) 5 (b) 9

(c) 4.5 (d) 11

J & K CET-(2005)

Ans. (b) : Given,

$[OH^-] = 1 \times 10^{-5}$

pOH = $-\log[OH^-] = -\log[10^{-5}] = 5$

pH + pOH = 14

pH = 14 – 5 = 9

614. The pH of a buffer solution of 0.1 M NH_4OH [pK_b= 5.0] and 0.01 m NH_4 Cl is

(a) 1 (b) 7

(c) 10 (d) 13

TS EAMCET-2020

Ans. (c) : Buffer solution – A solution that can resist change in pH eg. Blood

From Hendesson equation,

$$pOH = pK_b + \log\frac{[NH_4Cl]}{[NH_4OH]}$$

$$pOH = pK_b + \log\frac{0.01}{0.1}$$

pOH = 5 + log (0.1) = 5 – 1 = 4

pH + pOH = 14

pH = 14 – pOH = 14 – 4 = 10

615. 50 mL of 0.1 M HCl and 50 mL of 0.2 M NaOH are mixed. The pH of the resulting solution is

(a) 1.30 (b) 4.2

(c) 12.70 (d) 11.70

J & K CET-(2004)

Ans. (c) : 50 ml of 0.1 M HCl is mixed with 50 ml of 0.2 M NaOH,

$N_1V_1 = N_2V_2$

$50 \times 0.1 = 0.2 \times x$

Therefore X = 25 ml.

Hence 25 ml of 0.2 M NaOH neutralizes 50 ml of 0.1 M HCl. Thus 25 ml of 0.2 M NaOH solution remains unreacted in the solution of the final volume of 100 ml.

Hence, conc. of NaOH in 100 ml = 0.05 M

pOH = –log (0.05)

pOH = 1.3010

pH = 14 – pOH = 14 – 1.3010 = 12.699 ≈ 12.70

616. If $[H^+]$ of a solution of pH = 6 is decreased to 100 times, the solution will be

(a) more acidic (b) basic

(c) neutral (d) of the same pH.

J & K CET-(2002)

Ans. (b) :

pH = – log $[H^+]$

$[H^+] = 10^{-pH}$

$[H^+] = 10^{-6}$

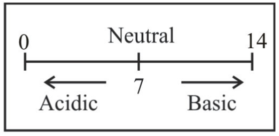
$= 1\times10^{-6}$

When $[H^+]$ is decreased by 100 times,

$$[H^+] = \frac{1\times10^{-6}}{100} = 10\times10^{-8}$$

pH = – log $[H^+]$

= – log $[10^{-8}]$ = 8



∴ The solution will be basic.

@apna_pdf

617. Slaked lime, $Ca(OH)_2$ is used extensively in sewage treatment. What is the maximum pH that can be established in $Ca(OH)_{2(aq)}$?
$Ca(OH)_{2(s)} \Leftrightarrow Ca^{2+}_{(aq)} + 2OH^-_{(aq)},$
$K_{sp} = 5.5 \times 10^{-6}$

(a) 1.66 (b) 12.3472
(c) 7.0 (d) 14.0

J & K CET-(2001)

Ans. (b) : Given,
Ksp = 5.5×10^{-6}

$$Ca(OH)2(s) \quad \underset{S}{Ca2+}\,(aq.) + \underset{2S}{2OH-}\,(aq.)$$

$$K_{sp} = [Ca^{2+}][OH^-]^2$$
$$= (s)\,(2s)^2$$
$$K_{sp} = 4s^3$$
$$5.5 \times 10^{-6} = 4s^3$$
$$s = \sqrt[3]{\frac{5.5\times10^{-6}}{4}} = 1.1 \times 10^{-2}\,M$$
$$\therefore \quad [OH^-] = 2s$$
$$= 2 \times 1. \times 10^{-2} = 2.2 \times 10^{-2}$$
$$pOH = -[\log(OH^-)]$$
$$= -\log(2.2 \times 10^{-2}) = 2 - 0.3424$$
$$= 1.6576$$
$$pH = 14 - pOH = 14 - 1.6576$$
$$= 12.3424$$

618. The pH of 0.1 N NaOH solution will be

(a) 0 (b) 1
(c) 7 (d) 13

J & K CET-(2001)

Ans. (d) : Given, Molarity of the solution is 0.1M

$$NaOH \rightarrow Na^+ + OH^-$$
$$Na^+ = 0.1\ N = 0.1M$$
$$OH^- = 0.1\ N = 0.1M$$
$$pOH = -\log[OH^-]$$
$$= -\log[0.1] = 1$$
$$pH + pOH = 14$$
$$pH = 14 - pOH = 14 - 1 = 13$$

619. If pH value of 0.1 mol L^{-1} HCl is nearly 1, then pH value of 0.05 mol L^{-1} H_2SO_4 is

(a) 0.5 (b) 1.0
(c) 0.05 (d) 2.00

J & K CET-(2000)

Ans. (b) : Normality of $H_2SO_4 = 0.05 \times 2 = 0.1$ N

$$\therefore \quad pH = -\log[H^+]$$
$$pH = -\log[10^{-1}]$$
$$pH = 1$$

620. Hydrogen ions, H^+ concentration in 0.5 M NaOH solution will be

(a) 0.5 M (b) 2×10^{-14} M
(c) 3.5×10^{-14}M (d) 5×10^{-14}M

J & K CET-(1998)

Ans. (b) : We know that,

$$[H^+]\,[OH^-] = 10^{-14}$$
$$[H^+] = \frac{10^{-14}}{[OH^-]} = \frac{10^{-14}}{0.5} = 2\times10^{-14}$$

621. pH-scale was proposed by:

(a) Arrhenius (b) Sorensen
(c) Pierre de Coubertin (d) none of the above

JCECE-2004

Ans. (b) : pH scale was proposed by Sorensen.

- Arrhenius – gave concept of acid and base
- Pierre de Coubertin –Father of modern Olympic games.

622. If pH of a solution is 4, then H^+ is :

(a) 10^4 (b) 10^{10}
(c) 10^{-4} (d) 10^{-10}

JCECE-2006

Ans. (c) : $pH = -\log[H^+]$

$$4 = -\log[H^+]$$
$$\log_{10}[H^+] = -4$$
$$[H^+] = 10^{-4}$$

623. The pH of a 0.001 M solution of HCl is

(a) 0 (b) 3
(c) 5 (d) 10

JCECE-2007, JIPMER – 2008

Ans. (b) : We know that,
pH = log (n factor × molarity)
Where, n factor is the no. of hydrogen atoms,
n factor in HCl = 1
So, $pH = -\log(1 \times 0.001)$
$= -\log(10^{-3})$
$pH = -(-3)$
$pH = 3$

624. A solution of an acid has $[H^+] = 2\times10^{-5}$. Find out the concentration of OH^- ions.

(a) 5×10^{-10} N (b) 4×10^{-10} N
(c) 2×10^{-5} N (d) 9×10^{-4} N

JCECE-2009

Ans. (a): Given, $[H^+] = 2\times10^{-5}$ $[OH^-] = ?$

$$\because \ [H^+]\times[OH^-] = 10^{-14}$$
$$\therefore \ 2\times10^{-5}\times[OH^-] = 10^{-14}$$
$$[OH^-] = \frac{10^{-14}}{2\times10^{-5}}$$
$$[OH^-] = 0.5\times10^{-9}$$
$$[OH^-] = 5\times10^{-10}$$

625. A solution contains 10 mL 0.1 N NaOH and 10 mL 0.05 N H_2SO_4, pH of this solution is

(a) less than 7 (b) 7
(c) zero (d) greater than 7

JCECE-2010

Ans. (d) :
Milliequivalent of NaOH = 10×0.1 = 1
Milliequivalent of H_2SO_4 = 10 × 0.05 = 0.5
Left milliequivalent of NaOH = 1 – 0.5 = 0.5 M

$$\therefore \ [OH^-] = \frac{0.5}{10+10} = 2.5\times10^{-2}$$

$pOH = -\log[OH^-] = -\log(2.5\times10^{-2}) = 1.6020$
$pH = 14 - pOH = 14 - 1.6020 = 12.398$
Therefore pH of the resulting solution will be greater than seven i.e. pH > 7 .

626. 20 mL of a HCl solution exactly neutralises 40 mL of 0.005 N NaOH solution. The pH of HCl solution is

(a) 2.5 (b) 2.0
(c) 1.5 (d) 1

JCECE-2011

@apna_pdf

Ans. (b) : For acid-base reaction,

$$\underset{\substack{\text{(acid)}\\ \text{HCl}}}{N_1V_1} = \underset{\substack{\text{(base)}\\ \text{NaOH}}}{N_2V_2}$$

$$20 \times N_1 = 40 \times 0.005$$

$$N_1 = \frac{40 \times 0.005}{20}$$

$$N_1 = 0.010 = 1 \times 10^{-2}$$

$$pH = -\log[H^+] = -\log(1 \times 10^{-2}) = 2.0$$

627. The pH value of an acid is 5 and its concentration is 1 M. What is the value of K_a for the acid?

(a) 10^{-7} (b) 10^{-5}

(c) 10^{-10} (d) 10^{-8}

JCECE-2012

Ans. (c) : Given, pH = 5 C = 1, K_a = ?

By using, $pH = -\log\sqrt{K_a.C}$

$$5 = -\log\sqrt{K_a \times 1} = -\frac{1}{2}\log K_a$$

$$\log K_a = -10$$

$$K_a = 10^{-10}$$

Hence, dissociation constant $(K_a) = 10^{-10}$.

628. Calculate pH of 1 M $NaHCO_3$. Given

$$\mathbf{H_2CO_3 + H_2O \rightleftharpoons HCO_3^- + H_3O^+;\ pK_1 = 6.38}$$

$$\mathbf{HCO_3^- + H_2O \rightleftharpoons CO_3^{2-} + H_3O^+;\ pK_2 = 10.26}$$

(a) 8.73 (b) 8.32

(c) 6.73 (d) 6.32

JCECE-2013

Ans. (b) : pH of 1 M $NaHCO_3$ is -

$NaHCO_3$ behaves as acid as well as base both because,

$$NaHCO_3 \rightleftharpoons Na^+ + HCO_3^-$$

Here HCO_3^- is behave proton accepter so act as acid and as well as HCO_3^- behaves as proton donar so act as base Hence,

$$pH = \frac{pK_1 + pK_2}{2} = \frac{6.38 + 10.26}{2} = 8.32$$

629. pH of 10^{-8} M NaOH is

(a) 8.0 (b) 6.0

(c) 6.98 (d) 7.04

JCECE - 2015

UPTU/UPSEE-2009

JIPMER-2004

Ans. (d) : For 10^{-8} M NaOH

$[OH^-] = 10^{-8} + 10^{-7}$

$= 11 \times 10^{-8}$

$pOH = -\log(OH^-)$

$= -\log 11 \times 10^{-8}$

$= 8 - 1.04 = 6.96$

$pH = 14 - 6.96 = 7.04$

630. When 750 mL of 0.5 M HCl is mixed with 250 mL of 2M NaOH solution, the value of pH will be

(a) pH = 7 (b) pH > 7

(c) pH < 7 (d) pH = 0

JIPMER-2017

Ans. (b) : $n_{HCl} = M_{HCl} \times V_{HCl}$ and $n_{NaOH} = M_{NaOH} \times V_{NaOH}$

Where, n = No. of moles, M = Molarity

V = Volume

$\therefore n_{HCl} = 0.5 \times 750 = 375$ milimoles

$n_{NaOH} = 2.0 \times 250 = 500$ milimoles

$\because n_{NaOH} > n_{HCl}$

The solution is basic and has pH > 7

631. The pK_a of acetic acid and pK_b of ammonium hydroxide are 4.76 and 4.75 respectively. Calculate the pH of ammonium acetate solution.

(a) 6.02 (b) 7.005

(c) 8 (d) 5.602

JIPMER-2013

Ans. (b) : Givne, pKa = 4.76

pKb = 4.75

When a weak acid and a weak base are mixed to form a solution, then the required solution has pH according to formula given below-

$$pH = 7 + \frac{1}{2}(pK_a - pK_b)$$

$$pH = 7 + \frac{1}{2}(4.76 - 4.75)$$

$$pH = 7 + 0.005$$

$$pH = 7.005$$

632. The pH value of 0.001 M aqueous solution of NaCl is

(a) 7 (b) 4

(c) 11 (d) unpredictable

JIPMER-2012

Ans. (a) : NaCl is salt made from the neutralization reaction of NaOH and HCl both of which are strong electrolyte. Therefore, NaCl is a neutral salt i.e. there is no acidic or basic character in the salt when dissolved in water it doesn't change the pH of the solution. Hence, it will remain neutral i.e. pH = 7.

NaCl = 0.001

$$NaCl \longrightarrow Na^+ + Cl^-$$

$$\underset{\text{Strong base}}{NaOH} + \underset{\text{Strong acid}}{HCl} \quad NaCl + H2O$$

633. Which of the following is correct?

(a) The pH of one litre solution containing 0.49 g of H_2SO_4 is 2.0

(b) The conjugate base of H_2S is S^{2-}

(c) BF_3 is a Lewis base

(d) Phenolphthalein is colourless in basic medium

JIPMER-2009

Ans. (a) : Given that, W = 0.49g

Molecular mass (M) of H_2SO_4 = 98g

Number of moles (n) = $\frac{W}{M}$

Number of moles (n) = $\frac{0.49}{98}$

Number of moles (n) = 0.005

Number of moles (n) = 5×10^{-3}

$$H_2SO_4 \rightarrow 2H^+ + SO_4^{--}$$

$$\left[H^+\right] = 2 \times 5 \times 10^{-3}$$

$$\left[H^+\right] = 10 \times 10^{-3}$$

$$[H^+] = 10^{-2}$$

@apna_pdf

Then,

$pH = -\log 10\left[H^+\right]$

$pH = -\log_{10}\left[10^{-2}\right]$

$pH = 2\log_{10}10 \quad (\because \log_{10}10 = 1)$

$pH = 2\times 1$

$pH = 2$

634. What is the correct relationship between the pHs of isomolar solutions of sodium oxide (pH_1), sodium sulphide (pH_2), sodium selenide (pH_3) and sodium telluride (pH_4)?

(a) $pH_1 > pH_2 \approx pH_3 > pH_4$
(b) $pH_1 < pH_2 < pH_3 < pH_4$
(c) $pH_1 < pH_2 < pH_3 \approx pH_4$
(d) $pH_1 > pH_2 > pH_3 > pH_4$

JIPMER-2007

Ans. (d) : $pH_1 > pH_2 > pH_3 > pH_4$
Acidic character increases in the order
$H_2O < H_2S < H_2Se < H_2Te$
Basic character of conjugate bases will be in the order
$O^{2-} > S^{2-} > Se^{2-} > Te^{2-}$
More the basic character, more the pH
$\therefore$ pHs are in the order
$pH_1 > pH_2 > pH_3 > pH_4$.

635. Given pH of a solution A is 3 and it is mixed with another solution B having pH 2. If both mixed then resultant pH of the solution will be:

(a) 3.2 (b) 1.9
(c) 3.4 (d) 3.5

JIPMER-2006

Ans. (b) : Given,
pH of A = 3 pH of B = 2
$\therefore \quad [H^+] = 10^{-3}m,\ [H^+] = 10^{-2}m$
Total $[H^+]$
$= 10^{-3} + 10^{-2} = 10^{-3} + 10 \times 10^{-3}$
$= 11 \times 10^{-3}$
$pH = -\log_{10}[H^+] = -\log(11 \times 10^{-3})$
$= 3 - \log 11 = 3 - 1.04 = 1.96$

636. NaOH(aq), HCl(aq) and NaCl(aq) concentration of each is 10^{-3} M. Their pH will be respectively

(a) 10, 6, 2 (b) 11, 3, 7
(c) 10, 3, 7 (d) 10, 4, 7

JIPMER-2005

Ans. (b) : Given,
OH^- ion concentration is 10^{-3}M
We know that,
$[H^+][OH^-] = 10^{-14}$

$$[H^+] = \frac{10^{-14}}{10^{-3}}$$

$[H^+] = 10^{-11}$
$\because \quad pH = -\log[H^+] = [-\log 10^{-11}]$
$pH = 11$
Similarly,
pH of HCl $= -\log\ [H^+]$
$= -\log\ [10^{-3}]$
$= 3$
pH of NaCl=7

637. The pH of a 10^{-10} M–NaOH solution is

(a) 10 (b) 7.01
(c) 6.99 (d) 4

JIPMER-2005

Ans. (b) : At 25°C concentration of OH^- ions is 10^{-7} m, as present in water.
But the concentration in this case is given as of (OH^-) $(10^{-7} + 10^{-10})m = 1.001 \times 10^{-7}$
Now, $pOH = -\log[OH^-] = -\log(1.001 \times 10^{-7})$
$= 7 - \log(1.001) = 7 - 0.00043 \approx 6.99$
$pH = 14 - pOH = 14 - 6.99 \approx 7.01$

638. If 50 mL of 0.1 HBr is mixed with 50 mL 0.2 M NaOH, find pH of resulting mixture

(a) 2.7 (b) 12.7
(c) 10.7 (d) 1.3

JIPMER-2019

Ans. (b) : $N_{mix}V_{mix} = \underset{NaOH}{N1V1} - \underset{HBr}{N2V2}$
Given,
$M_1 = 0.2M,\ N_1 = 0.2$ N
$M_2 = 0.1M,\ N_2 = 0.1$ N
$V_1 = 50$ ml,
$V_2 = 50$ ml, $V_{mix} = V_1 + V_2 = 100$ ml
$N_{mix} \times 100 = 50 \times 0.2 - 50 \times 0.1$
$N_{mix} = 5 \times 10^{-2}$
$pOH = -\log[OH^-] = -\log[5\times10^{-2}]$
$= 2 - \log 5 = 1.3$
$pH + pOH = 14$
$pH = 14 - 1.3 = 12.7$

639. An aqueous solution of $CuSO_4$ is subjected to electrolysis using inert electrodes. The pH of the solution will

(a) increase
(b) remains unchanged
(c) decrease
(d) increase or decrease depending on the strength of the current

Karnataka-CET-2019

Ans. (c) :

Anode: $2H_2O \longrightarrow 4H^+ + 4e^- + O_2$

Cathode: $Cu^{2+}(aq) + 2e^- \longrightarrow Cu(s) \times 2$

Net cell reaction: $2Cu^{2+}(aq) + 2H_2O \longrightarrow 4H^+ + 2Cu(s) + O_2\uparrow$

Due to increase in $[H^+]$, pH decreases.

640. The aqueous solution which of the following salt will have the lowest pH

(a) $NaClO_3$ (b) NaClO
(c) $NaClO_2$ (d) $NaClO_4$

Karnataka-CET-2015

Ans. (d) : $NaClO_4$, on hydrolysis gives strongest acid $HClO_4$ as compared to other salts. This is strongly ionized and gives highest concentration of H^+. Therefore aqueous solution of $NaClO_4$ will have lowest pH value.

641. One mole of ammonia was completely absorbed in one litre solution each of
I. 1 M H Cl
II. 1 M CH_3COOH and
III. 1 M H_2SO_4 at 298 K

@apna_pdf

The decreasing order for the pH of the resulting solution is (Given K_b (NH_3) = 4.74)

(a) II > III > I (b) I > II > III

(c) II > I > III (d) III > II > I

Karnataka-CET-2014

Ans. (c) : We know that,

Lowest pH is more, acidic in nature

$NaClO_3 \longrightarrow Na^+\ ClO_3^-$

$NaClO \longrightarrow Na^+\ ClO^-$

$NaClO_2 \longrightarrow Na^+\ ClO_2^-$

$NaClO_4 \longrightarrow Na^+\ ClO_4^-$

∵ ClO_4 can easily abstract protron from weaker $HClO_4$.

Acid which are weak in water will be highly acidic in NH_3

A. $HCl + NH_3 \rightleftharpoons NH_4Cl$

B. $CH_3COOH + NH_3 \rightleftharpoons CH_3COONH_4$

C. $H_2SO_4 + NH_3 \rightleftharpoons (NH_4)_2SO_4$

∴ Effect of ammonia is least in H_2SO_4 and maximum in CH_3COOH

∴ Acidic strength order of resulting solutions is $(NH_4)_2SO_4 > NH_4Cl > CH_3COONH_4$

∴ pH effect order is $CH_3COONH_4 > NH_4Cl > (NH4)_2SO_4$

So, II > I > III is correct order.

642. For $Cr_2O_7^{2-} + 14H^+ + 6e^- \longrightarrow 2Cr^{3+} + 7H_2O$ E^o = 1.33 V. At $[Cr_2O_7^{2-}] = 4.5$ millimole, $[Cr^{3+}]$ = 15 millimole, E is 1.067 V. The pH of the solution in nearly equal to

(a) 2 (b) 3 (c) 5 (d) 4

Karnataka-CET-2014

Ans. (a) : Given, E° = 1.33 V. E = 1.067 V pH = ?

$Cr_2O_7^{2-} + 14H^+ + 6e^- \longrightarrow 2Cr^{3+} + 7H_2O$

$$E = E° - \frac{0.059}{n}\log\frac{\left[Cr^{3+}\right]^2[H_2O]^7}{\left[Cr_2O_7^{2-}\right]\left[H^+\right]^{14}}$$

$$1.067 = 1.33 - \frac{0.059}{6}\log\frac{\left(15\times10^{-3}\right)^2(1)^7}{\left(4.5\times10^{-3}\right)\left(H^+\right)^{14}}$$

$$\frac{0.059}{6}\log\left[\frac{225\times10^{-6}}{(4.5\times10^{-3})(H^+)^{14}}\right] = 0.263$$

$$\log\left[\frac{225\times10^{-6}}{(4.5\times10^{-3})(H^+)^{14}}\right] = \frac{0.263}{0.059} = 26.74$$

$$\log\left[\frac{50\times10^{-3}}{[H^+]^{14}}\right] = 26.74$$

$\log(50 \times 10^{-3}) - \log[H^+]^{14} = 26.74$

$-1.3010 - 14\log[H^+] = 26.74$

$-14\log H^+ = 26.74 + 1.3010$

$14pH = 28.041$

$$pH = \frac{28.041}{14}$$

$[\because pH = -\log(H^+)] = 2$

643. The pH of the solution obtained by mixing 100 ml of a solution of pH = 3 with 400 mL of a solution of pH = 4 is

(a) 7 – log 2.8 (b) 4 – log 2.8

(c) 5 – log 2.8 (d) 3 – log 2.8

Karnataka-CET-2012

Ans. (b) : For pH = 3 $[H_3O^+] = 10^{-3}$

pH = 4, $[H_3O^+] = 10^{-14}$

Moles of H_3O^+ in 100 ml of solution pH = 3

$$= \frac{10^{-3}}{1000}\times100 = 10^{-4}$$

Moles of H_3O^+ in 400 ml of solution of pH = 4

$$= \frac{10^{-4}}{1000}\times400 = 4\times10^{-5}$$

$$[H_3O^+] = \frac{4\times10^{-5}\times1000}{500} = 2.8\times10^{-4}$$

$pH = -\log(2.8 \times 10^{-4})$

$= 4 - \log 2.8$

644. 5 mL of 0.4 N NaOH is mixed with 20mL of 0.1 N HCl. The pH of the resulting solution will be

(a) 7 (b) 8

(c) 5 (d) 6

Karnataka-CET-2012

Ans. (a) : Given, N_1 = 5mL, N_2 = 5mL

$V_1 = 0.4$, $V_2 = 0.1$

Milliequivalents of NaOH = N_1V_1

= 0.4 × 5 = 0.20

miliequivalents of HCl = N_2V_2

= 0.1 × 20 = 0.20

milliequivalents of NaOH (Base) = milliequivalents of HCl (Acid).

Thus , NaOH will be completely neutralised with HCl to form salt NaCl.

So, It's P^H will be 7.

645. On adding which of the following, the pH of 20 mL of 0.1 N HCl will not alter?

(a) 20 mL of distilled water

(b) 1 ML of 0.1 N NaOH

(c) 500 mL of HCl of pH = 1

(d) 1 mL of 1N HCl

Karnataka-CET-2012

Ans. (c) : Miliequivalents of 20 ml of 0.1 NHCl = N_1V_1

= 20 × 0.1 = 2

A. pH of distilled water = 7

$[H^+] = 10^{-pH} = 10^{-7}M$

∴ Miliequivalents = NV [For HCl N = M]

$= 10^{-7} \times 20 = 2.0 \times 10^{-6}$

B. Miliequivalents of NaOH = 0.1 × 1 = 1

C. pH of HCl = 1

∴ $[H^+] = 10^{-1} = 0.1m$

∵ miliequivlents = 0.1 × 500 = 50

D. miliequivalents of 500 ml of HCl having pH = 1 is more than that of 20 ml of 0.1 N HCl, therefore adding this pH of 0.1N HCl solution, does not alter.

646. 0.023 g of sodium metal is reacted with 100 cm^3 of water. The pH of the resulting solution is

(a) 10 (b) 8

(c) 9 (d) 12

Karnataka-CET-2011, 2010

@apna_pdf

Ans. (d) : HCl is monobasic acid its molarity is equal to its normality, Hence, 500 ml of HCl of HCl of $p^H = 1$ corresponds to 0.1 N solution.

$$\underset{\substack{(2\times23=46)\\0.023}}{2Na} + 2H_2O \longrightarrow \underset{\substack{(2\times40=80)\\0.04}}{2NaOH} + H_2$$

$$\therefore \quad [OH^-] = \frac{0.04}{40}\times10 = 10^{-2}$$

$pOH = 2$

$\because \quad pH + pOH = 14$

$pH = 14 - pOH$

$pH = 14 - 2$

$pH = 12$

647. pH value of which one of the following is not equal to one?

(a) 0.1 M CH_3 COOH

(b) 0.1 M HNO_3

(c) 0.05 M H_2SO_4

(d) 50 cm^3 0.4 M HCl + 50 cm^3 0.2 M NaOH

Karnataka-CET-2011, 2009

Ans. (a) : 0.1 M CH_3COOH is not completely dissociated. Therefore, pH will not be one.

648. A buffer solution contains 0.1 mole of sodium acetate dissolved in 1000 cm^3 of 0.1 M acetic acid. To the above buffer solution, 0.1 mole of sodium acetate is further added and dissolved. The pH of the resulting buffer is

(a) pK_a (b) $pK_a + 2$

(c) $pK_a - \log 2$ (d) $pK_a + \log 2$

Karnataka-CET-2011

Ans. (d) : According to the Henderson's equation,

$$pH = pK_a + \log\frac{[salt]}{[acid]}$$

When extra 0.1 mole sodium acetate is added

$[salt] = 0.2 \text{ mol dm}^{-3}$

$[acid] = 0.1 \text{ mol dm}^{-3}$

$$\therefore \quad pH = pK_a + \log\frac{[0.2]}{[0.1]}$$

$pH = pK_a + \log 2$

649. 10^{-6} M NaOH is diluted 100 times. The pH of the diluted base in

(a) between 7 and 8 (b) between 5 and 6

(c) between 6 and 7 (d) between 10 and 11

JIPMER-2011

Karnataka-CET, 2009

Ans. (a) : Given that,

Concentration of NaOH = 10^{-6} M

$$[OH^-] \text{ in the diluted base } \frac{10^{-6}}{10^2} = 10^{-8}$$

Total $[OH^-] = 10^{-8} + [OH^-]$ of water

$= (10^{-8} + 10^{-7})$ M

$= 10^{-8}\,[1 + 10]$ M

$= 11 \times 10^{-8}$ M

we know that,

$pOH = -\log_{10}[OH^-]$

pOH $= -\log 11 \times 10^{-8}$

$= -\log 11 + 8 \log 10$

$= 6.9586$

we know that,

$pH + pOH = 14$

$pH = 14 - pOH$

pH $= 14 - 6.9586 = 7.0414$

650. 30 cc of $\frac{M}{3}$ HCl, 20 cc of $\frac{M}{2}$ HNO_3 and 40 cc of $\frac{M}{4}$ NaOH solutions are mixed and the volume was made up to $1dm^3$. The pH of the resulting solution is

(a) 8 (b) 2 (c) 1 (d) 3

Karnataka-CET, 2009

Ans. (b) : Given that,

30 cc of $\frac{M}{3}$ HCl

20 cc of $\frac{M}{2}$ HNO_3

40 cc of $\frac{M}{4}$ NaOH

Total milliequivalents of H^+

$$= 30\times\frac{1}{3} + 20\times\frac{1}{2} = 20$$

Total milliequivalents of $[OH^-]$

$$= 40\times\frac{1}{4} = 10$$

Milli equivalence of H^+ left

$= 20 - 10 = 10$

$$\therefore \quad [H^+] = \frac{10}{1000} \text{ g ions/dm}^3 = 10^{-2}$$

$$\therefore \quad pH = -\log 10^{-2} = 2$$

651. Which one of the following salts on being dissolved in water gives pH > 7at 25°C?

(a) KCN (b) KNO_3

(c) NH_4Cl (d) NH_4CN

Karnataka-CET-2007

Ans. (a) : $KCN + H_2O \rightleftharpoons KOH + HCN$

KCN is a salt of weak acid and strong base hence, on being dissolved in water it gives basic solution i.e. pH > 7at 25°C.

652. The aqueous solution of which of the salt has pH close to 7?

(a) $FeCl_3$ (b) CH_3COONa

(c) Na_2CO_3 (d) CH_3COONH_4

(e) KCN

Kerala-CEE-2010

Ans. (d) $\underset{\text{Weak acid}}{CH_3COOH} + \underset{\text{Weak base}}{NH_4OH} \rightarrow \underset{\text{Neutral, pH = 7}}{CH_3COONH_4} + HO_2$

The aqueous solution of CH_3COONH_4 has pH close to 7 Because it is a salt of weak acid and weak base.

653. When 200 mL of aqueous solution of HCl (pH = 2) is mixed with 300 mL of an aqueous solution of NaOH (pH = 12), the pH of the resulting mixture is

(a) 10 (b) 2.7

(c) 4.0 (d) 11.3

(e) 2

Kerala-CEE-2009

@apna_pdf

Ans. (d) : Given that, Milliequivalent of $[H^+] = 2$
pH of NaOH = 12
$[OH^-] = 10^{-2}M$
Milliequivalent of $OH^- = 3$
$HCl = NaOH = NaCl + H_2O$
M_{eq} of OH^- after reaction = 3 – 2 = 1

$$[OH^-] \text{ after reaction} = \frac{1}{500} = 2 \times 10^{-3}M$$

We know,

$$pOH = -\log_{10}[OH^-] = -\log_{10} 2\times10^{-3} = 2.7$$
$$pH = 14 - 2.7 = 11.3$$

654. The pH of a solution obtained by mixing 50 mL of 1 N HCl and 30 mL of 1 N NaOH is [log 2.5 = 0.3979]

(a) 3.979
(b) 0.6021
(c) 12.042
(d) 1.2042
(e) 0.3979

Kerala-CEE-2008

Ans. (b):
moles of HCl = M × V = $50 \times 10^{-3} \times 1 = 5 \times 10^{-2}$
moles of NaOH = M × V = $30 \times 10^{-3} \times 1 = 3 \times 10^{-2}$
as number of moles of HCl are more than NaOH the resulting solution (30 + 50 = 80 ml) will contain excess of HCl.

$$= 5 \times 10^{-2} - 3 \times 10^{-2} = 2 \times 10^{-2} \text{ mol}$$

Remainging moles of H^+ ions = 2×10^{-2} mol

$$\therefore H^+ [\text{after mixing}] = \frac{2\times10^{-2}\text{ mol}}{80\times10^{-3}\text{ L}} = \frac{1}{4}M$$
$$pH = -\log H^+ = -\log\frac{1}{4} = \log 4 = 0.6021$$

655. The pH of a neutral water is 6.5, then the temperature of water

(a) is 25°C
(b) is more than 25°C
(c) is less than 25°C
(d) can be more or less than 25°C
(e) cannot be predicted

Kerala-CEE-2007

Ans. (b) : The ionization increase with temperature. So the amount of H^+ active in solution will increase with temperature, the pH should decrease. When there is decrease in pH of neutral water, it is normally assumed that the temperature is increased from room temperature 25°C. So, when the pH of neutral water in 6.5, the temperature should greater than 25°C.

656. The dissociation constant of acetic acid K_a is 1.74×10^{-5} at 298K. The pH of a solution of 0.1 M acetic acid is:

(a) 2.88
(b) 3.6
(c) 4.0
(d) 1.0
(e) 2.0

Kerala-CEE-2004

Ans. (a) Given,
$K_a = 1.74 \times 10^{-5}$
pH = ?
According to Ostwald dilution formula

$$[H^+] = \sqrt{K_a \times C}$$
$$[H^+] = \sqrt{1.7\times10^{-5}\times0.1}$$
$$[H^+] = \sqrt{0.017\times10^{-4}}$$
$$pH = -\log_{10}[H^+]$$
$$pH = -\log_{10}\sqrt{0.017\times10^{-4}}$$
$$pH = 2.88$$

657. 0.365g of HCl gas was passed through 100 cm³ of 0.2 M NaOH solution. The pH of resulting solution would be:

(a) 1
(b) 5
(c) 8
(d) 9
(e) 13

Kerala-CEE-2004

Ans. (e) Moles of HCl = $\frac{0.365}{36.5} = 10^{-2} = 0.01$ mol

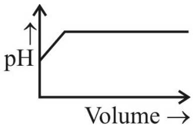
moles of NaOH = $\frac{0.2\times100}{1000} = 0.02$mol

moles of NaOH left unreacted = 0.01 mol
Volume of solution = 100 cm³ = 0.1L

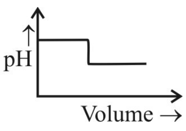
$$\therefore [NaOH] = \frac{0.01}{0.1} = 10^{-1}m$$
$$[OH^-] = 10^{-1}m$$
$$[H^+] = \frac{k_w}{[OH^-]} = \frac{10^{-14}}{10^{-1}} = 10^{-13}m$$
$$pH = 13$$

658. Which of the following plot represents the graph of pH against volume of alkali added in the titration of NaOH and HCl?

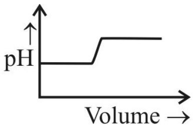
(a)



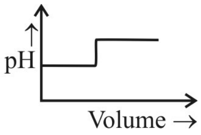
(b)



(c)



(d)



Manipal-2019

Ans. (a) : If pH is less then 7, the solution is acidic but if the pH is more than 7 the solution becomes basic.

0____7____14
Acid Base

if alkali is added in acid solution the pH increases.

659. Find the pH value of the mixture containing 50 cc M HCl and 30 cc M NaOH solution. assuming both to be completely ionised.

(a) 0.7051
(b) 0.6021
(c) 10.051
(d) 8.052

Manipal-2017

Ans. (b) : Total volume after mixing = 50+30 = 80cc

Moles of HCl after mixing = $\frac{50}{80}$M

Moles of NaOH after mixing = $\frac{30}{80}$M

Remaining number of moles of HCl after mixing

@apna_pdf

$= \frac{50}{80} - \frac{30}{80} = 0.25M$

$[H^+]=0.25=2.5\times10^{-1}$

$pH= -\log [2.5\times10^{-1}]=1- 0.3979=0.6021$

660. What will be the pH of a solution formed by mixing 10 mL 0.1 M NaH_2PO_4 and 15 mL 0.1 M Na_2HPO_4? [Given $pK_1 = 2.12$, $pK_2 = 7.2$]

(a) 7.0 (b) 6.9 (c) 7.4 (d) 7.5

AMU-2018

Ans. (c) : Given for (NaH_2PO_4)

10 ml of 0.1 M NaH_2PO_4 and $pK_1 = 2.12$

$$\because pH_1 = pK_1 + \log\left[\frac{A^-}{H_A}\right] = \frac{[0.1\times2]}{1}$$

Here, $[H_A] = [NaH_2PO_4] = 0.1 \times 10 = 1$

$[A^-] = [H^+]$

$$\therefore\ pH_1 = 2.12 + \log\frac{[0.2]}{1}$$

$pH_1 = 2.12 + (-0.6989)$

$pH_1 = 1.421$

For Na_2HPO_4

15 ml of 0.1 M Na_2HPO_4 and $pK_2 = 7.2$

$$\because pH_2 = pK_2 + \log\left[\frac{A^-}{H_A}\right]$$

Here, $[H_A] = [NaHPO_4]$

$[A^-] = [H^+]$

$$pH_2 = 7.2 + \log\left[\frac{0.1}{1.5}\right]$$

$pH_2 = 7.2 + (-1.1739)$

$pH_2 = 6.0261$

Total $pH = pH_1 + pH_2$

$= 1.421 + 6.0261 = 7.4471$

661. What is the pH of millimolar solution of ammonium hydroxide which is 20% dissociated?

(a) 3.699 (b) 10.301

(c) 4.691 (d) 9.301

MHT CET-2014

Ans. (b): Concentration of NH_4OH solution = 0.001 M

Degree of dissociation = 20% = $\frac{20}{100} = 0.2$

Concentration of OH^- i.e. $[OH^-]$ =

Concentration of solution × degree of dissociation

$= 0.001 \times 0.02 = 2 \times 10^{-4}$

$\because$ $[H^+]\ [OH^-] = 1 \times 10^{-14}$

$$\therefore\quad H^+ = \frac{1\times10^{-14}}{2\times10^{-4}} = \frac{1}{2}\times 10^{-10}$$

Again,

$\because$ $pH = -\log[H^+]$

$$\therefore\quad pH = -\log\left(\frac{1}{2}\times10^{-10}\right)$$

$= -\log (-10 - 0.3010) = 10.3010$

662. The sum of pH and pK_b for a basic buffer solution is 13. The ratio of the concentration of the base to that of the salt is

(a) 10 (b) 1

(c) 0.05 (d) 0.1

(e) 20

Kerala-CEE-2013

Ans. (d) : Given that,

$pH + pK_b = 13$ ____(i)

$$\text{From } pOH = pK_b - \log\frac{[base]}{[salt]}$$

$$14 - pH = pK_b - \log\frac{[base]}{[salt]}$$

$$\therefore\quad 14 = pH + pK_b - \log\frac{[base]}{[salt]}\ \_\_\_\_(ii)$$

Putting the value of (i) in equation (ii)

$$\text{or}\quad 14 = 13 - \log\frac{[base]}{[salt]}$$

$$\log\frac{[base]}{[salt]} = 13 - 14 = -1$$

$$\therefore\ \frac{[base]}{[salt]} = \text{Antilog}\ (-1) = 0.1$$

663. The hydrogen ion concentration of a solution is 3.98×10^{-6} mole per liter. The pH value of this solution will be

(a) 6.0 (b) 5.8 (c) 5.4 (d) 5.9

MHT CET-2012

Ans. (c) : Given that,

$[H^+] = 3.98 \times 10^{-6}$ mole per liter

We know that,

$pH = -\log [H^+]$

$pH = -\log (3.98 \times 10^{-6})$

$pH = -\log 3.98 + (-\log 10^{-6})$

$pH = -0.5998 + 6$

$pH = 5.40$

664. An acid solution of pH = 6 is diluted 1000 times, the pH of the final solution becomes

(a) 6.01 (b) 9 (c) 3.5 (d) 6.99

MHT CET-2011

Ans. (d) : Given pH = 6

Therefore, $[H^+] = 10^{-pH} = 10^{-6}$ M

After dilution

$$[H^+] = \frac{10^{-6}}{1000}$$

$= 10^{-9}$

$\therefore$ pH of water is 7

$\because$ $[H^+] = 10^{-7}$

Total $[H^+] = 10^{-9} + 10^{-7}$

$= 10^{-7}\ (10^{-2} + 1)$

$= 10^{-7}\ (1.01)$

We know that,

$pH = -\log [H^+]$

$pH = -\log (1.01 \times 10^{-7})$

$= 7 - 0.0043$

$pH = 6.9957$

665. Ammonium acetate which is 0.01 M, is hydrolysed to 0.001 M concentration. Calculate the change in pH in 0.001 M solution, if initially $pH = pK_a$

@apna_pdf

(a) 5 (b) 10
(c) 100 (d) 1

MHT CET-2010

Ans. (d) : Given, Ammonium acetate = 0.01M
after hydrolysis concentration = 0.001M

$$\underset{0.01M}{CH_3COONH_4} + H_2O \rightarrow \underset{0.001M}{CH_3COOH} + NH_4OH$$

$$pH = pK_a + \log \frac{[CH_3COONH_4]}{CH_3COOH]}$$

$$= pK_a + \log \left[\frac{0.01}{0.001}\right]$$

$$= pK_a + \log 10$$

$$= pK_a + 1$$

$\therefore$ change in pH = 1

666. In a solution, 0.02 M acetic acid is 4% dissociated. The [OH⁻] in the solution is

(a) 8×10^{-4} (b) 2×10^{-14}
(c) 8×10^{10} (d) 1.25×10^{-11}

MHT CET-2009

Ans. (d) : Given, acetic acid = 0.02M

$$[H^+] = \sqrt{a^2c^2} = \sqrt{(0.02)^2\cdot(0.04)^2} = 8\times10^{-4}$$

$$[H^+][OH^-] = 10^{-14}$$

$$\therefore \quad [OH^-] = \frac{10^{-14}}{8\times10^{-4}}$$

$$= 1.25\times10^{-11}\ M$$

667. The pH of a 0.1 M solution of NH_4OH (having $k_b = 1.0\times10^{-5}$) is equal to

(a) 10 (b) 6
(c) 11 (d) 12

MHT CET-2008

Ans. (c) : NH_4OH in a strong base. As the value of K_b is also given ($K_b = 1.0\times10^{-5}$), So we can find out concentration of OH^-

$$[OH^-] = \sqrt{K_b \times NH_4OH}$$

$$= (10^{-5}\times10^{-1})^{\frac{1}{2}} = 1\times10^{-3}$$

$$[H^+] = \frac{10^{-14}}{10^{-3}} = 10^{-11}$$

$$pH = -\log 10^{-11} = 11$$

668. When ammonium chloride is added to ammonia solution, the pH of the resulting solution will be

(a) increased (b) seven
(c) decreased (d) unchanged

MHT CET-2007

Ans. (c) : Due to common ion, effect rate of ionization of NH_4OH decreases. So lower $[OH^-]$ is obtained. Common ion effect is observed when a solution of ewak electrolyte is mixed with a solution of strong electrolyte which sharing a common ion to weak electrolyte.
Hence, pH value decrease.

669. The correct order of pH of solutions of $CuSO_4$, NaCN, NaCl and water is

(a) $CuSO_4 < NaCN < NaCl = H_2O$
(b) $CuSO_4 > NaCN = H_2O > NaCl$
(c) $CuSO_4 = H_2O > NaCN > NaCl$
(d) $CuSO_4 < NaCl = H_2O < NaCN$

AP - EAMCET(MEDICAL) - 2009

Ans. (d) : NaCl is a salt of strong base (NaOH) and strong acid (HCl), hence it will be neutral in nature. Therefore, pH of its solution will be 7. Similarly, H_2O is neutral itself in nature therefore its pH also will be 7. Copper sulphate is a salt of weak base $[Cu(OH)_2]$ and strong acid H_2SO_4, hence it will be acidic in nature. Therefore, pH of its solution must be less than 7. As we know, NaCN is a salt of strong base (NaOH) and weak acid (HCN), So its solution must be basic in nature showing pH greater than 7. Hence, the correct order of pH will be–

$$CuSO_4 < NaCl = H_2O < NaCN$$

670. The pH of a 10^{-8} molar solution of HCl in water is

(a) 8 (b) between 7 and 8
(c) between 6 and 7 (d) None of these

MHT CET-2007

Ans. (c) : From H_2O, $[H_2] = 1\times10^{-7}M$
From HCL, $[H^+] = 1\times10^{-8}$ m
Total $[H^+] = (1\times10^{-7} + 1\times10^{-8})$ M
$= (1\times10^{-7} + 0.1\times10^{-7})$ M
$= 1.1\times10^{-7}$ M
$pH = -\log(1.1\times10^{-7}) = 6.96$

671. The Compound whose water solution has the highest pH is

(a) NaCl (b) $NaHCO_3$
(c) Na_2CO_3 (d) NH_4Cl

NEET-2002, 1988

Ans. (c) : • NaCl is a salt of strong acid (HCl) and strong base (NaOH) which have the pH value 7 when dissolved in water.

- $NaHCO_3$ is a acidic salt in water with NaOH and H_2CO_3. Thus, the pH value of $NaHCO_3$ solution is less than 7.
- Na_2CO_3 in water gives strong base (NaOH) and weak acid (H_2CO_3) which makes the solution alkline with the pH of greater than 7.
- NH_4Cl gives the strong acid (HCl) and a weak base (NH_4OH) when dissolved in water solution and make the solution acidic in nature with the pH less than 7.

672. The pH value of N/10 NaOH solution is

(a) 12 (b) 13
(c) 10 (d) 11

NEET-1995

Ans. (b) : Given,

The concentration of $[OH^-]$ ions in NaOH solution $= \frac{1}{10}$

$$\therefore pOH = -\log[OH^-] = -\log\frac{1}{10} = -\log 10^{-1} = 1\log 10 = 1$$

Hence, pH = 14 – pOH = 14 – 1 = 13
Thus, the pH value of N/10 sodium hydroxide solution is 13.

673. The pH value of a 10 M solution of HCl is

(a) equal to 1 (b) equal to 2
(c) less than 0 (d) equal to 0

NEET-1995

Ans. (c) : Given that, Concentration of H^+ ion = $[H^+]$ = 10M
then, $pH = -\log[H^+] = -\log[10] = -1$
Hence, the pH value of a 10M solution of HCl is less then zero (which is –1).

@apna_pdf

674. Which statement is wrong about pH and H^+ ?

(a) pH of neutral water is not zero

(b) Adding 1 N solution of CH_3COOH and 1 N solution of NaOH, pH will be seven

(c) $[H^+]$ of dilute and hot H_2SO_4 is more than concentration and cold H_2SO_4

(d) Mixing solution of CH_3COOH and HCl, pH will be less than 7

NEET-2000

Ans. (b) : After mixing 1N solution of CH_3COOH (Weak Acid) and 1N NaOH (Strong Base) the resulting solution will have free OH^- ions which makes the solution alkaline in nature. Thus, pH value of solution will be higher than 7.

675. The concentration of $[H^+]$ and concentration of $[OH^-]$ of a 0.1 aqueous solutions of 2% ionised weak acid is [ionic product of water = 1×10^{-14}]

(a) 2×10^{-3} M and 5×10^{-12} M

(b) 1×10^{-3} M and 3×10^{-11} M

(c) 0.02×10^{-3} M and 5×10^{-11} M

(d) 3×10^{-2} M and 4×10^{-13} M

NEET-1999

Ans. (a) : Concentration of $[H^+]$ ions

$$= 1 \times 0.1 \times \frac{2}{100} \text{ M} = 2\times10^{-3} \text{ M}$$

But $[H^+][OH^-] = 10^{-14}$

$[2 \times 10^{-3}][OH^-] = 10^{-14}$

or $$[OH^-] = \frac{10^{-14}}{2\times10^{-3}} = 5 \times 10^{-12} \text{ M}$$

676. The hydride ion H^- is stronger base than its hydroxide ion OH^-. Which of the following reaction will occur if sodium hydride (NaH) is dissolved in water ?

(a) $H^- + H_2O \rightarrow$ no reaction

(b) $H^-(aq) + H_2O \rightarrow H_3O^-$

(c) $H^-(aq) + H_2O(l) \rightarrow OH^- + H_2$

(d) None of these

NEET-1997

Ans. (c) : As hydride ion is stronger base, solt with react with water which acts as an acid. The reaction occurring is as follows :

$$NaH + H_2O \rightarrow NaOH + H_2$$

or , $H(aq) + H_2O(l) \rightarrow OH^- + H_2\uparrow$

677. Calculate the pOH of a solution at 25ºC that contains 1×10^{-10} M hydronium ions, i.e. H_3O^+

(a) 4.000 (b) 9.000

(c) 1.000 (d) 7.000

NEET-2007

Ans. (a) : Given that,

$H_3O^+ = 1 \times 10^{-10}$M

$[H_3O^+] = [H^+] = 10^{-10}$M

We know that,

pH+ pOH = 14.............(i)

pH = – log $[H^+]$

pH= –log 10^{-10}

pH = 10

From equation (i)

pOH + 10 = 14

pOH = 14 – 10 = 4

678. The hydrogen ion concentration of a 10^{-8}M HCl aqueous solutions at 298 K ($K_w = 10^{-14}$) is

(a) 1.0×10^{-8} M (b) 1.0×10^{-6} M

(c) 1.0525×10^{-7} M (d) 9.525×10^{-8} M

NEET-2006

Ans. (c) : Given that,

$K_w = 10^{-14}$

Hydrogen ion concentration =

$[H^+] = 10^{-8}$ M

Due to dilute solution,

$[H^+] = 10^{-8} + 10^{-7}$ M

$= 10^{-7}$ [0.1 + 1]M

$= 1.1 \times10^{-7}$ M

$\simeq 1.0525\times10^{-7}$M

679. At 25°C, the dissociation constant of base, BOH is 1.0×10^{-12} M. The concentration of hydroxyl ions in 0.01 M aqueous solution of the base would be

(a) 1.0×10^{-5} mol L^{-1} (b) 1.0×10^{-6} mol L^{-1}

(c) 2.0×10^{-6} mol L^{-1} (d) 1.0×10^{-7} mol L^{-1}

NEET-2005

Ans. (d) :

$BOH \rightarrow B^+ + OH^-$

$K_b = [B^+][OH^-] / [BOH]$

At equilibrium $[B^+] = [OH^-]$

$\therefore K_b = [OH^-]^2 / [BOH]$

$\therefore K_b = 1.0\times10^{-12}$ and [BOH] = 0.01 M

Thus,

$1.0\times10^{-12} = [OH^-]^2 / 0.01$

$[OH^-]^2 = 1\times10^{-14}$

$[OH^-] = 1.0\times10^{-7}$ mol L^{-1}

680. Ionisation constant of CH_5COOH is 1.7×10^{-5} and concentration of H^+ ions is 3.4×10^{-4}. Then find out initial concentration of CH_3COOH molecules.

(a) 3.4×10^{-4} (b) 3.4×10^{-3}

(c) 6.8×10^{-4} (d) 6.8×10^{-3}

NEET-2001

Ans. (d) : Given that,

Ionisation constant (K_a) of $CH_3COOH = 1.7\times10^{-5}$

Concetration of H^+ ion = 3.4×10^{-4}

$$CH_3COOH \rightleftharpoons CH_3COO^- + H^+$$

$$K_a = \frac{[CH_3COO^-][H^+]}{[CH_3COOH]}$$

$[CH_3COO^-] = [H^+] = 3.4 \times 10^{-4}$ M

K_a for $CH_3COOH = 1.7 \times 10^{-5}$

CH_3COOH is weak acid and its ionization constant = 3.4×10^{-4} is very less.

Hence,

$$1.7 \times 10^{-5} = \frac{(3.4\times10^{-4})(3.4\times10^{-4})}{[CH_4COOH]}$$

$$[CH_3COOH] = \frac{3.4\times10^{-4} \times 3.4\times10^{-4}}{1.7\times10^{-5}}$$

$= 6.8 \times 10^{-3}$ M.

@apna_pdf

681. At 100ºC the K_w of water is 55 times its value at 25ºC. What will be the pH of neutral solution ? (log 55 = 1.74)

(a) 7.00 (b) 7.87
(c) 5.13 (d) 6.13

Karnataka NEET-2013

Ans. (d) : We know that , Ionisation constant of water at 25°C

$$K_w = 1 \times 10^{-14}$$

And At 100°C $K_w = 55 \times 10^{-14}$

At 100°C $K_w = [H^+]\,[OH^-] = 55 \times 10^{-14}$

$[H^+] = \sqrt{55\times10^{-14}}$

pH = – log $[H^+]$

pH = – log $\left[\sqrt{\left(55\times10^{-14}\right)}\right]$

$= \frac{1}{2}\,[-\log(55 \times 10^{-14})] = \frac{1}{2}(-\log 55 + 14 \log 10)$

$= \frac{1}{2}\,[-1.74 + 14] = \frac{1}{2}[12.26] = 6.13$

682. Equimolar solutions of the following substances were prepared separately. Which one of these will record the highest pH value ?

(a) $BaCl_2$ (b) $AlCl_3$
(c) LiCl (d) $BeCl_2$

NEET-2012

Ans. (a) : Barium chloride ($BaCl_2$) is a salt of strong acid and strong base which is neutral in nature. Thus have pH value of 7.

Rest of all being salt of strong acid and weak base are hydrolysed to give pH less than 7.

683. What is $[H^+]$ in mol/L of a solution that is 0.20 M in CH_3COONa and 0.10 M in CH_3COOH? (K_a for $CH_3COOH = 1.8 \times 10^{-5}$)

(a) 3.5×10^{-4} (b) 1.1×10^{-5}
(c) 1.8×10^{-5} (d) 9.0×10^{-6}

NEET-2010

Ans. (d) : Given that,

Concentration of CH_3COONa = 0.20M
Concentration of CH_3COOH = 0.10M
K_a for $CH_3COOH = 1.8 \times 10^{-5}$

CH_3COOH (Weak acid), CH_3COONa (Conjugated Salt) form acidic buffer.

For acidic buffer–

According to the Henderson's equation–

$pH = pK_a + \log\left[\frac{\text{salt}}{\text{acid}}\right]$ and

$[H^+] = -$ antilog pH

$pH = -\log K_a + \log\left[\frac{\text{salt}}{\text{acid}}\right]$ $[pK_a = -\log K_a]$

$= -\log(1.8 \times 10^{-5}) + \log\frac{0.20}{0.10}$

= 4.74 + log2

= 4.74 + 0.3010 = 5.041

Now $[H^+]$ = Antilog (– 5.045)

$= 9 \times 10^{-6}$ mol/L

684. What is the pH of the resulting salution when equal volumes of 0.1 M NaOH and 0.01 M HCl are mixed ?

(a) 2.0 (b) 7.0
(c) 1.04 (d) 12.65

NEET-2015

Ans. (d) : Given that,

Concentration of NaOH = 0.1M
Concentration of HCl = 0.01M

According to law of equivalent: To neutralize the whole solution there should be equal the normality (N_1) of acid and its volume (V_1) to normality (N_2) of base and its volume (V_2)

So, we can consider that–

$N_1V_1 - N_2V_2$ = equivalents of unreacted hydroxyl ions

$0.1 \times 1 - 0.01 = [OH^-]$

$[OH^-] = N_R = \frac{0.09}{2} = 0.045N$

pOH = – log (0.045) = 1.35

But we know, pH + POH = 14

⇒ pH = 14 – pOH = 14 – 1.35 = 12.65

685. Which of the following salts will give highest pH in water ?

(a) KCl (b) NaCl
(c) Na_2CO_3 (d) $CuSO_4$

NEET-2014

Ans. (c) : Na_2CO_3 which is a salt of NaOH (strong Base) and H_2CO_3 (weak acid) will produce a basic solution with pH greater than 7. NaCl and KCl are the salts of a strong acid and strong base. Their aqueous solutions are neutral.

686. Following solutions were prepared by mixing different volumes of NaOH and HCl of different concentration :

(a) 60 mL $\frac{M}{10}$ HCl + 40 mL $\frac{M}{10}$ NaOH

(b) 55 mL $\frac{M}{10}$ HCl + 45 mL $\frac{M}{10}$ NaOH

(c) 75 mL $\frac{M}{5}$ HCl + 25 mL $\frac{M}{5}$ NaOH

(d) 100 mL $\frac{M}{10}$ HCl + 100 mL $\frac{M}{10}$ NaOH

pH of which one of them will be equal to 1 ?

NEET-2018

Ans. (c) : pH = 1 , So $[H^+] = 10^{-1}$

for acid base mixture: $N_1V_1 - N_2V_2 = N_3V_3$

(For NaOH and HCl, normality = molarity)

(a) $M_1\,(H^+) = \frac{60\times\frac{1}{10}-40\times\frac{1}{10}}{100} = 20\times10^{-3}$M i.e. pH = 2.7

(b) $M_2\,(H^+) = 55 \times \frac{55\times\frac{1}{10}-45\times\frac{1}{10}}{100} = \frac{1}{100} = 10^{-2}$M i.e. pH = 2

(c) $M_3\,(H^+) = \frac{75\times\frac{1}{5}-25\times\frac{1}{5}}{100} = 10^{-1}$M i.e. pH = 1

(d) $M_4\,(H^+) = \frac{100\times\frac{1}{10}-100\times\frac{1}{10}}{200} = 0$ M i.e. pH = 7

@apna_pdf

687. The pK_b of dimethylamine and pK_a of acetic acid are 3.27 and 4.77 respectively at T(K). The correct option for the pH of dimethylammonium acetate solution is

(a) 6.25 (b) 8.50
(c) 5.50 (d) 7.75

NEET-2021

Ans. (d) : Acetic acid is a weak acid & dimethylamine is a weak base and after neutralization they form dimethylammonium acetate salt.

For a salt of weak acid and weak base pH does not depend on concentration of salt.

$$pH = 7 + \frac{1}{2}[pK_a - pK_b]$$

$$= 7 + \frac{1}{2}[4.77 - 3.27]$$

$$= 7.75$$

688. How much NaOH is to be dissolved in 1 lit water to obtain the solution having pH=12?

(a) 0.4 gm (b) 40 gm
(c) 4 gm (d) 0.04 gm

Tripura JEE-2021

Ans. (a) : Given, pH = 12

but, $pH + pOH = 14$

$pOH = 14 - pH$

$= 14 - 12$

$= 2$

$\therefore [OH^-] = 10^{-2}$

Therefore, mass of NaOH required to prepare 1L NaOH Solution of strength, pH = 12, is $10^{-2} \times 40 = 0.40$ gm.

689. The dissociation constant of a substituted benzoic acid at 25°C is 1.0×10^{-4}. The pH of 0.01 M solution of its sodium salt is

(a) 7 (b) 8
(c) 9 (d) 10

UP CPMT-2012

Ans. (b) : Given that,

K_a for benzoic acid at 25°C = 1.0×10^{-4}

Concentration of sodium salt = 0.01M

The hydrolysis reaction of conjugate base of acid is

$$A^-(aq) + H_2O \rightarrow HO^- + HA$$

$$K_h = \frac{K_W}{K_a} = \frac{10^{-14}}{10^{-4}} = 10^{-10}$$

Since, degree of hydrolysis is negligible

$C = 0.01M$

$C = 10^{-2}M$

$$\therefore [OH^-] = \sqrt{K_h C}$$

$$OH^- = \sqrt{10^{-10} \times 10^{-2}}$$

$$OH^- = \sqrt{10^{-12}}$$

$$OH^- = 10^{-6}$$

$$\therefore pOH = -\log[OH^-]$$

$$pOH = -\log\left[10^{-6}\right]$$

$$\therefore pOH = 6$$

$pH + pOH = 14$

$pH = 14 - 6 = 8$

690. The pK_b value of ammonium hydroxide is 4.75. An aqueous solution of ammonium hydroxide is treated with HCl. The pH of the solution at the point where half of ammonium hydroxide has been neutralised will be

(a) 9.25 (b) 8.25
(c) 7.50 (d) 4.75

UP CPMT-2011

Ans. (a) : When half of NH_4OH is neturalised,

$[NH_4OH] = [NH_4Cl]$

$$pOH = pK_b + \log\frac{[salt]}{[base]}$$

$pOH = pK_b = 4.75$

$pH + pOH = 14$

$pH = 14 - pOH$

$= 14 - 4.75 = 9.25$

691. The pH value of 0.01 N NaOH solution is

(a) 2 (b) 6
(c) 12 (d) 11

Odisha NEET-2019
UP CPMT-2010

Ans. (c) : Given, Normality of NaOH = 0.01 N

Normality = Molarity × Acidity of NaOH

$0.01 = M \times 1$

$M = 0.01 = 10^{-2}M$

$[OH^-] = 0.01M$

$= 1 \times 10^{-2}$

$pOH = -\log[OH^-]$

$= -\log(1 \times 10^{-2})$

$= 2$

$pH + pOH = 14$

$pH + 2 = 14$

$\therefore pH = 12$

692. What will be the pH value of 0.05 M $Ba(OH)_2$ solution?

(a) 12 (b) 13
(c) 1 (d) 12.96

UP CPMT-2004

Ans. (b) : Normality = Molarity × Acidity of $Ba(OH)_2$

$N = 0.05 \times 2 = 0.1$

$[OH^-] = N = 2 \times 0.05 = 0.1$

$pOH = -\log[OH^-] = -\log(0.1) = 1$

$pH = 14 - pOH = 14 - 1 = 13$

693. 0.005 M acid solution has 5 pH. The percentage ionization of acid is

(a) 0.8% (b) 0.6 %
(c) 0.4 % (d) 0.2 %

UP CPMT-2003

Ans. (d) : Given, pH= 5

Concentration of acid= 0.005 M

$pH = -\log[H^+]$

or $[H^+] = 10^{-pH}$

$= 10^{-5}$

$$\alpha = \frac{\text{actual concentration}}{\text{molar concentration}} = \frac{10^{-5}}{0.005} = 0.2 \times 10^{-2}$$

$\therefore$ Percentage ionization $= (0.2 \times 10^{-2}) \times 100$

$= 0.2\%$

@apna_pdf

694. The pH of a solution obtained by mixing 5 g of CH_3COOH and 7.5 g of CH_3COONa and making the volume equal to 500 mL is [K_a for $CH_3COOH = 1.80 \times 10^{-5}$]

(a) 2.8854 (b) 4.7882
(c) 6.1975 (d) 3.9494

UP CPMT-2001

Ans. (b) : pH of the solution is calculated by using following formula

$$pH = pK_a + \log\frac{[salt]}{[acid]}$$

Before using this formula, calculate pK_a, [salt] and [acid] from given data.

Given, $K_a = 1.80 \times 10^{-5}$
Mass of CH_3COOH = 5g
Mass of CH_3COONa = 7.5g
Volume of CH_3COOH = 500 mL
Volume of CH_3COONa = 500 mL

$pK_a = -\log [K_a] = -\log [1.8 \times 10^{-5}] = 4.7447$

$$[Acid] = \frac{mass}{volume} = \frac{5g}{500mL} = \frac{10g}{1000mL}$$

$$10g/L = \frac{10}{60} = 0.1666\ mol/L$$

($\because$ mol. wt. of CH_3COOH = 60)

$$[Salt] = \frac{mass}{volume} = \frac{7.5g}{500mL} = \frac{15g}{1000mL} = 15g/L$$

$$15\ g/L = \frac{15}{82} = 0.1829\ mol/L$$

($\because$ mol. wt. of CH_3COONa = 82)

$$\therefore \quad pH = pK_a + \log\frac{[salt]}{[acid]}$$

$$= 4.7447 + \log\frac{0.1829}{0.1666}$$

$= 4.7447 + 0.0435$
$= 4.7882$

695. A solution of pH 9.0 is 1000 times as basic as a solution. The pH of this solution is

(a) 9 (b) 8
(c) 7 (d) 6

UP CPMT-2001

Ans. (d) : $pH = -\log [H^+]$

$\because$ pH of solution = 9

$\therefore$ $[H^+] = 10^{-9}$

This solution is 1000 (or 10^3) times more basic than solution whose, $[H^+] = 10^{-9} \times 10^3 = 10^{-6}$

$pH = -\log [H^+]$
$= -\log [10^{-6}] = 6$

696. The pH value of 1/1000 N-KOH solution is:

(a) 3 (b) 10^{-11} (c) 2 (d) 11

UPTU/UPSEE-2006

Ans. (d) : In $\frac{1}{1000}$ N KOH solution, concentration of $[OH^-]$ is 10^{-3}. Hence, as we know that-

$pH + pOH = 14$ …..(i)

and $pOH = -\log [10^{-3}]$

$pOH = 3$ ….. (ii)

Put the value of pOH in equation (i) so we get

$pH + 3 = 14$
$pH = 14 - 3$
$pH = 11$

697. 100 mL of 0.04 N HCl aqueous solution is mixed with 100 mL of 0.02 N NaOH solution. The pH of the resulting solution is:

(a) 1.0 (b) 1.7 (c) 2.0 (d) 2.3

UPTU/UPSEE-2004

Ans. (c) : $N_1V_1 = 0.04 \times 100 = 4$
$N_2V_2 = 0.02 \times 100 = 2$
$N_1V_1 - N_2V_2 = N_3V_3$
$4 - 2 = N_3 \times 200$
$N_3 = 10^{-2}M$
$pH = -\log_{10} 10^{-2} = 2$

698. pH scale was introduced by:

(a) Arrhenius (b) Sorensen
(c) Lewis (d) Lowery

UPTU/UPSEE-2004

Ans. (b) : In 1909 Sorensen, a Danish chemist, introduced the concept of pH as a convenient way of expressing acidity. pH stands for potential of hydrogen, which refers to the concentration of hydrogen ion in a solution.

699. pH of 0.1 M NH_3 aqueous solution is : ($K_b = 1.8 \times 10^{-5}$)

(a) 11.13 (b) 12.5
(c) 13.42 (d) 11.55

UPTU/UPSEE-2004

Ans. (a) : $NH_3 + H_2O \rightleftharpoons NH_4 + OH^-$

$$K_b = \frac{[NH_4^+][OH^-]}{[NH_3]}$$

$$1.8 \times 10^{-5} = \frac{x^2}{0.1} \Rightarrow x = \sqrt{1.8\times10^{-6}} = 1.34 \times 10^{-3}$$

$pOH = -\log [OH^-] = -\log [1.33\times10^{-3}]$
$= 2.87$

$\therefore$ $pH = 14 - pOH = 14 - 2.87 = 11.13$

700. If the pK_a of acetic acid and pK_b of NH_4OH are 4.76 and 4.75 respectively, what will be the pH of ammonium acetate solution?

(a) 9.51 (b) 7.005
(c) 7.00 (d) 6.9

UPTU/UPSEE-2018

Ans. (b) : When a weak acid (acetic acid) and weak base (NH_4OH) are mixed to form a solution, pH of the solution is then determined by following formula:

$$pH = 7 + \frac{1}{2}[pK_a - pK_b]$$

But given that,

$pK_a = 4.76$, $pK_b = 4.75$

Then, $pH = 7 + \frac{1}{2}[pK_a - pK_b]$

$$pH = 7 + \frac{1}{2}[4.76 - 4.75]$$

$$= 7 + \frac{1}{2}[.01]$$

$pH = 7 + 0.005$
$pH = 7.005$

@apna_pdf

701. What is pH of 2 × 10^{-4} molar HCl solution? Here, log 2=0.301 and log 3 = 0.477

(a) 6.92 (b) 9.5
(c) 5.4 (d) 7.7

UPTU/UPSEE-2016

Ans. (a) As solution is very dilute

$\therefore [H^+] = [H^+]_{water} + [H^+]_{HCl}$

$= 10^{-7} + 2 \times 10^{-8} = 12 \times 10^{-8}$

$\therefore pH = -\log [12 \times 10^{-8}]$

$= -\log [2^2 \times 3 \times 10^{-8}]$

$= -[2\log(2) + \log(3) + \log(10^{-8})] = 6.92$

702. NaOH is a strong base. What will the be pH of 5.0 × 10^{-2} M NaOH solution? (log 2 = 0.3)

(a) 14.00 (b) 13.70
(c) 13.00 (d) 12.70

UPTU/UPSEE-2015

Ans. (d) : Given $[OH^-] = 5 \times 10^{-2}$, log2 = 0.3

$\therefore pOH = -\log [OH^-] = -\log [5 \times 10^{-2}]$

$= -\log 5 + 2\log 10 = 1.30$

But, pH + pOH = 14

pH = 14 – pOH

pH = 14 – 1.30 = 12. 70

703. Hydrogen ion concentration in mol/L in a solution of pH 5.4 will be

(a) 3.98×10^{8} (b) 3.88×10^{6}
(c) 3.68×10^{-6} (d) 3.98×10^{-6}

UPTU/UPSEE-2014

Ans. (d) : $pH = -\log [H^+]$

$5.4 = -\log [H^+]$

$\Rightarrow -5.4 = \log [H^+]$

$[H^+]$= Antilog (–5.4)

$[H^+] = 3.98 \times 10^{-6}$

704. 1 mL of 0.01 N HCl is added to 999 mL solution of 0.1 N Na_2SO_4. The pH of the resulting solution will.

(a) 2 (b) 7
(c) 5 (d) 1

UPTU/UPSEE-2013

Ans. (c) : As Na_2SO_4 solution is neutral, it simply dilutes the HCl solution from 1 ml to 1000 ml

$$\text{Now } [H^+] = \frac{0.01}{1000} = 10^{-5}$$

$pH = -\log [H^+]$

$pH = -\log [10^{-5}]$

pH = [5 log 10]

pH = 5

705. A chemist wishes to prepare a buffer solution of pH = 2.90 that efficiently resists a change in pH yet contains only small concentration of buffering agents. Which one of the following weak acid along with its salt would be best to use

(a) m-chlorobenzoic acid (pK_a = 3.98)
(b) Acetoacetic acid (pK_a = 3.58)
(c) 2.5-dihydrobengoic acid (pK_a = 2.97)
(d) p-chlorocimanic acid (pK_a = 4.41)

UPTU/UPSEE-2013

Ans. (c) : Buffer solution to be made should effectively resist a change in pH, i.e should have high buffer capacity.

$$\text{Buffer capacity}(\phi) = \frac{\text{no. of moles of acid or base added to } 1l}{\text{Change in pH}}$$

by one of any two way's , we can obtain it

(i) The higher the concentration of the components of a buffer mixture , the greater will be buffer capacity. But the condition is to maintain a small concentration of buffering components.

(ii) Buffer capacity of a buffer is maximum when the concentration of weak acid and its salt are equal i.e [salt] = [acid]

$$pH = pK_a + \log \frac{[salt]}{[acid]}$$

$= pK_a + \log 1$ (as [salt] = [acid])

$pH = pK_a = 2.9$

As 2.5 Dihydrobenzoic acid has pK_a value = 2.97

Hence it is the best choice for chemist to prepare buffer solution.

706. Which of the following represents the correct pH of 10^{-7} M HCl in doubly distilled air-free water?

(a) 6.6990 (b) 7.0000
(c) 7.3010 (d) 6.3980

UPTU/UPSEE-2011

Ans. (a) : pH of 10^{-7} M HCl–

Here, $[H^+]$ ions from $H_2O = 10^{-7}$M cannot be neglected in comparison to 10^{-7}M

$\therefore$ Total $[H^+] = 10^{-7} + 10^{-7} = 2 \times 10^{-7}$M

$\therefore pH = -\log [H^+]$

$= -\log (2 \times 10^{-7}) = [-\log 2 + \log 10^{-7}]$

$= -[0.3010 - 7] = 6.6990$

707. pH of a 0.000 1M HCl solution is

(a) 4.0 (b) 2.0
(c) 6.0 (d) 7.0

UPTU/UPSEE-2008

Ans. (a) : pH of a 0.0001 M HCl –

$pH = -\log [H^+]$

$pH = -\log(0.0001)$

$pH = -\log [1 \times 10^{-4}]$

pH = 4

708. Addition of sodium acetate to 0.1M acetic acid will cause

(a) Increase of pH
(b) Decrease in pH
(c) No change in pH
(d) Change in pH that cannot be predicted

WB-JEE-2008

Ans. (a) : Addition of sodium acetate in acetic acid solution, due to common ion NH_4^+ , the suppressed, ionization of acetic acid so concentration of $[H^+]$ decreases.

Hence pH of solution Increases.

709. Which of the following will decrease the pH of a 50 mL solution of 0.01 M HCl?

(a) Addition of 5 mL of 1 M HCl
(b) Addition of 50 mL of 0.01 M HCl
(c) Addition of 50 mL of 0.002 M HCl
(d) Addition of Mg

WB-JEE-2009

Ans. (a) : Addition of 5mlof 1 M HCL will decrease the pH, because only this will increase the H^+ ion concentration in the solution.

@apna_pdf

710. A weak acid of dissociation constant 10^{-5} is being litrated with aqueous NaOH solution. The pH at the point of one-third neutralisation of the acid will be.

(a) 5+log2-log3 (b) 5-log2

(c) 5-log3 (d) 5-log6

WB-JEE-2010

Ans. (b) : $K_a = 10^{-5} \Rightarrow pK_a = -\log K_a$

$-\log 10^{-5} = 5$

	Initial HA	+ NaOH →	NaA	+ H_2O
	1 mol	0	0	0
Final	$\left(1-\frac{1}{3}\right)$ mol		$\frac{1}{3}$ mol	$\frac{1}{3}$ mol
=	$\frac{2}{3}$ mol		$\frac{1}{3}$ mol	

Assumed weak acid to be monoprotic, since only dissociation constant value is provided final solution acts as an acidic buffer.

$$pH = pK_a + \log\left[\frac{\text{salt}}{\text{acid}}\right] \text{ or } pH = 5 + \log\frac{\frac{1}{3}}{\frac{2}{3}} = 5 + \log\frac{1}{2}$$

$\therefore$ pH = 5 – log 2

711. 0.1M HCL and 0.1M H_2SO_4 each of volume 2mL are mixed and the volume is made up to 6 mL by adding 2 mL of 0.1 N NaCl solution. The pH of the resulting mixture is

(a) 1.17 (b) 1.0

(c) 0.3 (d) log 2-log3

WB-JEE-2010

Ans. (b) : Given,

HCl = 0.1 M, H_2SO_4 = 0.1 M

V = 2 mL, V = 2 mL, V_T = 6 mL

NaCl = 0.01 N, V = 2 mL

$$[H^+]_{total} = \frac{\text{Total moles of } H^+}{V_T}$$

$$= \frac{0.1\times2 + 0.1\times2\times2}{6}$$

$[H^+]_T = 0.1$

pH = –log(0.1)

pH = 1

712. The pH of an aqueous solution of CH_3COONa of concentrated C(M) is given by

(a) $7 - \frac{1}{2}pK_a + \frac{1}{2}\log C$

(b) $\frac{1}{2}pK_w + \frac{1}{2}pk_b + \frac{1}{2}\log C$

(c) $\frac{1}{2}pK_w - \frac{1}{2}pK_b - \frac{1}{2}\log C$

(d) $\frac{1}{2}pK_w + \frac{1}{2}pK_a + \frac{1}{2}\log C$

WB-JEE-2011

Ans. (d) :

$$CH_3COONa + H_2O \rightleftharpoons \underset{\text{(Weak acid)}}{CH_3COOH} + \underset{\text{(Strong base)}}{NaOH}$$

As sodium acetate is a salt of weak acid and strong base, in Hydrolysis of sodium acetate the pH is given by

$$pH = \frac{1}{2}pK_w + \frac{1}{2}pKa + \frac{1}{2}\log c$$

713. 20 mL 0.1 (N) acetic acid is mixed with 10 mL 0.1(N) solution of NaOH. The pH of the resulting solution is [pKa of acetic acid is 4.74]

(a) 3.74 (b) 4.74

(c) 5.74 (d) 6.74

WB-JEE-2012

Ans. (b) : $CH_3COOH + NaOH \rightarrow CH_3COONa + H_2O$

Initial moles of acetic acid = 0.02 × 0.1 = 0.002 moles

Initial moles of NaOH = 0.01 × 0.1 = 0.001 moles

Moles after reaction–

Moles of acetic acid = 0.002 – 0.001 = 0.001 moles

Moles of CH_3COONa = 0.001 moles

From Henderson's equation,

$$pH = pKa + \log\frac{[CH_3COONa]}{[CH_3COOH]}$$

$$= 4.74 + \log\frac{1}{1} = 4.74$$

714. A 100 mL 0.1 = (M) solution of ammonium acetate to diluted by adding 100 mL of water the pH of the resulting solution will be (pk_a of aceticac acid is nearly equal to pk_b of NH_4OH)

(a) 4.9 (b) 5.0

(c) 7.0 (d) 10.0

WB-JEE-2012

Ans. (c): Ammonium acetate is a salt of weak acid and weak base. When solutions of such salts diluted resulting pH solution is calculated from following relationship

$$pH = 7 + \frac{1}{2}pK_a - \frac{1}{2}pK_b$$

$\because$ $pK_a = pK_b$ (given)

$\therefore$ pH of diluted solution = 7.0

715. 1×10^{-3} mole of HCl is added to a buffer solution made up of 0.01 M acetic acid and 0.01 M sodium acetate. The final pH of the buffer will be (given, pK_a of acetic acid is 4.75 at 25°C)

(a) 4.60 (b) 4.66

(c) 4.75 (d) 4.8

WB-JEE-2013

Ans. (b) : $CH_3COO^- + H^+ \longrightarrow CH_3COOH$

	CH_3COO^-	H^+	CH_3COOH
Initially	0.01	0.001	0.01
at equation	0.01 – 0.001		0.01 + 0.001
	= 0.009		= 0.011

$$pH = pKa + \log\left[\frac{\text{salt}}{\text{acid}}\right] = 4.75 + \log\left[\frac{0.009}{0.011}\right] = 4.66$$

716. At 25°C, pH of a 10^{-8} M aqueous KOH solution will be

(a) 6.0 (b) 7.02

(c) 8.02 (d) 9.02

WB-JEE-2013

@apna_pdf

Ans. (b) : KOH $\rightleftharpoons$ $K^+ + OH^-$, $[OH^-] = 10^{-8}M$

$H_2O \rightleftharpoons H^+ + OH^-$, $[OH^-] = 10^{-7}M$

$\therefore [OH^-]$ total $= (10^{-8} + 10^{-7})$ M

$= 10^{-7} (1.1) = 1.1 \times 10^{-7}$

$\therefore$ pOH = log $(1.1 \times 10^{-7}) \simeq 6.98$

$\therefore$ pH = 14 – 6.98 = 7.02

717. The pH of 10^{-4} M KOH solution will be

(a) 4 (b) 11

(c) 10.5 (d) 10

WB-JEE-2014

Ans. (d) : Given,

10^{-4} M KOH = 10^{-4}M $[OH^-]$

We know that,

$[H^+] [OH^-] = 1 \times 10^{-14}$

$[H^+] \times 10^{-4} = 1 \times 10^{-14}$

$$[H^+] = \frac{1\times10^{-14}}{10^{-4}} = 1 \times 10^{-10} \text{ M}$$

$\therefore$ pH = – log (H^+) = – log (1×10^{-10})

= 10

718. In which of the following mixed aqueous solutions, pH=pK$_a$ at equilibrium?

(a) 100 mL fo 0.1 M CH_3COOH+100 mL of 0.1 M CH_3 COONa

(b) 100 mL fo 0.1 M CH_3COOH+50 mL of 0.1 M NaOH

(c) 100 mL fo 0.1 M CH_3COOH+100 mL of 0.1 M NaOH

(d) 100 mL fo 0.1 M CH_3COOH+100 mL of 0.1 M NH_3

WB-JEE-2016

Ans. (a, b) : pH of buffer solution is given by

$$pH = pK_a + \log\left[\frac{\text{salt}}{\text{acid}}\right]$$

(a) CH_3COOH and CH_3CONa

100 × ·1 100 × ·1

no. of milimoles = 10 10

$[salt] = [acid] = 10, pH = pK_a + \log\frac{10}{10}$

pH = Pk$_a$

(b) $CH_3COOH + NaOH \rightarrow CH_3COOHNa + H_2O$

100×.1 50×.1

Initial 10 5 0 0

Final 0 0 5 5

$[Salt] = [acid] = 5, pH = pK_a + \log\frac{5}{5}$

pH = pK$_a$

(c) $CH_3COOH + NaOH \rightarrow CH_3COONa + H_2O$

100× 0.1 100×0.1

Initial 10 10 0 0

Final 0 0 10 10

Salt = 10 and acid = 0

$pH = pK_a + \log\frac{10}{0}$

pH ≠ pK$_a$

(d) $CH_3COOH + NH_3 \rightarrow CH_3COONH_4$

Initial 10 10 → No bufter action

Final due to work CH_3COONH_4 salt

pH ≠ pK$_a$

719. Dissolving NaCN in de-ionised water will result in a solution having

(a) pH < 7 (b) pH = 7

(c) pOH = 7 (d) pH > 7

WB-JEE-2017

Ans. (d) :

∵ On dissolving NaCN in de-ionized water following reaction takes place

$CN^- + H_2O \rightleftharpoons HCN + OH^-$

∵ CN^- ions come from the salt of strong base and weak acid

∴ The solution becomes basic and pH >7

720. The desirable range of pH for drinking water is

(a) 6.5 to 8.5 (b) 5.0 to 6.5

(c) 6.5 to 7.0 (d) 7.0 to 8.5

NDA (II)-2017

Ans. (a) : In general, a water with a pH<7 is considered acidic and with a pH>7 is considered basic. The normal range for pH for drinking water from 6.5 to 8.5

721. The solution of which of the following will have pH less than 7?

(a) NaOH (b) KCl

(c) $FeCl_3$ (d) NaCl

NDA (II)-2018

Ans. (c) : The constituent of $FeCl_3$ is a strong acid (HCl) salt and weak base Fe(OH). So, Ferric chloride is an acidic salt whose pH less than 7.

722. Which of the following mixtures will have the lowest pH at 298 K?

(a) 10 mL 0.05 N CH_3COOH + 5 mL 0.1 N NH_4OH

(b) 5 mL 0.2 N NH_4Cl + 5 mL 0.2 N NH_4OH

(c) 5 mL 0.1N CH_3COOH + 10 mL 0.05 N CH_3COONa

(d) 5 mL 0.1 N CH_3COOH + 5 mL 0.1 N NaOH

WB-JEE-2019

Ans. (c) : Option(a) Produces CH_3COONH_4 considering pK$_a$ of CH_3COOH and pK$_b$ of NH_4OH same, pH of solution the solution is 7 since it will completely neutralize.

Option(b) is an example of a basic buffer so pH is more than 7

Option(c) is an example of an acidic buffer so pH is less than 7

Option(d) an aqueous solution of CH_3COONa that Hydrolysis to form a basic solution.

So, pH is more than 7

6. Common Ion Effect

723. Which pair of the following will not show common ion effect?

(a) $H_2S + HNO_3$ (b) $H_2S + HCl$

(c) $NH_4Cl + NH_4OH$ (d) KCN + HCN

CG PET-22.05.2022

@apna_pdf

Ans. (a) : Common ion effect is shown when weak electrolyte and strong electrolyte is mixed.

H_2S + HNO_3 not shown common ion effect because these are not weak and strong electrolyte.

Rest of all are weak and strong electrolyte hence they shows common ion effect.

724. When common salt is added to a saturated solution of soap, soap is precipitated. This is based on the principle of

(a) common ion effect
(b) solubility product
(c) adsorption form solution
(d) peptisation.

COMEDK-2018

Ans. (a) : The saturated solution of soap (RCOONa), show precipitation addition of NaCl, because an increase in Na^+ concentration helps in crossing over ionic product to their K_{sp} values.

$$C_{17}H_{35}COONa(s) \rightleftharpoons C_{17}H_{35}COO^-(aq) + Na^+(aq)$$

When NaCl is added, $[Na^+]$ increases due to which ionic product, $[RCOO^-]$ $[Na^+]$ also increases which results in precipitation of soap. It can also be explained on the basis of common ion effect.

Among the given compound the NH_3 is the most basic. Hence has highest proton affinity.

725. Assertion (A) : Sb_2S_3 is not soluble in yellow ammonium sulphide.

Reason (R) : The common ion effect due to S^{2-} ions reduces the stability of Sb_2S_3.

(a) Both A and R are true and R is the correct explanation of the A.
(b) Both A and R are true but R is not the correct explanation of the A.
(c) A is true, but R is false.
(d) Both A and R are false statements.

SRMJEEE – 2014

Ans. (d) :

(A) Sb_2S_3 is soluble in yellow ammonium sulphide.

$$Sb_2S_3 + 3(NH_4)_2S \longrightarrow 2(NH_4)_3 SbS_3$$

Hence, the statement is false.

(R) This is due to the fact that when the colour changes from white to yellow the number of sulphur increases. therefore the ions of the sulphur atoms increases i.e. S^{2-} ions. So, as the amount of the sulphur ions increases the common ion effect also increases. Therefore, we can say that as the common ion effect increases the solubility will also increases. Hence, the reason is also false.

Hence, both A and R are false statement.

726. The common ion effect is shown by which one of the following set solution

(a) $NH_4OH + NH_4Cl$ (b) $AgCN + KCN$
(c) $BaCl_2 + BaNO_3$ (d) $NaCl + HCl$

AMU–2001

Ans. (a) : $NH_4OH + NH_4Cl$ shows common ion effect NH_4OH is a weak base and undergoes ionisation to a limited extent as follows:

$$NH_4OH \rightleftharpoons NH_4^+ + OH^-$$

NH_4Cl is strong electrolyte

$$NH_4Cl \longrightarrow NH_4^+ + Cl^-$$

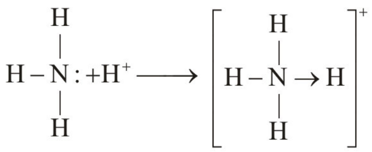
Due to the addition of NH_4Cl, the conc. of NH_4^+ ion in NH_4OH solution increases and equilibrium shift towords left. So, due to NH_4^+(common ion) dissociation of NH_4OH is suppressed.

727. Which one of the following substances has the highest proton affinity?

(a) H_2O (b) H_2S
(c) NH_3 (d) PH_3

[AIEEE-2003]

Ans. (c) : NH_3 is a Lewis base, accepting proton to form ammonium ion as it has tendency to donate an electron pair.



728. Assuming that $Ba(OH)_2$ is completely ionised in aqueous solution under the given conditions the concentration of H_3O^+ ions in 0.005 M aqueous solution of $Ba(OH)_2$ at 298 K is........ $\times 10^{-12}$ mol L^{-1}. (Nearest integer)

[JEE Main 2021, 25 July Shift-II]

Ans. (10^{-12}) : $Ba(OH)_2 \rightarrow Ba^+ + 2OH^-$

$$2 \times 0.005 = 0.01 = 10^{-2}$$

At 298K in aq. solution $[H_3O^+]$ $[OH^-] = 10^{-14}$

$$[H_3O^+] = \frac{10^{-14}}{10^{-2}} = 10^{-12}$$

729. The pH of the resultant solution obtained by mixing 20 mL of 0.01M HCl and 20mL of 0.005M $Ca(OH)_2$ is

(a) 2 (b) 0
(c) 1 (d) 7
(e) 5

Kerala-CEE-2020

Ans. (d) : Total no. of moles present in 20 ml of 0.01 M HCl.

$= 20 \times 0.01$
$= 20 \times 1 \times 10^{-2}$
$= 2 \times 10^{-1}$
$= 0.2$ moles

Similarly, Total no. of moles present in 20 ml of 0.005 M

$Ca(OH)_2 = 20 \times 0.005 \times 2$
$= 40 \times 0.005$
$= 4 \times 5 \times 10^{-2}$
$= 20 \times 10^{-2}$
$= 0.2$ moles.

So, pH of the resultant solution will be 7.

730. Which is not an example of common ion effect?

(a) $NaCl + AgCl$ (b) $H_2S + HCl$
(c) $CH_3COOH + NaOH$ (d) $NH_4OH + NH_4Cl$

MHT CET-2010

Ans. (c) : Among the given, $CH_3COOH + NaOH$ has no common ion, thus does not exhibit common ion effect.

Common ion effect is the suppression of degree of dissociation of weak electrolyte in the presence of a strong electrolyte having common ion.

@apna_pdf

731. **Correct relation between dissociation constant of a dibasic acid is**

(a) $K_{a_1} = K_{a_2}$ (b) $K_{a_1} > K_{a_2}$

(c) $K_{a_1} < K_{a_2}$ (d) $K_{a_1} = \frac{1}{K_{a_2}}$

NEET-2000

Ans. (b) :

(i) $H_2A \underset{}{\overset{Ka_1}{\rightleftharpoons}} HA^- + H^+$

(ii) $HA^- \underset{}{\overset{Ka_2}{\rightleftharpoons}} A^{2-} + H^+$

In the 1st step H^+ ion comes from neutral molecule, while in the 2nd step the H^+ ion comes from negatively charged ions.

The presence of –ve charge makes the removal of H^+ ion difficult

Thus $K_{a_1} > K_{a_2}$

732. **The ionization constant of ammonia hydroxide is 1.77×10^{-5} at 298 K. Hydrolysis constant of ammonium chloride is**

(a) 6.50×10^{-12} (b) 5.65×10^{-13}

(c) 5.65×10^{-12} (d) 5.65×10^{-10}

NEET-2009

Ans. (d) : NH_4Cl is a salt of strong acid and weak Base, so hydrolysis constant is

$$K_h = \frac{K_w}{K_b}$$

Given - K_b (NH_4OH) = 1.77×10^{-5}

$K_w = 10^{-14}$

$$\therefore \quad K_h = \frac{10^{-14}}{1.77 \times 10^{-5}} = 0.565 \times 10^{-9}$$

or $K_h = 5.65 \times 10^{-10}$

733. **What is the $[OH^-]$ in the final solution prepared by mixing 20.0 mL of 0.050 M HCl with 30.0 of 0.10 M $Ba(OH)_2$?**

(a) 0.40 M (b) 0.0050 M

(c) 0.12 M (d) 0.10 M

NEET-2009

Ans. (d) : Milimoles of H^+ produced

= 20 × 0.05 = 1

milimoles of OH^- produced = 30 × 0.1 × 2 = 6

$\because Ba(OH)_2 \rightleftharpoons Ba^{2+} + 2OH^-$

$\therefore$ Milimoles of OH^- remaining in solution

6 – 1 = 5

Total volume of solution = 20 + 30 = 50 mL

$$\therefore \quad [OH^-] = \frac{5}{50} = 0.1 \text{ M}$$

734. **Equal volumes of three acid solutions of pH 3, 4 and 5 are mixed in a vessel. What will be H^+ ion concentration in the mixture ?**

(a) 3.7×10^{-3} M (b) 1.11×10^{-3} M

(c) 1.11×10^{-4} M (d) 3.7×10^{-4} M

NEET-2008

Ans. (d) : We know that, pH=– log $[H^+]$ $[H^+] = 10^{-pH}$

Given,

$[H^+]$ of soln. $1 = 10^{-3}$

$[H^+]$ of soln. $2 = 10^{-4}$, $[H^+]$ of soln. $3 = 10^{-5}$

Total concentration of

$[H^+] = 10^{-3}(1 + 1 \times 10^{-1} + 1 \times 10^{-2})$

$$10^{-3}\left(\frac{1}{1} + \frac{1}{10} + \frac{1}{100}\right) \Rightarrow 10^{-3}\left(\frac{10+10+1}{100}\right)$$

$= 1.11 \times 10^{-3}$

So, H^+ ion concentration in mixture of equal volume of these acid solution.

$$= \frac{1.11 \times 10^{-3}}{3} = 3.7 \times 10^{-4} \text{M}$$

735. **A weak acid, H*A* has a K_a of 1.00×10^{-5}. If 0.100 mol of this acid is dissolved in one litre of water, the percentage of acid dissociated at equilibrium is closest to**

(a) 1.00% (b) 99.9%

(c) 0.100% (d) 99.0%

NEET-2007

Ans. (a) : For a weak acid degree of dissociation -

$$\alpha = \sqrt{\frac{K_a}{C}} = \sqrt{\frac{1 \times 10^{-5}}{0.1}} = 10^{-2} = 0.01 = 1\%$$

736. **Which of the following pairs of ions cannot be separated by H_2S in dilute HCl?**

(a) Bi^{3+}, Sn^{4+} (b) Al^{3+}, Hg^{2+}

(c) Cu^{2+}, Zn^{2} (d) Ni^{2+}, Cu^{2+}

UPTU/UPSEE-2013

Ans. (a) : Bi^{3+} (IIA), Sn^{4+} (IIB) can't be separated by H_2S in dilute hydrochloric acid. Both the radicals are precipitated as their sulphides Bi_2S_3 (Black) and SnS_2 (yellow)

737. **When common salt is dissolved in water,**

(a) the melting point of the solution increases

(b) the boiling point of the solution increases

(c) the boiling point of the solution decreases

(d) both the melting and boiling point of the solution decrease

UPTU/UPSEE-2010

Ans. (b) : Boiling point of solution increases common salt in a non vocative solute which lower the vapour pressure of the solution and eventually increases boiling points of solution.

738. **Which of the following pairs will show common ion effect?**

(a) barium chloride + barium sulphate

(b) silver cyanide + potassium nitrite

(c) ammonium hydroxide + ammonium chloride

(d) sodium chloride + hydrogen chloride

UPTU/UPSEE-2010

Ans. (c) : Common ion effect is show when weak electrolyte and strong electrolyte is mixed. NH_4OH is weak base to which NH_4Cl is added which provides common NH_4 ion dissociation of NH_4OH is suppressed. Since NH_4OH is a weak electrolyte whereas NH_4Cl is a strong electrolyte it shows the common ion effect.

@apna_pdf

09.

Redox Reactions

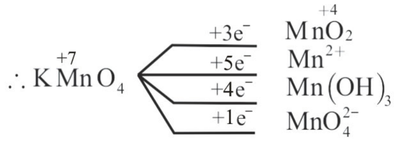
1. Oxidation Number and Oxidation State

1. Number of electrons transferred in each case when $KMnO_4$ acts as an oxidising agent to give MnO_2, Mn^{2+}, $Mn(OH)_3$, MnO_4^{2-} are respectively-

(a) 3, 5, 4, 1　　(b) 4, 3, 1, 5
(c) 1, 3, 4, 5　　(d) 5, 4, 3, 1

CG PET-22.05.2022

Ans. (a) : Oxidation state of Mn in $KMnO_4$ is +7



∴ Correct answer is 3, 5, 4, 1

2. Statement-I : Leaching of gold with cyanide ion in absence of air/O_2 leads to cyano complex of Au(III).
Statement-II : Zinc is oxidized during the displacement reaction carried out for gold extraction. In the light of the above statements, choose the correct answer from the options given below.
(a) Both statement-I and statement-II are correct
(b) Both statement-I and statement-II are incorrect
(c) Statement-I is correct but statement-II is incorrect
(d) Statement-I is incorrect but statement-II is correct

JEE Main-27.06.2022, Shift-II

Ans. (d) : Statement – I :–
Cyanide process/Mac Arthur Process:–

$$4M(s)+8CN^-(aq)+2H_2O(aq)+O_2(g)\rightarrow 4[M(CN)]^-(aq)+4OH^-(aq)$$

[M = Ag or Au]

∴ For $[M(CN)_2]^{-1}$, x – 2 = –1
x = –1 + 2 = 1

∴ Cyanide complex has oxidation no. +1.

Statement – II :–

$$2[M(CN)_2]^-(aq) + \overset{0}{Zn}(s)\rightarrow\left[\overset{+2}{Zn}(CN)_4\right]^{2-}(aq)+2M(s)$$

x – 4 = –2
x = +2
∴ Zn get oxide from 0 to +2

3. The number of terminal oxygen atoms present in the product B obtained from the following reactions is ———.
$FeCr_2O_4+Na_2CO_3+O_2\rightarrow A + Fe_2O_3 + CO_2$
$A +H^+\rightarrow B + H_2O +Na^+$

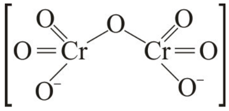
JEE Main-29.06.2022, Shift-I

Ans. (6) :

$$FeCr_2O_4+Na_2CO_3+O_2\rightarrow \underset{(A)}{Na_2CrO_4}+Fe_2O_3+CO_2$$

$$\therefore\ 2\underset{(A)}{Na_2CrO_4}+2H^+\rightarrow \underset{(B)}{Cr_2O_7^{2-}}+H_2O+4Na^+$$

$B = Cr_2O_7^{2-}\rightarrow$



So, number of terminal oxygen atom in B = 6.

4. The difference in oxidation state of chromium in chromate and dichromate salts is ______.

JEE Main-24.06.2022, Shift-I

Ans. (0) : Dichromate $\rightarrow \overset{x\ \ -2}{Cr_2O_7^{2-}}$
x × 2 + (–2) × 7= –2
x = +6

Chromate $\rightarrow \overset{y\ \ -2}{Cr_2O_4^{2-}}$
y + (–2) (4) = –2
y – 8 = –2
y = +6

∴ Difference in oxidation state (x – y) = 6 – 6 = 0.

5. The oxidation number of chromium in potassium dichromate is

(a) +2　　(b) +4
(c) +6　　(d) +8

MHT-CET-2012, BITSAT-2008
BCECE-2007, CG PET -2004

Ans. (c) : Chemical formula of potassium dichromate is $K_2Cr_2O_7$.
Consider, $K_2Cr_2O_7$
Let, x be the oxidation state of Cr.
⇒ 2(+1)+2x+7(–2)=0
2+2x–14=0
2x=12
x= +6

6. The oxidation state of sulphur in the anions SO_3^{2-}, $S_2O_4^{2-}$ and $S_2O_6^{2-}$ follow the order

(a) $S_2O_4^{2-} < SO_3^{2-} < S_2O_6^{2-}$
(b) $SO_3^{2-} < S_2O_4^{2-} < S_2O_6^{2-}$
(c) $S_2O_4^{2-} < S_2O_6^{2-} < SO_3^{2-}$
(d) $S_2O_6^{2-} < S_2O_4^{2-} < SO_3^{2-}$

BITSAT-2009, CG PET-2007, NEET-2003

@apna_pdf

Ans. (a) : Sulphur in $SO_3^{2-}, S_2O_4^{2-}$, and $S_2O_6^{2-}$ has +4, +3 and +5 oxidation state respectively.
So, the order is–

$$S_2O_4^{-2} < SO_3^{2-} < S_2O_6^{-2}$$

7. Which of the following species do not show disproportionation reaction?

(a) $HClO$ (b) $HClO_2$
(c) $HClO_3$ (d) $HClO_4$

TS EAMCET 10.08.2021, Shift-I
AP-EAMCET (Engg.)-21.09.2020, Shift-I
COMEDK-2014

Ans. (d) :

$H\overset{+1}{Cl}O$, $H\overset{+3}{Cl}O_2$, $H\overset{+5}{Cl}O_3$, $H\overset{+7}{Cl}O_4$

In $HClO_4$, chlorine has +7 oxidation state which is its maximum oxidation state.
To reduce other compound it has to gain e^-.
But $HClO_4(ClO_4^-)$ cannot gain e^- in disportionation. It is necessary that ClO_4^- get oxidized as well as reduced which is not possible in $HClO_4$.

8. What are the oxidation numbers of nitrogen in NH_4NO_3?

(a) +3, -5 (b) -3, +5
(c) +3, -6 (d) +2, +2

SRMJEEE – 2013, AP EAMCET- 2001
AP EAMCET (Engg.), 2001

Ans. (b) : NH_4NO_3 exists as NH_4^+ and NO_3^-.
Let, the oxidation state of N is x in NH_4^+.

$$x + 4 \times (+1) = +1$$
$$x = -3$$

And, NO_3^-

$$x + 3(-2) = -1$$
$$x = +5$$

Hence, the correct option is (b).

9. When hydrogen peroxide is added to acidified solution of dichromate to $Cr_2O_7^{2-}$, a deep blue coloured complex of chormic peroxide CrO_5 is formed. Oxidation state of Cr in CrO_5 is

(a) +5 (b) +3
(c) +6 (d) –10

JIPMER-2018
Odisha NEET-2019-2014

Ans. (c) : When H_2O_2 is added to an acidified solution of a dichromate $Cr_2O_7^{-2}$ a deep blue coloured complex, of CrO_5 formed.

$$Cr_2O_7^{-2} + 2H^+ + 4H_2O \rightarrow 2CrO(O_2)_2 + 5H_2O$$

$\Rightarrow x+(-2)+(-1)\ 4=0$
$x-6=0$
$x = +6$

10. For the redox reaction

$$MnO_4^- + C_2O_4^{2-} + H^+ \rightarrow Mn^{2+} + CO_2 + H_2O.$$

The correct coefficients of the reactions for the balanced equation are

	MnO_4^-	$C_2O_4^{2-}$	H^+
(a)	16	5	2
(b)	2	5	16
(c)	2	16	5
(d)	5	16	2

NEET-2018
BITSAT-2006

Ans. (b) : Let the two half reactions oxidation half and reduction half are as follows,

Reduction: $MnO_4^- \rightarrow Mn^{2-}$

Oxidation: $C_2O_4^- \rightarrow CO_2$

Balance all atom other than O and H.

$MnO_4^- \rightarrow Mn^{2-}$

$C_2O_4^{2-} \rightarrow 2CO_2$

Now, balance the oxygen atom by adding H_2O molecule.

$MnO_4^- \rightarrow Mn^{2+} + 4H_2O$

$C_2O_4^{2-} \rightarrow 2CO_2$

Now, balance hydrogen atom by adding H^+ ion

$MnO_4^- + 8H^+ \rightarrow Mn^{2+} + 4H_2O$

$C_2O_4^{2-} \rightarrow 2CO_2$

Balance the charge

$MnO_4^- + 8H^+ + 5e^- \rightarrow Mn^{2+} + 4H_2O$

$C_2O_4^{2-} \rightarrow 2CO_2 + 2e^-$

Now, multiply oxidation half reaction by 2 & reduction half reaction by 5, and adding, we get

$$2MnO_4^- + 5C_2O_4^{2-} + 16H^+ \rightarrow 2Mn^{2+} + 10CO_2 + H_2O$$

11. $CH_4(g) + 4Cl_2(g) \rightarrow CCl_4(l) + 4\ HCl(g)$
In the above reaction, the change of oxidation state of carbon is

(a) from + 4 to –4 (b) from +1 to + 4
(c) from – 4 to + 4 (d) from –1 to + 1
(e) from – 4 to – 1

Kerala-CEE-2020
NEET-2020

Ans. (c) : $CH_4(g) + 4Cl_2(g) \rightarrow CCl_4\ (l) + 4HCl(g)$
Oxidation State of C in $CH_4(g) = x + 4 \times (+1) = 0$
$\Rightarrow x = -4$
Oxidation state of C in $CCl_4 = x + 4 \times (-1) = 0$
$\Rightarrow x - 4 = 0$
$\Rightarrow x = +4$
So, change in oxidation state = – 4 to + 4

12. The oxidation states of sulphur in S_8, S_2F_2, H_2S respectively, are

(a) 0,+1 and –2 (b) +2,+1 and –2
(c) 0,+1 and +2 (d) +7,+1 and –2

(AIIMS-2012, 2010)

Ans. (a): In $S_8 \Rightarrow$ Oxidation number of S is 0.
$S_2F_2 \Rightarrow$ F is in –1 oxidation state. Hence, S is in +1 oxidation state.
$H_2S \Rightarrow$ H is in +1 oxidation state.
Hence, S is in –2 oxidation state.
=0,+1,–2

@apna_pdf

13. What is the oxidation state of chlorine in hypochlorous acid?

(a) +1 (b) +3

(c) +5 (d) +7

AP EAMCET (Medical), 2001
AP EAMCET- 2000

Ans. (a) : The molecular formula of hypochlorous acid is HClO.

Let, the oxidation state of Cl is x.

∴ +1 + x – 2 = 0

x = +1

Hence, the correct option is (a).

4. Oxidation states of Cr in $K_2Cr_2O_7$ and CrO_5 are, respectively

(a) +6,+5 (b) +6,+10

(c) +6,+6 (d) None of these

WB-JEE-30.04.2022

Ans. (c) : Oxidation no. of Cr in $K_2Cr_2O_7$

$\Rightarrow 2(+1)+2(x)+7(-2)=0$

$2+2x+(-14)=0$

$x = +6$

And oxidation no. of Cr in CrO_5 or $CrO(O_2)_2$

$\Rightarrow x+4(-1)+1(-2)=0$

$x-4-2=0$

$x = +6$

So, option (c) is correct.

15. Dichromate ion is treated with base, the oxidation number of Cr in the product formed is............

JEE Main 26.02.2021, Shift-I

Answer - 6

$$Cr_2O_7^{2-} + 2OH^- \rightleftharpoons 2CrO_4^{2-} + H_2O$$

Let, oxidation state of Cr in chromate ion is x.

$CrO_4^{2-} \Rightarrow x + (-2)4 = -2$

$\Rightarrow x=6$

Hence, the oxidation state of Cr in CrO_4^{2-} is +6.

16. The sum of oxidation states of two silver ions in $[Ag(NH_3)_2]$ $[Ag(CN)_2]$ complex is............

JEE Main- 01.09.2021, Shift-II

Answer - 2

$[Ag(NH_3)_2]$ $[Ag(CN)_2]$ complex is dissociates into $[Ag(NH_3)_2]^+$ and $[Ag(CN)_2]^-$.

∵ $[Ag(NH_3)_2]^+$

Let, oxidation state of Ag is x_1.

∴ $x_1 + 2(0) = +1$

Or $x_1 = +1$

And $[Ag(CN)_2]^-$

Let, oxidation state of Ag is x_2.

∴ $x_2 + 2(-1) = -1$

Or $x_2 = +1$

∴ $x_1 + x_2 = 1 + 1 = 2$

17. In Pb_3O_4, the different oxidation states of Pb is/are

(a) 2.66 only (b) 2 only

(c) 2 and 4 only (d) 2, 4 and 1

TS-EAMCET (Engg.), 07.08.2021, Shift-II

Ans. (a) : Pb_3O_4 is considered to be mixture of 2PbO, PbO_2. Oxidation number of Pb in PbO is +2 while in PbO_2 is +4. So that the average oxidation state is 8/3 = 2.66.

18. Dichromate ion is treated with base, the oxidation number of Cr in the product formed is ______.

JEE Main 26.02.2021, Shift-I

Ans. (6) : $Cr_2O_7^{2-} + 2OH^- \rightleftharpoons 2CrO_4^{2-} + H_2O$

Let, oxidation state of Cr in CrO_4^{2-} is x

∴ $x + 4(-2) = -2$

$x - 8 = -2$

$x = +6$

19. The oxidation number of phosphorous in orthophosphorous acid is

(a) +1 (b) +2

(c) +5 (d) +3

Assam CEE-2021

Ans. (d) : The chemical formula of orthophosphorus acid is H_3PO_3.

H_3PO_3

Let, the oxidation state of P is x.

$+3 + x - 6 = 0$

$x = +3$

20. Which of the following is correct for all elements from Sc to Cu ?

(a) The lowest oxidation state shown by them is +2

(b) 4s orbital is completely filled in the ground state

(c) 3d orbital is not completely filled in the ground state

(d) The ions in +2 oxidation states are paramagnetic

Kerala-CEE-29.08.2021

Ans. (d) : (A) All elements from Sc to Cu shows the lowest oxidation state i.e. +2 except Sc. Hence the statement is false.

(B) In 3d-series of transition metal from Sc to Cu, 4s orbital is completely filled in ground state except Cr and Cu. Thus, statement is false.

(C) Cu has the completely filled 3d-orbital. Hence the statement is false.

(D) The given statement is true because all metal i.e. Sc to Cu have the unpaired electron with +2 oxidation state which shows the paramagnetic behaviour.

21. Which of the following reactions is the metal displacement reaction? Choose the right option.

(a) $2Pb(NO_3)_2 \rightarrow 2PbO + 4NO_2 + O_2\uparrow$

(b) $2KClO_3 \xrightarrow{\Delta} 2KCl + 3O_2$

(c) $Cr_2O_3 + 2Al \xrightarrow{\Delta} Al_2O_3 + 2Cr$

(d) $Fe + 2HCl \rightarrow FeCl_2 + H_2\uparrow$

NEET-2021

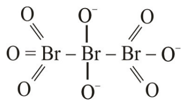
Ans. (c) : $Cr_2O_3 + 2Al \xrightarrow{\Delta} Al_2O_3 + 2Cr$.

Reaction (1) & (2) are examples of decomposition reactions. Reaction (3) & (4) are the example of displacement reaction. While reaction (3) is metal displacement reaction.

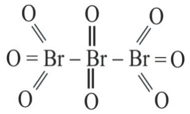
@apna_pdf

22. The correct structure of tribromooctaoxide is

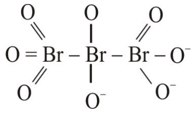
(a)



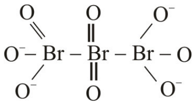
(b)



(c)

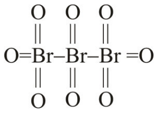


(d)



NEET-2020

Ans. (b) : The structure of tribromooctaoxide is-



It's the tribromooctaoxide.

23. The oxidation states of transition metal atoms in $K_2Cr_2O_7$, $KMnO_4$ and K_2FeO_4, respectively, are x, y and z. The sum of x, y and z is

[JEE Main 2020, 2 Sep Shift-II]

Answer - 19

$K_2Cr_2O_7 \Rightarrow 2(+1)+2x+7(-2)=0$

oxidation state $\Rightarrow x=6$

$KMnO_4 \Rightarrow 1+y+4(-2)=0$

$y=7$

$K_2FeO_4 \Rightarrow 2(1)+z+4(-2)=0$

$z=6$

So, $x+y+z=6+7+6=19$

24. On heating, lead (II) nitrate gives a brown gas (A). The gas (A) on cooling changes to a colourless solid/liquid (B). (B) on heating with No changes to a blue solid (C). The oxidation number of nitrogen in solid (C) is

(a) +5 (b) +4
(c) +2 (d) +3

[JEE Main 2020, 4 Sep Shift-I]

Ans. (d): Given that, according to question lead(II) nitrate on heating gives a brown gas 'A' therefore, gas 'A' must nitrogen dioxide (NO_2).

(i) $2Pb(NO_3) \rightarrow 2PbO + \underset{\text{(gas A)}}{4NO_2} + O_2$

(ii) B must be N_2O_4 (dinitrogen tetroxide)

$$2NO_2 \rightleftharpoons \underset{\text{(Colourless solid B)}}{N_2O_4}$$

(iii) Since colourless solid 'B' on heating with NO, gives a blue solid 'C' therefore 'C' must be dinitrogen trioxide

$$2NO + N_2O_4 \rightarrow \underset{\text{(Blue solid C)}}{2N_2O_3}$$

Here, $N_2O_3 \Rightarrow 2(x)+3(-2)=0$

$2x=6$

$x=+3$

25. The oxidation number of nitrogen atoms in NH_4NO_3 are

(a) +5, +5 (b) – 3, + 5
(c) +3, – 5 (d) –3, –3

Karnataka-CET-2020

Ans. (b) : The oxidation state of nitrogen atom in NH_4NO_3.

First, we get–

NH_4^+

$x+1\times4=1$

$\boxed{x=-3}$

Similarly, NO_3^-

$x+3(-2)=-1$

$x=+5$

26. Oxidation number of potassium in K_2O, K_2O_2 and KO_2, respectively, is

(a) +1, +4 and +2 (b) +1, +2 and +4
(c) +1, +1 and +1 (d) +2, +1 and $+\frac{1}{2}$

[JEE Main 2020, & Jan Shift-I]

Ans. (c) : The given species are K_2O, K_2O_2 and KO_2. Let oxidation state of potassium (K) in all species is x.

$\therefore \quad \underset{\substack{2x-2=0\\x=+1}}{K_2O} \quad \underset{\substack{2x+2(-1)=0\\x=+1}}{K_2O_2} \quad \underset{\substack{x+2(-0.5)=0\\x=+1}}{KO_2}$

27. The number of elements among O, Cl, F, N, P, Sn, Ti, K, Sc, which show more than one non-zero oxidation state is

(a) 2 (b) 3
(c) 6 (d) 8

AP EAMCET (Engg.) 21.09.2020, Shift-I

Ans. (c) : Sodium (+1), scandium (+3) and fluorine (–1) show only one non-zero oxidation state. The oxidation states of oxygen are –1, –2 and +2. The oxidation states of chlorine range from –1 to +7. The oxidation states of nitrogen and phosphorus range from –3 to +5.

The oxidation states of tin range from +2 to +4. The oxidation states of scandium is +3. Scandium (Z = 21) does not exhibit variable oxidation states and yet it is regarded as a transition element because scandium has partially filled d-orbitals in the ground state.

The oxidation states of titanium are +2, +3, +4 respectively.

Hence, the correct option is (c).

28. The oxidation number of an element in a compound is evaluated on the basis of certain rules. Which of the following rules is not correct?

1. **The oxidation number of hydrogen is always +1.**
2. **The algebraic sum of all the oxidation numbers of all elements in a compound is zero.**
3. **An element in the free or the uncombined state bears oxidation number zero.**
4. **In all its compounds, the oxidation number of fluorine is -1.**

(a) 1 (b) 2
(c) 3 (d) 4

AP EAMCET (Engg.) 18.09.2020, Shift-I

Ans. (a) : Oxidation number of hydrogen is usually +1 compounds with more electronegative atoms (as in H_2O) is +1. But in alkali metal hydride like lithium hydride of the molecule where the oxidation state of hydrogen atom = -1.

@apna_pdf

29. When a current of 0.5 A is passed for 2 hours through a molten metal salt, 3.88 g of the metal was deposited. If atomic mass of the metals is 208 units, the oxidation state of the metal in the salt is ....

(a) +1
(b) +2
(c) +3
(d) +4

AP EAMCET (Engg.) 18.9.2020 Shift-I

Ans. (b) : $w = \frac{Eit}{F} = \frac{\frac{A}{n} \times i \times t}{F}$

$\Rightarrow n = \frac{A \times i \times t}{w \times F} = \frac{208 \times 0.5 \times (2 \times 3600)}{388 \times 96500} = 1.999 \simeq 2$

[$\because$ A = atomic mass of the metal = 208 unit

i = current = 0.5 A

t = time = 2 hrs = 2 × 3600 s

$E = \frac{A}{n}$ = Equivalent mass of the metal

n = Valency of the metal in the salt

So, oxidation state of the metal in the salt = +2.

30. H_2O_2 reduces MnO_4^- ion to

(a) Mn^{3+}
(b) Mn^{2+}
(c) Mn^-
(d) Mn^+

COMEDK-2020

Ans. (b) :

$2MnO_4^- + 5H_2O_2 + 6H^+ \rightarrow 2Mn^{2+} + 8H_2O + 5O_2$.

Thus, in this reaction, H_2O_2 reduces the MnO_4^- ion to Mn^{2+} ion.

31. Assertion: Oxidation state of Cr in CrO_5 is + 10 by conventional method is wrong.

Reason: Because the maximum oxidation state of Cr can't be more than +6 since it has 5 electron in 3d orbital and one electron in 4s orbital.

(a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS 25 May 2019 (Morning)

Ans. (a): Since chromium Cr has an electronic configuration of [Ar] $3d^5$ $4s^1$. Its maximum oxidation state can be +6, reason being it has only six electrons in (n–1) d and ns orbitals.

32. The ionic charges on chromate ion and dichromate ion respectively is

(a) –2, –2
(b) –3, –2
(c) –2, –4
(d) –4, –2

MHT CET-02.05.2019, SHIFT-III

Ans. (a): Chromate salts contain the chromate anion, CrO_4^{2-} with –2 ionic charge. Dichromate salts contain the dichromate anion, CrO_7^{2-} with –2 ionic charge. They are oxoanion of chromium in the +6 oxidation state.

33. In the reaction,

$MnO_4^{-1}(aq) + Br^{-1}(aq) \longrightarrow MnO_2(s) + BrO_3^{-1}(aq)$, the correct change in oxidation number of the species involved is

(a) Br^{+5} to Br^{-1}
(b) Mn^{+7} to Mn^{+2}
(c) Mn^{+7} to Mn^{+3}
(d) Br^{-1} to Br^{+5}

MHT CET-02.05.2019, SHIFT-III

Ans. (d) : $\overset{+7}{Mn}O_4^{-1}(aq) + Br^{-1}(aq) \longrightarrow$

$\overset{+4}{Mn}O_2(s) + \overset{+5}{Br}O_3^{-1}(aq)$

In the above reaction, oxidation number of Mn in MnO_4^{-1} (aq) decreases from + 7 to +4 in MnO_2(s) and oxidation number of Br increase from–1(in Br^-(aq.)) to + 5 (in BrO_3^{-1}(aq)). Thus, the correct option is (d).

34. Which element can have oxidation state from range +4 to +6?

(a) Fe
(b) Mg
(c) Co
(d) Cr

AIIMS 25 May 2019 (Morning)

Ans. (d): Fe oxidation state range → +2 to +6 (but +6 is less stable).

Mg oxidation state +2

Co oxidation state range → +2 to +4

Cr oxidation state range → +2 to +6 (But +6 is more stable).

35. The oxidation state of potassium in KO_2 is

(a) +2
(b) +4
(c) +1
(d) –1

COMEDK-2019

Ans. (c) : In superoxides like KO_2, each oxygen atom is assigned an oxidation number of –1/2.

Let, oxidation state of K be x.

$\Rightarrow x + 2(-1/2) = 0 \Rightarrow x + (-1) = 0 \Rightarrow x = +1$

36. Which one of the following compounds does not exhibit a different oxidation number of the same element?

(a) Pb_3O_4
(b) Fe_3O_4
(c) Fe_2O_3
(d) Mn_3O_4

NDA (II)-2019

Ans : (c) The compound Fe_2O_3 does not exhibit different oxidation number of Fe.

In Fe_2O_3,

Let x be the oxidation number of Fe.

$\therefore 2(x) + 3(-2) = 0$

$x = +3$

Hence, Fe is only +3 oxidation state in Fe_2O_3 among all.

37. Which of the following reactions are disproportionation reactions ?

(i) $2Cu^+ \rightarrow Cu^{+2} + Cu^0$

(ii) $3MnO_4^{2-} + 4H^+ \rightarrow 2MnO_2^{2-} + MnO_2 + H_2O$

(iii) $2KMnO_4 \xrightarrow{\Delta} K_2MnO_4 + MnO_4 + O_2$

(iv) $2MnO_4^- + 3Mn^{2+} + H_2O \rightarrow 5MnO_2 + 4H^+$

Select the correct option from the following.

(a) (i) and (iv) only
(b) (i) and (ii) only
(c) (i), (ii) and (iii)
(d) (i), (iii) and (iv)

NEET-2019

@apna_pdf

Ans. (b) : Disproportionation reaction are the reactions in which the same element compound get oxidized and reduced.
Since, I and II reactions are as follows

$$2Cu^+ \rightarrow Cu^{2+} + Cu^o$$

$$3\,MnO_4^{2-} + 4H^+ \rightarrow 2MnO_4^- + MnO_2 + 2H_2O$$

So, (I) & (II) reaction is correct and belong to disproportionation reaction.

38. The correct order of N-compounds is its decreasing order of oxidation states is
(a) HNO_3, NO, N_2, NH_4Cl
(b) HNO_3, NO, NH_4Cl, N_2
(c) HNO_3, NH_4Cl, NO, N_2
(d) NH_4Cl, N_2, NO, HNO_3

NEET-2018

Ans. (a) : Oxidation state of N in HNO_3= +5
Oxidation state of N in NO = +2
Oxidation state of N in N_2 = 0
Oxidation state of N in NH_4Cl = –3
HNO_3, NO, N_2, NH_4Cl

39. Oxidation state of phosphorus in orthophosphoric acid is
(a) +5 (b) +4
(c) +3 (d) +2

JCECE - 2018

Ans. (a) : The molecular formula of orthophosphoric acid is H_3PO_4.
H_3PO_4

$$\Rightarrow \quad 3 \times 1 + x + 4(-2) = 0$$
$$3 + x - 8 = 0$$
$$x = 8 - 3$$
$$x = +5$$

The oxidation state of phosphorus in orthophosphorus acid is +5.

40. Valence electrons in the element X are 3 and that in element Y is 6. Most probable compound formed from X and Y is
(a) X_2Y (b) XY_2
(c) X_6Y_3 (d) X_2Y_3

JIPMER-2018

Ans. (d) : Same number of electrons is denoted.
So, 3×X = (8–6) ×Y

$$\frac{X}{Y} = \frac{2}{3}$$

Hence, X_2Y_3.

41. When $KMnO_4$ acts as an oxidising agent and ultimately forms $MnO_4^{2-}, MnO_2, Mn_2O_3$ and Mn^{2+}, then the member of electrons transferred in each case respectively is ?
(a) 4, 3, 1, 5 (b) 1, 5, 3, 7
(c) 1, 3, 4, 5 (d) 3, 5, 7, 1

[AIIMS-27 May 2018(M)]

Ans. (c): According to the question –

$$KMnO_4 \xrightarrow{+1e^-} MnO_4$$

$$KMnO_4 \xrightarrow{+3e^-} MnO_2$$

$$KMnO_4 \xrightarrow{+4e^-} Mn_2O_3$$

$$KMnO_4 \xrightarrow{+5e^-} Mn^{2+}$$

Then, the member of electrons transferred in each case respectively is = 1,3,4,5

42. A metal ion M^{3+} loses 3 electrons, its oxidation number will be
(a) +3 (b) +6
(c) 0 (d) –3

COMEDK-2018

Ans. (b) : When M^{3+} loses 3 electron then its oxidation no. increases +3 to +6.

$$M^{3+} \longrightarrow M^{+6} + 3e^-$$

43. The coefficients of I^-, IO_3^- and H^+ in the redox reaction,

$$\mathbf{I^- + IO_3^- + H^+ \rightarrow I_2 + H_2O}$$

in the balanced form respectively are :
(a) 5, 1, 6 (b) 1, 5, 6
(c) 6, 1, 5 (d) 5, 6, 1

Manipal-2018

Ans. (a) : Balanced the redox reaction, we get

$$6H^+ + 5I^- + IO_3^- \rightarrow 3I_2 + 3H_2O$$

The coefficient of I^-, IO_3^- and H^+ are 5, 1 and 6 respectively

44. Out of the following outer electronic configurations of atoms, the highest oxidation state is achieved by which one?
(a) $(n-1)d^8ns^2$ (b) $(n-1)d^5ns^2$
(c) $(n-1)d^3ns^2$ (d) $(n-1)d^5ns^1$

WB-JEE-2018

Ans. (b) : The outer electronic configurations of atoms $(n-1)\,d^5ns^2$ is [Mn]
Thus, Mn showing the highest oxidation state =+7

45. In view of $\Delta_r G^o$ for the following reactions

$$\mathbf{PbO_2 + Pb \longrightarrow 2PbO, \Delta_r G^o < 0}$$

$$\mathbf{SnO_2 + Sn \longrightarrow 2SnO, \Delta_r G^o > 0}$$

Which oxidation state is more characteristic for lead and tin?
(a) For lead +2, for tin +2
(b) For lead +4, for tin +4
(c) For lead +2, for tin +4
(d) For lead +4, for tin +2

UPTU/UPSEE-2017

Ans. (c) : The given reaction,

$$\overset{+4}{PbO_2} + \overset{0}{Pb} \rightarrow 2\overset{+2}{PbO}, \quad \Delta_r G^o < 0$$

Spontaneous +2 is more stable

$$\overset{+4}{SnO_2} + \overset{0}{Sn} \rightarrow 2\overset{+2}{SnO}, \quad \Delta_r G^o > 0$$

Non spontaneous +2 less stable
So, for lead +2 and for Sn+4

46. In the conversion of Br_2 to BrO_3^-, the oxidation number of Br changes from
(a) 0 to +5 (b) +1 to +5
(c) 0 to –3 (d) +2 to +5

COMEDK-2017

@apna_pdf

Ans. (a) : $Br_2 \rightarrow BrO_3^-$

Any free (unattached) element with no charge has the oxidation state of zero.

Let, the oxidation number of Br in BrO_3^- be x.

Hence, x+3×(–2)= –1 or, x–6=–1, x = +5

Hence, conversion of Br_2 to BrO_3^- the oxidation no. changes from 0 to +5.

47. Which of the following is an energy releasing process?

(a) $X(s) \longrightarrow X(g)$

(b) $O^-(g) \xrightarrow{e^-} O^{2-}(g)$

(c) $O(g) \longrightarrow O^+(g) + e^-$

(d) $O(g) \xrightarrow{e^-} O^-(g)$

BCECE-2017

Ans. (d) : $O(g) \xrightarrow{e^-} O^-(g)$

It represents the first electron gain enthalpy of oxygen which has value –141 kJ/mol.

When an electron is added to a neutral gaseous atom, the energy is released. Option A & C represents ionization enthalpy.

The option B represents the electron gain enthalpy of oxygen which equal to +780 kJ/mole.

So, energy is required to odd electron to gaseous ion in order to overcome the electrostatic force of repulsion between negatively charged ion and electron.

48. Which among the following compounds does not act as reducing agent?

(a) H_2O (b) H_2S

(c) H_2Se (d) H_2Te

MHT CET-2017

Ans. (a) : $H_2O\rightarrow$ has H–Bonding which is strong and cannot be broken easily. So, H_2O does not act as reducing agent.

49. What is the change in the oxidation state of Mn in the reaction of MnO_4^- with H_2O_2 in acidic medium?

(a) $7 \rightarrow 4$ (b) $6 \rightarrow 4$

(c) $7 \rightarrow 2$ (d) $6 \rightarrow 2$

TS-EAMCET-2016

Ans. (c) : The change in oxidation state of Mn in the reaction of MnO_4^- with H_2O_2 in acidic medium is 7 → 2.

$$2\overset{+7}{Mn}O_4^-(aq) + 5H_2O_2(aq) + 6H_3O^+(aq) \rightarrow 2Mn^{2+}(aq) + 5O_2(g) + 14H_2O(l)$$

x + 4(-2)=-1
x = +7

x = 2

50. Which of the following species can function both as oxidizing as well as reducing agent ?

(a) Cl^- (b) ClO_4^-

(c) ClO^- (d) MnO_4^-

(AIIMS-2016)

Ans. (c): $\overset{x}{Mn}\overset{-2}{O}{}_4^{2-} \Rightarrow x + 4(-2) = -1$

$x - 8 = 1$

$\boxed{x = +7}$

So, can't lose e^- (oxidizing agent)

$\overset{x}{Cl}\overset{-2}{O}{}_4^{-1} \Rightarrow x + 4(-2) = -1$

$x = +7$

Cl⇒ (–1 to +7)

So, can't lose e^-

$\overset{x}{Cl}\overset{-2}{O}{}^- \Rightarrow x + (-2) = -1$

x=+1

Hence, ClO^- has both oxidising as well as reducing character.

51. A compound of Xe and F is found to have 53.5% of Xe. What is oxidation number of Xe in this compound ?

(a) – 4 (b) 0

(c) + 4 (d) + 6

BITSAT 2016

Ans. (d) : Given, Xe = 53.5%

∴ F = 46.5%

Relative number of atoms Xe

$$= \frac{53.5}{131.2} = 0.4 \text{ and } F = \frac{46.5}{19} = 2.4$$

Simple ratio Xe = 1 and F = 6,

∵ Molecular formula is XeF_6.

∴ O.N. of Xe is +6.

52. Hot concentrated sulphuric acid is a moderately strong oxidizing agent. Which of the following reactions does not show oxidizing behaviour ?

(a) $Ca + 2H_2SO_4 \rightarrow CuSO_4 + SO_2 + 2H_2O$

(b) $S + 2H_2SO_4 \rightarrow 3SO_4 + 2H_2O$

(c) $C + 2H_2SO_4 \rightarrow CO_2 + 2SO_2 + 2H_2O$

(d) $CaF_2 + H_2SO_4 \rightarrow CuSO_4 + 2HF$

NEET-2016

Ans. (d) : Given,

$CaF_2+H_2SO_4\rightarrow CaSO_4+2HF$

In this reaction, the oxidation no. of Ca, H, S and O are not changed.

Hence, H_2SO_4 is not acting as an oxidising and reducing agent.

53. Potassium dichromate is a good oxidising agent in acidic medium, the oxidation state of chromium changes by

(a) 2 (b) 3

(c) 4 (d) 5

MHT CET-2015

Ans. (b) : Dichromate oxidized to Cr^{+3} from CrO_7^{-2} in acidic medium to the reaction

$$CrO_7^{-2} + 14H^+ + 6e^- \rightarrow 2Cr^{+3} + 7H_2O$$

Chromium is in +6 oxidation state and on the RN_5, we get Cr in +3 state.

So, oxidation state change by 3 units.

@apna_pdf

54. Oxidation numbers of P in PO_4^{3-}, of S in SO_4^{2-} and that of Cr in $Cr_2O_7^{2-}$ are respectively

(a) +3,+ 6 and + 5 (b) +5,+ 3 and + 6

(c) -3,+ 6 and + 6 (d) +5,+ 6 and + 6

(AIIMS-2015)

Ans. (d): The given species are PO_4^{3-}, SO_4^{2-} and $Cr_2O_7^{2-}$.

$$PO_4^{-3} \Rightarrow x + 4(-2) = -3$$
$$x = -3 + 8 = +5$$
$$SO_4^{2-} \Rightarrow x + 4(-2) = -2$$
$$x = +6$$
$$Cr_2O_7^{2-} \Rightarrow 2x + 7(-2) = -2$$
$$2x = +12$$
$$x = +6$$

The oxidation no. of P, S and Cr are +5, +6 and +6 respectively.

55. The oxidation numbers of phosphorous in Ba $(H_2PO_2)_2$ and xenon in Na_4XeO_6 respectively are

(a) +3 and +4 (b) +2 and +6

(c) +1 and +8 (d) –1 and – 6

UPTU/UPSEE-2015

Ans. (c) : $Ba(H_2PO_2)_2 \rightleftharpoons Ba^{2+} + H_2PO_2^-$

Oxidation state of P in $Ba(H_2PO_2)_2$

$\Rightarrow 2+4(+1)+2x+4(-2)=0$

$2+4+2x-8=0$

$2x+6-8=0$

$x = +1$

And $H_2PO_2^- \Rightarrow 1\times2+x+2(-2) = -1$

$\Rightarrow 2+x-4 = -1$

$\Rightarrow x= +1$

And Oxidation state of Xe in Na_4XeO_6

$\Rightarrow +1\times4+x+(-2)6 = 0$

$4+x-12 = 0$

$x = 12-4$

$x = 8$

56. The non existence of PbI_4 and $PbBr_4$ is due to

(a) highly oxidizing nature of Pb^{4+} ions

(b) highly reducing nature of I^- and Br^- ions

(c) larger size of Pb^{4+}, Br^- and I^- ions

(d) both (a) and (b)

COMEDK-2014

Ans. (d) : The non-existence of PbI_4 and $PbBr_4$ is probably due to the strong oxidizing power of Pb^{4+} ions and strong reducing power of I^- and Br^- ions.

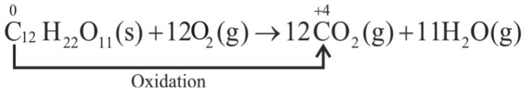
57. When sugar $C_{12}H_{22}O_{11}$ is burned to give carbon dioxide CO_2, the increase in oxidation number of carbon atoms is

(a) +4 (b) +2

(c) +1 (d) 0

SCRA-2014

Ans. (a) : The complete combustion reaction given as follows– :



$$\overset{0}{C}_{12}H_{22}O_{11}(s) + 12O_2(g) \rightarrow 12\overset{+4}{C}O_2(g) + 11H_2O(g)$$

Hence, the oxidation no. of carbon atom is +4.

58. Which one of the following oxidation states is not possible in metal carbonyls?

(a) +1 (b) 0

(c) –1 (d) +2

AMU-2014

Ans. (d) : Metal carbonyl are defined as the metal attached to the carbonyl group. The oxidation state of metal carbonyl is not possible +2 because for the formation of π-back bond between metal and the carbonyl carbon.

59. The ratios of oxidation states of Cl in potassium chloride to that in potassium chlorate is

(a) $\frac{+1}{5}$ (b) $\frac{-1}{5}$

(c) $\frac{-2}{5}$ (d) $\frac{+3}{5}$

BITSAT-2014

Ans. (b) :

Chemical formula of potassium chloride = KCl

Chemical formula of potassium chlorate = $KClO_3$

$$K\overset{+5}{Cl}O_3 \rightarrow K\overset{-1}{Cl} + O_2$$

$$\text{Ratio} = \frac{\text{Oxidation state of Cl in KCl}}{\text{Oxidation state of Cl in } KClO_3}$$

$$= \frac{-1}{5}$$

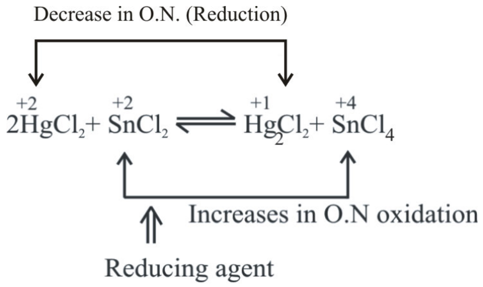
60. A reagent which lowers the oxidation number of an element in a given substance is known as

(a) Oxidising agent (b) Reduction

(c) Reducing agent (d) Oxidation.

J & K CET-(2014)

Ans. (c) : An oxidixing agent decreases the oxidation no. of an element where a reducing agent increases the oxidation no. of an element e.g.



$$2\overset{+2}{Hg}Cl_2 + \overset{+2}{Sn}Cl_2 \rightleftharpoons \overset{+1}{Hg_2}Cl_2 + \overset{+4}{Sn}Cl_4$$

61. Addition of oxygen to an element or a compound is termed as

(a) oxidation (b) reduction

(c) ionisation (d) redox reaction.

J & K CET-(2014)

@apna_pdf

Ans. (a) : Addition of oxygen to an element or a compound it termed as oxidation.

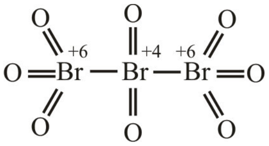
e.g. $C + O_2 \rightarrow CO_2$

62. In Br_3O_8 compound, oxidation number of bromine is

(a) 16/13 (b) 26/3
(c) 24/3 (d) 16/3

J & K CET-(2014)

Ans. (d) : The given species is Br_3O_8. Let, oxidation state of Br is x.



(i) Oxidation state of Ist Br-

$x_1 + 3 \times (-2) = 0$ or $x_1 = +6$

(ii) Oxidation state of IInd Br-

$x_2 + 2 \times (-2) = 0$ or $x_2 = +4$

(iii) Oxidation state of IIIrd Br-

$x_3 + 3 \times (-2) = 0$ or $x_3 = +6$

$$\because \text{ Oxidation state of Br} = \frac{\text{Sum of all O.S. of Br}}{\text{No.of Br}}$$

$$\therefore \quad x = \frac{x_1 + x_2 + x_3}{3} = \frac{6+4+6}{3} = \frac{16}{3}$$

$$x = \frac{16}{3}$$

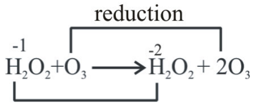
So, answer is 16/3.

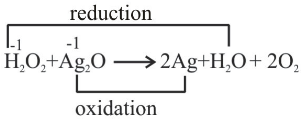
63. (I) $H_2O_2 + O_3 \rightarrow H_2O + 2O_2$
(II) $H_2O_2 + Ag_2O \rightarrow 2Ag + H_2O + O_2$
role of hydrogen peroxide in the above reactions is respectively

(a) Oxidizing in (I) and reducing (II)
(b) Reducing in (I) and oxidizing (II)
(c) Reducing in (I) and (II)
(d) Oxidizing in (I) and (II)

NEET-2014

Ans. (c) : By Given equation,





64. The pair compound that can exist together is

(a) $FeCl_3$, $SnCl_2$ (b) $HgCl_2$, $SnCl_2$
(c) $FeCl_2$, $SnCl_2$ (d) $FeCl_3$, KI

NEET-2014

Ans. (c) : The compounds with lower oxidation number and those which cannot be reduced by one another can exist together.

So, $FeCl_2$ and $SnCl_2$ can exist together as Fe^{2+} cannot be reduced by Sn^{2+}.

65. If Cl_2 is passed through hot aqueous NaOH, the products formed have Cl in different oxidation states. These are indicated as

(a) –1 and +1 (b) –1 and +5
(c) +1 and +5 (d) –1 and +3

WB-JEE-2014

Ans. (b) : Reaction is,

$$3\overset{0}{Cl_2} + 6NaOH \xrightarrow{\Delta} 5Na\overset{-1}{Cl} + Na\overset{+5}{Cl}O_3 + 3H_2O$$

So, $\underbrace{3\overset{0}{Cl_2} \rightarrow 5Na\overset{-1}{Cl}}_{\text{Reduction}}$

& $\underbrace{3\overset{0}{Cl_2} \rightarrow Na\overset{+5}{Cl}O_3}_{\text{Oxidation}}$

Therefore, option (b) correct.

66. The oxidation state of sulphur in $Na_2S_4O_6$ is

(a) + 6 (b) $\frac{+3}{2}$
(c) $\frac{+5}{2}$ (d) – 2

BITSAT-2013

Ans. (c) : Let, oxidation state of S is x.

$\because$ Oxidation state of Na is +1

Oxidation state of O is –2

$\therefore$ $Na_2S_4O_6$

$2(+1)+4x+6(-2)=0$

$2 + 4x - 12 = 0$

$4x=12-2$

$$x = \frac{10}{4} = +\frac{5}{2}$$

Oxidation state of sulphur is $= +\frac{5}{2}$

67. Consider the following statements for the reaction,

$KIO_3 + 5KI + 6HCl \rightarrow 3I_2 + 6KCl + 3H_2O$

1. I^- is reduced to I_2
2. IO^-_3 is oxidized to I_2
3. IO^-_3 is reduced to I_2
4. Oxidation number of I increases from –1 (in KI) to zero (in I_2)

The correct statements are

(a) 1, 2 and 4 (b) 3 and 4
(c) 1 and 4 (d) 1, 3 and 4

AP EAMCET (Medical) - 2013

Ans. (b) : For the reaction-

$$KIO_3 + 5KI + 6HCl \longrightarrow 3I_2 + 6KCl + 3H_2O$$

(i) $2I^- \xrightarrow{\text{oxidation}} I_2$

$x = -1$ $\quad$ $x = 0$

Hence, the statement is false.

(ii) $IO_3^- \xrightarrow{\text{reduction}} I_2$

$x+3(-2) = -1$ $\quad$ $x = 0$

$x = +5$

@apna_pdf

Thus, the statement is false

(iii) $KI \longrightarrow I_2$

$+1+x = 0 \qquad x = 0$

$x = -1$

The oxidation number increases from –1 to 0, Thus statement is true.

68. The oxidation number of C atom in CH_2Cl_2 and CCl_4 are respectively

(a) –2 and –4 (b) 0 and –4
(c) 0 and 4 (d) 2 and 4

MHT CET-2012

Ans. (c) : Let, Oxidation number of C be x.

In CH_2Cl_2, the oxidation state of C atom is

$x+2(+1)+2(-1) = 0$
$x+2-2=0$
$x = 0$

In CCl_4, the oxidation state of C atom is,

$x+4(-1)=0$
$x-4=0$
$x=4$

69. A mixture of potassium chlorate oxalic acid and sulphuric acid is heated. During the reaction which element undergoes maximum change in the oxidation number ?

(a) S (b) H
(c) Cl (d) C

NEET-2012

Ans. (c) :

$$KClO_3 + H_2C_2O_4 + H_2SO_4 \xrightarrow{\Delta} K_2SO_4 + KCl + CO_2$$

Oxidation no. of 'S' in $H_2SO_4 \Rightarrow 2+x+4(-2)=0$
$\Rightarrow \quad x= +6$

Oxidation no. of 'S' in $K_2SO_4 \Rightarrow 2+x+(-8)=0$
$x = +6$

Change in O.N = 0

Oxidation no. of 'C' in $H_2C_2O_4 \Rightarrow 2+2x+(-8)= 0$
$2x = +6$
$x = +3$

Change in O.N = 0

Oxidation no. of 'C' in $CO_2 \Rightarrow x + 2(-2) = 0$
$x = +4$

Change oxidation no. of 'C' = 1

Oxidation no. of Cl in $KClO_3 = 1+x+3(-2)=0$
$x = +5$

Oxidation no. of Cl in $KClO_3 \Rightarrow 1+x+3(-2)=0$
$x= +5$

Oxidation no. of Cl in $KCl \Rightarrow 1+x = 0$
$x = -1$

Change in O.N = 5 – (–1) = +6

Maximum change in oxidation number is undergone by 'Cl'.

70. The oxidation number of oxygen is –1 in

(a) NO_2 (b) PbO_2
(c) Na_2O_2 (d) MnO_2

COMEDK-2012

Ans. (c) : The oxidation number of oxygen in most of the compounds is –2 except in sodium peroxides (–1). Na_2O_2 is a peroxides hence, it show –1 oxidation state. Superoxides (–1/2), oxygendifluoride (+2).

71. The oxidation state of chromium in potassium chromate is

(a) +7 (b) +5
(c) +4 (d) +6

COMEDK-2012

Ans. (d) : Let, oxidation state of Cr in K_2CrO_4 be x.

$\Rightarrow +2 + x + 4(-2) = 0$
$\Rightarrow +2 + x - 8 = 0$
$\Rightarrow x = +6$

72. A common metal used for the extraction of metals from their oxides by reduction is

(a) Al (b) Fe
(c) Cr (d) Co

CG PET- 2012

Ans. (a) : Al is electropositive which have more binding affinity to O and having more reducing nature.

$Al + Fe_2O_3 \rightarrow 2Fe + Al_2O_3$

73. The number of electrons transferred when $KMnO_4$ acts as an oxidising agent to give MnO_2 and Mn^{2+} respectively are

(a) 2,3 (b) 1,5
(c) 3,5 (d) 1,3

CG PET- 2012

Ans. (c) : When $KMnO_4$ acts as an oxidising agent to give MnO_2–

$$K\overset{+7}{Mn}O_4 \rightarrow \overset{+4}{Mn}O_2$$

Here, no. of electron transferred = 3

When $KMnO_4$ acts as an oxidising agent to give Mn^{2+} –

$$K\overset{+7}{Mn}O_4 \rightarrow \overset{2+}{Mn}$$

Here, no. of electron transferred = 5

74. The process of oxidation involve

(a) Loss of electron (b) Gain of electron
(c) Loss of proton (d) Loss of neutron

CG PET- 2012

Ans. (a) : Oxidation involves lose of electrons while reduction involves gain of electrons i.e. oxidation⇒ Loss of electron.

75. In which of the following compounds, carbon exhibits a valency of 4 but oxidation state –2 ?

(a) CH_3Cl (b) $CHCl_3$
(c) CH_2Cl_2 (d) HCHO

J & K CET-(2011)

Ans. (a) : In CH_3Cl.

Carbon exhibits a valency of 4 but oxidation state –2.

$x+3-1=0$
$x+2=0$
$x=-2$

76. Iron nails are dipped into blue copper sulphate solution. After some time iron nails are:

(a) dissolved and blue colour is discharged.
(b) dissolved but blue colour is not discharged.
(c) not dissolved and blue colour is not discharged.
(d) not dissolved but blue colour is discharged.

NDA (I)-2011

@apna_pdf

Ans. : (a) When iron nails are dipped into blue copper sulpahte solution after some time iron nails are dissolved and blue colour is discharged.

$Fe + CuSO_4 \rightarrow FeSO_4 + Cu$
(discharge)

Fe is more reactive than copper.

77. In chromite ore, the oxidation number of iron and chromium are respectively

(a) +3, +2 (b) +3, +6
(c) +2, +6 (d) +2, +3

Karnataka-CET-2011

Ans. (d) : The chemical formula of chromite ore is CrO_4^{2-}

Oxidation state of Fe in FeO –
$x + (-2) = 0$
$x = +2$

Let, oxidation state of Cr is x in Cr_2O_3.
$\therefore \quad 2x + (-2) \times 3 = 0$
$2x = 6$
$x = +3$

78. When a manganous salt is fused with a mixture of KNO_3 and solid NaOH the oxidation number of Mn changes from +2 to

(a) +4 (b) +3
(c) +6 (d) +7

WB-JEE-2010

Ans. (c) :
$MnO + NaOH + KNO_3 \rightarrow Na_2MnO_4 + KNO_2 + H_2O$

Let, the oxidation no. of Mn is x.
In MnO, the oxidation no. Mn is–
$x + (-2) = 0$
$x = +2$

In Na_2MnO_4 the oxidation state of Mn is–
$2 \times 1 + x + 4(-2) = 0$
$x = +6$

Thus, can be written as

$$\overset{+2}{Mn}O + NaOH + KNO_3 \rightarrow Na_2\overset{+6}{Mn}O_4 + KNO_2 + H_2O$$

When a manganous salt (MnO)is fused with a mixture of KNO_3 and solid NaOH the oxidation number of Mn changes from +2 to +6.

79. The oxidation number of sulphur atoms in peroxomonosulphuric acid (H_2SO_3) and peroxodisulphuric acid ($H_2S_2O_8$) are respectively

(a) +8 and +7 (b) +3 and +3
(c) +6 and +6 (d) +4 and +6

J & K CET-(2009)

Ans. (c) : Both the peroxomonosulphuric acid (H_2SO_3) and $H_2S_2O_8$ have peroxide linkage. The oxidation state of S in H_2SO_3 is x.

$2(+1) + x + 3(-2) + 2(-1) = 0$
$2 + x - 6 - 2 = 0$
$x = +6$

$H_2S_2O_8 \Rightarrow 2(+1) + 2x + 6(-2) + 2(-1) = 0$
$2 + 2x - 14 = 0$
$x = +6$

80. Oxidation numbers of P in PO_4^{3-}, of S in SO_4^{2-}, and that of Cr in $Cr_2O_7^{2-}$ are respectively

(a) + 3, + 6 and + 5 (b) + 5, + 3 and + 6
(c) + 3, + 6 and + 6 (d) + 5, + 6 and + 6

NEET-2009

Ans. (d): The oxidation number –

(1) $PO_4^{3-} \Rightarrow x + 4(-2) = -3$
$x = +5$

Oxidation of P= +5

(2) $SO_4^{2-} \Rightarrow x + 4(-2) = -2$
$x = +6$

Oxidation no. of S = +6

(3) $Cr_2O_7^{2-} = 2x + 7(-2) = -2$
$2x = -2 + 14$
$x = \frac{12}{2} = +6$
$x = +6$

Oxidation number of Cr = +6.

81. Number of moles of MnO_4^- required to oxidize one mole oxalate completely in acidic medium will be

(a) 7.5 moles (b) 0.2 moles
(c) 0.6 moles (d) 0.4 moles

NEET-2008

Ans. (c) : No. of moles MnO_4^- required oxidize one mole of FeC_2O_4 completely in acidic medium.

$$3MnO_4^- + 24H^+ + 5FeC_2O_4 \rightarrow 3Mn^{2+} + 12H_2O + 10CO_2 + 5Fe^{3+}$$

5 mole of FeC_2O_4 reacts with 3 mole of MnO_4^-

5 mole of $FeC_2O_4 \rightarrow$ 3 mole of MnO_4^-

1 mole of $FeC_2O_4 \rightarrow \frac{3}{5}$ mole of MnO_4^-

$\therefore$ The number of mole of MnO_4^- required to oxidize one mole of ferrous oxalate completely in the acidic medium will be 0.6 mole.

It means option (c) is correct.

82. When chlorine reacts with dil. NaOH under cold conditions, the oxidation state of chlorine changes from zero to

(a) –1 and +5 (b) +1 and +4
(c) +5 and +3 (d) –1 and +1

J & K CET-(2008)

Ans. (d) : According to question

$2NaOH + 2Cl_2 \rightarrow NaCl + NaClO + H_2O$

Let oxidation state of Cl in NaCl is x

$NaCl \Rightarrow +1 + x = 0$
$x = -1$

$NaClO \Rightarrow +1 + x + (-2) = 0$
$x - 1 = 0$
$x = +1$

$\therefore$ oxidation state of chlorine changes from –1 and +1.

83. The oxidation states of iodine in HIO_4, H_3IO_5 and H_5IO_6 are respectively

@apna_pdf

(a) + 1,+ 3,+7 (b) + 7,+ 7,+3
(c) + 7,+ 7,+7 (d) + 7,+ 5,+3

(AIIMS-2008)

Ans. (c): An oxidation state is a number that is assigned to an element in a chemical combination. This number represents the no. of electrons that an atom can gain, lose, or share electron.

The oxidation state of H is +1 in a compound. The oxidation state of O is –2 in a compound calculating the oxidation state of I, we get,

$H_5IO_6 \Rightarrow 5+x-12=0$

$x=+7$

$H_3IO_5 \Rightarrow 3+x-10=0$

$x=+7$

$HIO_4 \Rightarrow 1+x-8=0$

$x=+7$

So, = $\boxed{+7,+7,+7}$

84. Which of the following molecules can act as an oxidizing as well as a reducing agent?

(a) H_2S (b) SO_3
(c) H_2O_2 (d) F_2

(AIIMS-2008)

Ans. (c): A substance can act as oxidizing as well as reducing agent when it is present in its intermediate oxidation state.

$H_2S \Rightarrow$ S is present in –2 oxidation state
i.e. minimum oxidation state
So, it can't acts as oxidizing agent

$SO_3 \Rightarrow$ S is present in +6 oxidation state
i.e. maximum oxidation state
So, it can't acts as reducing agent

$H_2O_2 \Rightarrow$ Oxygen is +1 oxidation state so it can acts as both oxidizing as well as reducing agent.

F_2 cannot acts as reducing agent.

85. The oxidation number of oxygen in KO_3, Na_2O_2 is

(a) 3, 2 (b) 1, 0
(c) 0, 1 (d) –0.33, –1

VITEEE- 2008

Ans. (d) : To find the oxidation number of a given compound we have to equal the charge on the overall compound with the charge on individual atom of which the compound is made of.

In KO_3, K is an alkali metal.

KO_3

Suppose oxidation number of O = x

$\Rightarrow 1 + 3x = 0$

$3x = -1 \Rightarrow x = -0.33$

Na_2O_2

Suppose oxidation number of O is x

$2 \times 1 + 2x = 0$

$2 + 2x = 0$

$x = -1$

86. For the reaction,

$$MnO_4^- + C_2O_4^{2-} + H^+ \rightarrow Mn^{2+} + CO_2 + H_2O$$

Which of the following is correct?

	Mn^{2+}	$C_2O_4^{2-}$	CO_2	H^+
(a)	5	2	4	10
(b)	2	5	10	16
(c)	6	8	16	18
(d)	10	12	24	12

CG PET -2008

Ans. (b) : Given that,

$MnO_4^- +$ $C_2O_4^{-2}$ $+H^+ \rightarrow Mn^{2+} + CO_2 + H_2O$

Write the reaction in two half reaction-

Reduction: $MnO_4^- \rightarrow Mn^{2+}$

Oxidation: $C_2O_4^{2-} \rightarrow CO_2$Balance all atoms other than O &H

$MnO_4^- \rightarrow Mn^{2+}$

$C_2O_4^- \rightarrow 2CO_2$

Now, balance the oxygen atoms by adding H_2O molecules

$MnO_4^- \rightarrow Mn^{2+} 4H_2O$

$C_2O_4^{2-} \rightarrow 2CO_2$

Now, balance hydrogen atoms by adding H^+ ions.

$MnO_4^- + 8H^+ \rightarrow Mn^{2+} + 4H_2O$

$C_2O_4^{2-} \rightarrow 2CO_2$

To balance the charge, add electrons to a more positive side of the half reaction.

$MnO_4^- + 8H^+ + 5e^- \rightarrow Mn^{2+} + 4H_2O$

$C_2O_4^{2-} \rightarrow 2CO_2 + 2e^-$

Now multiply oxidation half reaction by 5 and reduction half –reaction by 2. Add both reactions we will get-

$$2MnO_4^- + 5C_2O_4^{2-} + 16H^+ \rightarrow 2Mn^{2+} + 10CO_2 + 8H_2O$$

87. Acidic $K_2Cr_2O_7$ reacting with H_2S the oxidation number of chromium is changed

(a) from+3 to +6 (b) from+6 to +3
(c) from+6 to +2 (d) remains unchanged

CG PET -2008

Ans. (b): When acidic $K_2Cr_2O_7$ reacts with H_2S then chromium sulphate is formed during the reaction.

$K_2Cr_2O_7 + H_2S + H_2SO_4 \rightarrow$
$Cr_2(SO_4)_3 + K_2SO_4 + S + H_2O$

$K_2Cr_2O_7$

$1 \times 2 + 2x + (-2)7 = 0$

$x = 6$

And

$Cr_2(SO_4)_3$

$2x + 3(-2) = 0$

$x = +3$

88. In which of the following compound the oxidation number of oxygen is +2?

(a) H_2O_2 (b) CO_2
(c) H_2O (d) OF_2

CG PET -2008

Ans. (d) : Let, the oxidation state of O is x.

F_2O

$\therefore$ $2(-1) + x = 0$

$x = +2$

So, oxidation state of oxygen in F_2O is +2.

@apna_pdf

89. The oxidation state of sulphur in sodium tetrathionate ($Na_2S_4O_6$) is

(a) 2 (b) 0

(c) 2.5 (d) 3.5

J & K CET-(2008)

Ans. (c) : The given species is $Na_2S_4O_6$ or $S_4O_6^{2-}$

Let, oxidation state of S is x in $S_4O_6^{2-}$

$\therefore \quad 4x + 6(-2) = -2$

$x = \frac{10}{4}$

$x = 2.5$

90. In which of the following the oxidation number of oxygen has been arranged in increasing order?

(a) $OF_2 < KO_2 < BaO_2 < O_3$

(b) $BaO_2 < KO_2 < O_3 < OF_2$

(c) $BaO_2 < O_3 < OF_2 < KO_2$

(d) $KO_2 < OF_2 < O_3 < BaO_2$

(e) $OF_2 < O_3 < KO_2 < BaO_2$

Kerala-CEE-2008

Ans. (b): Let, Oxidation state of O is x.

(1) OF_2

$x + 2(-1) = 0$

$x = +2$

(2) KO_2

$1 + 2(x) = 0$

$2x = -1$

$x = -1/2$

$x = -0.5$

(3) BaO_2

$(+2) + 2(x) = 0$

$2x = -2$

$x = -1$

(4) O_3

$3x = 0$

$x = 0$

Hence, $BaO_2 < KO_2 < O_3 < OF_2$

91. Oxidation state of oxygen in F_2O is

(a) +1 (b) –1

(c) +2 (d) –2

UP CPMT-2008

Ans. (c): Let the oxidation state of oxygen in F_2O is x.

F_2O

$2(-1) + x = 0$ (F is more electronegative)

$-2 + x = 0$

$x = +2$

92. The brown complex obtained in the detection of nitrate radical is formulated as $[Fe(H_2O)_5NO]SO_4$. What is the oxidation number of Fe in this complex?

(a) +1 (b) +2

(c) +3 (d) 0

WB-JEE-2008

Ans. (a) : The brown colour complex obtained in the detection of nitrate radical is formulated as $[Fe(H_2O)_5NO]SO_4$. In this complex, oxidation state of iron is +1.

The univalent character of Iron in the complex is justified by the presence of a coordinated NO^+ group. The oxidation number of Fe in the complex is +1.

93. If equal volumes of 1 M $KMnO_4$ and 1 M $K_2Cr_2O_7$ solutions are allowed to oxidize Fe (II) to Fe (III) in acidic medium, then Fe (II) oxidized will be

(a) More by $KMnO_4$

(b) More by $K_2Cr_2O_7$

(c) Equal in both the cases

(d) Cannot be determined

AP - EAMCET (Medical) - 2007

Ans. (b) : The redox half cell reactions are written below–

$$Fe^{2+} \rightarrow Fe^{3+} + 1e^{\ominus}$$

$$MnO_4^{\ominus} + 8H^{\oplus} + 5e^{\ominus} \rightarrow Mn^{2+} + 4H_2O$$

$$Cr_2O_7^{2-} + 14H^{\oplus} + 6e^{-} \rightarrow 2Cr^{3+} + 7H_2O$$

Using the concept of mole–

$$1\ \text{mol}\ MnO_4^{-} = 5\text{mol}\ Fe^{2+}$$

And $\quad 1\text{mol}\ Cr_2O_7^{2-} = 6\text{mol}\ Fe^{2+}$

So, $K_2Cr_2O_7$ will oxidize more Fe^{2+} to Fe^{3+}.

94. What is an oxidation number of carbonyl carbon in Methanal?

(a) + 3 (b) + 2

(c) + 4 (d) zero

GUJCET-2007

Ans. (d) : As we know methanal (HCHO) is the neutral compound. We can also calculate the oxidation number by mathematical way –

The charge of hydrogen = +1

Let, oxidation state of carbon = x

Oxidation state of oxygen = –2

$\therefore\ 2(+1) + x - 2 = 0$

or $x = 0$

95. In which of the following pairs, there is greatest difference in the oxidation number of the underlined elements?

(a) $\underline{N}O_2$ and $\underline{N}_2O_4$ (b) $\underline{P}_2O_5$ and $\underline{P}_4O_{10}$

(c) $\underline{N}_2O$ and $\underline{N}O$ (d) $\underline{S}O_2$ and $\underline{S}O_3$

BITSAT-2007

Ans. (d) : Oxidation no. of elements have been mentioned in brackets as shown below –

(a) $NO_2(x=4)$ & $N_2O_4\ [x=4]$

Difference in oxidation state of N=0

(b) $P_2O_5\ (x = +5)$ & $P_4O_{10}\ (x = +5)$

Difference in oxidation state of P = 0

(c) $N_2O\ (x=1)$ & $NO\ (x = 2)$

Difference in oxidation state of N =1

(d) $SO_2\ (x = 4)$ & $SO_3\ (x = 6)$

Difference in oxidation state of S = 2

Hence, the difference in oxidation states of underlined elements is greater in SO_2.

96. H_2O_2 on oxidation gives

(a) O^{2-} (b) OH^-

(c) O_2^- (d) O_2

CG PET -2007

@apna_pdf

Ans. (d) : H_2O_2 gives oxygen gas (O_2) on oxidation.

$H_2O_2 \rightleftharpoons O_2 + 2H^+ + 2e^-$

97. In which of the following compounds, the oxidation number of iodine is fractional ?

(a) IF_3 (b) IF_5

(c) I_3^- (d) IF_7

BCECE-2006

Ans. (c) : Oxidation no. of Iodine in –

$IF_3 \Rightarrow x+3(-1)=0, x=3$

$IF_5 \Rightarrow x+5(-1)=0, x=5$

$I_3^- \Rightarrow x(3)=-1, x=-1/3$

$IF_7 \Rightarrow x + 7(-1) = 0, x = +7$

So, oxidation no. of I is fraction form in I_3^- .

98. $Cu^{2+} + Ag \longrightarrow Cu + Ag^+$ oxidation half reaction is :

(a) $Cu^{2+} \rightarrow Cu$ (b) $Ag \rightarrow Ag^+$

(c) $Cu \rightarrow Cu^{2+}$ (d) all of these

JCECE - 2006

Ans. (b) : Oxidation means loss of electrons.
In the reaction

$Cu^{2+} + Ag \rightarrow Cu + Ag^+$

$Ag - e^- \rightarrow Ag^+$

Silver loses electron to becomes silver ion. So

$\boxed{Ag \rightarrow Ag^+}$

99. Oxidation number of S in SO_4^{2-} :

(a) + 6 (b) + 3

(c) + 2 (d) – 2

BCECE-2005

Ans. (a) : The given species is SO_4^{2-}.

SO_4^{2-}

Let, oxidation state of S is x.

$\therefore$ $x+4(-2)=-2$

$x = -2 + 8$

$x = +6$

100. The oxidation state of chromium in the final product formed by the reaction between KI and acidified potassium dichromate solution is

(a) + 3 (b) + 2

(c) + 6 (d) + 4

[AIEEE 2005]

Ans. (a): When potassium iodide reacts with acidified $K_2Cr_2O_7$ then following products are formed-

$K_2Cr_2O_7+7H_2SO_4+6KI \rightarrow 4K_2SO_4+Cr_2(SO_4)_3+7H_2O + 3I_2$

$\because$ $Cr_2(SO_4)_3$

Let oxidation state of Cr is x

$\therefore$ $2x + 3(-2) = 0$

$x = +3$

101. The oxidation number of xenon in $XeOF_2$ is

(a) zero (b) 2

(c) 4 (d) 3

J & K CET-(2005)

Ans. (c): Oxidation state of xenon in $XeOF_2$

$\Rightarrow 1(x) + 1(-2) + 2(-1) = 0$

$x-2-2=0$

$x = 4$

102. When $K_2Cr_2O_7$ is converted into K_2CrO_4, the change in oxidation number of chromium is:

(a) 0 (b) 5

(c) 7 (d) 9

UPTU/UPSEE-2005

Ans. (a) : For the equation,

$K_2\overset{+6}{Cr_2}O_7 \rightarrow K_2\overset{+6}{Cr}O_4$

No change in oxidation state of chromium in this equation. When $K_2Cr_2O_7$ is converted into K_2CrO_4. Both have same oxidation number that is 6. So, the oxidation number change is zero.

103. The compound having the lowest oxidation state of iron is:

(a) $K_4Fe(CN)_6$ (b) K_2FeO_4

(c) Fe_2O_3 (d) $Fe(CO)_5$

UPTU/UPSEE-2005

Ans. (d) : $K_4[Fe(CN)_6] \Rightarrow 4\times1+x+6(-1)=0$

$x = +2$

Similarly, K_2FeO_4 and Fe_2O_3 is highest

And $Fe(CO)_5 \Rightarrow x + 0 \times 5 = 0$

$x=0$

So, the oxidation state of Fe is zero in $Fe(CO)_5$ is lowest.

104. The oxidation state of sulphur is +4 in

(a) Sulphurous acid

(b) Sulphuric acid

(c) Peroxomonosulphuric acid

(d) Dithionic acid

AMU-2004

Ans. (a) : In sulphurous acid (H_2SO_3), oxidation state of S is +4.

H_2SO_3

$2+x-6=0$

$\Rightarrow$ $x=+4$

105. What will be the oxidation numbers of carbon in C_6H_6 and CH_2Cl_2?

(a) +4 in both

(b) –4 in both

(c) –1 and 0, respectively

(d) +1 and +4, respectively

AMU-2004

Ans. (c) : The given species are C_6H_6 and CH_2Cl_2.

$\overset{x}{C_6}\overset{+1}{H_6} \Rightarrow x(6)+(+6)=0$

$6x = -6$

$x = -1$

CH_2Cl_2

Let the oxidation of C = x

And, H=+1

Cl= –1

$CH_2Cl_2 \Rightarrow x+(+2)+(-2)=0$

$x=0$

So, $\boxed{-1 \text{ \& } 0, \text{ respectively}}$

@apna_pdf

106. Arrange the following as increase in oxidation number :

(i) Mn^{2+} **(ii) MnO_2**
(iii) $KMnO_4$ **(iv) K_2MnO_4**

(a) (i) > (ii) > (iii) > (iv)
(b) (i) < (ii) < (iv) < (iii)
(c) (ii) < (iii) < (i) < (iv)
(d) (iii) > (i) > (iv) > (ii)

BCECE-2004

Ans. (b) : Oxidation state of given compounds is as follows–

$$\overset{+2}{Mn}<\overset{+4}{Mn}O_2<K_2\overset{+6}{Mn}O_4<K\overset{+7}{Mn}O_4$$

107. In potassium manganate, the oxidation state of manganese is

(a) +5 (b) +6
(c) +7 (d) +8

CG PET -2004

Ans. (b) : The chemical formula of potassium manganate is K_2MnO_4.

K_2MnO_4

Let, oxidation state of Mn is x.

$\therefore$ 2(1) + x + 4(–2) = 0

Or x = +6

108. Which is the best description of the behaviour of bromine in the reaction given below ?

$H_2O + Br_2 \rightarrow HOBr + HBr$

(a) Proton acceptor only
(b) Both oxidised and reduced
(c) Oxidised only
(d) Reduced only

NEET-2004

Ans. (b) : In the given reaction,

$$H_2O+\underset{0}{Br_2}\rightarrow HO\underset{+1}{Br}+H\underset{-1}{Br}$$

Here, Br is oxidized from 0 to 1 in HOBr and reduced from 0 to –1 in HBr. Thus, it is oxidised as well as reduced.

109. Which of the following reaction involves oxidation and reduction?

(a) $NaBr + HCl \rightarrow NaCl + HBr$
(b) $HBr + AgNO_3 \rightarrow AgBr + HNO_3$
(c) $H_2 + Br_2 \rightarrow 2HBr$
(d) $Na_2O + H_2SO_4 \rightarrow Na_2SO_4 + H_2O$

UP CPMT-2004

Ans. (c) : The reaction in which oxidation number of elements change will involve oxidation and reduction.

Write oxidation number of each of the element in reactant and product molecules to find the answer.

(a) $\overset{+1}{Na}\,\overset{-1}{Br}+\overset{+1}{H}\,\overset{-1}{Cl}\longrightarrow\overset{+1}{Na}\,\overset{-1}{Cl}+\overset{+1}{H}\,\overset{-1}{Br}$

$\because$ Oxidation number are changed.

$\therefore$ It is not a redox reaction.

(b) $\overset{+}{H}\,\overset{-}{Br}+\overset{+1}{Ag}\,\overset{-1}{NO_3}\longrightarrow\overset{+1}{Ag}\,\overset{-1}{Br}+\overset{+1}{H}\,\overset{-1}{NO_3}$

$\because$ Oxidation number remain same.

$\therefore$ It is not oxidation reduction reaction.

(c) $\overset{0}{H_2}+\overset{0}{Br_2}\rightarrow 2\overset{+1}{H}\overset{-1}{Br}$

Oxidation number of H_2 changes from 0 to +1 and oxidation number of Br_2 changes from 0 to -1.

$\therefore$ It is oxidation- reduction reaction.

(d) $\overset{+1}{Na_2}\,\overset{-2}{O}+\overset{+1}{H_2}\overset{+6}{S}\,\overset{-2}{O_4}\longrightarrow\overset{+1}{Na_2}\overset{+6}{S}\,\overset{-2}{O}+\overset{+1}{H_2}\overset{-2}{O}$

$\therefore$ Oxidation number remain same.

$\therefore$ It is not oxidation-reduction reaction.

110. In the chemical reaction $Cl_2 + H_2S \rightarrow 2HCl + S$. The oxidation number of sulphur changes from

(a) 0 to 2 (b) 2 to 0
(c) –2 to 0 (d) –2 to –1

CG PET -2004

Ans. (c) : The oxidation state of sulphur in H_2S is –2 while it is zero in S i.e. in this reaction oxidation of sulphur and reduction of chlorine is taking place.

111. In which of the following reactions, hydrogen is acting as an oxidising agent?

(a) With Li to form LiH (b) With I_2 to give HI
(c) With S to give H_2S (d) None of the above

BCECE-2003

Ans. (a) : An oxidising agent itself undergoes reduction. Its oxidation no. decreases. When H_2 is converted to hydride ion (H^-), it itself is reduced and acts as oxidizing agent. In the following reaction, hydrogen is acting as an oxidising agent with lithium to give lithium hydride.

$$H_2+2Li\rightarrow 2LiH$$

112. Oxidation number of nitrogen is highest in

(a) N_3H (b) N_2H_4
(c) NH_2OH (d) NH_3

J & K CET-(2003)

Ans. (a) : (i) $N_3H \Rightarrow$ oxidation state $\Rightarrow$ 3x+1=0

x= –1/3

(ii) $N_2H_4 \Rightarrow$ oxidation state $\Rightarrow$ 2x+4=0

x = – 2

(iii) NH_2 OH$\Rightarrow$ oxidation state $\Rightarrow$ x+2–2+1=0

x= –1

(iv) $NH_3 \Rightarrow$ oxidation state $\Rightarrow$ x+3=0

x = –3

$\therefore$ The highest oxidation state of nitrogen is in N_3H.

113. The oxidation number of sulphur is –1 in

(a) FeS (b) FeS_2

(c)  (d) 
J & K CET-(2002)

Ans. (b) : Oxidation state of S in FeS is-

$\overset{2}{Fe}S \Rightarrow x+2 = 0$

x = –2

$FeS_2 \Rightarrow 2+x(2)=0$

2x = –2

x = –1

@apna_pdf

114. In which of the following compounds manganese has oxidation number equal to that of iodine in KIO_4?

(a) Potassium manganate
(b) Potassium permanganate
(c) Manganous chloride
(d) Manganese chloride

J & K CET-(2002)

Ans. (b) : Oxidation state of Iodine in KIO_4

$1+x+4(-2)=0$

$x=8-1$

$\boxed{x=7}$

Now, we will find the oxidation no. of Mn in the given compounds.

(a) potassium manganate (K_2MnO_4)

$\Rightarrow 2(+1)+x+4(-2)=0$

$\Rightarrow 2+x-8=0$

$\boxed{x=+6}$

(b) potassium permanganate ($KMnO_4$)

$\Rightarrow 1+x+4(-2)=0$

$\Rightarrow x=8-1$

$x=+7$

This is the equal of KIO_4 oxidation no.

115. When ammonium nitrate is gently heated, an oxide of nitrogen is formed. What is the oxidation state of nitrogen in this oxide?

(a) +4 (b) +2
(c) +3 (d) +1

AP-EAMCET (Medical), 2002

Ans. (d) : When ammonium nitrate is gently heated, nitrous oxide (N_2O) of nitrogen is formed which is also known as laughing gas.

$NH_4NO_3 \rightarrow N_2O + H_2O$

The oxidation state of nitrogen in N_2O given below :

$\overset{x}{N}_2\overset{-2}{O}$

Let, oxidation state of N = x

$\therefore$ $2x-2=0$

or $x=+1$

116. Oxidation state of Fe in Fe_3O_4 is:

(a) $\frac{3}{2}$ (b) $\frac{5}{4}$
(c) $\frac{4}{5}$ (d) $\frac{8}{3}$

(AIIMS-2002), NEET-1999

Ans. (d): Fe_3O_4 is basically a mixture of Fe_2O_3 and FeO. In Fe_2O_3, the two Fe atom has 3 oxidation state–

$2x-6=0$

$\boxed{x=+3}$

In FeO, Fe has 2 oxidation state

$x-2=0$

$\boxed{x=+2}$

Average oxidation state of

$$Fe=\frac{3+3+2}{3}=\frac{8}{3}$$

117. Oxidation state of nitrogen is correctly given for

	Compound	**Oxidation state**
(a)	Mg_3N_2	–3
(b)	NH_2OH	+1
(c)	$(N_2H_5)_2SO_4$	+2
(d)	$[Co(NH_3)_5Cl]Cl_2$	0

AMU 2002

Ans. (a) : Let, the oxidation number of nitrogen in different compound is x.

Checked by option–

(A) Mg_3N_2

$3(2)+2x=0$

or $x=-3$

(B) NH_2OH

$x+2(1)-2+1=0$

or $x=-1$

(C) $(N_2H_5)_2SO_4$

$x=-2$

(D) $[Co(NH_3)_5Cl]Cl_2$

$+3+5(NH_3)-1=+2$

or $NH_3=0$

$x+3=0$

$x=-3$

118. Oxidation number of Cl in $CaOCl_2$ (bleaching powder) is

(a) Zero, since it contains Cl_2
(b) –1, since it contains Cl^-
(c) +1, since it contains ClO^-
(d) +1 and –1, since it contains ClO^- and Cl^-

[AIEEE 2002]

Ans. (d) : The chemical name of the bleaching powder is calcium oxychloride.

$\because$ $[CaOCl_2]$

Or $[Ca(OCl)Cl]$

Here, two Cl or present in different oxidation state.

$Cl \rightarrow -1$

$OCl^- \rightarrow -2+x=-1 \Rightarrow x=+1$

So, the chlorine atom present in two oxidation state i.e. +1 and –1.

119. Consider the following reaction.

$6NaOH + 3Cl_2 \rightarrow 5NaCl + A + 3H_2O$

What is the oxidation number of chlorine in A?

(a) +5 (b) –1
(c) +3 (d) +1

AP-EAMCET (Medical), 2001

Ans. (a) : For the reaction-

$$6NaOH+3Cl_2 \rightarrow 5NaCl+\underset{\substack{\text{Sodium}\\\text{Chlorate}\\\text{(A)}}}{NaClO_3}+3H_2O$$

Oxidation number of chlorine in sodium chlorate is:-

For, $NaClO_3$

$(+1)+x+3(-2)=0$

$1+x-6=0$

Or $x=+5$

@apna_pdf

120. What is the oxidation number of C in CH_3Cl?

(a) –3 (b) 0
(c) –2 (d) –4

J & K CET-(2001)

Ans. (c) : Oxidation state of carbon in CH_3Cl

$\Rightarrow$ x+3 (1) +(–1)=0

x+3–1=0

Oxidation no. of C, x = –2

121. The oxidation number of sulphur in $H_2S_2O_7$ is :

(a) +2 (b) +6
(c) +4 (d) +8

(AIIMS-2000)

Ans. (b): Let, the oxidation no. of sulphur be x.
Oxidation no. of H & O are +1 and –2 respectively.

$\therefore$ 2(+1)+2x+7(-2)=0

2+2x–14=0

2x=+12

$\boxed{x = +6}$

122. What is the oxidation number of chromium in potassium dichromate?

(a) +7 (b) +5
(c) +6 (d) +4

AP-EAMCET (Med.)-1999

Ans. (c) : The molecular formula of potassium dichromate is $K_2Cr_2O_7$. The calculation of oxidation number of chromium is given below-

$K_2Cr_2O_7$

Let, x be the oxidation number of Cr.

$\therefore$ 2(1)+2(x)+7(–2)=0

or 2+2x – 14=0

or x = +6

123. The oxidation number of nitrogen in HN_3 is

(a) $+\frac{1}{3}$ (b) 0
(c) $-\frac{1}{3}$ (d) 1

AP EAMCET- 1999

Ans. (c) : The oxidation number of nitrogen in HN_3 is-

1+3x=0

x= –1/3

Hence, the correct option is (c).

124. Oxidation number of Os in OsO_4 is:

(a) +2 (b) +6
(c) +8 (d) +10

(AIIMS-1999)

Ans. (c): We know that, the most common oxidation state of O is–2, which is the case here also.
If x is the oxidation number of O.S. then

x+4(-2)=0

x = +8 Ans.

125. Chlorine is passed into dilute cold KOH solution. What are the oxidation number of chlorine in the products formed?

(a) –1, +5 (b) –1, +3
(c) +1, +7 (d) –1, +1

AP EAMCET- 1999

Ans. (d) : When chlorine is passed into dilute cold KOH then following product is formed-

$$2KOH + Cl_2 \rightarrow KCl + KOCl + H_2O$$

$\therefore$ KCl KOCl

+1+x=0 1+(–2) + x=0

x=–1 X=+1

Hence, the correct option is (d).

126. The number of moles of acidified $KMnO_4$ required to oxidize one mole of ferrous oxalate (FeC_2O_4) is

(a) 5 (b) 3
(c) 0.6 (d) 1.5

J & K CET-(1999)

Ans. (c) : The reaction between MnO_4^- with FeC_2O_4 is given as

$$MnO_4^- + 24H^+ + 5FeC_2O_4 \rightarrow 3Mn^{+2} + 12H_2O + 10CO_2 + 5Fe^{3+}$$

From this, we can see 5 mole of $5FeC_2O_4$ react with 3 moles of MnO_4^-.

So, 1 mole of $5FeC_2O_4$ react with 3/5 moles of MnO_4.

$\therefore$ 0.6 mole of MnO_4^- are required to oxidize one mole of ferrous sulphate.

127. A 2.5 mol sample of N_2H_4 loses 25 mole of electrons in being converted to a new compound X, assuming that all of the nitrogen appears in the new compound, what is the oxidation state of nitrogen in the compound?

(a) –1 (b) –2
(c) +3 (d) +4

J & K CET-(1998)

Ans. (c) : Let oxidation no. in new compound be x.

$$N_2^{+6}H_4 \rightarrow 2N^{+x} + ne^-$$

n=2x+4

No. of electron lost per mole

= 2(x+2)

25 mol = 2.5×(x+2) ×2

5×(2+x)=25

x= +3

128. Which one of the following halogens does not exhibit positive oxidation state in its compounds?

(a) I (b) Br
(c) Cl (d) F

AP EAMCET- 1997

Ans. (d) : Fluorine does not exhibit positive oxidation state in its compound because fluorine is highly electronegative element with highest oxidation power.

129. Which of the following sequence is correct with reference to the oxidation number of iodine?

(a) $I_2 < ICl < HI < HIO_4$
(b) $HIO_4 < ICl < I_2 < HI$
(c) $I_2 < HI < ICl < HIO_4$
(d) $HI < I_2 < ICl < HIO_4$

AP – EAMCET - (Medical)-1997

@apna_pdf

Ans. (d) The oxidation number of Iodine is calculated as –

(i) I_2
$x = 0$

(ii) ICl
$x - 1 = 0$
$x = +1$

(iii) HI
$+1 + x = 0$
$x = -1$

(iv) HIO_4
$+1 + x - 8 = 0$
$x - 7 = 0$
$x = +7$

The correct order of oxidation no. of iodine compound is– $HI < I_2 < ICl < HIO_4$

130. In the reactions: $2P_2O_5 + 2HNO_3 \rightarrow P_4O_{10} + x$, the term x is

(a) N_2O_4
(b) H_2O only
(c) N_2O_5
(d) PNO_3

AIIMS-1996

Ans. (c): In this reactions– phosphorus pentaoxide acts as a dehydration agent and desiccant to remove water molecules.

$$2P_2O_5 + 2HNO_3 \longrightarrow P_4O_{10} + H_2O + N_2O_5 \uparrow$$

So, x = dinitrogen pentaoxide

$= \boxed{N_2O_5}$

131. Reaction of sodium thiosulphate with iodine gives

(a) Tetrathionate ion
(b) Sulphide ion
(c) Sulphate ion
(d) Sulphite ion

NEET-1996

Ans. (a) : $\underset{\text{Sodium thiosulphate}}{2Na_2S_2O_3} + \underset{\text{(Iodine)}}{I_2} \rightarrow 2NaI + Na_2S_4O_6$

132. The oxide which cannot act as a reducing agent is

(a) CO_2
(b) ClO_2
(c) NO_2
(d) SO_2

NEET-1995

Ans. (a) : A substance can acts as the reducing agent when it can increase its oxidation state by losing electrons. In CO_2, carbon is present in +4 oxidation state which is its maximum oxidation state so it can't acts as a reducing agent.

133. Which substance is serving as a reducing agent in the following reactions ?

$$\mathbf{14H^+ + Cr_2O_7^{2-} + 3Ni \rightarrow 7H_2O + 2Cr^{3+} + 3Ni^{2+}}$$

(a) H^+
(b) $Cr_2O_7^{2-}$
(c) H_2O
(d) Ni

NEET-1994

Ans. (d) : In the given reaction,

$$14H^+ + \overset{+6}{Cr_2}O_7^{2-} + 3\overset{0}{Ni} \rightarrow 2\overset{+3}{Cr^{3+}} + 7H_2O + 3\overset{+2}{Ni^{2+}}$$

As, Ni is oxidized form 0 to +2 it will acts as reducing agent.

134. The oxidation state of 1 in $H_4IO_6^-$ is

(a) + 1
(b) – 1
(c) + 7
(d) + 5

NEET-1994

Ans. (c) : Oxidation state of I in $H_4IO_6^-$

$\Rightarrow 1(4) + x + 6(-2) = -1$
$4 + x - 12 = -1$
$x = 12 - 5$
$x = +7$

135. In the reaction,

$NO_2^- + OCl^- \rightarrow NO_3^- + Cl^-$, the oxidation state of chorine

(a) Does not change
(b) Changes from +1 to –1
(c) Changes from –2 to –1
(d) Changes from 0 to –1

AP EAMCET- 1994

Ans. (b) : Given the reaction-

$NO_2^- + OCl^- \rightarrow NO_3^- + Cl^-$

$\therefore$ The oxidation state of OCl^- and Cl^- are-

(i) OCl^-
$-2 + x = -1$
$x - 2 = -1$
$x = -1 + 2$
$x = +1$

(ii) Cl^-
$x = -1$

Hence, the oxidation state of chlorine is changes from +1 to –1.

136. Among the SO_2, H_2SO_4 and sodium thiosulphate, sulphur has the highest oxidation state in

(a) SO_2
(b) H_2SO_4
(c) Sodium thiosulphate
(d) Same in all

AP EAMCET- 1991

Ans. (b) : Let, x be the oxidation state (O.S) of S in all species.

(i) SO_2
$x + 2(-2) = 0$
$x = +4$

(ii) H_2SO_4
$2 + x + 4(-2) = 0$
$x = +6$

(iii) $Na_2S_2O_3$
$2 + 2x + 3(-2) = 0$
$x = +2$

In H_2SO_4, sulphur has highest oxidation state.

137. Acidified potassium dichromate is treated with hydrogen sulphide. In the reaction, the oxidation number of chromium

(a) Increases from + 3 to +6
(b) Decreases from +6 to +3
(c) Remains unchanged
(d) Decreases from +6 to +2

VITEEE- 2019

Ans. (b) : Acidified $K_2Cr_2O_7$ is treated with H_2S then cromate sulphate and potassium sulphate are formed.

$$K_2\overset{+6}{Cr_2}O_7 + 4H_2SO_4 + 3H_2S \rightarrow K_2SO_4 + \overset{+3}{Cr_2}(SO_4)_3 + 7H_2O + 3S$$

$\because K_2Cr_2O_7$
$2(+1) + 2x + 7(-2) = 0$
or $x = +6$

$\because Cr_2(SO_4)_3$
$2x + 3(-2) = 0$
$x = +3$

Oxidation number of chromium decreases from +6 to +3.

@apna_pdf

138. In the reaction,

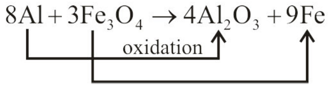
$$8Al + 3Fe_3O_4 \longrightarrow 4Al_2O_3 + 9Fe$$

the number of electrons transferred from the reductant to the oxidant is

(a) 8 (b) 4
(c) 16 (d) 24

VITEEE- 2014

Ans. (d) : Given the reaction



$$8Al + 3Fe_3O_4 \rightarrow 4Al_2O_3 + 9Fe$$

Oxidation state of Al in transition state = O
Oxidation no. of Al in Al_2O_3 = +3
∴ No. of e^- transferred by 1 Al atom =3

Therefore, No. of e^- transferred by 8 Al atoms = 8×3 = 24 electrons. Hence, 24 electrons are transferred from reductant to oxidant.

2. Redox Reaction, Types of Redox Reactions

139. In the neutral of faintly alkaline medium, $KMnO_4$ oxidises iodide into iodate. The change in oxidation state of manganese in this reaction is from

(a) + 6 to + 5 (b) + 7 to + 4
(c) + 6 to + 4 (d) + 7 to + 3

NEET-17.07.2022

Ans. (b) : In neutral alkaline solution,

$$2\overset{+7}{Mn}O_4^- + H_2O + I^- \rightarrow 2\overset{+4}{Mn}O_2 + 2OH^- + \overset{+5}{I}O_3^-$$

The oxidation state of Mn decreases from +7 to +4.

140. Which one of the following is an example of disproportionation reaction?

(a) $3MnO_4^{2-} + 4H^+ \rightarrow 2MnO_4^- + MnO_2 + 2H_2O$
(b) $MnO_4^- + 4H^+ + 4e^- \rightarrow MnO_2 + 2H_2O$
(c) $10I^- + 2MnO_4^- + 16H^+ \rightarrow 2Mn^{2+} + 8H_2O + 5I_2$
(d) $8MnO_4^- + 3S_2O_3^{2-} + H_2O \rightarrow 8MnO_2 + 6SO_4^{2-} + 2OH^-$

JEE Main-26.06.2022, Shift-II

Ans. (a) : $3\overset{+6}{Mn}O_4^{2-} + 4H^+ \longrightarrow 2\overset{+7}{Mn}O_4^- + \overset{+4}{Mn}O_2 + 2H_2O$

Disproportionation reaction is a reaction in which a compound (MnO_4^{2-}) undergoes oxidation as well as reduction.

Here, MnO_4^{2-} is an intermediate oxidation state and is converted into compounds having higher and lower oxidation state.

141. The reaction, $3ClO^-(aq) \rightarrow ClO_3^-(aq)+2Cl^-(aq)$ is an example of

(a) oxidation reaction
(b) reduction reaction
(c) disproportionation reaction
(d) decomposition reaction

Karnataka CET-2017
CG PET- 2013, SCRA - 2009

Ans. (c) : The reaction is a disproportionation reaction.

$3ClO^-(aq) \rightarrow ClO_3^-(aq)+2Cl^-(aq)$

Disproportionation reaction is a specific type of redox reaction in which a species is simultaneously reduced and oxidised from two different products.

$$3\overset{+1}{Cl}O^-(aq) \rightarrow \overset{+5}{Cl}O_3^-(aq) + 2\overset{-1}{Cl^-}(aq)$$

So, Cl is oxidised as well as reduced.

142. In the following reaction

$$3Br_2 + 6CO_3^{2-} + 3H_2O \rightarrow 5Br^- + BrO_3^- + 6HCO_3^-$$

(a) Bromine is reduce and carbonate is oxidised
(b) Bromine is oxidized and carbonate is reduce
(c) Bromine is neither oxidized nor reduced
(d) Bromine is reduced and oxidised

Assam CEE-2021
BITSAT-2005

Ans. (d) : In the reaction -

$$3Br_2 + 6CO_3^{2-} + 3H_2O \rightarrow 5Br^- + BrO_3^- + 6HCO_3^-$$

Here Br_2 reduced from 0 to –1 as well as oxidised from 0 to +5.

143. Which of the following involves transfer of five electrons ?

(a) $MnO_4^- \rightarrow Mn^{2+}$ (b) $CrO_4^{2-} \rightarrow Cr^{3+}$
(c) $MnO_4^- \rightarrow MnO_2$ (d) $Cr_2O_7^{2-} \rightarrow 2Cr^{3+}$

JEE Main-25.07.2021, Shift-II
(AIIMS-2014)

Ans. (a): $MnO_4^- \rightarrow Mn^{2+}$

The oxidation state of Mn in MnO_4^- is

$x + 4(-2) = -1$
$x - 8 = -1$
$x = 7$

The oxidation state of Mn in Mn^{2+} is +2

Hence, $MnO_4^- \rightarrow Mn^{2+}$ involve transfer of five electron.

144. Which of the following changes does not involve any electron transfer?

(a) $Na \rightarrow Na^+$ (b) $Zn^{2+} \rightarrow Zn$
(c) $Cr_2O_7^{2-} \rightarrow Cr_2O_4^{2-}$ (d) $VO^{2+} \rightarrow V_2O_3$

Assam CEE-2021, 2018

Ans. (c) : Following reaction does not involve any electron transfer.

$$\overset{+6}{Cr_2}O_7^{2-} \rightarrow \overset{+6}{Cr_2}O_4^{2-}$$

In this reaction oxidation state of Cr is +6 in reactant and oxidation state of Cr is +6 in product. Hence, the no electron transfer.

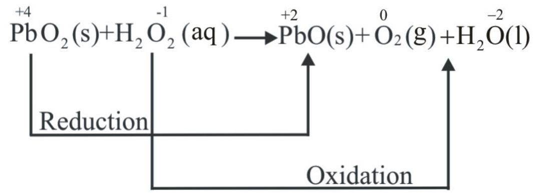
145. In which of the following reactions, H_2O_2 acts as a reducing reagent?

(a) $PbO_2(s)+H_2O_2(aq) \rightarrow PbO(s)+H_2O(l)+O_2(g)$
(b) $Na_2SO_3(aq)+H_2O_2(aq) \rightarrow Na_2SO_4(aq)+H_2O(l)$
(c) $2KI(aq)+H_2O_2(aq) \rightarrow 2KOH(aq)+I_2(s)$
(d) $KNO_2(aq)+H_2O_2(aq) \rightarrow KNO_3(aq)+H_2O(l)$

AP EAMCET- 2001, 2000

@apna_pdf

Ans. (a) :



$\overset{+4}{Pb}O_2(s) + H_2\overset{-1}{O_2}(aq) \longrightarrow \overset{+2}{Pb}O(s) + \overset{0}{O_2}(g) + H_2\overset{-2}{O}(l)$

146. Which quantities are conserved in all oxidation-reduction reaction?

(a) Charge only
(b) Mass only
(c) Both charge and mass
(d) Neither charge nor mass

COMEDK-2016
UPTU/UPSEE-2009

Ans. (c) : A redox reaction is a type of chemical reaction in which involves a transfer of electron. In a redox reaction, the mass of reactant particles is conserved. Electron are transferred between atoms, one donates and the other accepts. The charge of atoms depends on this gain or loss of electrons. A gain of electrons reduced the charge of an atom whereas loss of electron increase the charge. Hence, charge and mass conserve in an oxidation reduction reaction.

147. In an oxidation reduction reaction, dichromate ($Cr_2O_7^{2-}$) ion is reduced to Cr^{3+} ion. The equivalent weight of $K_2Cr_2O_7$ in this reaction is

(a) $\frac{\text{molecular weight}}{3}$ (b) $\frac{\text{molecular weight}}{6}$

(c) $\frac{\text{molecular weight}}{1}$ (d) $\frac{\text{molecular weight}}{2}$

UP CPMT-2008
AP-EAMCET (Medical)-2007

Ans.(b): $K_2\overset{+6}{C}r_2O_7 + 4H_2SO_4 \longrightarrow K_2SO_4 + \overset{+3}{Cr_2}(SO_4)_3 + 4H_2O + 3[O]$

Equivalent weight

$$= \frac{\text{Molecular weight}}{\text{Change in O.S. of atom present in one molecule}}$$

$$\therefore \ \text{Equivalent weight} = \frac{\text{Molecular weight}}{2\times3}$$

$$= \frac{\text{Molecular weight}}{6}$$

148. Which of the following is a redox reaction ?

(a) Evaporation of H_2O
(b) Both oxidation and reduction
(c) H_2SO_4 with NaOH
(d) In atmosphere O_3 from O_2 by lightening

AIIMS-2013, NEET-1997

Ans. (b) : A redox reaction can be defined as a chemical reaction in which electrons are transferred between two reactants participating in it.

Redox Reaction = oxidation + reduction

So, redox reaction follows the both oxidation as well as reduction.

149. $KMnO_4$ acts as an oxidising agent in alkaline medium. When alkaline $KMnO_4$ is treated with KI, iodide ion is oxidised to

(a) I_2 (b) IO^-
(c) IO_3^- (d) IO_4^-

Karnataka-CET-2018
Assam CEE-2018

Ans. (c) :

$2KMnO_4 + H_2O + KI \longrightarrow 2MnO_2 + KOH + KIO_3$

$I + 6OH^- \longrightarrow IO_3^- + 3H_2O + 6e^-$

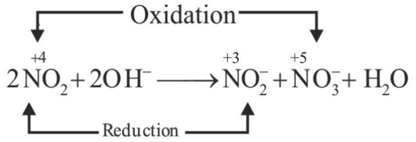
When alkaline $KMnO_4$ is treated with KI, I is oxidized to IO_3^-.

150. Identify disproportionation reaction.

(a) $CH_4 + 2O_2 \rightarrow CO_2 + 2H_2O$
(b) $CH_4 + 4Cl_2 \rightarrow CCl_4 + 4HCl$
(c) $2F_2 + 2OH^- \rightarrow 2F^- + OF_2 + H_2O$
(d) $2NO_2 + 2OH^- \rightarrow NO_2^- + NO_3^- + H_2O$

JIPMER-2018
JCECE - 2015

Ans. (d) :



$2\overset{+4}{N}O_2 + 2OH^- \longrightarrow \overset{+3}{N}O_2^- + \overset{+5}{N}O_3^- + H_2O$

Since, in above reaction, the same element, i.e. N is reduced as well as oxidised, so it is a disproportionation reaction.

151. In basic medium, H_2O_2 exhibits which of the following reactions?

A. $Mn^{2+} \rightarrow Mn^{4+}$
B. $I_2 \rightarrow I^-$
C. $PbS \rightarrow PbSO_4$

Choose the most appropriate answer from the options given below.

(a) A and C (b) Only A
(c) Only B (d) A and B

[JEE Main 2021, 18 March Shift-II]

Ans. (d) : In basic medium, oxidising action of H_2O_2

$Mn^{2+} + H_2O_2 \rightarrow Mn^{+4} + 2OH^-$

and $I_2 + H_2O_2 + 2OH^- \rightarrow 2I^- + 2H_2O + O_2$

and In acidic medium oxidising action of H_2O_2

$PbS(s) + 4H_2O_2(aq) \rightarrow PbSO_4(s) + 4H_2O(l)$

152. To oxidize 1 mole sulphite ion in acid medium, tell the required molar amount of $KMnO_4$

(a) 1/5 (b) 2/5
(c) 3/5 (d) 4/5

Tripura JEE-2021

Ans. (b) :

$2MnO_4^- + 5SO_3^{2-} + 6H^+ \rightarrow 2Mn^{2+} + 5SO_4^{2-} + 3H_2O$

Since, 5 moles of sulphite ions react with 2 moles of MnO_4^-.

So, 1 mole of sulphite ions react with 2/5 moles of MnO_4^-.

@apna_pdf

153. Observe the following redox reaction:
$NaNO_3 + aZn + bNaOH \rightarrow NH_3 + cNa_2ZnO_2 + H_2O$
Which one will be the correct value of a, b and c among the following?

(a) 2, 4, 2 (b) 3, 8, 3
(c) 1,3,1 (d) 4,7,4

Tripura JEE-2021

Ans. (d) : The redox reaction are given below–
$NaNO_3 + 4Zn + 7NaOH \rightarrow NH_3 + 4Na_2ZnO_2 + H_2O$

154. Given below are two statements.
Statement I : Potassium permanganate on heating at 573 K forms potassium manganate.
Statement II : Both potassium permanganate and potassium manganate are tetrahedral and paramagnetic in nature.
In the light of the above statements, choose the most appropriate answer from the options given below

(a) Statement I is true but statement II is false.
(b) Both statement I and statement II are true.
(c) Statement I is false but statement II is true.
(d) Both statement I and statement II are false.

[JEE Main 2021, 17 March Shift-I]

Ans. (a) : $\underset{\text{Potassium permanganate}}{2K\overset{+7}{Mn}O_4} \xrightarrow{573k} K_2\overset{+6}{M}nO_4 + MnO_2 + O_2$

$KMnO_4$ and K_2MnO_4, both are tetrahedral. In $KMnO_4$ is diamagnetic and K_2MnO_4 is paramagnetic.
So, statement I is true but statement II is false.

155. Which of the following equations depicts the oxidizing nature of H_2O_2 ?

(a) $Cl_2 + H_2O_2 \rightarrow 2HCl + O_2$
(b) $KIO_4 + H_2O_2 \rightarrow KIO_3 + H_2O + O_2$
(c) $2I^- + H_2O_2 + 2H^+ \rightarrow I_2 + 2H_2O$
(d) $I_2 + H_2O_2 + 2OH^- \rightarrow 2I^- + 2H2O + O_2$

JEE Main 25-02-2021, Shift-I

Ans. (c) : (i) $\overset{0}{Cl}_2 + H_2\overset{-1}{O}_2 \rightarrow 2H\overset{-1}{Cl} + \overset{0}{O}_2$

(ii) $K\overset{+7}{I}O_4 + H_2\overset{-1}{O}_2 \rightarrow K\overset{+5}{I}O_3 + H_2\overset{-2}{O} + \overset{0}{O}_2$

Reduction

(iii)

Oxidation

$2I^- + H_2O_2 + 2H^+ \rightarrow \overset{0}{I}_2 + 2H\overset{-2}{O}$

Reduction

O reduces from –1 to –2 so, reduction take place. Hence, it will behave as oxidising agent.

156. Which of the following is not a disproportionation reaction?

(a) $Cl_2(g) + 2OH^-(aq) \rightarrow ClO^-(aq) + Cl^-(aq) + H_2O$
(b) $F_2(g) + 2OH^-(aq) \rightarrow OF_2(g) + 2F^-(aq) + H_2O(l)$
(c) $4ClO_3^-(aq) \rightarrow Cl^-(aq) + 3ClO_4^-(aq)$
(d) $4ClO^-(aq) \rightarrow 2Cl^-(aq) + ClO_3^-(aq)$

TS-EAMCET (Engg.), 06.08.2021

Ans. (b): That reaction in which same substance undergoes oxidation as well as reduction to give two different products called disproportionation reaction.
$2F_2(g) + 2OH^-(aq) \rightarrow OF_2(g) + 2F^-(aq) + H_2O(l)$
So, the above reaction is not disproportionation reaction.

157. Given below are two statements:
Statement I: H_2O_2 can act as both oxidizing and reducing agent in basic medium.
Statement II: In the hydrogen economy, the energy is transmitted in the form of dihydrogen.
In the light of the above statements, choose the correct answer from the options given below:

(a) Both statement I and statement II are true
(b) Both statement I and statement II are false
(c) Statement I is true but statement II is false
(d) Statement I is false but statement II is true

JEE Main 16.03.2021, Shift-I

Ans. (a) : Statement I is correct because H_2O_2 acts as oxidizing and reducing agent in acidic as well as basic medium. Dihydrogen is ecofriendly and releases more energy than petrol. Hydrogen economy refers to the transmission of this energy in the form of dihydrogen. Hence, both statement are true.

158. (A) $HOCl + H_2O_2 \rightarrow H_3O^+ + Cl^- + O_2$
(B) $I_2 + H_2O_2 + 2OH^- \rightarrow 2I^- + 2H_2O + O_2$
Chose the correct option.

(a) H_2O_2 acts as oxidising agent in equations (A) and (B).
(b) H_2O_2 acts as reducing agent in equations (A) and (B).
(c) H_2O_2 acts as oxidizing and reducing agent respectively in equations (A) and (B).
(d) H_2O_2 acts as reducing and oxidising agent respectively in equation (A) and (B).

JEE Main 24.02.2021, Shift-I

Ans. (b) : The given reaction are:
(A) $HOCl + H_2O_2 \longrightarrow H_3O^+ + Cl^- + O_2$
(B) $I_2 + H_2O_2 + 2OH^- \longrightarrow 2I^- + 2H_2O + O_2$
H_2O_2 acts as an oxidising as well as reducing agent in both acidic and alkaline media. In first reaction, HOCl is an acid hence H_2O_2 acts as a reducing agent. The second reaction is take place in basic medium hence the H_2O_2 acts as reducing agent. Hence statement (b) is correct option.

159. Which among the following species doesn't show disproportionation reaction?

(a) ClO^- (b) ClO_2^-
(c) ClO_3^- (d) ClO_4^-

AP EAPCET 20.08.2021 Shift-I

Ans. (d) : A disproportionation reaction is a reaction in which a compound undergoes oxidation as well as reduction ClO_4^- does not show disproportionation reaction.

@apna_pdf

160. Which of the following is not a disproportionation reaction?

(a) $P_4 + 5OH^- \longrightarrow H_2PO_2^- + PH_3$

(b) $Cl_2 + OH^- \longrightarrow Cl^- + ClO$

(c) $2H_2O_2 \longrightarrow 2H_2O + O_2$

(d) $PbO_2 + H_2O \longrightarrow PbO + H_2O_2$

BITSAT-2020

Ans. (d) : Disproportionation reaction means both oxidation and reduction.

Option (a), (b) and (c) is the disproportion reaction because oxidation reduction both follow.

and in the reaction-

$PbO_2 + H_2O \rightarrow PbO + H_2O_2$

$$\overset{x+2(-2)=0}{x=4} \xrightarrow[\text{oxidation}]{\text{loss of } e^-} \overset{x+(-2)=0}{x=2}$$

So this is not a Disproportionation reaction.

161. Which oxide among the following cannot act as a reducing agent ?

(a) SO_2 (b) NO_2

(c) CO_2 (d) ClO_2

AP EAMCET (Engg.) 18.9.2020 Shift-I

Ans. (c) : In CO_2, carbon present in the +4 oxidation state which is its maximum oxidation state. So, it cannot act as a reducing agent.

162. Which of the following represents disproportionation of potassium chlorate ?

(a) $2KClO_3 \rightarrow 2KCl + 3O_2$

(b) $3KClO_3 \rightarrow 2KClO_2 + KClO_3$

(c) $4KClO_3 \rightarrow 3KClO_4 + KCl$

(d) None of the above

AP EAMCET (Engg.) 21.09.2020, Shift-I

Ans. (c) : $4K\overset{(+5)}{Cl}O_3 \rightarrow 3K\overset{(-7)}{Cl}O_4 + K\overset{(-1)}{Cl}$

Potassium chlorate disproportionate into potassium perchlorate and potassium chloride at higher temperature. Hence, the correct option is (c).

163. The redox reaction among the following is

(a) reaction of H_2SO_4 with NaOH

(b) reaction of $[Co(H_2O)_6]\,Cl_3$ with $AgNO_3$

(c) combination of dinitrogen with dioxygen at 2000 K

(d) formation of ozone from atmospheric oxygen in the presence of sunlight

[JEE Main 2020, 7 Jan Shift-II]

Ans. (c) : Combination of dinitrogen with dioxygen at 2000 K.

$N_2(g) + O_2(g) \rightarrow 2NO(g)$

Oxidation state of N in $N_2 = 0$

Oxidation state of O in $O_2 = 0$

As in this case, there is addition of oxygen taking place so its oxidation.

So, change in oxidation state of N from 0 to +2 oxidation state and reduction for oxygen from 0 to –2.

164. Which of the following oxides can act both as an oxidising agent as well as reducing agent?

(a) N_2O (b) SO_2

(c) SO_3 (d) P_2O_5

MHT CET-03.05.2019, SHIFT-I

Ans. (b) : In SO_2, the oxidation state of sulphur is–

$x + 2(-2) = 0$

$x = +4$

SO_2 : Sulphur is present in +4 oxidation state so it can act as both oxidizing as well as reducing agent.

165. Consider the change in oxidation state if bromine corresponding to different emf values as shown in the given diagram :

$$BrO_4^- \xrightarrow{1.82V} BrO_3^- \xrightarrow{1.5V} HBrO \xrightarrow{1.595V} Br_2 \xrightarrow{1.0652V} Br^-$$

Then the species undergoing disproportionation is

(a) BrO_3^- (b) BrO_4^-

(c) Br_2 (d) HBrO

NEET-2018

Ans. (d) : HBrO will disproportionation to BrO_3^- and Br_2

$$H\overset{+1}{Br}O \rightarrow \overset{0}{Br_2}, \quad E^o_{HBrO/Br_2} = 1.595V$$

$$H\overset{+1}{Br}O \rightarrow \overset{+5}{Br}O_3^-, \quad E^o_{BrO_3^-/HBrO} = 1.5V$$

$\therefore$ E^o_{cell} for the disproportionation of HBrO.

So, $E^o_{cell} = E^o_{HBrO/Br_2} - E^o_{BrO_3^-/HBrO}$

$= 1.595 - 1.5$

$= 0.095$ V = +ve

The positive value of net cell reaction indicates that the overall cell reaction.

166. How many electrons are involved during the oxidation reaction of $KMnO_4$ in acidic medium?

(a) 1 (b) 3

(c) 5 (d) 4

J & K CET-(2018)

Ans. (c) : Acidic medium the oxidation state of the 'Mn' atom in $KMnO_4$ is +7 in an acidic medium,

$MnO_4^- + 8H^+ + 5e^- \rightarrow Mn^{2+} + 4H_2O$

$MnO_4^- \rightarrow Mn^{2+}$

Change the oxidation state = $7 - 2 = +5$

167. Which of the following is the disproportionation redox reaction?

(a) $2CH_3COOH \xrightarrow{P_2O_5/\Delta}$

(b) $2CH_3CHO \xrightarrow{\text{dil NaOH}}$

(c) $2CH_3COCH_3 \xrightarrow[H_2O]{\text{Mg-Hg}}$

(d) $2HCHO \xrightarrow{50\%\,NaOH(aq)}$

GUJCET-2017

Ans. (d) : $2HCHO \xrightarrow{50\%\,NaOH(aq)} NaCHO_2 + H_2O$ is a disproportionation reaction.

@apna_pdf

168. Which of the following reactions is an example of a redox reaction?

(a) $XeF_4 + O_2F_2 \rightarrow XeF_6 + O_2$

(b) $XeF_2 + PF_5 \rightarrow [XeF]^+ PF_6^-$

(c) $XeF_6 + H_2O \rightarrow XeOF_4 + 2HF$

(d) $XeF_6 + 2H_2O \rightarrow XeO_2F_2 + 4HF$

[JEE Main 2017]

Ans. (a) : The reaction -
$XeF_4 + O_2F_2 \rightarrow XeF_6 + O_2$ is a redox reaction .
Where Xenon (Xe) is oxidized and oxygen (O_2) is reduced. In the above given chemical eq^n.
The oxidation no. of Xe increase from + 4 to +6 and oxidation no. of oxygen decreases from +1 to 0.
So, this is the redox reaction.

169. Which reaction represents the oxidising behaviour of H_2SO_4 ?

(a) $NaCl + H_2SO_4 \rightarrow NaHSO_4 + HCl$

(b) $2NaOH + H_2SO_4 \rightarrow Na_2SO_4 + 2H_2O$

(c) $2HI + H_2SO_4 \rightarrow I_2 + SO_2 + 2H_2O$

(d) $2PCl_5 + H_2SO_4 \rightarrow 2POCl_3 + SO_2Cl_2 + 2HCl$

JCECE - 2016

Ans. (c) : $2HI + H_2SO_4 \rightarrow I_2 + SO_2 + 2H_2O$
In above reaction shows the oxidising behaviour of H_2SO_4. The oxidation no. of iodine increases from –1 (in HI) to 0 in I_2. Thus, iodine is oxidised. Rest of all, there is no change in the oxidation no.

$$H_2\overset{+6}{S}O_4 \rightarrow \overset{+4}{S}O_2$$

Here, oxidation number of 'S' decreases by two, thus this is a reduction reaction and H_2SO_4 behaves as oxidizing agent.

170. Which of the following acts as both reducing and oxidising agents?

(a) H_2SO_4	(b) HNO_3
(c) H_2O_2	(d) $KMnO_4$

BCECE-2016

Ans. (c) : Sulphur, nitrogen and Mn are in their maximum oxidation state. So, can only able to reduce, thus only act as oxidizing agent only.
Here, H_2O_2 will act as both.
(i) In case of oxidizing agent

$$\overset{+1}{H_2}\overset{-1}{O_2} \rightarrow \overset{-2}{O}(H_2O)$$

(ii) In case of reducing agent

$$H_2\overset{-1}{O_2} \rightarrow O_2$$

171. The combustion of methane is written as –

$$CH_4(g) + 2O_2(g) \rightarrow CO_2(g) + 2H_2O(l)$$

The difference between enthalpy charge and energy change is equal to

(a) -2RT	(b) 0
(c) RT	(d) $\frac{RT}{2}$

SCRA-2015

Ans. (a) : Given the combustion of methane is –
$CH_4(g) + 2O_2(g) \rightarrow CO_2(g) + 2H_2O(l)$
Δn_g = No. of moles of product – No. of moles of reactant

$\Delta n_g = (1-3) = -2$

$\therefore$ $\Delta H = \Delta U + \Delta n_g RT$

or $\Delta H - \Delta U = -2RT$

172. Strongest reducing agent among the following is

(I) $Na^+ + e^- \longrightarrow Na(s); E° = -2.71V$

(II) $Al_3 + 3e^- \longrightarrow Al(s); E° = -1.66V$

(iii) $F_{2(g)} + 2e^- \longrightarrow 2F^-; E° == 2.87V$

(iv) $2H_2O + 2e^- \longrightarrow H_2(g) + 2OH^-(aq); E° = -0.83V$

(a) (IV)	(b) (III)
(c) (II)	(d) (I)

COMEDK-2015

Ans. (d) : Lower the E° value (more negative), stronger is the reducing agent.

173. Choose the correct statement applicable for the reaction : $2H_2O + 2F_2 \longrightarrow 4HF + O_2$

(a) Water is oxidized to O_2.

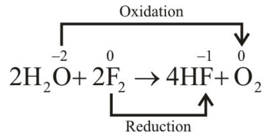
(b) F_2 is oxidized to HF.

(c) Water is reduced to HF.

(d) F_2 acts as reducing agent in the reaction.

COMEDK 2015

Ans. (a) :



$$2H_2\overset{-2}{O} + 2\overset{0}{F_2} \rightarrow 4H\overset{-1}{F} + \overset{0}{O_2}$$

In this reaction water is oxidised to O_2.

174. When $KMnO_4$ acts as an oxidizing agent and ultimately forms MnO_4^{2-} , MnO_2, Mn_2O_3 and Mn^{2+}, then the number of electrons transferred in each case respectively are

(a) 1, 3, 4, 5	(b) 3, 2, 1, 4
(c) 1, 5, 3, 7	(d) 4, 3, 2, 1

JIPMER-2015

Ans. (a) : $KMnO_4 \xrightarrow{+1e^-} MnO_4^{2-}$

$KMnO_4 \xrightarrow{+3e^-} MnO_2$

$KMnO_4 \xrightarrow{+4e^-} Mn_2O_3$

$KMnO_4 \xrightarrow{+5e^-} Mn^{2+}$

So, number of electron transferred is– 1, 3, 4, 5

175. In the redox reaction,

$$MnO^-{}_4 + 8H^+ + 5Br^- \rightarrow Mn^{2+} + 4H_2O + \frac{5}{2}Br_2$$

which one is the reducing agent?

(a) H^+	(b) MnO_4^-
(c) Br^-	(d) Mn^{2+}

AMU-2014

@apna_pdf

Ans. (c) : Given the redox reaction is -

Reduction

$$\overset{+7}{MnO_4^-} + 8H^+ + 5Br^- \rightarrow Mn^{2+} + 4H_2O + \frac{5}{2}\overset{0}{Br_2}$$

Oxidation

So, In this reaction Br^- reduces $KMnO_4^-$ into Mn^{2+} and itself gets oxidised into Br_2. So, it acts as the reducing agent.

176. The compound that can work both as an oxidizing as well as reducing agent is

(a) $KMnO_4$ (b) H_2O_2

(c) $Fe_2(SO_4)_3$ (d) $K_2Cr_2O_7$

UPTU/UPSEE-2014

Ans. (b) : Hydrogen peroxide (H_2O_2) acts as oxidizing as well as reducing agent in both as acidic as well as basic medium. The oxidation state of oxygen in hydrogen peroxide is –1 can be oxidised to O_2 is zero and reduced to H_2O in oxidation of oxygen is –2.

$$H_2\overset{-1}{O_2} \rightarrow H_2\overset{-2}{O} + \overset{0}{O_2}$$

177. The reaction.
$10FeSO_4+2KMnO_4+8H_2SO_4 \rightarrow 2MnSO_4+5Fe_2(SO_4)_3+K_2SO_4+8H_2O$
is an example of reaction of

(a) disproportionation

(b) intermolecular redox

(c) intramolecular redox

(d) None of these

UPTU/UPSEE-2014

Ans. (b) : In intermolecular redox reaction oxidation reduction takes place when molecules of two different substance react each others.

$$10\overset{+2}{Fe}SO_4 + 2K\overset{+7}{Mn}O_4 + 8H_2SO_4 \rightarrow 2\overset{+2}{Mn}SO_4 + 5\overset{+3}{Fe_2}(SO_4)_3 + K_2SO_4 + 8H_2O$$

So, this reaction is intermolecular redox reaction.

178. The correct descending order of oxidizing power of the following is

(a) $Cr_2O_7^{2-} > MnO_4^- > VO_2^+$

(b) $MnO_4^- > Cr_2O_7^{2-} > VO_2^+$

(c) $VO_2^+ > MnO_4^- > Cr_2O_7^{2-}$

(d) $MnO_4^- > VO_2^+ > Cr_2O_7^{2-}$

(e) $Cr_3O_7^{2-} > VO_2^+ > MnO_4^-$

Kerala-CEE-2014

Ans. (b) : The species are given below–

(i) VO_2^+

$x + 2(-2) = +1$
$x - 4 = +1$
$x = +5$

(ii) $Cr_2O_7^{2-}$

$2x + 7(-2) = -2$
$2x - 14 = -2$
$2x = +12$
$x = +6$

(iii) MnO_4^-

$x + 4(-2) = -1$
$x - 8 = -1$
$x = +7$

Hence, the oxidizing power depend upon the stability of reduction. If oxidation no. increases then oxidizing power increases.

So, the order is $MnO_4^- > Cr_2O_7^{2-} > VO_2^+$.

179. The number of electrons that are involved in the reduction of permanganate to manganese (II) salt, manganate and manganese dioxide respectively are

(a) 5, 1, 3 (b) 5, 3, 1

(c) 2, 7, 1 (d) 5, 2, 3

(e) 2, 3, 1

Kerala-CEE-2014

Ans. (a) : The no. of e^- that are involved in the reduction of permanganate ion into manganese (II) salt

$$MnO_4^- \longrightarrow Mn^{2+}$$

$x + (-2) \times 4 = -1$ $x = +2$
$x = +7$

Change in no. of electrons = 7 – 2 = 5

The no. of e^- that are involved in the reduction of permanganate into manganate

$$MnO_4^- \longrightarrow MnO_4^{2-}$$

$x + (-2) \times 4 = -1$ $x + (-2) \times 4 = -2$
$x = 7$ $x = +6$

Change in no. of e^- = 7 – 6 = 1

The no. of e^- that are involved in the reduction of permanganate into manganese dioxide

$$MnO_4^- \longrightarrow \overset{+2}{MnO_2}$$

$x + (-2) \times 4 = -1$ $x + (-2) \times 2 = 0$
$x = +7$ $x = +4$

Change in no. of e^- = 7 – 4 = 3

180. In which of the following reactions H_2O_2 acts as a reducing agent?

A. $H_2O_2 + 2H^+ + 2e^- \rightarrow 2H_2O$

B. $H_2O_2 - 2e^- \rightarrow O_2 + 2H^+$

C. $H_2O_2 + 2e^- \rightarrow 2OH^-$

D. $H_2O_2 + 2OH^- - 2e^- \rightarrow O_2 + 2H_2O$

(a) A, B (b) C, D

(c) A, C (d) B, D

[JEE Main 2014]

Ans. (d) :

(a) $H_2O_2 + 2H^+ + 2e^- \rightarrow 2H_2O$

H_2O_2 loses an O atom and it reduced.

(b) $H_2O_2 + 2e^- \rightarrow O_2 + 2H^+$

mole of H_2O_2 loses $2e^-$ and is oxidized

(c) $H_2O_2 + 2e^- \rightarrow 2(OH^-)$

H_2O_2 gains 2 electrons and is reduced.

(d) $H_2O_2 + 2OH^- + 2e^- \rightarrow O_2 + 2H_2O$

Molecules of H_2O_2 loses hydrogen and is oxidized.

181. On heating, chloric acid decomposes to

(a) $HClO_4$, Cl_2, O_2 and H_2O

(b) $HClO_2$, Cl_2, O_2 and H_2O

(c) $HClO$, Cl_2O and H_2O_2

(d) HCl, HClO, Cl_2O, and H_2O

WB-JEE-2013

@apna_pdf

Ans. (a) : In the heating chloric acid decomposes to

$$3HClO_3 \xrightarrow{\Delta} HClO_4 + Cl_2 + 2O_2 + H_2O$$

182. In the reaction Pb(s) + Cu^{2+}(aq) → Pb^{2+}(aq) + Cu(s) which is reducing agent?

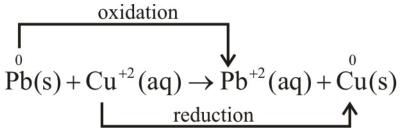
(a) Pb^{2+}(aq) (b) Cu^{2+}(aq)
(c) Pb(s) (d) Cu(s)

MPPET-2013

Ans. (c) : A reducing agent is an element or compound that loses an electron to another substance in a redox reaction. The reducing agent after losing electrons gets oxidised.

Here, Pb ion loses 2 electrons and gets oxidised to Pb^{2+}.

Hence, it is a reducing agent.



$$\overset{0}{Pb}(s) + Cu^{+2}(aq) \rightarrow Pb^{+2}(aq) + \overset{0}{Cu}(s)$$

183. In which of the following reactions, H_2O_2 acts as oxidizing agent?

(a) $Cl_2 + H_2O_2 \rightarrow 2HCl + O_2$
(b) $Ag_2O + H_2O_2 \rightarrow 2Ag + H_2O + O_2$
(c) $2NaOH + H_2O_2 \rightarrow Na_2O_2 + 2H_2O$
(d) $KNO_2 + H_2O_2 \rightarrow KNO_3 + H_2O$

AP EAMCET (Medical) - 2013

Ans. (d) : For the reaction-

$$KNO_2 + H_2O_2 \longrightarrow KNO_3 + H_2O$$

1+x–2(2) = 0 1+x–6 = 0
x = +3 x = +5

The oxidation state of N increases from +3 to +5. Thus, H_2O_2 act as a oxidising agent.

184. Fluorine reacts with $KHSO_4$ to form HF and $\underline{X}$. Which one of the following is $\underline{X}$?

(a) SO_3 (b) K_2SO_4
(c) $K_2S_2O_8$ (d) H_2S

AP EAMCET (Medical) - 2013

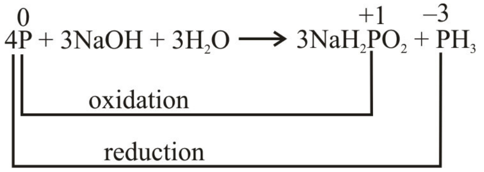
Ans. (c) : Fluorine reacts with potassium hydrogen sulphate to form hydrogen fluorite (HF) and potassium per sulphate. The oxidation state of S in $KHSO_4$ is +6 and $K_2S_2O_8$ is +7 .

185. 4P + 3NaOH + $3H_2O$ → $3NaH_2PO_2$ + PH_3 In the above reaction, find the element undergoing both oxidation and reduction,

(a) Na (b) P
(c) H (d) O

SRMJEEE – 2013

Ans. (b) :



$$\overset{0}{4P} + 3NaOH + 3H_2O \longrightarrow 3NaH_2\overset{+1}{P}O_2 + \overset{-3}{P}H_3$$

Hence, P (Phosphorous) is undergoing both oxidation and reduction in the given reaction.

186. See the following redox reaction

$A^{2+} + 2e^- \rightarrow A; E^0 = +0.34V$

$A^+ + e^- \rightarrow A; E^0 = +0.52V$

Which ion is expected to be stable?

(a) A^{2+}
(b) A^+
(c) Both can form stable complexes
(d) None can from stable complexes

CG PET- 2013

Ans. (a) : For given reaction E^0 is minimum, so ion is expected to be stable and E^0 is maximum so ion is not expected to be stable.

Thus, the equation -

$A^{2+} + 2e^- \rightarrow A, E^0 = +0.34V$

Thus, A^{2+} is stable.

187. What is Z in the following reactions?

$$BCl_3 + H_3 \xrightarrow[450^0C]{Cu-Al} X + HCl, X \xrightarrow{methylation} Z$$

(a) $(CH_3)BH_2$ (b) $(CH_3)_4B_2H_2$
(c) $(CH_3)_3B_2H_3$ (d) $(CH_3)_6B_2$

AP EAMCET (Engg.) - 2012

Ans. (b) : $BCl_3 + 3H_2 \xrightarrow[450°C]{Cu-Al} \underset{\substack{Diborane\\(X)}}{B_2H_6} + 6HCl$

$$\underset{(X)}{B_2H_6} + 4CH_3Cl \xrightarrow{methylation} \underset{(Z)}{(CH_3)_4B_2H_2} + 4HCl$$

In this reaction X is diborane (B_2H_6) and Z is $(CH_3)_4B_2H_2$.

188. The strength of an aqueous solution of I_2 can be determined by titrating the solution with standard solution of:

(a) oxalic acid (b) sodium thiosulphate
(c) sodium hydroxide (d) mohr's salt

(AIIMS-2012)

Ans. (b): The strength of an aqueous solution of I_2 can be determined by titrating the solution with standard solution is Sodium Thiosulphate –

$$I_2 + \underset{\substack{Sodium\\thiosulphate}}{2Na_2S_2O_3} \rightarrow Na_2S_4O_6 + 2NaI$$

189. The reaction, $2H_2O_2 \rightarrow 2H_2O + O_2$; shows that H_2O_2

(a) is decomposed
(b) acts as oxidizing agent
(c) acts as reducing agent
(d) None of the above

UP CPMT-2012

Ans. (a) : H_2O_2 decomposes on standing or heating. It is an example of auto oxidation-reduction.

$$2H_2\overset{-1}{O_2} \rightarrow 2H_2\overset{-2}{O} + \overset{0}{O_2}$$

190. The correct order of increasing oxidizing power in the series is

(a) $VO_2^+ < Cr_2O_7^{2-} < MnO_4^-$
(b) $Cr_2O_7^{2-} < VO_2^+ < MnO_4^-$
(c) $Cr_2O_7^{2-} < MnO_4^- < VO_2^+$
(d) $MnO_4^- < Cr_2O_7^{2-} < VO_2^+$

J & K CET-(2012)

@apna_pdf

Ans. (a) : $VO_2^+ < Cr_2O_7^{2-} < MnO_4^-$

This is due to the increasing stability of the lower species to which they are reduced.

$MnO_4^-(Mn^{+7})$ is reduced to (Mn^{2+}) which is having half-filled d^5 stable configuration.

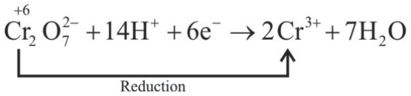
191. Which of the following does not/do not represent the correct equivalent mass of $Cr_2O_7^{2-}$ in the reaction

$Cr_2O_7^{2-} + 14H^+ + 6e^- \to 2Cr^{3+} + 7H_2O$?

(a) The molar mass of dichromate
(b) One third of the molar mass of dichromate
(c) One sixth of the molar mass of dichromate
(d) One half of the molar mass of dichromate

UPTU/UPSEE-2011

Ans. (a,b,d) :



$$\overset{+6}{Cr_2}O_7^{2-} + 14H^+ + 6e^- \to 2Cr^{3+} + 7H_2O$$

Reduction

$$\text{Equivalent weight} = \frac{\text{Molecular mass}}{\text{No.of } e^- \text{ involved}}$$

$$\text{Equivalent weight} = \frac{294.26}{6} = 49\,g/eq.$$

Hence, the option (a), (b) and (d) do not represent correct equivalent mass of $Cr_2O_7^{2-}$ in the reaction.

192. What products are expected from the dispropotionation reaction of hypochlorous acid?

(a) $HClO_3$ and Cl_2O
(b) $HClO_2$ and $HClO_4$
(c) HCl and Cl_2O
(d) HCl and $HClO_3$

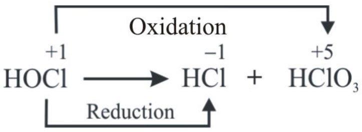
JCECE - 2011

Ans. (d) : In disproportionation reaction, the same element is oxidised as well as reduced.

In HOCl, the oxidation state of Cl is +1.

In $HClO_3$, Cl_2O, $HClO_2$, $HClO_4$ and HCl, the oxidation states of Cl are +5, +1, +3, +7 and –1 respectively.

Thus, the disproportionation products are HCl and $HClO_3$.



193. Consider the following equation, which represents a reaction in the extraction of chromium from its ore

$$2Fe_2O_3.Cr_2O_3 + 4Na_2CO_3 + 3O_2 \longrightarrow 2Fe_2O_3 + 4Na_2CrO_4 + 4CO_2$$

Which one of the following statements about the oxidation states of the substances is correct?

(a) The iron has been reduced from +3 to +2 state.
(b) The chromium has been oxidised from +3 to +6 state.
(c) The carbon has been oxidised from +2 to +4 state.
(d) There is no change in the oxidation state of the substances in the reaction.

VITEEE- 2011

Ans. (b) : The given redox reaction is :

$$2\overset{+3}{Fe_2}O_3\cdot Cr_2O_3 + 4Na_2\overset{+4}{C}O_3 + 4O_2 \to 2\overset{+3}{Fe_2}O_3 + 4Na_2CrO_4 + 4\overset{+4}{C}O_2$$

Hence, the oxidation occurred in chromium from + 3 to +6.

194. In oxidation

1. Hydrogen is displaced from a substance

2. an electropositive element is added to or proportion of electropositive element increases in substance

Select the correct answer using the code given below :

(a) 1 only
(b) 2 only
(c) Both 1 and 2
(d) Neither 1 nor 2

NDA (II)-2011

Ans : (a) In oxidation, hydrogen is displayed from a substance.

• Oxidation is a process where in a synthetic substance changes as a result of the expansion of oxygen in oxidation reaction an element combines with oxygen and removal of hydrogen.

195. When a copper rod is dipped in aqueous silver nitrate solution, the colour of the solution changes to blue. This is because

(a) Cu is more easily reduced than Ag
(b) Ag is more easily reduced than Cu
(c) Nitrate ion acts as an oxidizing agent
(d) Nitrate ion acts as a reducing agent

NDA (II)-2011

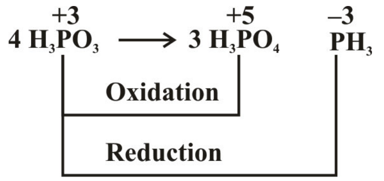
Ans : (a) When a copper rod is dipped in aqueous silver nitrate solution, the colour of the solution changes to blue because copper is more easily reduced than silver.

196. $4H_3PO_3 \to 3H_3PO_4 + PH_3$, in this reaction, phosphorus in H_3PO_3 undergoes

(a) oxidation
(b) reduction
(c) hydrolysis
(d) both (a) and (b).

SRMJEEE – 2011

Ans. (d) :



Therefore, P in H_3PO_3 undergoes both oxidation as well as reduction.

197. A gas X at 1 atm is bubbled through a solution containing a mixture of 1 M Y^- and 1 MZ^- at 25°C . If the reduction potential is Z > Y > X, then

(a) Y will oxidise X and not Z
(b) Y will oxidise Z and not X

@apna_pdf

(c) Y will oxidis both X and Z
(d) Y will reduce both X and Z

BITSAT-2011

Ans. (a) : Given the order of reduction potential $Z > Y > X$

So, higher reduction potential means self reduction of species but oxidised others (oxidising agent).

And lower reduction potential means self oxidation of species but reduce others (reducing agent).

Thus, Y will oxidize X and not Z.

198. Which of the following can be the oxidizing as well as reducing agent?

(a) MnO_4^- (b) CrO_4^-
(c) H_2O_2 (d) $Cr_2O_7^-$

SCRA-2010

Ans. (c) : H_2O_2 can acts oxidizing as well as reducing agent. Oxygen is present in –1 oxidation states. The oxidising activity of hydrogen peroxide results from the presence of extra oxygen atom compared with the structure of water.

199. Oxidation potential of unimoles of calomel is

(a) + 0.25 V (b) 0.00 V
(c) + 0.287 V (d) – 0.28 V

MHT CET-2010

Ans. (d) : The calomel electrode is a saturated calomel electrode (SCE) is a reference electrode based on the reaction between elemental mercury and mercury(I) chloride. The electrode reaction when the electrode acts as cathode is–

$$\frac{1}{2}Hg_2Cl_2 + e^- \rightleftharpoons Hg + Cl^-$$

Hence, the oxidation potential of unimoles of calomel is –0.28V.

200. Which of the following species can function both as oxidizing as well as reducing agent?

(a) Cl^- (b) ClO_4^-
(c) ClO^- (d) MnO_4^-
(e) NO_3^-

Kerala-CEE-2010

Ans. (c) :

Species	O.N
Cl^-	–1
ClO_4^-	+7
ClO^-	+1
MnO_4^-	+7
NO_3^-	+5

In all the given species except ClO^-, the chlorine element have minimum or maximum oxidation state, and they can't for the decrease & increase oxidation state So, In ClO^-, the oxidation state of Cl be a reducing agent.

201. The reduction potential values of X, Y and Z are – 3.05 V, – 0.44 V and 0.83 V respectively. Which of the following order is correct with respect to their reducing property?

(a) $X > Y > Z$ (b) $X > Z > Y$
(c) $Y > Z > X$ (d) $Z > Y > X$

J & K CET-(2010)

Ans. (b) : The reduction potential have more negative value then its shows the stronger reducing nature. The order of reduction potential values with negative sign of given element is-

$$\underset{(-3.05)}{X} > \underset{(-0.83V)}{Z} > \underset{(-0.44v)}{Y}$$

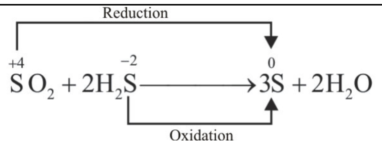
So, the order of reducing property is $X > Z > Y$.

202. In the reaction, $SO_2 + 2H_2S \longrightarrow 3S + 2H_2O$ the substance oxidised is

(a) H_2S (b) SO_2
(c) S (d) H_2O

JCECE - 2010

Ans. (a) :



$$\overset{+4}{S}O_2 + 2H_2\overset{-2}{S} \longrightarrow 3\overset{0}{S} + 2H_2O$$

∴ H_2S is oxidised in this reaction whereas SO_2 get reduced.

203. The reaction that takes place when Cl_2 gas is passed through conc. NaOH solution is

(a) oxidation (b) reduction
(c) displacement (d) disproportionation

WB-JEE-2009

Ans. (d) : $3\overset{0}{Cl_2} + 6NaOH \rightarrow Na\overset{+5}{Cl}O_3 + 5Na\overset{-1}{Cl} + 3H_2O$

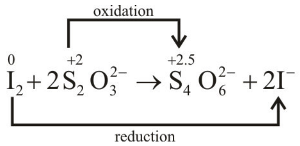
In this reaction chlorine is oxidized to $NaClO_3$ and reduced to NaCl. So this a disproportination in which a substance is simultaneously oxidized and reduced.

204. $I_2 + 2S_2O_3^{2-} \longrightarrow S_4O_6^{2-} + 2I^-$

(a) iodine is reduced, sulphur is reduced
(b) iodine is reduced, sulphur is oxidised
(c) iodine is oxidised, sulphur is reduced
(d) iodine is oxidised, sulphur is oxidised

UP CPMT-2009

Ans. (b):



$$\overset{0}{I_2} + 2\overset{+2}{S_2}O_3^{2-} \rightarrow \overset{+2.5}{S_4}O_6^{2-} + 2I^-$$

The oxidation state of iodine goes 0 to –1. The oxidation state of sulphur goes +2 to 2.5.

Hence, iodine is reduced, sulphur is oxidised.

205. Lead nitrate on heating gives lead oxide, nitrogen dioxide and oxygen. This reaction is known as

(a) Combustion (b) Combination
(c) Displacement (d) Decomposition

MPPET- 2009

Ans. (d) : Decomposition reaction in which compound break down into two or more simpler substances. Lead nitrate on heating decomposes to lead oxide, nitrogen dioxide and oxygen.

$$2Pb(NO_3)_2 \xrightarrow{\Delta} 2PbO + 4NO_2 + O_2$$

@apna_pdf

206. The value of 'n' in the reaction:

$$\mathbf{Cr_2O_7^{2-} + 14H^+ + nFe^{2+} \rightarrow 2Cr^3 + nFe^{3+} + 7H_2O}$$

Will be

(a) 2 (b) 3
(c) 6 (d) 7

MPPET-2008

Ans. (c) :

$Cr_2O_7^{2-} + 14H^+ + 6Fe^{2+} \rightarrow 2Cr^{3+} + 6\ Fe^{3+} + 7H_2O$

Hence, the value of n is +6.

207. Which one of the following reactions occur at the cathode?

(a) $2OH^- \longrightarrow H_2O + 1/2O_2 + 2e^-$
(b) $Ag \longrightarrow Ag^+ + e^-$
(c) $Fe^{2+} \longrightarrow Fe^{3+} + e^-$
(d) $Cu^{2+} + 2e^- \longrightarrow Cu$

AP-EAMCET (Medical), 2008

Ans. (d) :

$$2OH^- \rightarrow H_2O + \frac{1}{2}O_2 + 2e^{\ominus} \quad \text{(oxidation)}$$
$$Ag \rightarrow Ag^+ + e^{\ominus} \quad \text{(oxidation)}$$
$$Fe^{2+} \rightarrow Fe^{3+} + e^{\ominus} \quad \text{(oxidation)}$$
$$Cu^{2+} + 2e^{\ominus} \rightarrow Cu \quad \text{(reduction)}$$

As we know oxidation occurs at the anode whereas reduction occurs at cathode.

208. Which of the following carbonates decomposes readily at low temperatures?

(a) Na_2CO_3 (b) K_2CO_3
(c) Li_2CO_3 (d) Rb_2CO_3

UP CPMT-2008

Ans. (c): On moving in a group from top to bottom electropositive character increases. Hence, the stability of carbocation increase. All the carbonate of the alkali group thermally stable and readily decomposes at low temperature except the lithium.

$$Li_2CO_3 \xrightarrow{\Delta} Li_2O + CO_2$$

209. Which of the following is used as an oxidiser in rocket propellants?

(a) Alcohol (b) Acrylic rubber
(c) Hydrazine (d) Polyurethane
(e) Ammonium perchlorate

Kerala-CEE-2008

Ans. (e) : The propellant is a combination of an oxidiser and a fuel. Among the given only ammonium perchlorate is used as an oxidiser while other are generally used as a fuel in rocket propellant.

210. During a redox titration involving a solution containing Fe^{2+} ions against MnO_4^- in the presence of excess of H+ ions, the number of electrons that get transferred is

(a) 6 (b) 5
(c) 4 (d) 2

J & K CET-(2008)

Ans. (b) : $MnO_4^- + 8H^+ + 5e^- \longrightarrow Mn^{2+} + 4H_2O$

$[Fe^{2+} \longrightarrow Fe^{3+} + e^-]5$

$MnO_4^- + 8H^+ + 5Fe^{2+} \longrightarrow Mn^{2+} + 5Fe^{3+} + 4H_2O$

So, 5 electrons gets transferred.

211. Which of the following is combustion reaction?

(a) $C + O_2 \rightarrow CO_2$
(b) $CH_4 + O_2 \rightarrow CO_2 + H_2O$
(c) $Mg + O_2 \rightarrow MgO$
(d) All of the above

UP CPMT-2007

Ans. (b) : When all substance in a compound combine with oxygen and produces carbon dioxide and water, it is commonly called burning.

During combustion, substances react with oxidising agent such as O_2 and F_2. Not all combustion reaction releases CO_2 and H_2O.

e.g. $Mg + O_2 \rightarrow MgO + heat$

212. One gas bleaches the color of flowers in reduction and another gas by oxidation. The gases respectively are

(a) SO_2 and Cl_2 (b) CO and Cl_2
(c) NH_3 and SO_2 (d) H_2S and Br_2

AP - EAMCET (Medical) - 2007

Ans. (a) : Sulphur dioxide (SO_2) and chlorine gas (Cl_2) are the two gases that bleach the color of flower by oxidation and reduction. Chlorine reacts with water and produces a single oxygen atom also called nascent oxygen. This nascent oxygen when combines with any color make it colorless.

213. A solution of sodium metal in liquid ammonia is a strong reducing agent due to the presence of

(a) sodium atoms (b) sodium hdride
(c) sodium amide (d) solvated electron

CG PET -2007

Ans. (d) : In liquid ammonia, sodium ionizes to give Na^+ ion. The electron is solvated with ammonia.

So this solvated electron gives reducing properties to the solution of sodium in liquid ammonia.

214. In the reaction

$$\mathbf{Cr_2O_7^{2-} + 14H^+ + 6I^- \rightarrow 2Cr^{3+} + 7H_2O + 3I_2}$$

Which element is reduced

(b) I (b) O
(c) H (d) Cr

BITSAT-2006

Ans. (d) : Cr is reduced in this reaction

$$\overset{+6}{Cr_2}O_7^{2-} + 14H^+ + 6I^- \rightarrow 2\overset{+3}{Cr^{+3}} + 3H_2O + 3I_2$$

Reduction

In this reaction $Cr_2O_7^{2-}$ gets reduced to Cr^{3+}→Cr gets reduced and I^- gets oxidized to I_2.

215. Which of the following occurs at anode?

(a) Reduction (b) Oxidation
(c) Both (a) and (b) (d) None of these

CG PET -2006

@apna_pdf

Ans. (b) : Electrochemical cell, in anode oxidation takes place and cathode reduction takes place.
So, anode is oxidation.

216. Which of the following chemical reactions depicts the oxidising behaviour of H_2SO_4?

(a) $2HI + H_2SO_4 \rightarrow I_2 + SO_2 + 2H_2O$
(b) $Ca(OH)_2 + H_2SO_4 \rightarrow CaSO_4 + 2H_2O$
(c) $NaCl + H_2SO_4 \rightarrow NaHSO_4 + HCl$
(d) $2PCl_5 + H_2SO_4 \rightarrow 2POCl_3 + 2HCl + SO_2Cl_2$

[AIEEE 2006]

Ans. (a) : In the reaction,

$$2\underset{+1-1}{HI}+\underset{+1+6-2}{H_2SO_4}\rightarrow \underset{0}{I_2}+\underset{+4}{SO_2}+\underset{+1\ -2}{2H_2O}$$

Ist half reaction–

$$2\underset{-1}{HI}\rightarrow \underset{0}{I_2}$$

In this reaction oxidation number of I increases by one, thus this is an oxidation reaction and HI behaves as a reducing agent.

IInd half reaction–

$$\underset{+6}{H_2SO_4}\rightarrow \underset{+4}{SO_2}$$

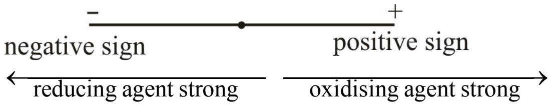
In this reaction oxidation number of S decreases by two, thus this is a reduction reaction and H_2SO_4 behaves as oxidising agent.

217. Given the standard reduction potentials $Zn^{2+}/Zn = -0.74$ V, $Cl_2/Cl^- = 1.36$ V, $H^+/1/2H_2$ = 0V and Fe^{3+}/Fe^{2+} = 0.77 V. The order of increasing strength of reducing agent is:

(a) Cl^-, Zn, H_2, Fe^{2+}
(b) H_2, Zn, Fe^{2+}, Cl^-
(c) Cl^-, Fe^{2+}, Zn, H_2
(d) H_2, Fe^{2+}, Cl^-, Zn
(e) Cl^-, Fe^{2+}, H_2, Zn

Kerala-CEE-2006

Ans. (e) : We know that,



So, given reduction potential in order of increasing strength.

$$\underset{(1.36V)}{Cl^-} < \underset{0.77V}{Fe^{2+}} < \underset{0V}{H_2} < \underset{-0.74V}{Zn}$$

218. Which of the following statements are correct concerning redox properties?

(1) A metal M for which E° for the half reaction $M^{n+} + ne^- = M$, is very negative will be a good reducing agent
(2) The oxidizing power of the halogens decreases from chlorine to iodine
(3) The reducing power of hydrogen halides increases from hydrogen chloride to hydrogen iodide.

(a) 1, 2, and 3
(b) 1 and 2
(c) 1 only
(d) 2 and 3 only
(e) 3 only

Kerala-CEE-2006

Ans. (a) :
(i) High negative value of E° means lower reduction potential which means, the metal M is a good reducing agent.
(ii) Reduction potential of Cl, Br and I are respectively +1.36V, 1.06V and 0.54V show higher oxidizing agent
Cl → Br → I
(iii) Large size of Halogen atom, weaker the bond and easier is the tendency to given hydrogen.

So, stronger is the reducing power. So, Cl < Br < I & reducing power of HCl < HBr < HI

219. The tendency of an electrode to lose electrons is known as

(a) electrode potential
(b) reduction potential
(c) oxidation potential
(d) e.m.f.

J & K CET-(2005)

Ans. (c) : The magnitude of electrode potential of a metal is a measure of its relative tendency to loose or gain electrons.

It is a measure of the relative tendency to undergo oxidation (less of e^-) or deduction (gain of e^-)

$$M \longrightarrow M^{n+} + ne^-$$
(Oxidation potential)

$$M^{n+} + ne^- \longrightarrow M$$
(Reduction potential)

220. In one of the following reactions HNO_3 does not behave as an oxidizing agent. Identify it:

(a) $I_2 + 10HNO_3 \rightarrow 2HIO_3 + 10NO_2 + 4H_2O$
(b) $3Cu + 8HNO_3 \rightarrow 3Cu(NO_3)_2 + 2NO + 4H_2O$
(c) $4Zn + 10HNO_3 \rightarrow 4Zn(NO_3)_2 + NH_4NO_3 + 3H_2O$
(d) $2HNO_3 + P_2O_5 \rightarrow 2HPO_3 + N_2O_5$

JCECE - 2005

Ans. (d) : $2H\overset{+5}{N}O_3+\overset{+5}{P_2}O_5 \longrightarrow 2H\overset{+5}{P}O_3+\overset{+5}{N_2}O_5$

Oxidation no. of phosphorus (P) does not changes and it remains same i.e. (+5).

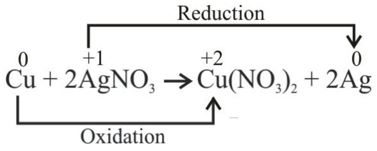
In this reaction, HNO_3 is not behave as oxidizing agent.

221. Which of the following reactions is a redox reaction?

(a) $2AgNO_3 + BaCl_2 \rightarrow 2AgCl + Ba(NO_3)_2$
(b) $BaO_2 + H_2SO_4 \rightarrow BaSO_4 + H_2O_2$
(c) $P_2O_5 + 2H_2O \rightarrow H_4P_2O_7$
(d) $Cu + 2AgNO_3 \rightarrow 2Ag + Cu(NO_3)_2$

CG PET -2005

Ans. (d) :



In the above reaction Cu change in oxidation state 0 to +2 and Ag change in oxidation state +1 to 0.

@apna_pdf

222. For the reaction

$$\mathbf{CrO_4^{-2}(aq.) + 2H^+ \rightarrow Cr_2O_7^{2-}(aq). + H_2O,}$$

Element oxidized is

(a) Oxygen (b) H
(c) Chromium (d) None

BITSAT-2005

Ans. (d) : For the reaction -

$$2CrO_4^{2-} + 2H^+ \rightarrow Cr_2O_7^{-2} + H_2O$$
$$x - 8 = -2 \qquad 2x - 14 = -2$$
$$x = +6 \xrightarrow[\text{oxidation}]{\text{no change}} x = +6$$

223. Among the properties (A) reducing, (B) oxidising and (C) complexing, the set of properties shown by CN⁻ ion towards metal species is

(a) A, B (b) B, C
(c) C, A (d) A, B, C

[AIEEE 2004]

Ans. (c) : CN^- ion acts as ligand and reducing agent. In $K_3[Fe(CN)_6]$ and $K_4[Fe(CN)_6]$, CN^- ion acts as complexing agent.

$$CuI_2 + 5KCN \rightarrow K_3[Cu(CN)_4] + \frac{1}{2}(CN)_2 + 2KCl$$

$$Ni^{+2} + 4CN^- \rightarrow [Ni(CN)_4]^{2-}$$

$\therefore$ CN^- reduce Cu^{2+} to Cu^+

224. Which of the following substances acts as an oxidizing as well as a reducing agent?

(a) Na_2O (b) $SnCl_2$
(c) Na_2O_2 (d) $NaNO_2$

UPTU/UPSEE-2004

Ans. (d) : $NaNO_2$ (sodium nitrite) act both as oxidising as well as reducing agent because nitrogen is in +3 oxidation state.

Oxidising:

$$2Na\overset{+3}{N}O_2 + 2KI + 2H_2SO_4 \rightarrow 2\overset{+2}{N}O + I_2 + Na_2SO_4 + K_2SO_4 + 2H_2O$$

Reducing:

$$H_2O_2 + Na\overset{+3}{N}O_2 \rightarrow Na\overset{+5}{N}O_3 + H_2O$$

225. Of the following reaction, only one is a redox reaction. Identify this reaction.

(a) $Ca(OH)_2 + 2HCl \rightarrow CaCl_2 + 2H_2O$
(b) $2S_2O_7^{2-} + 2H_2O \rightarrow 2SO_4^{2-} + 4H^+$
(c) $BaCl_2 + MgSO_4 \rightarrow BaSO_4 + MgCl_2$
(d) $Cu_2S + 2FeO \rightarrow 2Cu + 2Fe + SO_2$

J & K CET-(2003)

Ans. (d) : In redox reaction oxidation & reduction take place side by side.

$$Cu_2S + 2FeO \longrightarrow 2Cu + 2Fe + SO_2$$

oxidation state of Cu changes from +1 to 0 is reduction
oxidation state of S changes from –2 to +4 is oxidation,

226. In reaction,

$$MnO_4^- + H^+ + C_2O_4^{2-} \longrightarrow Mn^{2+} + H_2O + CO_2$$

What is happening?

(a) Reduction of Mn
(b) Reduction of $C_2O_4^{2-}$
(c) Oxidation of Mn
(d) None of these

JCECE - 2003

Ans. (a) :

$$MnO_4^- + H^+ + C_2O_4^{2-} \longrightarrow Mn^{2+} + H_2O + CO_2$$

Reduction: $MnO_4^- \longrightarrow Mn^{2+}$

Oxidation: $C_2O_4^{2-} \longrightarrow CO_2$

In this reaction, the reduction of MnO_4^- is take place. Hence, the correct option is (a).

227. The oxidation state of halogen atom is '+4' in

(a) Cl_2O_3 (b) ClO_2
(c) Cl_2O_6 (d) I_2O_5

AMU–2003

Ans. (b) : The oxidation of halogen atom in the following reaction–

(a) Cl_2O_3
$2x + 3(-2) = 0$
$2x - 6 = 0$
$x = +3$

(b) ClO_2
$x + 2(-2) = 0$
$x - 4 = 0$
$x = +4$

(c) Cl_2O_6
$2x + 6(-2) = 0$
$2x = 12$
$x = +6$

Therefore, ClO_2 Oxidation no. of + 4.

228. The reaction,

$$\mathbf{Ag^{2+}(aq) + Ag(s) \rightleftharpoons 2Ag^+(aq)}$$

is an example of :

(a) reduction (b) oxidation
(c) comproportionation (d) disproportionation

BCECE-2003

Ans. (c) : A reaction in which an element in a higher oxidation state reacts with the same element in a lower oxidation state to give the element in an intermediate oxidation state.

$$Ag^{2+}(aq) + Ag(s) \rightarrow 2Ag^+(aq)$$

229. Which of the following is a redox reaction?

(a) $NaCl + KNO_3 \rightarrow NaNO_3 + KCl$
(b) $CaC_2O_4 + 2HCl \rightarrow CaCl_2 + H_2C_2O_4$
(c) $Ca(OH)_2 + 2NH_4Cl \rightarrow CaCl_2 + 2NH_3 + 2H_2O$
(d) $2K[Ag(CN)_2] + Zn \rightarrow 2Ag + K_2[Zn(CN)_4]$

[AIEEE 2002]

Ans. (d) : In this reaction oxidation and reaction take place this reaction is know has redox reaction.

Reduction

$$\overset{0}{Zn} + 2K[\overset{+1}{Ag}(CN)_2] \rightarrow 2\overset{0}{Ag} + K_2[\overset{+2}{Zn}(CH)_2]$$

Oxidation

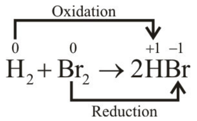
230. Both oxidation and reduction takes place in:

(a) $NaBr + HCl \rightarrow NaCl + HBr$
(b) $HBr + AgNO_3 \rightarrow AgBr + HNO_3$
(c) $H_2 + Br_2 \rightarrow 2HBr$
(d) $CaO + H_2SO_4 \rightarrow CaSO_4 + H_2O$

(AIIMS-2001)

@apna_pdf

Ans. (c)



$$\overset{0}{H_2} + \overset{0}{Br_2} \rightarrow 2\overset{+1}{H}\overset{-1}{Br}$$

In this reaction both oxidation and reduction take place.

231. In the following chemical reaction:

$$Ag_2O + H_2O + 2e^- \rightarrow 2Ag + 2OH^-$$

(a) hydrogen is reduced
(b) electrons are reduced
(c) water is oxidised
(d) silver is oxidised

(AIIMS-2000)

Ans. (c): $Ag_2O+H_2O + 2e^- \rightarrow 2Ag + 2OH^-$
So, Oxidation state of Ag in Ag_2O is +1 and after the reaction Ag has 0.5 to be 0.
So, Silver is reduced and water is being oxidized because it is accepting oxygen.

232. Which of the following is the strongest oxidizing agent?

(a) F_2 (b) Br_2
(c) Cl_2 (d) O_2

AP EAMCET- 2000

Ans. (a) : Fluorine (F_2) has the strongest oxidizing agent due to highest tendency to form F^- ion. Fluorine is the most electronegative element in the periodic table.

233. Without losing its concentrations $ZnCl_2$ solution cannot be kept in contact with

(a) Pb (b) Al
(c) Au (d) Ag

NEET-1998

Ans. (b) : $ZnCl_2$ solution cannot be kept in contact with Al without losing its concentration because Al is more reactive than Zn due to its highly negative electrode reduction potential. So aluminum displaces zinc from $ZnCl_2$. So, it can't keep in contact with Al.

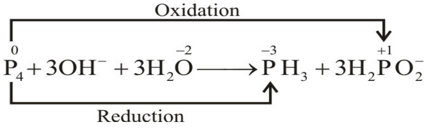
234. When phosphorus is heated with aqueous alkali, the main products are phosphine and a hypophosphite.

P_4 + $3OH$ + $3H_2O \rightarrow PH_3$ + $3H_2PO_2^-$. The reaction is an example of

(a) oxidation (b) reduction
(c) disproportionation reaction (d) hydrolysis

J & K CET-(1998)

Ans. (c) : Given the reaction,



$$\overset{0}{P_4} + 3OH^- + 3H_2\overset{-2}{O} \longrightarrow \overset{-3}{P}H_3 + 3H_2\overset{+1}{P}O_2^-$$

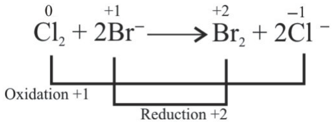
So, this solution is disproportionation reaction.

235. Which of the following reactions is a redox reaction?

(a) $CaCO_3+2HCl \rightarrow CaCl_2+H_2O+CO_2$
(b) $AgNO_3+KI \rightarrow AgI+KNO_3$
(c) $Cl_2+2Br^- \rightarrow Br_2+2Cl^-$
(d) $BaCl_2 + SO_4^{2-} \rightarrow BaSO_4 + 2Cl^-$

J & K CET-(1997)

Ans. (c) : In this reaction, chlorine reduced and bromine is oxidised then this type of reaction is called redox reaction.



$$\overset{0}{Cl_2} + 2\overset{+1}{Br^-} \longrightarrow \overset{+2}{Br_2} + 2\overset{-1}{Cl^-}$$

236. Standard electrode potential data are useful for understanding the suitability of an oxidant in a redox titrations. Some half-cell reactions and their standard potentials are given below:

$$MnO_4^-(aq) + 8H^+(aq) + 5e^- \rightarrow Mn^{2+}(aq) + 4H_2O(l), E^o = 1.51V$$

$$Cr_2O_7^{2-}(aq) + 14H^+(aq) + 6e^- \rightarrow 2Cr^{3+}(aq) + 7H_2O(l), E^o = 1.38V$$

$$Fe^{3+}(aq) + e^- \rightarrow Fe^{2+}(aq), E^o = 0.77\ V$$

$$Cl_2(g) + 2e^- \rightarrow 2Cl^-(aq), E^o = 1.40\ V$$

Identify the only incorrect statement regarding the quantitative estimation of aqueous $Fe(NO_3)_2$.

(a) MnO_4^- can be used in aqueous HCl
(b) $Cr_2O_7^{2-}$ can be used in aqueous HCl
(c) MnO_4^- can be used in aqueous H_2SO_4
(d) $Cr_2O_7^{2-}$ can be used in aqueous H_2SO_4

J & K CET-(1997)

Ans. (a) : MnO_4^- can be used in aqueous HCl. MnO_4^- will oxidize Cl^- into Cl_2. According to the following equation–

$$2MnO_4^- + 16H^+ + 10Cl^- \longrightarrow 2Mn^{2+} + 8H_2O + 5Cl_2$$

The corresponding cell is $PtCl_2$ (1 atm) $|Cl^-|$ MnO_4^-, Mn^{2+}, H^+ (Pt).

$$E^0_{cell} = +1.51 - 1.40 = +0.11V$$

A positive value confirms that the above process is spontaneous. Thus, MnO_4^- will oxidize Cl^- as well as $Fe(NO_3)_2$.

237. Which of the following is reduced by hydrogen peroxide in acid medium?

(a) Potassium permanganate
(b) Potassium iodide
(c) $FeSO_4$
(d) Potassium ferrocyanide

AP – EAMCET - (Medical)-1997

Ans. (a) : Hydrogen peroxide reduced potassium permanganate in acidic medium as:

$$\underset{\substack{\text{Potassium}\\\text{Permanganate}\\\text{ion}}}{2MnO_4^-} + 6H^+ + \underset{\substack{\text{Hydrogen}\\\text{peroxide}}}{5H_2O_2} \longrightarrow 2Mn^{2+} + 8H_2O + 5O_2$$

238. Cu^{2+} salt reacts with potassium iodide to give

(a) Cu_2I_2 (b) Cu_2I_2
(c) CuI (d) $Cu(I_3)_2$

JEE Main, 03.07.2021

Ans. (a) : Cu^{2+} salt reacts with potassium to give Cu_2I_2
For reaction.
$2Cu^{+2} + 4KI \rightarrow Cu_2I_2 + I_2 + 4K^+$

@apna_pdf

239. The species given below that does not show disproportionation reaction is

(a) BrO_4^- (b) BrO^-

(c) BrO_2^- (d) BrO_3^-

COMEDK- 2014

Ans. (a) : The species whose oxidation state maximum can't oxidise further.

In BrO_4^-, Br is the highest oxidation state of +7, so it can't oxidise further.

So, it can't show disproportionation reaction.

3. Method for Balancing Redox Reaction

240. Which one of the following reactions indicated the reducing ability of hydrogen peroxide in basic medium?

(a) $HOCl + H_2O_2 \rightarrow H_3O^+ + Cl^- + O_2$

(b) $PbS + 4H_2O_2 \rightarrow PbSO_4 + 4H_2O$

(c) $2MnO_4^- + 3H_2O_2 \rightarrow 2MnO_2 + 3O_2 + 2H_2O + 2OH^-$

(d) $Mn^{2+} + H_2O_2 \rightarrow Mn^{4+} + 2OH^-$

JEE Main-29.06.2022, Shift-I

Ans. (c) : $KMnO_4$ reduced to MnO_2 in the presence of H_2O_2 in basic medium

$\therefore\ 2MnO_4^- + 3H_2O_2 \rightarrow 2MnO_2 + 3O_2 + 2H_2O + 2OH^-$

is correct answer.

241. $aK_2Cr_2O_7 + bKCl + cH_2SO_4 \rightarrow xCrO_2Cl_2 + yKHSO_4 + zH_2O$. The above equation balances when:

(a) a=2, b=4, c=6 and x=2, y=6, z=3

(b) a=4, b=2, c=6 and x=6, y=2, z=3

(c) a=6, b=4, c=2 and x=6, y=3, z=2

(d) a=1, b=4, c=6 and x=2, y=6, z=3

(e) a=1, b=6, c=4 and x=6, y=2, z=3

Kerala-CEE-2004
BITSAT-2019

Ans. (d) : In $K_2Cr_2O_7$ act as a oxidising agent.

So, balanced eq^n is

$K_2Cr_2O_7 + 4KCl + 6H_2SO_4 + 3H_2O$

So, a = 1 , b = 4 , c = 6, x = 2

y = 6 , z = 3

242. In the balanced chemical reaction,

$IO_3^- + aI^- + bH^+ \rightarrow cH_2O + dI_2$

a, b, c and d respectively corresponds to :

(a) 5, 6, 3, 3 (b) 5, 3, 6, 3

(c) 3, 5, 3, 6 (d) 5, 6, 5, 5

Assam CEE-2014
(AIIMS-2005)

Ans. (a): $IO_3^- + aI^- + bH^+ \rightarrow cH_2O + dI_2$

The balanced equation is :

$IO_3^- + 5I^- + 6H^+ \rightarrow 3H_2O + 3I_2$

Hence, a = 5, b = 6, c = 3, d = 3

243. For the redox reaction

$MnO_4^- + C_2O_4^{2-} + H^+ \rightarrow Mn^{2+} + CO_2 + H_2O.$

the correct coefficients of the reactants for the balanced reaction are respectively MnO_4^-, $C_2O_4^{2-}$ and H^+ ___

(a) 2, 5, 16 (b) 16, 3, 12

(c) 15, 16, 12 (d) 2, 16, 5

AP EAPCET 19-08-2021, Shift-II
AIEEE-2013

Ans. (a) : $MnO_4^- + C_2O_4^{2-} + H^+ \rightarrow Mn^{2+} + CO_2 + H_2O$

Now, the chemical reaction atoms other than H and O, coefficient 2 is added in front of CO_2. C is oxidised. It's oxidation number increases from +3 to +4. The net increase in the oxidation no. is +2, Mn is reduced. The oxidation no. decreases from +7 to +2. The net decrease in the oxidation no. is +5. Hence, coefficient of C is multiplied with 5 and the coefficient of Mn is multiplied with 2 balance oxygen atoms, 7 water molecules are added to right. To balance H atoms. 15 protons are added to left. Hence balanced reaction is -

$2MnO_4^- + 5C_2O_4^{2-} + 16H^+ \rightarrow 10CO_2 + 8H_2O + 2Mn^{2+}$

244. Balance the following redox-reaction:

$aI_2 + bNO + 4H_2O = cHNO_3 + dHI$

Hence, find the values of a, b, c and d.

(a) 3,2,2,6 (b) 6,2,3,2

(c) 2,6,3,2 (d) 3,6,2,2

Tripura JEE-2022

Ans. (a) : Balancing the equation of redox reaction–

$3I_2 + 2NO + 4H_2O \rightarrow 2HNO_3 + 6HI$

245. Which of the following equation depicts the oxidising nature of H_2O_2?

(a) $KIO_4 + H_2O_2 \rightarrow KIO_3 + H_2O + O_2$

(b) $I_2 + H_2O_2 + 2OH^- \rightarrow 2I^- + 2H_2O + O_2$

(c) $2I^- + H_2O_2 + 2H^+ \rightarrow I_2 + 2H_2O$

(d) $Cl_2 + H_2O_2 \rightarrow 2HCl + O_2$

[JEE Main 2021, 25 Feb Shift-I]

Ans. (c) : Oxidizing nature of H_2O_2 means it oxidizes other substances and itself gets reduced. In such reactions O_2 is not evolved

In A > reduced
B > reduced
C > Oxidised

I^- gets oxidised to I_2

246. The reaction of sulphur in alkaline medium is given below

$S_8(s) + aOH^-(aq) \rightarrow bS^{2-}(aq) + cS_2O_3^{2-}(aq) + dH_2O(l)$

The value of 'a' is .... (Integer answer)

[JEE Main 2021, 24 Feb Shift-I]

Ans. (12) :

$16e^- + S_8 \rightarrow 8S^{2-}$

$12\ H_2O + S_8 \rightarrow 4S_2O_3^{2-} + 24H^+$

For balancing in basic medium add an equal no of OH^- that of H^+

$2S_8 + 12H_2O + \rightarrow 8s^{2-}O_8^{2-} + 12H_2O$

@apna_pdf

$2S_8 + 24OH^- \rightarrow 8s^- + 4s^-\ 4O_8^{2-} + 12H_2O$

$S_8 + 12OH^- \rightarrow 4s^{2-} + 4s^{2-}2O_8^{2-} + 6H_2O$

So, $a = 12$

247. In the balanced equation of the following reaction, the ratio of a/b is a

$aCaCO_3 + bH_3PO_4 \rightarrow pCa_3(PO_4)_2 + qCO_2 + rH_2O$

(a) 2/3 (b) 3/2

(c) 1/2 (d) 7/5

TS EAMCET 04.08.2021, Shift-I

Ans. (b) : $3CaCO_3+2H_3PO_4\rightarrow1Ca_3(PO_4)_2+3CO_2+3H_2O$

In the balance equation the values are–

$a = 3, b = 2, p = 1, q = 3$ and $r = 3$

Hence, the ratio of a/b is 3/2.

248. The x and y in the following equations, respectively, are

i) $2K_3\left[Fe(CN)_6\right]+2KOH+x\rightarrow2K_4\left[Fe(CN)_6\right]+2H_2O+O_2$

ii) $C_6H_6+H_2O_2\xrightarrow{y}C_6H_5OH+H_2O$

(a) $FeSO_4$, H_2O_2 (b) H_2O_2, $FeSO_4$

(c) H_2O_2, Zn dust (d) H_2O_2, $H^{\oplus}/H_2O$

TS EAMCET 10.08.2021, Shift-II

Ans. (b) :

$$2K_3[\overset{+3}{Fe}(CN)_6]+2KOH+H_2\overset{-1}{O_2}\rightarrow2K_4[\overset{+2}{Fe}(CN)_6]+2H_2O+\overset{0}{O_2}$$

$$C_6H_6+H_2O_2\xrightarrow{FeSO_4}C_6H_5OH+H_2O$$

249. Balance the following equation

$xMnO_4 + yC_2O_4 + zH^+ \rightarrow pMn^{2+} + qCO_2 + rH_2O$

the correct values of x, y and z are

	x	y	z
(a)	5	16	2
(b)	2	5	16
(c)	5	5	16
(d)	2	2	5

TS EAMCET 10.08.2021, Shift-I

Ans. (b) : The balanced chemical equation is

$2MnO_4 + 5C_2O_4^{-2} + 16H^+ \rightarrow 2Mn^{+2} + 10CO_2 + 8H_2O$

Hence, the value of $x = 2$, $y = 5$ and $z = 16$.

250. $2MnO_4^- + bC_2O_4^{2-} + cH^+ \rightarrow xMn^{2+} + yCO_2 + zH_2O$

If the above equation is balanced with integer coefficients, the value of c is ______ (Round off to the Nearest Integer).

JEE Main 16.03.2021, Shift-I

Ans. (16) : The given equation is :

$2MnO_4^- + bC_2O_4^{2-} + cH^+ \rightarrow xMn^{2+} + yCO_2 + zH_2O$

Writing the half reaction—

$MnO_4^- \rightarrow Mn^{2+}$

Balancing oxygen, $MnO_4^- \rightarrow Mn^{2+} + 4H_2O$

Balancing hydrogen, $8H^+ + MnO_4^- \rightarrow Mn^{2+} + 4H_2O$

Balancing charge–

$5e^- + 8H^+ + MnO_4^- \rightarrow Mn^{2+} + 4H_2O$

Reduction half reaction –

$C_2O_4^{2-} \rightarrow CO_2$

Balancing carbon, $C_2O_4^{2-} \rightarrow 2CO_2$

Balancing charge, $C_2O_4^{2-} \rightarrow 2CO_2 + 2e^-$

Net equation–

$16H^+ + 2MnO_4^- + 5C_2O_4^{2-} \rightarrow 10CO_2 + 2Mn^{2+} + 8H_2O$

$\therefore$ The value of c = 16.

251. BrO_3^- changes into Br_2 in an acidic medium of a unbalanced equation. How many electron should be present on the balanced equation?

(a) 10 electron in left (b) 6 electron in left

(c) 3 electron in left (d) 3 electron in right

JIPMER-2019

Ans. (a) : Solution is by balancing

$12H^+ + 10e^- + 2BrO_3^- \rightarrow Br_2 + 6H_2O$

There are $10e^-$ present on balanced the equation.

252. For the redox reaction

$xMnO_4^- + yH_2C_2O_4 + zH^+ \rightarrow mMn^{2+} + nCO_2 + pH_2O$

The values of x, y, m and n are

(a) 10, 2, 5, 2 (b) 2, 5, 2, 10

(c) 6, 4, 2, 5 (d) 3, 5, 2, 10

Karnataka-CET-2018

Ans.(b):

$2MnO_4^- + 5H_2C_2O_4 + 6H^+ \longrightarrow 2Mn^{2+} + 10CO_2 + 8H_2O$

So, the value of x = 2, y = 5, m = 2, n = 10

253. In the redox reaction

The correct coefficients of $C_2O_4^{2-}$ and H^+ ions in the balanced equation are

(a) 5 and 15 (b) 5 and 16

(c) 2 and 16 (d) 2 and 15

BCECE-2017

Ans. (b) : Overall the balance chemical reaction is–

$2MnO_4^- + 5C_2O_4^{2-} + 16H^+ \rightarrow 10CO_2 + 8H_2O + 2Mn^{2+}$

Hence, the overall chemical reaction it is clear that–

$MnO_4^{2-} = 2$, $C_2O_4^{2-} = 5$, $H^+ = 16$

Thus, coefficient of $MnO_4^{-2}, C_2O_4^{-2}$ and H^+ are 2, 5 and 16 respectively.

254. Consider the following reaction occurring in basic medium

$2MnO_4^-(aq) + Br^-(aq) \longrightarrow 2MnO_2(s) + BrO_3^-(aq)$

How the above reaction can be balanced further?

(a) By adding 2 OH^- ions on right side

(b) By adding one H_2O molecule to left side

(c) By adding $2H^+$ ions on right side

(d) Both (a) and (b)

(AIIMS-2017)

@apna_pdf

Ans. (d):
$2MnO_4^-(aq) + Br^-(aq) + H_2O \rightarrow 2MnO_2(s) + BrO_3^-(aq) + 2OH^-$
So, adding $2OH^-$ ions on right side and adding one H_2O molecule to left side.
So, both (a) and (b) follow.

255. Pick out the wrong reaction.
(a) $2Na_2CrO_4 + 4H^+ \rightarrow Na_2Cr_2O_7 + 2Na^+ + H_2O$
(b) $4MnO_2 + 4KOH + O_2 \rightarrow 4KMnO_4 + 2H_2O$
(c) $MnO_4^- + 8H^+ + 5Fe^{2+} \rightarrow 5Fe^{3+} + Mn^{2+} + 4H_2O$
(d) $2MnO_4^- + 5C_2O_4^{2-} + 16H^+ \rightarrow 2Mn^{2+} + 10CO_2 + 8H_2O.$

COMEDK 2017

Ans. (b) : Manganese dioxide, potassium hydroxide and oxygen react in the following-
$2MnO_2 + 4KOH + O_2 \rightarrow 2K_2MnO_4 + 2H_2O$
Manganese dioxide is oxidized to potassium manganate and not to potassium permanganate.

256. The value of n in
$MnO_4^- + 8H^+ + ne^- \rightarrow Mn^{2+} + 4H_2O$ is
(a) 5 (b) 4
(c) 2 (d) 3

JIPMER-2016

Ans. (a) : $MnO_4^- + 8H^+ + ne^- \longrightarrow Mn^{2+} + 4H_2O$
$-1 + 8 - n = +2$
$n = +5$

257. Consider the following reaction
$6FeSO_4 + K_2Cr_2O_7 + 7H_2SO_4 \rightarrow$
$3Fe(SO_4) + Cr_2(SO_4)_3 + K_2SO_4 + 7H_2O$
How many electrons are involved in the above redox reaction?
(a) 9 (b) 6
(c) 3 (d) 2

SCRA-2015

Ans. (b): $6FeSO_4 + K_2Cr_2O_7 + 7H_2SO_4 \rightarrow 3Fe_2(SO_4)_3 + Cr_2(SO_4)_3 + K_2SO_4 + 7H_2O$
In the above reaction six electrons are involved in the redox reaction.

258. In neutral or faintly alkaline medium, thiosulphate is quantitatively oxidized by $KMnO_4$ to
(a) SO_3^{2-} (b) SO_4^{2-}
(c) SO_2 (d) SO_5^{2-}
(e) $S_2O_8^{2-}$

Kerala-CEE-2013

Ans. (b) : The reaction between thiosulphate ion and $KMnO_4$ in neutral medium is given as
$8MnO_4^- + 3S_2O_3^{2-} + H_2 \longrightarrow 8MnO_2 + 6SO_4^{2-} + 2OH^-$

259. For the reaction,
$NH_3 + OCl^- \longrightarrow N_2H_4 + Cl^-$
occurring in basic medium, the coefficient of N_2H_4 in the balanced equation will be
(a) 1 (b) 2
(c) 3 (d) 4

JIPMER-2012

Ans. (a) : $NH_3 + OCl^- \rightarrow N_2H_4 + Cl^-$
For ammonia.
$2NH_3 \rightarrow N_2H_4 + 2H^+ + 2e^-$
since, it is in basic media for OCl^-
$OCl^- + 2H^+ + 2e^- \rightarrow Cl^- + H_2O$
adding both eq^n we get,
$2NH_3 + OCl^- \rightarrow N_2H_4 + Cl^- + H_2O$
So, coefficient of N_2H_4 is 1.

260. The reduction potential of three metallic ions X, Y and Z correspondingly are +0.52,-3.03 and -1.18 V. The sequence of reducing capacity of these metals will be
(a) $Y > Z > X$ (b) $X > Y > Z$
(c) $X > Z > Y$ (d) $Z > X > Y$

CG PET -2008

Ans. (a) : The reducing potential in greater then metal is fast reduced
So, reduction potential = (–O.P)
So, $-3.03 > -1.18V > 0.52V$
So, $Y > Z > X$

261. E°= –0.44 V for the reaction,
$Fe^{2+} + 2e^- \rightarrow Fe$ and $E^o = -0.76 V$
for the reaction, $Zn^{2+} + 2e^- \rightarrow Zn$. **Which of the following statement is correct?**
(a) Fe is more electropositive
(b) Zn is more electropositive
(c) Zn is more electronegative
(d) None of the above

CG PET -2008

Ans. (b) : Zn is more electropositive
$Zn^{2+} + 2e^- \rightarrow Zn(s)$
$$E = E^0 - \frac{RT}{nF}\ln Q$$
$$\ln Q = \frac{1}{[Zn^{2+}]}$$
or $$E = E^0 - \frac{RT}{nF}\ln\frac{1}{[Zn^{2+}]}$$

262. For the electrolysis of aqueous $CuSO_4$ solution using inert Pt electrodes, the reaction on anode is
(a) $2SO_4^{-2} \rightarrow S_2O_3^{2-} + 2\frac{1}{2}O_2 + 2e^-$
(b) $Cu^{2+} + 2e^- \rightarrow Cu$
(c) $2H_2O \rightarrow O_2 + 4H^+ + 4e^-$
(d) $2H^+ + 2e^- \rightarrow H_2$

CG PET -2008

@apna_pdf

Ans. (c) : Oxidation is defined as loss of electron. At anode oxidation takes place.

$$2H_2O \rightarrow O_2 + 4H^+ + 4e^-$$

263. For decolourisation of 1 mole of $KMnO_4$, the moles of H_2O_2 required is:

(a) 1/2 (b) 3/2
(c) 5/2 (d) 7/2

(AIIMS-2004)

Ans. (c): $KMnO_4+H_2O+H^+ \rightarrow K^++Mn^{2+}+H_2O+O_2$

Balancing a chemical reaction

$$K\overset{+7}{M}nO_4 + H_2\overset{-1}{O_2} \rightarrow \overset{2+}{M}n^{2+} + \overset{0}{O_2}$$

Reduction = $K\overset{+7}{M}nO_4 \rightarrow \overset{+2}{M}n^{2+}$

Oxidation= $H_2\overset{-1}{O_2} \rightarrow \overset{0}{O_2}$

Show that above oxidation change in reduction gain $5e^-$ 4 oxidation loss $2e^-$ then balance the total charge

Reduction:– $K\overset{+7}{M}nO_4 \rightarrow \overset{+2}{M}n^{2+} \times 2(\text{gain of } 10e^-)$

Oxidation:– $H_2\overset{-1}{O_2} \rightarrow \overset{0}{O_2} \times 5(\text{loss of } 10e^-)$

Balance K, atom zero in reduction by adding H_2O and then balance H by H^+

Reduction:– $2K\overset{+7}{M}nO_4 + 16H^+ \rightarrow 2\overset{+2}{M}n^{+2} + 2K^+ + 8H_2O$

Oxidation:– $5H_2\overset{-1}{O_2} \rightarrow 5\overset{0}{O_2} + 10H^+$

This overall balanced react

$$2K^+ + 8H_2O + 5\overset{0}{O_2} + 10H^+$$

Cancel H^+ from both sides.

$2KMnO_4+6H^+ + 5H_2O_2 \rightarrow 2Mn^{2+}+2K^++8H_2O+5O_2$

So 2 mole of $KMnO_4$ require 5 mol of H_2O_2 for decolourisation. Therefore decolourisation of 1 mole of acidified $KMnO_4$ the moles of H_2O_2 required are 5/2.

264. MnO_4^{2-} (1 mole) in neutral aqueous medium disproportionate of

(a) 2/3 mole of MnO_4^- and 1/3 mole of MnO_2
(b) 1/3 mole of MnO_4^- and 2/3 mole of MnO_2
(c) 1/3 mole of Mn_2O_7 and 1/3 mole of MnO_2
(d) 2/3 mole of Mn_2O_7 and 1/3 mole of MnO_2

(AIIMS-2003)

Ans. (a): MnO_4^- (one mole) in neutral aqueous medium disproportionate to 2/3 mole MnO_4^- and 1/3 mole of MnO_2.

$$3K_2MnO_4+2H_2O \rightarrow 2KMnO_4+MnO_2+4KOH$$

265. MnO_4^- is a good oxidising agent in different medium changing to

$MnO_4^- \rightarrow Mn^{+2} \rightarrow MnO_4^{2-} \rightarrow MnO_2 \rightarrow Mn_2O_3$

Changes is oxidation number respectively, are

(a) 1,3,4,5 (b) 5,4,3,2
(c) 5,1,3,4 (d) 2,6,4,3

[AIEEE 2002]

Ans. (c) : Changes in oxidation no.–

(i) $MnO_4^- \longrightarrow Mn^{2+}$

$x+4\times(-2)=-1 \quad x = 2$
$x = +7$

∵ Change in oxidation no. = (7 – 2) = 5

(ii) $MnO_4^- \longrightarrow MnO_4^{2-}$

$x+4\times(-2)=-1 \quad x+4\times(-2)=-2$
$x = +7 \quad x = +6$

∵ Change in oxidation no. = (7 – 6) = 1

(iii) $MnO_4^- \longrightarrow MnO_2$

$x+4\times(-2)=-1 \quad x+2\times(-2)=0$
$x = +7 \quad x = +4$

∵ Change in oxidation no. = (7 – 4) = 3

(iv) $MnO_4^- \longrightarrow Mn_2O_3$

$x+4\times(-2)=-1 \quad 2x+3\times(-2)=0$
$x = +7 \quad x = +3$

∵ Change in oxidation no. = (7 – 3) = 4

4. Oxidising and Reducing Agent

266. Which compound among the following can act an oxidizing and a reducing agent?

(a) H_2O_2 (b) SO_3
(c) H_2S (d) F_2

AP- EAPCET- 07-09-2021, Shift-I

Ans. (a) : Hydrogen peroxide (H_2O_2) both as oxidizing and reducing agent. H_2O_2 oxygen has -1 oxidation state lies between –2 to +2. Therefore oxygen can be oxidized to O_2 zero oxidation state acting as reducing agent or can be reduced to H_2O or OH^- is –2 oxidation state acting as an oxidizing agent.

267. The compound that cannot act both as oxidising and reducing agent is

(a) H_2SO_3 (b) H_3PO_4
(c) HNO_2 (d) H_2O_2

[JEE Main 2020, 9 Jan Shift-I]

Ans. (b) : The oxidation no. of P in H_3PO_4,

$3 (+1) + x + 4 (-2) = 0$
$3 + x - 8 = 0$
$x = +5$

P has its highest oxidation state +5 means cannot be further released electrons to act as a reducing agent therefore, act as an oxidizing.

@apna_pdf

268. Which one of the following statements is NOT correct for the given reaction ?

$Fe(s) + CuSO_4(aq) \rightarrow FeSO_4(aq) + Cu(s)$

(a) Iron is the reducing agent
(b) The solution turns green in colour after the reaction
(c) Copper is a more reactive metal than iron
(d) The reaction is an example of a redox reaction

NDA (I)-2019

Ans : (c) In the given reaction,

$Fe(s)+CuSO_4(aq)\rightarrow FeSO_4(aq)+Cu(s)$

Iron(Fe) displace copper (Cu) from its solution. Therefore, Copper is less reactive than iron.

269. Identify the weakest oxidising agent among the following.

(a) Li^+
(b) Na^+
(c) Cs^{2+}
(d) I_2

MHT CET-2017

Ans. (a) : Li^+ is the weakest oxidizing agent as it has most negative standard reduction potential. Lithium is small in size and high ionization enthalpy. Therefore lithium has a high tendency to lose electron in solution other an alkali metals. Hence, lithium is the weakest oxidizing agent.

270. In the reaction ZnO + C → Zn + CO, 'C' acts as:

(a) an acid
(b) a base
(c) an oxidising agent
(d) a reducing agent

NDA (I)-2015

Ans : (d) : In reaction ZnO + C → Zn + CO, 'C' (1) act as a reducing agent.

271. Which of the following is not a reducing agent?

(a) SO_2
(b) H_2O_2
(c) CO_2
(d) NO_2

JCECE - 2014

Ans. (c) : In CO_2, the oxidation number of C, i.e., +4 is already the maximum and it cannot increase its oxidation number. Hence, does not act as a reducing agent.

272. Which one of the following gases has both oxidizing as well as reducing property?

(a) CO
(b) SO_2
(c) H_2S
(d) PH_3

CG PET- 2011

Ans. (b) : The oxidation no. of sulphur lies from –2 to +6. In SO_2 the oxidation state of sulphur is +4.

Thus oxidation no. may increase or decrease. So it can behave as both oxidising agent as well as reducing agent.

273. Which of the following is reducing agent?

(a) $LiAlH_4$
(b) Zn + HCl
(c) Sn + HCl
(d) All of the above

CG PET -2007

Ans. (d) : A substance which loses electrons to other substance in a redox reaction and gets oxidized to the higher valency state is called reducing agent.

(a) $LiAlH_4$ is reducing agent H^- easily thought.
(b) Zn + HCl is reducing agent reduce HCl.
(c) Sn + HCl is reducing agent reduce HCl.

274. Which of the following is the strongest oxidising agent?

(a) HOCl
(b) $HClO_2$
(c) $HClO_3$
(d) $HClO_4$

J & K CET-(2004)

Ans. (d) : Perchloric acid ($HClO_4$) is the strongest acid among these acidic character of oxoacid increases with increasing the oxidation no. of a particular halogen atom.

$$HO\overset{+1}{Cl} < H\overset{+2}{Cl}O_2 < H\overset{+5}{Cl}O_3 < H\overset{+7}{Cl}O_4$$

275. In organic reactions, sodium in liquid ammonia is used as

(a) Reducing agent
(b) Hydrating agent
(c) Oxidizing agent
(d) Precipitating agent

AP EAMCET- 2001

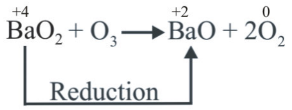
Ans. (a) : In organic reaction sodium in liquid ammonia is used as reducing agent. Sodium is a strong electropositive element.

276. In which of the following reactions ozone acts as a reducing agent?

(a) $BaO_2+O_3 \rightarrow BaO+2O_2$
(b) $2HCl+O_3 \rightarrow Cl_2+H_2O+O_2$
(c) $PbS+4O_3 \rightarrow PbSO_4+4O_2$
(d) $2KI+O_3+H_2O \rightarrow 2KOH+I_2+O_2$

AP EAMCET- 1999

Ans. (a) :



Hence, BaO_2 is reduced into BaO by O_3. O_3 act as reducing agent.

277. In the following two reactions :

(1) $2H_2O_2 \rightarrow 2H_2O+O_2$

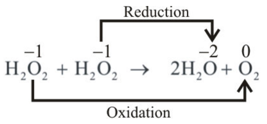
(2) $H_2O_2+2I^-+2H^+ \rightarrow I_2+2H_2O$

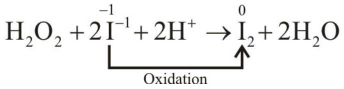
H_2O_2 acts as

(a) An oxidizing agent
(b) A reducing agent
(c) Both oxidizing agent and reducing agent respectively
(d) Both reducing agent and oxidizing agent respectively

AP EAMCET- 1995

Ans. (a) :





@apna_pdf

10.

Hydrogen

1. Heavy water

1. **Heavy water is**
   (a) $CaSO_4$
   (b) Water contain $CaSO_4$, $MgSO_4$
   (c) D_2O
   (d) Water contain $CaCO_3$

UPTU/UPSEE-2008, 2006
JIPMER-2008, JCECE – 2007
UPCPMT-2007

Ans. (c) :
- Heavy water is a compound that is made up of oxygen and deuterium, a heavier isotope of hydrogen which is denoted by D.
- Heavy water is also called deuterium oxide and denoted by the chemical formula D_2O.
- "Heavy water" deuterium oxide (D_2O) is sometimes used in nuclear reactors to slow down the speed of neutrons associated with the fission process.

2. **Some statements about heavy water are given below.**
   (i) Heavy water is used as moderator in nuclear reactors
   (ii) Heavy water is more associated than ordinary water
   (iii) Heavy water is more effective solvent than ordinary water
   Which of the above statements are correct?
   (a) (i) and (ii) (b) (i), (ii) and (iii)
   (c) (ii) and (iii) (d) (i) and (iii)

JEE Main-2021, 26 Feb Shift-I
VITEEE- 2012 , NEET-2010

Ans. (a) : In nuclear reactors heavy water is used as a moderator. It has higher boiling point as compared to ordinary water. Thus, it is more associated as compared to ordinary water. The dielectric constant is however higher for H_2O. Thus, H_2O is a more effective solvent as compare to heavy water (D_2O).

3. **Statements about heavy water are given below.**
   A. Heavy water is used in exchange reactions for the study of reaction mechanisms.
   B. Heavy water is prepared by exhaustive electrolysis of water.
   C. Heavy water has higher boiling point than ordinary water.
   D. Viscosity of H_2O is greater than D_2O.
   Choose the most appropriate answer from the options given below:
   (a) A and B only (b) A and C only
   (c) A and D only (d) A, B and C only

JEE Main 26.02.2021, Shift-I
[JEE Main-2021, 26 Aug Shift-II]

Ans. (d) : Heavy water is used in exchange reactions for study of reaction mechanisms.
Heavy water is prepared by exhaustive electrolysis of water.

B.P. of D_2O = 374.4 K
B.P. of H_2O = 373 K
Viscosity of H_2O = 0.89 centipoise
Viscosity of D_2O = 1.107 centipoise

4. **The incorrect statements (s) about heavy water is (are)**
   (a) used as a moderator in nuclear reactor.
   (b) Obtained as a by-product in fertilizer industry.
   (c) Used for the study of reaction mechanism.
   (d) Has a higher dielectric constant than water.
   Choose the correct answer from the options given below:
   (a) (B) only (b) (C) only
   (c) (D) only (d) (C) and (D) only

[JEE Main-2021, 17 March Shift-I]

Ans. (c) Heavy water:-
- Used as a moderator in nuclear reactor.
- Obtained as a by-product in fertilizer industry
- Used for the study of reaction mechanism.

The dielectric constant of H_2O is greater than heavy water
Heavy water is used as a moderater in nuclear reactor and is more associated than ordinary water.

5. **Observe the following statements**
   1. Heavy water is harmful for the growth of animals.
   2. Heavy water reacts with Al_4C_3 and forms deuterated acetylene.
   3. $BaCl_2 . 2D_2O$ is an example of interstitial deuterate.
   The correct statements are
   (a) 1 and 3 (b) 1 and 2
   (c) 1, 2 and 3 (d) 2 and 3

AP-EAMCET (Engg.) 2013

Ans. (a) : Heavy water is injurious to human beings, plants and animals since it slows down the rate of reactions occurring in them. Heavy water reacts with Al_4C_3 and forms deutero methane.

$$Al_4C_3 + 12D_2O \longrightarrow 4Al(OD)_3 + \underset{\text{deuteromethane}}{3CD_4}$$

$BaCl_2 \cdot 2D_2O$ is an example of interstitial deuterate

6. **With hard water, ordinary soap forms curdy precipitate of**
   (a) $(RCOO)_2Ca$ (b) $(RCOO)_2Mg$
   (c) Both (a) and (b) (d) None of these

BCECE-2013

@apna_pdf

Ans. (c) : Hardness in water is due to dissolved sulphate, chlorides and bicarbonates of calcium and magnesium, when such type of water is used for cleaning clothes with soap (i.e, sodium stearate) a curdy precipitate of calcium and magnesium salts are formed.

Therefore, hard water and soap produce a curdy precipitate called soap scum.

7. The reagent commonly used to determine hardness of water titrimetrically is

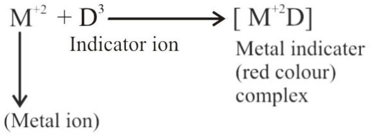
(a) oxalic acid
(b) disodium salt of EDTA
(c) sodium citrate
(d) sodium thiosulphate

JCECE - 2012

Ans. (b) : The hardness of water is estimated by simple titration of Ethylenediamine tetraacetate (EDTA) solution. EDTA forms stable complexes with metal ions present in hard water.

Estimate of disodium salt of EDTA used to Ca^{+2} and mg^{+2}

(i)



$$M^{+2} + D^{3} \longrightarrow [M^{+2}D]$$

(ii) $$[M^{+2}D]^{-1} + EDTA^{-4} \rightleftharpoons [M^{+2}EDTA]^{-2} + D^{-3}$$

Red Blue colour.

8. Heavy water is not used for drinking because

(a) It is costly
(b) Its chemical properties are different from ordinary water
(c) Its physiological action is different from ordinary water
(d) Its physical properties are different

SCRA-2010

Ans. (c) : As molecular mass of heavy water is higher than water so its physiological action is different from ordinary water. So, it can't be used as drinking water.

- Density : 1.11 g cm^3
- Melting point: 3.8 °C
- Boiling point: 101.4 °C
- Molar mass: 20.276 g/m
- D_2O is more toxic to normal animal cells as it starts to gum up all matter of body parts if consumed in a large quantity.

9. Assertion: We feel cold on touching the ice.
Reason: Ice is a solid form of water.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and reason are incorrect.

(AIIMS-2009)

Ans. (b): We feel cold when we touch on object or matter like ice at a lower temperature then our body temperature. This is because the heat from our body being higher in amount moves to the ice through our skin (by thermal conduction) in order to attain thermal equilibrium between the ice and the body.

10. Assertion (A) : NaCl is less soluble in heavy water than in ordinary water.
Reason (R) : Dielectric constant of ordinary water is more than that of heavy water.
The correct answer is

(a) Both (A) and (R) are true and (R) is the correct explanation of (A)
(b) Both (A) and (R) are true and (R) is not the correct explanation of (A)
(c) (A) is true, (R) is not true
(d) (A) is not true, (R) is true

AP EAMCET- 2007

Ans. (a) : Due to the lower dielectric constant of heavy water (D_2O) over ordinary water (H_2O), NaCl is less soluble in D_2O than in ordinary water.

- The solubility of a substance mainly depends on the composition of solute and solvent (including their pH and the presence of dissolved substances) as well as on temperature and pressure.

Hence, both (A) and (R) are true and (R) is the correct explanation of (A).

11. The value of .... is less for D_2O compared to that of H_2O.

(a) Density (g. mL^{-1}) at 20°C
(b) Boiling point
(c) Dielectric constant at 20°C
(d) Latent heat of vaporisation ($J.g^{-1}$)

AP-EAMCET (Engg.)-2005

Ans. (c) : The dielectric constant is less for D_2O than H_2O due to the strong H-bonding in H_2O.

- Value of solubility ability are less for D_2O than H_2O due to strong H-bonding and self ionization power.
- Density of water is roughly 1 gram per milliliter whereas the density of heavy water is 1.107 gmL^{-1}.
- The value of boiling point is more for D_2O (101.4°C) compared to that of H_2O.
- The latent heat of vapourization of water is 2260 kJ/kg & heavy water is 2073.20 kJ/kg.

12. Water gas is essentially a mixture of

(a) $H_2O_{(g)}$ and CO_2 (b) H_2O and CO
(c) H_2 and CO (d) CO and CO_2

AMU 2002

Ans. (c) : Water gas is a mixture of CO and H_2. It is prepared by passing steam over red hot coke.

$$C + H_2O \longrightarrow \underset{\text{(Water gas)}}{CO + H_2}$$

13. The products formed when heavy water is reacted with magnesium nitride, are

(a) NH_3, $Mg(OH)_2$ (b) NH_3, $Mg(OD)_2$
(c) ND_3, $Mg(OH)_2$ (d) ND_3, $Mg(OD)_2$

AP EAMCET- 2002

@apna_pdf

Ans. (d) : When heavy water is reacted with magnesium nitride then the following products are formed–

$$\underset{\text{Magnesium nitride}}{Mg_3N_2} + \underset{\text{Heavy water}}{6D_2O} \rightarrow 3Mg(OD)_2 + 2ND_3$$

• The reaction between heavy water and magnesium nitride is a double decomposition reaction in which the anion of one reactant is exchanged with the anion of another reactant, and new products are formed.

14. At what temperature, the density of heavy water will be maximum?

(a) 0 °C (b) 11.6 °C

(c) 4 °C (d) 27 °C

AP EAMCET- 1999

Ans. (b) : The Density of heavy water is maximum at temperature 11.6 °C.

• The formula of heavy water is D_2O.

• Heavy water is about 11% heavier than ordinary water.

• The density of heavy water at 298K is 1.1059 g/mL.

• The density of water (H_2O) is maximum at 4 °C.

15. Which of the following statement concerning heavy water is correct?

(a) It is also known as dry ice.

(b) It is an isotope of water.

(c) It is used as moderator in nuclear reactors.

(d) It occurs in plenty in natural water.

Ans. (c) : Heavy water is used as moderator in nuclear reactors because it slows down neutrons effectively and also has a low probability of absorption of neutrons.

• Heavy water is used as a primary coolant to transport heat generated by the fission reaction to secondary coolant light water.

2. Hydrogen peroxide

16. The correct statements about H_2O_2 are

(A) Used in the treatment of effluents.

(B) Used as both oxidising and reducing agents.

(C) The two hydroxyl groups lie in the same plane.

(D) Miscible with water.

Choose the correct answer from the options given below.

(a) (A), (B), (C) and (D) (b) (A), (B) and (D)

(c) (B), (C) and (D) (d) (A) , (C) and (D)

[JEE Main-2021, 16 March Shift-II]

Ans. (b) : (a) H_2O_2 Used in the treatment of effluents as it is an oxidizing agent.

(b) In H_2O_2 oxidation of oxygen is –1. Therefore, it acts both as O.A. and R.A.

(c) H_2O_2 has an open book structure in which both –OH group are not in the same plane.

(d) H_2O_2 is miscible in water due to intermolecular H-bonding.

17. Given below are two statements: One is labelled as Assertion A and other is labelled as Reason R.

Assertion (A) The dihedral angles in H_2O_2 in gaseous phase is 90.2° and in solid phase is 111.5°.

Reason (R) The change in dihedral angle in solid and gaseous phase is due to the difference in the intermolecular forces.

Choose the most appropriate answer from the options given below for A and R.

(a) A is correct but R is not correct.

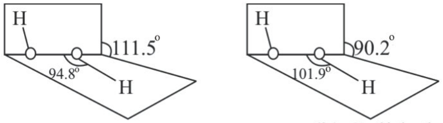
(b) Both A and R are correct but R is not the correct explanation of A.

(c) Both A and R are correct and R is the correct explanation of A.

(d) A is not correct but R is correct.

[JEE Main-2021, 20 July Shift-I]

Ans. (d) :



(a) Gas phase (b) Solid phase

(a) H_2O_2 structure in gas phase, dihedral angle is 111.5°.

(b) H_2O_2 structure in solid phase at 110K dihedral angle is 90.2°.

In H_2O_2 the change in dihedral angle in solid and gaseous phase is due to the difference in the inter molecular forces.

The change in dihedral angle in solid and gaseous phase is due to the difference in the inter molecular forces.

Hence A is not correct but R is correct.

18. When H_2O_2 reacts with chlorine the product obtained is :

(a) O_2 (b) H_2

(c) ClO_2 (d) HOCl

AP EAMCET (Medical) -1998

Ans. (a): When hydrogen peroxide (H_2O_2) reacts with chlorine, (Cl_2) the product obtained is oxygen(O_2).

$$H_2O_2+Cl_2 \rightarrow 2HCl+O_2$$

• In this reaction chlorine is reduced to HCl.

19. The moderator used in nuclear reactor is

(a) TEL (b) D_2O

(c) H_2O_2 (d) R–O–R

UP CPMT-2002

Ans. (b) : TEL[$(C_2H_5)_4$ Pb]- Tetraethyl lead used as antiknocking agent in fuel.

D_2O – It is used as a moderator in nuclear reactor.

H_2O_2- Used an antiseptic for skin to prevent infection in cut, or burns.

Ether(R-O-R)- As a solvent, for fat, oil, waxes and perfumes.

20. Consider the following compounds.

1. **Sulphur dioxide**
2. **Hydrogen peroxide**
3. **Ozone**

Among the compound identify those that can acts as bleaching agent.

@apna_pdf

(a) 1 and 3 (b) 2 and 3
(c) 1 and 2 (d) 1, 2 and 3

JCECE - 2005

Ans. (d) : All three compounds act as a bleaching agents. SO_2 through reduction process where as H_2O_2 and O_3 through oxidation process.

$SO_2 + 2H_2O \rightarrow 2H_2SO_4 + 2\,[H]$

Colour matter + [H] → colourless matter

$H_2O_2 \rightarrow H_2O + [O]$

[O] + colourd matter → colourless matter

$O_3 \rightarrow O_2 + [O]$

21. Hydrogen peroxide when added to a solution of potassium permanganate acidified with sulphuric acid:
(a) Forms water only
(b) Acts as an oxidizing agent
(c) Acts as a reducing agent
(d) Reduces sulphuric acid

JCECE - 2005

Ans. (c) :

$$2K\overset{+7}{Mn}O_4 + 3H_2SO_4 + 5H_2O_2 \rightarrow K_2SO_4 + 2\overset{+2}{Mn}SO_4 + 8H_2O + 5O_2$$

∴ H_2O_2 is acting as a reducing agent it reduce $KMnO_4$ to Mn^{+2} ion.

22. Which of the following statements is incorrect?
(a) H_2O_2 has weak acidic property
(b) H_2O_2 has weak basic property
(c) H_2O_2 can act as an oxidising agent
(d) H_2O_2 can act as a reducing agent

AP- EAMCET(Medical) -2010

Ans. (b): Hydrogen peroxide is a very weak acid. So, a 0.1N solution should have a pH of about 6.4. It acts as an oxidising agent in acidic medium and also as a reducing agent in acidic as well as basic medium.

- H_2O_2 is weakly acidic in nature and pure hydrogen peroxide turns blue litmus to red litmus.

($K_a = 1.57 \times 10^{-12}$ at 293K). It ionizes in two steps.

$$H_2O_2 \rightleftharpoons H^+ + HO_2^-$$

$$HO_2^- \rightleftharpoons H^+ + O_2^{2-}$$

23. Find the reaction in which hydrogen peroxide is a reducing agent.
(a) $SO_2 + H_2O_2 \rightarrow H_2SO_4$
(b) $2KI + H_2O_2 \rightarrow 2KOH + I_2$
(c) $PbS + 4H_2O_2 \rightarrow PbSO_4 + 4H_2O$
(d) $Ag_2O + H_2O_2 \rightarrow 2Ag + H_2O + O_2$

SRMJEEE – 2013, BITSAT-2010
AMU – 2009

Ans. (d) : Hydrogen peroxide acts as an oxidising agent as well as reducing agent in both acidic and basic media. Silver oxide reacts with hydrogen peroxide to produce elemental silver and oxygen. In this reaction oxidation state of Ag changes from +1 to 0 and oxidation state of oxygen in H_2O_2 changes from –1 to 0

$H_2O_2 + Ag_2O \longrightarrow 2Ag + H_2O + O_2$

24. (A) $HOCl + H_2O_2 \rightarrow H_3O^+ + Cl^- + O_2$
(B) $I_2 + H_2O_2 + 2OH^- \rightarrow 2I^- + 2H_2O + O_2$
Choose the correct option.
(a) H_2O_2 acts as oxidising agent in equations (A) and (B)
(b) H_2O_2 acts as reducing agent in equations (A) and (B).
(c) H_2O_2 act as oxidising and reducing agent respectively in equations (A) and (B).
(d) H_2O_2 acts as reducing and oxidising agent respectively in equations (A) and (B)

[JEE Main-2021, 24 Feb Shift-I]
BITSAT-2018

Ans. (b) : (A) $HOCl + H_2O_2 \rightarrow H_3O^+ + Cl^- + O_2$
In this reaction, H_2O_2 is reducing chlorine from +1 to –1.
(B) $I_2 + H_2O_2 + 2OH^- \rightarrow 2I^- + 2H_2O + O_2$
In this reaction, H_2O_2 is reducing iodine from 0 to –1.
In (A) reduction of HOCl occurs so it will be an oxidising agent.Hence, H_2O_2 will be a reducing agent.
In (B) reduction of I_2 occurs so it will be an oxidising agent and H_2O_2 will be a reducing agent.

25. Which of the following is not correct regarding the electrolytic preparation of H_2O_2?
(a) Lead is used as cathode
(b) 50% H_2SO_4 is used
(c) Hydrogen is liberated at anode
(d) Sulphuric acid undergoes oxidation

UP CPMT-2008
AP-EAMCET (Engg.)-2005

Ans. (c): H_2O_2 can be prepared by electrolysis of 50% H_2SO_4. In this method, hydrogen is liberated at cathode.

$H_2SO_4 \rightleftharpoons 2H^+ + 2HSO_4^-$

At anode: $2HSO_4^- \rightarrow H_2S_2O_8 + 2e^-$

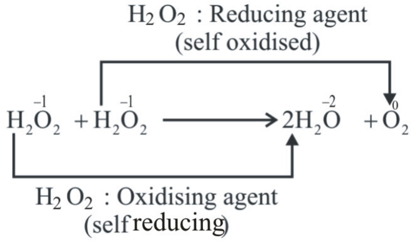
$H_2S_2O_8 + 2H_2O \rightarrow 2H_2SO_4 + H_2O_2$

At cathode: $2H^+ + 2e^- \rightarrow H_2\uparrow$

26. Hydrogen peroxide is ....
(a) an oxidising agent
(b) a reducing agent
(c) both an oxidising and a reducing agent
(d) neither oxidising nor reducing agent

AP EAMCET (Engg.) 17.09.2020, Shift-II
Karnataka CET-2018

Ans. (c) :



H_2O_2 : Reducing agent
(self oxidised)
$\overset{-1}{H_2O_2} + \overset{-1}{H_2O_2} \longrightarrow 2\overset{-2}{H_2O} + \overset{0}{O_2}$
H_2O_2 : Oxidising agent
(self reducing)

So, H_2O_2 (hydrogen peroxide) can act both as oxidising agent and reducing agent.

27. H_2O_2 cannot oxidise
(a) PbS (b) Na_2SO_3
(c) O_3 (d) KI

Karnataka-CET-2015, BCECE-2007

Ans. (c) : H_2O_2 can not oxidise O_3 because O_3(ozone) is a much better oxidizing agent. When H_2O_2 react with O_3, it act as reducing agent.

@apna_pdf

28. Which of the following gives hydrogen peroxide on reaction with dilute acids?

(a) PbO_2 (b) MnO_2
(c) TiO_2 (d) Na_2O_2

SRMJEEE – 2013
BCECE-2005

Ans. (d) : When sodiumdioxide is treated with dil-H_2SO_4 then sodium sulphate and hydrogen peroxide are formed during the reaction.

$$\underset{\text{sodiumdioxide}}{Na_2O_2} + \underset{\text{Sulfuric acid}}{\text{dil. }H_2SO_4} \longrightarrow \underset{\text{Sodiumsulfate}}{Na_2SO_4} + \underset{\text{Hydrogenperoxide}}{H_2O_2}$$

29. Hydrogen peroxide reacts with iodine in basic medium to give

(a) IO_4^- (b) IO^-
(c) I^- (d) IO_3^-

[JEE Main-2021, 1 Sep Shift-II]

Ans.(c):$I_{2(s)}+H_2O_{2(aq)}+2OH^-_{(aq)}\to 2I^-_{(aq)}+2H_2O_{(l)}+O_{2(g)}$
Therefore, the product of the reaction of I_2 with H_2O_2 in the basic medium is Iodine (I^-).

30. Which of the following solution produces H_2O_2 on electrolysis?

(a) 0.2N NaOH (b) 50% H_2SO_4
(c) 2% H_2SO_4 (d) 5% NaCl

AP EAPCET 25.08.2021, Shift-II

Ans. (b) : Hydrogen peroxide can be produced by electrolysis of sulphuric acid.

$$2HSO_4^- \to S_2O_8^{2-} + 2H^+ + 2e^-$$

$$S_2O_8^{2-} + 2H_2 \to H_2O_2 + 2HSO_4^-$$

So the option 50% H_2SO_4 is correct.

31. The correct statements about H_2O_2 are:

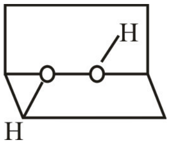
(A) used in the treatment of effluents.
(B) used as both oxidising and reducing agents.
(C) the two hydroxyl groups lie in the same plane.
(D) miscible with water.

Choose the correct answer from the options given below:

(a) (A), (B) and (D) only
(b) (B), (C) and (D) only
(c) (A), (C) and (D) only
(d) (A), (B), (C) and (D)

JEE Main 16.03.2021, Shift-II

Ans. (a) : Hydrogen peroxide used as a treatment of effluents. The structure of H_2O_2 is like as open book i.e. both OH group are in non-planer. H_2O_2 acts as oxidising as well as reducing



Structure of H_2O_2
(open book type) → non-planer

agent in acidic and basic medium. It is miscible in water due to hydrogen bonding.

32. Which metal oxide among the following gives H_2O_2 on treatment with dilute acid?

(a) BaO_2 (b) RbO_2
(c) MnO_2 (d) Al_2O_3

AP EAPCET 19-08-2021 Shift-I

Ans. (a) :
(i) $BaO_2 + H_2SO_4(\text{dil}) \longrightarrow H_2O_2 + BaSO_4$
(ii) RbO_2 + dilute acid $\longrightarrow$ X(Reaction is not take place with RbO_2
(iii) $MnO_2 + 4HCl \longrightarrow MnCl_2 + Cl_2 + 2H_2O$
(iv) $Al_2O_3 + 6HCl \longrightarrow 2AlCl_3 + 3H_2O$

33. A commercial sample of H_2O_2 marked as 100 volume hydrogen peroxide means

(a) 1 mL of H_2O_2 will give 100 mL of O_2 at STP
(b) 1 L of H_2O_2 will give 100 mL of O_2 at STP
(c) 1 L of H_2O_2 will give 22.4 L O_2 at STP
(d) 1 mL of H_2O_2 will give 1 mole of O_2 at STP

AP EAMCET (Engg.) 18.9.2020 Shift-I

Ans. (a) : 100 volume H_2O_2 solution indicates 1 mL of the H_2O_2 solution will give 100 mL of O_2 (g) at STP.

34. Hydrogen peroxide, in the pure state, is

(a) Non-planar and almost colourless
(b) Linear and blue in colour
(c) Linear and almost colourless
(d) Planar and blue in colour

[JEE Main-2020, 5 Sep Shift-II]

Ans. (a) : H_2O_2 has open book structure and it is non-planar and colourless.

35. Among statements (A)-(D), the correct ones are

(A) Decomposition of hydrogen peroxide gives dioxygen.
(B) Like hydrogen peroxide compounds, such as $KClO_3$ $Pb(NO_3)_2$ and $NaNO_3$ when heated liberate dioxygen.
(C) 2-ethylanthraquinone is useful for the industrial preparation of hydrogen peroxide.
(D) Hydrogen peroxide is used for the manufacture of sodium perborate.

(a) (A), (B) and (C) only
(b) (A), (B), (C) and (D)
(c) (A), (C) and (D) only
(d) (A) and (C) only

[JEE Main-2020, 7 Jan Shift-II]

Ans. (b):
(A) Hydrogen peroxide decomposes to give water and oxygen gas.

$$2H_2O_2(l) \longrightarrow 2H_2O(l) + O_2(g) \quad \Delta H = -196\ kJmol^{-1}$$

Hence, statement is true.
(B) When $Pb(NO_3)_2$, $KClO_3$ and $NaNO_3$ are heated then the oxygen gas evolved.

$$2Pb(NO_3)_2 \xrightarrow{\Delta} 2PbO + 4NO_2 + O_2$$

$$2KClO_3 \xrightarrow{\Delta} 2KCl + 3O_2(g)$$

$$2NaNO_3 \xrightarrow[800^\circ C]{\Delta} 2Na_2O + 2N_2 + 5O_2$$

Hence, statement is true.

@apna_pdf

(C) By the auto-oxidation, 2-ethyl anthraquinone is reduced to 2-ethyl enthraquinol and H_2O_2. Thus, statement is true.

(D) Sodium perborate is produced by adding one mole of sodium peroxide to one mol of borax and then add H_2O_2 to complete the oxidation. Hence, statement is true.

36. The chemical nature of hydrogen peroxide is
- (a) Oxidising and reducing agent in both acidic and basic medium
- (b) Oxidising and reducing agent in acidic medium, but not in basic medium
- (c) Reducing agent in basic medium, but not in acidic medium
- (d) Oxidising agent in acidic medium, but not in basic medium

[JEE Main-2019, 10 Jan Shift-I]

Ans. (a) : H_2O_2 act as oxidizing agent and reducing agent in acidic medium as well as basic medium.

H_2O_2 Acts as oxidant:-

$H_2O_2+2H^{\oplus}+2e^{\ominus}\rightarrow 2H_2O$ (In acidic medium)

$H_2O_2+2e^{\ominus}\rightarrow 2OH^{\ominus}$ (In basic medium)

H_2O_2 Acts as reductant:-

$H_2O_2\rightarrow 2H^{\oplus}+O_2+2e^{\ominus}$(In acidic medium)

$H_2O_2+2OH^{\ominus}\rightarrow 2H_2O+O_2+2e^{\ominus}$ (In basic medium)

37. Which reaction shows oxidizing nature of H_2O_2?
- (a) $H_2O_2+2KI\rightarrow 2KOH+I_2$
- (b) $Cl_2+H_2O_2\rightarrow 2HCl+O_2$
- (c) $H_2O_2+Ag_2O\rightarrow 2Ag+H_2O+O_2$
- (d) $NaClO+H_2O_2\rightarrow NaCl+H_2O+O_2$

BITSAT-2019

Ans. (a) : $H_2O_2+KI\rightarrow I_2$

O.S. of I^- (-1) changes to I_2 (zero)

There is increase in oxidation numbers hence oxidation.

38. Assertion: Hydrogen peroxide forms two series of salts called peroxides and hydroperoxides.

Reason: Hydrogen peroxide molecule has two replaceable hydrogen atoms.
- (a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.
- (b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
- (c) If Assertion is correct but Reason is incorrect.
- (d) If both the Assertion and Reason are incorrect.

AIIMS 26 May 2019 (Evening)

Ans. (a): Both Assertion and reason are true. Hydrogen peroxide forms two series of salt called hydroperoxide and peroxides.

39. H_2O_2 is obtained by which of the following?

(a) BaO_2	(b) MnO_2
(c) SeO_2	(d) TeO_2

AIIMS 26 May 2019 (Evening)

Ans. (a): $BaO_2+H_2SO_{4\,(aq)}\longrightarrow BaSO_{4\,(s)}+H_2O_{2\,(aq)}$

$BaO_2\cdot 8H_2O(s)+H_2SO_4(aq)\longrightarrow BaSO_4(s)+H_2O_2(aq)+8H_2O(l)$

40. The label on a bottle of H_2O_2 solution reads as '10 volume'. The concentration of H_2O_2 in percentage by volume is

(a) 4.05%	(b) 3.03%
(c) 6.06%	(d) 2.03%

(AIIMS-26 May, 2018(E))

Ans. (b): $2H_2O_2\rightarrow 2H_2O+O_2$

From equation, it is cleared that 22400 mL O_2 is formed by 68g of H_2O_2 10 mL O_2 is formed by

$$\frac{68}{22400}\times 10=0.0303\,g\,H_2O_2$$

100 mL= 3.03 g i.e. 3.03 %

41. The following reactions show the H_2O_2 behaviour in A and B reactions as

(i) $PbS_{(s)}+4H_2O_{2(aq)}\rightarrow PbSO_{4(s)}+4H_2O_{(l)}$

(ii) $HOCl+H_2O_2\rightarrow H_3O^++Cl^-+O_2$
- (a) oxidising in acidic medium and reducing in basic medium
- (b) reducing in acidic medium and oxidising in basic medium
- (c) oxidising in acidic medium and reducing in acidic medium
- (d) reducing in acidic medium and oxidising in acidic medium.

AMU-2018

Ans. (c) : Hydrogen peroxide, H_2O_2 oxidises lead sulphide, PbS(s) to lead sulphate. $PbSO_4$(s) in acidic medium.

$$\underset{\text{Black}}{PbS(s)}+4H_2O_2(aq)\rightarrow \underset{\text{White}}{PbSO_4(s)}+4H_2O(l)$$

It reacts with hydrochloric acid, HOCl, to produce water, oxygen and hydrochloride acid, showing oxidising action in acidic medium.

$HOCl+H_2O_2\rightarrow H_3O^++Cl^-+O_2$

42. Hydrogen peroxide oxidises $[Fe(CN)_6]^{4-}$ to $[Fe(CN)_6]^{3-}$ in acidic medium but reduces $[Fe(CN)_6]^{3-}$ to $[Fe(CN)_6]^{4-}$ in alkaline medium. The other products formed are, respectively.
- (a) (H_2O+O_2) and H_2O
- (b) (H_2O+O_2) and (H_2O+OH^-)
- (c) H_2O and (H_2O+O_2)
- (d) H_2O and (H_2O+OH^-)

[JEE Main-2018]

Ans. (c) : Oxidising action of H_2O_2 in acidic medium .

$[Fe(CN)_6]^{4-}+H_2O_2+2H^+\rightarrow [Fe(CN)_6]^{3-}+2H_2O$

Reducing action of H_2O_2 in alkaline medium.

$[Fe(CN)_6]^{3-}+2OH^-+H_2O_2\rightarrow [Fe(CN)_6]^{4-}+2H_2O+O_2$

43. Decomposition of hydrogen peroxide can be prevented by adding

(a) NaOH	(b) MnO_2
(c) Urea	(d) Oxalic acid

COMEDK 2015

Ans. (c) : H_2O_2 decomposes slowly on exposure to light.

$2H_2O_{2(l)}\longrightarrow 2H_2O_{(l)}+O_{2(g)}$

Its decomposition can be prevented by adding urea as a stabilizer.

@apna_pdf

44. From the following statements regarding H_2O_2, Choose the incorrect statement.
(a) It can act only as an oxidising agent
(b) It decomposed on exposure to light
(c) It has to be stored in plastic or wax lined glass bottles in dark
(d) It has to be kept away from dust

[JEE Main-2015]

Ans. (a) : H_2O_2 acts as an oxidizing as well as a reducing agent.

45. Peroxide ion.........
i. has five completely filled antibonding molecular orbitals
ii. is diamagnetic
iii. has bond order one
iv. is isoelectronic with neon
Which one of these is correct?
(a) ii and iii
(b) i, ii and iv
(c) i, ii and iii
(d) i and iv

BCECE-2014

Ans. (a) : Peroxide ion is O_2^{2-}

$$O_2^{2-}(18) = \sigma 1s^2, \overset{*}{\sigma}1s^2, \sigma 2s^2, \overset{*}{\sigma}2s^2, \sigma 2p_z^2$$

$$\pi 2p_x^2 \approx \pi 2p_y^2,\ \overset{*}{\pi}2p_x^2 \approx \overset{*}{\pi}2p_y^2$$

$$\text{Bond order} = \frac{N_b - N_a}{2} = \frac{10-8}{2} = 1$$

It contains four completely filled antibonding molecular orbitals. Since, all the electrons are paired, O_2^{2-} is diamagnetic. Peroxide ion is isoelectronic with argon, not with neon.

46. Moist hydrogen peroxide can not be dried over conc. H_2SO_4 because
(a) It can catch fire
(b) It is reduced by H_2SO_4
(c) It is oxidized by H_2SO_4
(d) It is decomposed by H_2SO_4

JIPMER-2012

Ans. (d) : Concentrated H_2SO_4 decomposes H_2O_2 and cannot be dried over it.
$H_2O_2+[O]\rightarrow H_2O+O_2$

47. The product (s) formed when H_2O_2 reacts with disodium hydrogen phosphate is
(a) $P_2O_5{\cdot}Na_3PO_4$
(b) $Na_2HPO_4{\cdot}H_2O_2$
(c) $NaH_2PO_4{\cdot}H_2O$
(d) $Na_2HPO_4{\cdot}H_2O$

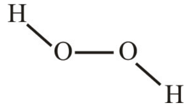
AP EAMCET (Engg.) - 2012

Ans. (b) : $Na_2HPO_4+H_2O_2\rightarrow Na_2HPO_4{\cdot}H_2O_2$ The product formed when H_2O_2 reacts with disodium hydrogen phosphate is $Na_2HPO_4{\cdot}H_2O_2$.

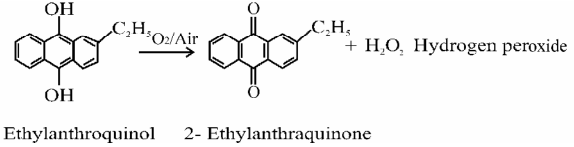
48. Which one of the following is not correct in respect of hydrogen peroxide?
(a) It is industrially produced from 2-ethylanthroquinol.
(b) It has a linear structure.
(c) Hydrogen peroxide acts as a strong oxidizing and reducing agent.
(d) It acts widely used as bleaching agent.

SCRA 2012

Ans. (b) : Hydrogen peroxide having the open book like structure.



(a) The first statement is true. H_2O_2 formed from auto-oxidation of 2-ethyl anthroquinol.

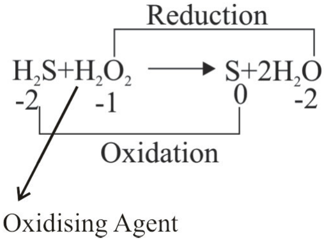


(b) Second statement is false because the H_2O_2 has the open book like structure.
(c) Third statement is true because hydrogen peroxide acts as a strong oxidizing and reducing agent.
(d) Fourth statement is true because hydrogen peroxide acts as bleaching agent due to the release of nascent oxygen.

49. In the reaction $H_2S + H_2O_2 \longrightarrow S + 2H_2O$
(a) H_2S is an acid and H_2O_2 is a base
(b) H_2S is a base and H_2O_2 is an acid
(c) H_2S is an oxidizing agent and H_2O_2 is a reducing agent
(d) H_2S is a reducing agent and H_2O_2 is an oxidizing agent
(e) H_2S is hydrolysed to S

Kerala-CEE-2011

Ans. (d) : The reaction-
$H_2S+H_2O_2\rightarrow S+2H_2O$
manifests oxidising nature of H_2O_2 as it oxidizes S from -2 to 0 oxidation state



Hence, H_2S is oxidised to S.

50. Which of the following undergoes reduction with hydrogen Peroxide in alkaline medium?
(a) Mn^{2+}
(b) HOC
(c) PbS
(d) Fe^{2+}
(e) I_2

Kerala-CEE-2010

Ans.(e):$I_2(S)+H_2O_2(aq)+2OH^-\rightarrow 2I^-(aq)+2H_2O(l)+O_2$
H_2O_2 reduces iodine to iodide solution in an alkaline medium.

51. Which one of the following statements is correct for H_2O_2?
(a) It reduces ferricyanide to ferrocyanide in acid medium.
(b) It oxidises lead monoxide to lead dioxide.

@apna_pdf

(c) It acts as a reducing agent in the decolourisation of acidified $KMnO_4$.

(d) It oxidises hydrides of chlorine and bromine to their diatomic gases.

AP - EAMCET(MEDICAL) - 2009

Ans. (c) : As we know that H_2O_2 reduces acidified $KMnO_4$ into colourless manganous salt and gets oxidised into O_2.

$$\underset{\text{Potassium permanganate}}{2KMnO_4}+\underset{\text{Sulfuric acid}}{3H_2SO_4}+\underset{\text{Hydrogen peroxide}}{5H_2O_2}\rightarrow\underset{\text{Potassium sulfate (colourless)}}{K_2SO_4}+2MnSO_4+8H_2O+SO_2$$

It reduces ferricyanide to ferrocyanide in alkaline medium not in acid medium.

52. 30 volume hydrogen peroxide means:

(a) 30% of H_2O_2 solution

(b) 30 cm^3 of solution contains 1g of H_2O_2

(c) 1cm^3 of solution liberates 30 cm^3 of O_2 at STP

(d) 30 cm^3 of solution contains 1 mole of H_2O_2

BITSAT-2008

Ans. (c) : 30 volume H_2O_2 means one volume of H_2O_2 on decomposition will give 30 volume of oxygen.

53. Which one of the following reactions represents the oxidizing property of H_2O_2?

(a) $2KMnO_4 + 3H_2SO_4 + 5H_2O_2 \rightarrow K_2SO_4 + 2MnSO_4 + 8H_2O + 5O_2$

(b) $2K_3[Fe(CN)_6] + 2KOH + H_2O_2 \rightarrow 2K_4[Fe(CN)_6] + 2H_2O + O_2$

(c) $PbO_2 + H_2O_2 \longrightarrow PbO + H_2O + O_2$

(d) $2KI + H_2SO_4 + H_2O_2 \longrightarrow K_2SO_4 + I_2 + 2H_2O$

AP EAMCET- 2008

Ans. (d) : The reaction in which H_2O_2 is reduced while the other reactant is oxidized represent the oxidizing property of H_2O_2.

54. Match the following

	Set-I		Set-II
(A)	10 vol H_2O_2	1.	perhydrol
(B)	20 vol H_2O_2	2.	5.358 N
(C)	30 vol H_2O_2	3.	1.785 M
(D)	100 vol H_2O_2	4.	3.03%

The correct match is

(a) A–4, B–3, C–2, D–1

(b) A–1, B–2, C–3, D–4

(c) A–1, B–3, C–2, D–4

(d) A–4, B–2, C–3, D–1

AP - EAMCET (Medical) - 2007

Ans. (a) : Set-I		**Set-II**
(A) 10 vol H_2O_2	–	(4) 3.03%
(B) 20 vol H_2O_2	–	(3) 1.785 M
(C) 30 vol H_2O_2	–	(2) 5.358 N
(D) 100 vol H_2O_2	–	(1) Perhydrol

55. In the hydrogen peroxide molecule:

(a) O-H bonds are polar but molecule is non polar

(b) The four atoms are arranged in a non linear and non planar manner

(c) All the four atoms are in same plane

(d) Two hydrogen atoms are connected to one of the oxygen

BITSAT-2005

Ans. (b) : Hydrogen peroxide (H_2O_2) has open book like structure and both-OH bonds are trans to each other thus they cancel each other polarity. So H_2O_2 is non polar.

56. Which one of the following is reduced by hydrogen peroxide in acid medium?

(a) Potassium permanganate

(b) Potassium iodide

(c) $FeSO_4$

(d) Potassium ferrocyanide

AP EAMCET- 1997

Ans. (a) : Potassium permanganate ($KMnO_4$) is Mn^{+7} state gets reduced to Mn^{+2}state by the action of H_2O_2 in acidic medium. Hence, $KMnO_4$ is reduce by H_2O_2.

57. Sodium amalgam is useful as

(a) Oxidising agent (b) Catalyst

(c) Reducing agent (d) Bleaching agent

AP EAMCET- 1996

Ans. (c) : Sodium amalgam Na(Hg) reduces H_2O to H_2. So it is used as a reducing agent. It is safer to handle than sodium itself. It is also used in Emde degradation and also for reduction of aromatic ketones to hydrols.

58. In aqueous solutions, H_2O_2 oxidizes H_2S to

(a) Sulphur (b) Sulphuric acid

(c) Caro's acid (d) Marshall's acid

AP EAMCET- 1994

Ans. (a) : H_2O_2 oxidizes H_2S to sulphur in the presence of aqueous solution. The reaction is given as under–

$$\underset{\text{Hydrogen peroxide}}{H_2O_2}+H_2S\rightarrow 2H_2O+\underset{\text{Sulphur}}{S}$$

59. Hydrogen peroxide molecules are

(a) monoatomic and form X_2^{2-} ions

(b) diatomic and form X^- ions

(c) diatomic and form X_2^- ions

(d) monoatomic and form X^- ions

NEET-1991

Ans. (a) : Hydrogen peroxide molecules are monoatomic as it contain only one atom. It acts as both reducing and oxidizing agent in both acidic and basic medium. It forms $(OH)_2^{2-}$ ions on breakage.

i.e. it forms X_2^{2-} ions.

$$OH-OH \rightleftharpoons (OH)_2^{2-}$$

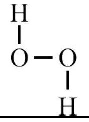
60. Which of the following is the true structure H_2O_2?

(a) $H-O-O-H$

(b) 
(c) 
(d) 
NEET-1989

@apna_pdf

Ans. (b) : The structure of H_2O_2 is non planar but open book structure. The O–O–H bond angle is 101.5^o and O–O single bond distance is $1.48\ \overset{o}{A}$.



61. The reaction of H_2O_2 with H_2S is an example of ...... reaction.

(a) addition (b) oxidation

(c) reduction (d) acidic

NEET-1988

Ans. (b) : When H_2O_2 is reacted with hydrogen sulphide (H_2S) it form S and water. In this reaction H_2S is oxidized to suphur. H_2O_2 act as oxidizing agent.

$H_2O_2 + H_2S \rightarrow S + 2H_2O$

3. Properties of hydrogen

62. Given below are two statements one is labelled as Assertion A and the other is labelled as Reason R:

Assertion A: The amphoteric nature of water is explained by using Lewis acid/base concept

Reason R: Water acts as an acid with NH_3 and as a base with H_2S.

In the light of the above statements choose the correct answer from the options given below:

(a) Both A and R are true and R is the correct explanation of A

(b) Both A and R are true but R is NOT the correct explanation of A

(c) A is true but R is false

(d) A is false but R is true

JEE Main-25.06.2022, Shift-II

Ans. (d) : The amphoteric nature of water is explained by using Bronsted - Lowry acid base concept

$$H_2O + NH_3 \rightleftharpoons OH^- + NH_4^+$$

$$H_2S + H_2O \rightleftharpoons H_3O^+ + HS^-$$

So, A is false but R is true.

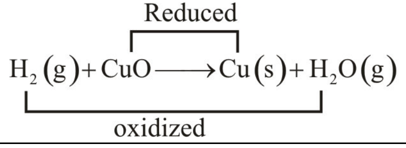
63. Dihydrogen reacts with CuO to give

(a) CuH_2 (b) Cu

(c) Cu_2O (d) $Cu(OH)_2$

JEE Main-28.06.2022, Shift-I

Ans. (b) : Dihydrogen reacts with CuO to give Cu.



$$H_2(g) + CuO \longrightarrow Cu(s) + H_2O(g)$$

64. In the industrial production of which of the following, molecular hydrogen is obtained as a by product?

(a) NaOH (b) NaCl

(c) Na metal (d) Na_2CO_3

JEE Main-24.06.2022, Shift-II

Ans. (a) : Molecular hydrogen is produced as a by product in the industrial production of NaOH by electrolysis of aq NaCl solution.

$$NaCl \longrightarrow Na^+ + Cl^-$$

$$H_2O \rightleftharpoons H^+ + OH^-$$

Cathode : $2H_2O + 2e \longrightarrow H_2 + 2OH^-$

Anode : $2Cl^- \longrightarrow Cl_2 + 2e^-$

NaOH is crystallized from the remaining part of electrolyte.

65. The correct order of increasing intermolecular hydrogen bond strength is

(a) $HCN < H_2O < NH_3$ (b) $HCN < CH_4 < NH_3$

(c) $CH_4 < HCN < NH_3$ (d) $CH_4 < NH_3 < HCN$

JEE Main-27.06.2022, Shift-II

Ans. (c) : Due to high difference in electronegativity of H and N the H-bond strength of NH_3 is highest. It is clear that smaller the size of the atom, greater is the electronegativity and because of that hydrogen holds strong bonding between the molecules.

Methane can not form hydrogen bond because it does not contain an N–H, O–H bond.

Degree of H-bonding is highest in HCN.

The correct order of increasing intermolecular hydrogen bond strength is-

$CH_4 < HCN < NH_3$

66. Hydrogen has three isotopes: protium (^1H), deuterium (^2H or D) and tritium (^3H or T). They have nearly same chemical properties but different physical properties. They differ in

(a) Number of proton

(b) Atomic number

(c) Electronic configuration

(d) Atomic mass

JEE Main-28.06.2022, Shift-II

Ans. (d) : ${}^1_1H, {}^2_1H$ and ${}^3_1H$ have same atomic number but their atomic masses are different.

Isotopes have same atomic number i.e. same number of protons.

67. Given below are two statements: one is labelled as Assertion A and the other is labelled as Reason R.

Assertion A: Polluted water may have a value of BOD of the order of 17 ppm.

Reason R: BOD is a measure of oxygen required to oxidize both the bio-degradable and non- biodegradable organic material in water.

In the light of the above statements, choose the most appropriate answer from the options given below.

(a) Both A and R are correct and R is the correct explanation of A

(b) Both A and R are correct but R is NOT the correct explanation of A

(c) A is correct but R is not correct

(d) A is not correct but R is correct

JEE Main-25.06.2022, Shift-II

@apna_pdf

Ans. (c) : The amount of oxygen required by bacteria to breakdown the organic matter present in a certain volume of a sample of water is called Biochemical Oxygen Demand (BOD).

Clean water could have BOD value of less than 5ppm whereas highly Polluted water could have a BOD value of 17 ppm or more.

68. The measured BOD values for four different water samples (A-D) are as follows:
A = 3 ppm; B = 18 ppm; C = 21 ppm; D = 4 ppm; the water samples which can be called as highly polluted with organic wastes, are

(a) A and B (b) A and D
(c) B and C (d) B and D

JEE Main-26.06.2022, Shift-II

Ans. (c) : Biological Oxygen Demand (BOD) is used as a measure of degree of water pollution.

Clean water $\rightarrow$ B.O.D. < 5ppm

Highly polluted $\rightarrow$ B.O.D. > 17ppm

69. The production of dihydrogen gas via water-gas shift reaction:

$$CO_{(g)} + H_2O_{(g)} \xrightarrow[\text{Catalyst}]{\Delta} CO_{2(g)} + H_{2(g)}$$

The CO_2 gas is removed by scrubbing with solution of

(a) sodium arsenite (b) calcium oxide
(c) sodium phosphite (d) aluminium oxide

AMU-2014

Ans. (a) : The given water gas shift reaction, is used to increase the production of hydrogen gas. Here, the obtained carbon dioxide (CO_2) is removed by scrubbing with a solution of sodium arsenite.

- The water gas shift reaction is an important and commonly employed reaction in the industry. In the water gas shift reaction, hydrogen is produced from water or steam while carbon monoxide is converted into carbon dioxide.

$$CO_{(g)} + H_2O_{(g)} \xrightarrow[\text{Catalyst}]{\Delta} CO_{2(g)} + H_{2(g)}$$

70. Radioactive isotope of hydrogen is

(a) uranium (b) deuterium
(c) tritium (d) None of these

CG PET-2006
UP CPMT-2005

Ans. (c) : (i) Tritium $\left({}_1^3H\right)$ is the most stable radioactive isotope of hydrogen. Half life of hydrogen is 12.32 years. It has n/p ratio = 2.0. So, it is unstable.

(ii) Deuterium $\left({}_1^2H\right)$ is heavy hydrogen, another isotope of hydrogen.

71. When same amount of zinc is treated separately with excess of sulphuric acid and excess of sodium hydroxide solution, the ratio of volumes of hydrogen evolved is:

(a) 1 : 1 (b) 1 : 2
(c) 2 : 1 (d) 9 : 4

JEE Main-09.01.2020, Shift-II
BITSAT-2013

Ans. (a) : The balance chemical reaction of zinc with sulphuric acid and NaOH are -

$Zn+H_2SO_4 \rightarrow ZnSO_4+H_2(g)$

$Zn+2NaOH \rightarrow Na_2ZnO_2 + H_2\uparrow$

Since, one mole of H_2(g) is produced per mole of zinc with both sulphuric acid and NaOH respectively, hydrogen gas is produced in the molar ratio 1:1 in the above reaction.

72. The shortest wavelength in hydrogen spectrum is approximately______

(a) 121 nm (b) 91.2 nm
(c) 91.5 nm (d) 912 nm

AP-EAMCET 25-08-2021 Shift - I

Ans. (b) : According to Rydberg's formula –

$$\frac{1}{\lambda} = R_H Z^2 \left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)$$

Where R = Rydbergs constant [$\because$ $R_H = 109678\ cm^{-1}$]

From line spectrum of hydrogen

Fro lyman series, $n_1 = 1$

For shortes wavelength of lyman series, the energy difference in two levels showing transition should be maximum ($n_2 = \infty$)

$$\frac{1}{\lambda} = R_H \left(\frac{1}{1^2} - \frac{1}{\infty}\right) \Rightarrow \frac{1}{\lambda} = 109678$$

$$\lambda = 911.7 \times 10^{-8}\ cm = 91.17 nm \quad [\because 1cm = 10^7\ nm]$$

73. Which of the following forms of hydrogen emits low energy β^- particles?

(a) Proton H^+ (b) Protium ${}_1^1H$
(c) Deuterium ${}_1^2H$ (d) Tritium ${}_1^3H$

JEE Main 26.02.2021,Shift-II

Ans. (d) : Tritium $\left({}_1^3H\right)$ isotope of hydrogen is radioactive and emits low energy β^- particle. It has one proton and two neutrons in the nucleus. Thus n/p ratio of tritium which makes nucleus unstable. The concentration of tritium is very low.

For tritium ${}_1H^3$

No. of neutron (n) = 2

No. of proton (p) = 1

$$\frac{n}{p} = 2$$

$\therefore$ $\frac{n}{p}$ is high, tritium will emit β particle.

74. Which one of the following methods in most suitable for preparing de-ionised water?

(a) Synthetic resin method (b) Clark's method
(c) Calgon's method (d) Permutit method

[JEE Main-2021, 26 Aug Shift-I]

Ans. (a) : Pure demineralised (de-ionised) water free from all soluble mineral salts is obtained by passing water successively through a cation exchange (in the H^+ form) and an anion exchange (in the OH^+ forms) resins.

@apna_pdf

75. The functional groups that are responsible for the ion-exchange property of cation and anion exchange resins, respectively, are

(a) —SO_3H and —NH_2
(b) — SO_3H and —COOH
(c) —NH_2 and —COOH
(d) —NH_2 and —SO_3H

[JEE Main-2021, 17 March Shift-II]

Ans. (a) : The functional groups that are responsible for the ion-exchange property of cation and anion exchange resins, respectively, are –SO_3H and – COOH are cation exchange resin and –NH_2 is anion exchange resin.

76. Calgon is used for water treatment. Which of the following statements is not true about Calgon?

(a) Calgon contains the 2nd most abundant element by weight in the Earth's crust.
(b) It is polymeric compound and is water soluble.
(c) It is also known as Graham's salt,
(d) It does not remove Ca^{2+} ion by precipitation.

[JEE Main-2021, 26 Feb Shift-II]

Ans. (a) : Calgon contains the 2nd most abundant element by weight in the earth's crust.

• 2nd most abundant element is Si and it is not present is calgon $Na_6P_6O_{18}$ (Graham's salt or hexametaphosphate).

• It exist in polymeric form as $(NaPO_3)_6$ and water soluble compound.

• It removes Ca^{2+} in soluble ion but not by precipitation.

77. The single largest industrial application of dihydrogen is

(a) Manufacture of metal hydrides
(b) Rocket fuel in space research
(c) In the synthesis of ammonia
(d) In the synthesis of nitric acid

[JEE Main-2021, 20 July Shift-II]

Ans. (c) : The single largest industrial application of dihydrogen is in the synthesis of ammonia. Which is mainly used in the manufacture of fertilizer.

78. Match the following and identify the correct option.

(A) $CO_{(g)} + H_{2(g)}$	**(i)$Mg(HCO_3) + Ca(HCO_3)_2$**
(B) Temporary hardness of water	**(ii) An electron deficient hydride**
(C) B_2H_6	**(iii) Synthesis gas**
(D) H_2O_2	**(iv) Non-planar structure**

	A	B	C	D
(a)	(iii)	(i)	(ii)	(iv)
(b)	(iii)	(ii)	(i)	(iv)
(c)	(iii)	(iv)	(ii)	(i)
(d)	(i)	(iii)	(ii)	(iv)

NEET-2020

Ans. (a) : • Synthesis gas is a fuel gas mixture consisting primarily of hydrogen carbon monoxide.

• Temporary hardness is a type of water hardness caused by the presence of dissolved bicarbonate minerals (calcium bicarbonate and magnesium bicarbonate)

• B_2H_6 an electron deficient hydride

• H_2O_2 Hydrogen peroxide is a non-planar molecule with (twisted) symmetry. It is non-linear, non-planar molecule with a open book structure.

79. Dihydrogen of high purity (>99.95%) is obtained through

(a) The reaction of Zn with dilute HCl
(b) The electrolysis of acidified water using Pt electrodes
(c) The electrolysis of brine solution
(d) The electrolysis of warm $Ba(OH)_2$ solution using Ni electrodes.

[JEE Main-2020, 6 Sep. Shift-II]

Ans. (d) : High purity (>99.95%) dihydrogen is obtained by electrolysis of warm aqueous barium hydroxide solution between nickel electrodes.

As water does not conduct electricity very well it is usual to electrolyse aqueous solution of Barium hydroxide.

80. The equation that represents the water-gas shift reaction is

(a) $C(s)+H_2O(g)\xrightarrow{1270K}CO(g)+H_2(g)$
(b) $2C(s)+O_2(g)+4N_2(g)\xrightarrow{1273K}2CO(g)+4N_2(g)$
(c) $CO(g)+H_2O(g)\xrightarrow[\text{Catalyst}]{673K}CO_2+H_2(g)$
(d) $CH_4(g)+H_2O(g)\xrightarrow[\text{Ni}]{1270K}CO(g)+3H_2(g)$

[JEE Main-2020, 5 Sep. Shift-I]

Ans. (c)

(c)Water gas shift reaction.

The reaction of carbon monoxide and water vapor to form carbon dioxide and hydrogen.

$$CO_{(g)}+H_2O_{(g)}\xrightarrow[\text{Catalyst}]{673K}CO_{2(g)}+H_{2(g)}$$

(a) Water gas is produced by this reaction.

$$C_{(s)}+H_2O_{(g)}\xrightarrow{1270K}CO_{(g)}+H_{2(g)}$$

(b) Producer gas is produced by this reaction

$$2C_{(s)}+O_{2(g)}+4N_{2(g)}\xrightarrow{1273K}2CO_{(g)}+4N_{2(g)}$$

(d) Water gas is produced by this reaction.

$$CH_{4(g)}+H_2O_{(g)}\xrightarrow[\text{Ni}]{1273K}CO_{(g)}+3H_{2(g)}$$

81. Water gas is a mixture of

(a) CO and N_2
(b) CO and H_2
(c) CO, H_2 and N_2
(d) CO_2 and H_2 O

COMEDK 2020

Ans. (b) : $C_{(s)}+H_2O_{(g)}\to CO_{(g)}+H_{2(g)}$. Thus,when the steam ($H_2O$) is passed over red-hot coke (C), then mixture of carbon monoxide (CO) and hydrogen (H_2) is formed. It is known as water gas.

82. The amount of H_2O_2 present in 1 litre of 1.5 NH_2O_2 solution is:

(a) 25.5 g
(b) 3.0 g
(c) 8.0 g
(d) 2.5 g

BITSAT-2020

Ans. (a) : Normality = Molarity × n*f*

Molecular mass of H_2O_2 = 34

Normality = 1.5

For $H_2\overset{-1}{O_2}\to H_2\overset{-2}{O}$

@apna_pdf

Nf = 2×1=2

N = M×2

$$1.5 = \frac{\text{No. of moles}}{\text{Volume}} \times 2$$

$$1.5 = \frac{\text{mass}}{\text{molar mass of } H_2O_2} \times \frac{1}{\text{Volume}} \times 2$$

$$1.5 = \frac{\text{mass}}{34} \times \frac{1}{1L} \times 2$$

mass of H_2O_2 =25.5g.

83. The correct statements among (I) to (IV) regarding H_2 as a fuel are :

I. It produces less pollutants than petrol.

II. A cylinder of compressed dihydrogen weights~30 times more than a petrol tank producing the same amount of energy.

III. Dihydrogen is stored in tanks of metal alloys like $NaNi_5$.

IV. On combustion, values of energy released per gram of liquid dihydrogen and LPG are 50 and 142 kJ, respectively.

(a) I, II and III only (b) II, III and IV only

(c) II and IV only (d) I and III only

[JEE Main-2019, 11 Jan Shift-I]

Ans. (a)

- H_2 is a 100% pollution free fuel.
- Molecular weight of

H_2 (2u) = $\frac{1}{29}$ × molecular weight of butane C_4H_{10} (LPG) (58u)

So, compressed H_2 weighs ~ 30 times more than a petrol tank.

- $NaNi_5$, Ti-TiH_2 etc. are used for storage of H_2 in small quantities.
- On combustion, values of energy released per gram of liquid dihydrogen (H_2): 50 kJ g^{-1}, and for LPG : 142 kJ g^{-1} is incorrect statement because LPG produces less energy than dihydrogen for per gm.
- The hydrogen fuel is a zero-emission fuel that is when it burned in presence of oxygen it produces fewer pollutants in the atmosphere. Hydrogen is made by using fossil fuels by steam reforming process.

84. The correct statements among (a) to (d) are:

(1) Saline hydrides produce H_2 gas when reacted with H_2O.

(2) Reaction of $LiAlH_4$ with BF_3 leads to B_2H_6.

(3) PH_3 and CH_4 are electron rich and electron precise hydrides, respectively.

(4) HF and CH_4 are called as molecular hydrides.

(a) (1), (2), (3) and (4) (b) (1), (2) and (3) only

(c) (3) and (4) only (d) (1), (3) and (4) only

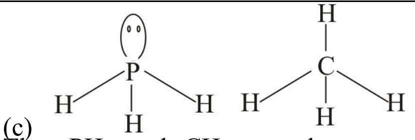
[JEE Main-2019, 10 April Shift-II]

Ans. (a)

(a) $\underset{\text{saline hydride}}{MH} + HOH \rightarrow MOH + H_2$

(b) $4\,BF_3 + 3LiAl\,H_4 \rightarrow 2B_2H_6 + 3LiF + 3AlF_3$

(c)



Thu, PH_3 and CH_4 are electron- rich and electron precise hydrides respectively.

(d) HF and CH_4 are molecular hydride because they are covalent molecules.

85. The metal that gives hydrogen gas upon treatment with both acid as well as base is

(a) Magnesium (b) Mercury

(c) Zinc (d) Iron

[JEE Main-2019, 12 April Shift-I]

Ans. (c) : $Zn + 2HCl \rightarrow ZnCl_2 + H_2$

$Zn + NaOH \rightarrow Na_2ZnO_2 + H_2$

Here Zinc (Zn) is amphoteric metal, that is why it reacts with both acid and base.

86. The isotopes of hydrogen are

(a) Deuterium and tritium only

(b) Protium and deuterium only

(c) Protium, deuterium and tritium

(d) Tritium and protium only

[JEE Main-2019, 9 Jan Shift-I]

Ans. (c) : Isotopes of hydrogen

(1) Protium ($1H^1$)

(2) Deuterium ($1H^2$)

(3) Tritium ($1H^3$)

87. Which one of the following substances is NOT a mixture ?

(a) Ice (b) Ice-cream

(c) Air (d) Honey

NDA (I)-2019

Ans : (a) Among the given option, ice is not a mixture. Ice is pure substance as it is simply frozen water. Ice is the solid state of water and since water is a compound of hydrogen and oxygen.

88. Which one of the following statements about water is not true?

(a) Hydrogen bonds are present in liquid water.

(b) Water has a high boiling point.

(c) Water has a high heat of fusion.

(d) Water is a non-polar molecule.

NDA (II)-2019

Ans : (d) : Water molecule is a polar molecule with opposite ends of the molecule with opposite charges.

In a water molecule, two hydrogen atoms form single polar covalent bonds with an oxygen atom.

89. Match the following items in Column I with the corresponding items in column II.

Column I	**Column II**
(i) $Na_2CO_3.\,10H_2O$	A. Portland cement ingredient
(ii) $Mg(HCO_3)_2$	B. Castner-kellner process
(iii) NaOH	C. Solvay process
(iv) $Ca_3Al_2O_6$	D. Temporary hardness

@apna_pdf

(a) (i)-(D);(ii)-(A);(iii)-(B);(iv)-(C)
(b) (i)-(B);(ii)-(C);(iii)-(A);(iv)-(D)
(c) (i)-(C);(ii)-(B);(iii)-(D);(iv)-(A)
(d) (i)-(C);(ii)-(D);(iii)-(B);(iv)-(A)

[JEE Main-2019, 11 Jan Shift-II]

Ans. (d) : Na2CO$_3$.10H2O→ Solvay process
Mg $(HCO_3)_2$ →Temporary hardness
NaOH→Castner kellner cell
$Ca_3Al_2O_6$→ Portland cement ingredient.

90. The recommended concentration of fluoride ion in drinking water is up to 1 ppm as fluoride ion required to make teeth enamel harder by converting $[3Ca_3(PO_4)_2.Ca(OH)_2]$ to:

(a) $[CaF_2]$
(b) $[3(CaF_2).Ca(OH)_2]$
(c) $[3Ca_3(PO_4)_2.CaF_2]$
(d) $[3\{Ca_3\ (PO_4)_2\}.\ CaF_2]$

[JEE Main-2018]

Ans. (c) : The fluoride ion converts
$[3Ca_3(PO_4)_2Ca(OH)_2]$ to $[3Ca_3(PO_4)_{2.}CaF_2]$
hydroxyapatite Fluorapatite
The reaction can be given as follows:-

$$\underset{\text{Drinking water upto 1 ppm}}{[3Ca_3(PO_4)_2.Ca(OH)_2]+2F^-} \longrightarrow \underset{\text{Harder teeth enamel}}{3[Ca_3(PO_4)_2CaF_2]+2OH^-}$$

91. Water softening by Clark's process uses

(a) Calcium bicarbonate (b) Sodium bicarbonate
(c) Potash alum (d) Calcium hydroxide

COMEDK 2018

Ans. (d) : In Clark's process, calculated amount of quick lime is added to hard water to convert bicarbonates to carbonates.

92. The dielectric constant of H_2O is 80. The electrostatic force of attraction between Na^+ and Cl^- will be

(a) reduced to 1/40 in water than in air.
(b) reduced to 1/80 in water than in air.
(c) will be increased to 80 in water than in air.
(d) will remain unchanged.

(AIIMS-27 May, 2018(E))

Ans. (b): Water is a polar solvent and have dielectric constant 80. As NaCl is a polar compound forces of attraction between Na^+ and Cl^- ion will reduce to $\frac{1}{80}$ in water.

93. Which of the following properties of interstitial hydrides is correct?

(a) They generally form non-stoichiometric species.
(b) The hydrogen dissolved in titanium improves its mechanical properties.
(c) They can be used as hydrogenation catalysts.
(d) All of these.

COMEDK 2017

Ans. (a) : (a) These interstitial hydrides are often form non-stoichiometric species because in these hydrides law of constant composition does not hold good.
(b) Titanium hydride releases hydrogen which serves to remove carbon, oxygen and producing a strong alloy due to this hydrogen dissolves in titanium improves its mechanical properties.
(c) Due to interstitial hydride formation, metal absorb large volume of hydrogen on their surface. So, it is used as hydrogenation catalyst.
Here, all options are correct.

94. In which of the following reactions, hydrogen is liberated?

(i) $Al(s) + HCl(aq) \longrightarrow$
(ii) $Al(s) + NaOH(aq) \longrightarrow$
(iii) $NaBH_4 + I_2 \longrightarrow$

(d) i, ii (b) ii, iii
(c) i, iii (d) i, ii, iii

AP EAMCET-2017

Ans. (d):
(i) $2Al(s) + 6HCl(aq) \longrightarrow 2AlCl_3\ (aq) + 3H_2$
(ii) $2Al(s) + 2NaOH(aq) \longrightarrow 2Na[Al(OH)_4] + 3H_2$
(iii) $NaBH_4 + I_2 \longrightarrow BH_3 + NaI + HI$
$\quad \xrightarrow{NaBH_4} 2BH_3 + 2NaI + H_2$

So the option (d) is correct. Hydrogen is liberated in all there reactions.

95. Identify the structure of water in the gaseous phase.

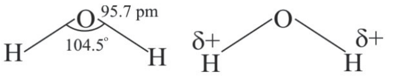
(a) $H-\ddot{O}-H$

(b) $H-\overset{+}{\underset{|}{O}}-H$
$\quad\quad H$

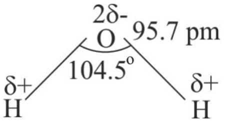
(c) 
(d) None of these

BITSAT-2017

Ans. (c) :



So,



96. There are two statements, one labeled as Assertion (A) and the other as Reason (R). Examine both the statements carefully and mark the correct choice.

(A) Hydrogen has one electron in its orbit but it produces several spectral lines.
(R) There are many excited energy levels available.

(a) Both (A) and (R) are correct and (R) is the correct explanation of (A).
(b) Both (A) and (R) are correct but (R) is not the correct explanation of (A).
(c) (A) is correct and (R) is wrong.
(d) (A) is wrong and (R) is correct.

J & K CET-(2017)

@apna_pdf

Ans. (a) : Hydrogen has one electron in its orbit but it produces several spectra line. Different lines correspond to different transitions.

- Different transitions are due to different excited states available.

Hence, option (a) is correct.

97. Which one of the following statements about water is false?

(a) Water can act both as an acid and as a base
(b) There is extensive intramolecular hydrogen bonding in the condensed phase
(c) Ice formed by heavy water sinks in normal water
(d) Water is oxidised to oxygen during photosynthesis

[JEE Main-2016]

Ans. (b) : Water possesses intermolecular hydrogen bonding in the condensed phase rather than intramolecular hydrogen bonding.

98. Which of the following option best describes the 'hydrogen economy?'

(a) Using dihydrogen in an efficient manner
(b) Dihydrogen is carried and stored in the form of liquid or gas
(c) Addition of dihydrogen to the reactant
(d) Both (a) and (b)

Manipal-2016

Ans. (d) : The term "hydrogen economy" refers to the vision of using hydrogen as a low-carbon energy source- replacing for example, gasoline as a transport fuel or natural gas as heating fuel.

99. Moist hydrogen cannot be dried over (conc.) H_2SO_4 because

(a) It catches fire
(b) It is reduced by H_2SO_4
(c) It is oxidised by H_2SO_4
(d) It decomposes H_2SO_4

JCECE - 2016

Ans. (c) : Moist hydrogen cannot be dried over conc. H_2SO_4 because it is oxidised by H_2SO_4.

$$H_2SO_{4(Conc.)} + H_2 \longrightarrow 2H_2O + SO_{2(g)}$$

100. Which of the following statements is incorrect?

(a) Ionic hydrides are stoichiometric compounds of dihydrogen formed with most of s-block elements.
(b) Ionic hydrides are crystalline, non-volatile and non-conducting in solid state.
(c) Melts of ionic hydrides conduct electricity and liberate dihydrogen gas at cathode.
(d) Both (a) and (c)

(AIIMS-2016)

Ans. (c): Ionic hydrides have high melting and boiling points and conduct electricity in fused states, liberating dihydrogen at the anode.

- The ionic hydrides are stoichiometric compounds of dihydrogen formed with most of the s-block elements which are highly electropositive in character. Hence, the statement is true.
- The ionic hydrides are crystalline and non-volatile and non-conducting in solid state. Thus, statement is true.

101. Consider the following statement in respect of reactivity of hydrogen

(1) Hydrogen is not reactive under ambient conditions
(2) Hydrogen reacts with fluorine violently
(3) Hydrogen and chlorine reaction is catalyzed by daylight
(4) Hydrogen and nitrogen can react directly in presence of visible light

Which of the above statement are correct?

(a) 1, 2, 3 and 4
(b) 1, 2, and 3 only
(c) 2 and 3 only
(d) 1 and 4 only

SCRA-2015

Ans. (b): Hydrogen is not reactive under ambient conditions and hydrogen reacts with fluorine violently. Hydrogen and chlorine reaction is catalyzed by daylight.

$$H_2(g) + Cl_2(g) \xrightarrow{hv} 2HCl(g)$$

Hence, statement is true.

- Hydrogen and nitrogen can't react directly in presence of visible light. Hence, statement is false.

102. H^+ ion always gets associated with other atoms or molecules due to

(a) its positive charge
(b) absence of any electron in its orbitals
(c) its resemblance with alkali metal cations
(d) small size so that it cannot exist free

SCRA-2015

Ans. (d): H^+ ion always get associated with other atoms or molecules due to small size so that it can't exist as free.

103. Assertion: Hydrogen combines with other elements by losing, gaining or sharing of electrons.

Reason: Hydrogen forms electrovalent and covalent bonds with other elements.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and reason are incorrect.

(AIIMS-2015)

Ans. (a): Hydrogen to attain stable configuration, combines with other elements by sharing of electrons which is called covalent bond and either by loosing or gaining electrons which is called electrovalent bond. Here, reason is the correct explanation of assertion.

104. 500 mL of a sample of water required 19.6 mg of $K_2Cr_2O_7$ for the oxidation of dissolved organic matter in it in the presence of H_2SO_4. The COD of water sample is

(a) 3.2 ppm
(b) 7.2 ppm
(c) 6.4 ppm
(d) 4.6 ppm

JIPMER-2015

@apna_pdf

Ans. (c) : The molecular weight of $K_2Cr_2O_7$ is 294 g/mol

$K_2Cr_2O_7 + 4H_2SO_4 \rightarrow K_2SO_4 + Cr_2(SO_4)_3 + 4H_2O + 3[O]$

$\because$ 294 g $K_2Cr_2O_7$ correspond to $3\times16 = 48$ g [O]

$\therefore$ 19.6 mg $K_2Cr_2O_7$ corresponds to $19.6\times\frac{48}{294}$

$= 3.2$ mg [O]

This is for 500 mL of sample.

for 1000 mL of sample, COD $= 3.2\times\frac{1000}{500}$

$= 6.4$ ppm.

105. Consider the following trends in properties of hydrogen halides :

1. Acidic Strength : HF < HCl < HBr < HI
2. Thermal stability : HF > HCl > HBr > HI
3. Dipole moment : HF < HCl < HBr < HI
4. Reducing power : HF > HCl > HBr > HI

The number of correct trends is :

(a) One (b) Two
(c) Three (d) Four

S. C. R. A - 2014

Ans. (b) : The trend of acidic strength down the group in 17 group is increases due to the increase the size down the group. Hence, the trend of acidic strength is correct.

Thermal stability of hydrogen halides decreases down the group 17 because the size of anions is increases. Thus, the trend of thermal stability is correct.

- Dipole moment of hydrogen halides decreases from HF to HI because the electronegativity difference decreases down the group. Hence, the correct order of dipole moment is HI < HBr < HCl < HI.

106. The radioactivity is highest for which one of the following?

(a) ortho hydrogen (b) Tritium
(c) Protium (d) Deuterium

S. C. R. A - 2014

Ans. (b) : Hydrogen have three isotope namely protium, deuterium and tritium. Tritium has two neutrons, where regular hydrogen does not have any neutron which makes tritium unstable and therefore radioactive.

107. In which one of the following properties of hydrogen, its resemblance with halogens is seen?

1. It forms oxides
2. It forms a diatomic molecule
3. Its ionization enthalpy is quite high
4. It forms numerous covalent compounds

Select the correct answer using the code given below :

(a) 2, 3 and 4 only (b) 1, 2 and 3 only
(c) 1 and 4 only (d) 1, 2, 3 and 4

S. C. R. A - 2014
(AIIMS-2000)

Ans. (a) : (i) All the halogens does not form an oxide due to high electronegativity and small size.

(ii) All the halogens are forming the diatomic molecule. So the statement is true.

(iii) As we know that in the periodic table, the halogens group shown the higher ionization energy. Hence, the statement is true.

(iv) The 17-group elements forms many number of covalent compounds.

108. Consider the following statements :

1. Atomic hydrogen is obtained by passing hydrogen through an electric arc.
2. Hydrogen gas will not reduce heated aluminium oxide.
3. Finely divided palladium absorbs large volume of hydrogen gas.
4. Pure nascent hydrogen is best obtained by reacting Na with C_2H_5OH.

Which of the above statements is/are correct?

(a) Only 1 (b) Only 2
(c) 1, 2 and 3 (d) 2, 3 and 4

(AIIMS-2012)

Ans. (c): By passing hydrogen through an electric arc, atomic hydrogen is obtained. Hydrogen gas will not reduce heated Al_2O_3 due to low reactivity of H_2 than Al, hence cannot displace Al in the reaction. Pd being neutral metal provider large volume of H_2 to be absorbed.

- Pure nascent hydrogen is best obtained by reaction with Na and C_2H_5OH.

$$C_2H_5OH + Na \longrightarrow C_2H_5ONa + \underset{\text{Nascent hydrogen}}{[H]}$$

Hence, statement is true.

109. The boiling point of water is exceptionally high because

(a) There is a covalent bond between H and O
(b) Water molecule is linear
(c) Water molecules associate due to hydrogen bonding
(d) Water molecule is not linear.

BITSAT-2012

Ans. (c) : Boiling point of water is exceptionally high because water molecules associate due to hydrogen bonding. Hydrogen bonding increases the melting point of water also.

110. Very pure hydrogen (99.9%) can be made by which of the following processes?

(a) Reaction of methane with steam
(b) Mixing natural hydrocarbons of high molecular weight
(c) Electrolysis of water
(d) Reaction of salts like hydrides with water

[AIEEE-2012]

Ans. (c) : Hydrogen of high purity is usually prepared by the electrolysis of water using platinum electrodes in presence of small amount of acid or alkali.

$$2H_2O(l) \xrightarrow{\text{electrolysis}} 2H_2(g) + O_2(g)$$

Hydrogen is collected at cathode

111. Which property among the following is same for both hydrogen and deuterium molecules?

(a) Bond energy (b) Melting point
(c) Boiling point (d) Bond length

AP-EAMCET- (Engg.)-2011

@apna_pdf

Ans. (d) : Hydrogen (H_2) and deuterium (D_2) both molecules have same bond length. The two isotopes have same atomic number therefore inter nuclear distance is same. But it has different bond energy, melting point and boiling point.

Property	**Hydrogen(H_2) 74pm**	**Deuterium 74pm**
Bond energy	436 kJ mol^{-1}	443.3 kJ mol^{-1}
Melting point	0°C	3.81°C
Boiling point	100°C	101.42°C

112. The temperature of maximum density of H_2O and D_2O respectively are

(a) 0ºC and 11.6ºC (b) 4ºC and 0ºC
(c) 4ºC and 11.6ºC (d) 4ºC and 12.5ºC

CG PET- 2011

Ans. (c) : The temperature of maximum density H_2O and D_2O are 4 °C and 11.6 °C respectively.

113. Hydrogen can have oxidation number/s of

(a) –1 only (b) +1 only
(c) 0 only (d) –1, 0, +1

JCECE - 2011

Ans. (d) : Hydrogen can have –1, 0 and +1 oxidation states.

(–1 in H^-, 0 in H atom or H_2 gas and +1 in H^+)

114. Hydrogen is prepared on large scale for an industrial use

(a) by $Zn + H_2SO_4$ (b) by $Al + NaOH$
(c) by $Na + C_2H_5OH$ (d) from water gas

CG PET -2009

Ans. (d) : Water gas is the mixture of CO and H_2 gas. To increase the production of hydrogen from water gas, CO is oxidized to CO_2 by mixing it with steam and mixture is passed over and hot $FeCrO_4$ catalyst at 673 K.

$$\underbrace{H_2 + CO}_{\text{Water gas}} + H_2O \xrightarrow[FeCrO_4]{673K} CO_2 + 2H_2$$

115. Which one of the following pairs of substances will not produce hydrogen when reacted together?

(a) Copper and conc. nitric acid
(b) Ethanol and metallic sodium
(c) Magnesium and steam
(d) Phenol and metallic sodium
(e) Sodium hydride and water

Kerala-CEE-2009

Ans. (a) : $\underset{\text{Conc.}}{Cu + 4HNO_3} \rightarrow Cu(NO_3)_2 + 2H_2O + 2NO_2\uparrow$

Copper and conc. nitric acid pairs of substances will not produce hydrogen when reacted together.

$2C_2H_5OH(l) + 2Na(s) \rightarrow 2C_2H_5ONa(l) + H_2(g)$
$Mg(s) + H_2O(g) \rightarrow MgO(s) + H_2(g)$
$C_6H_6OH + Na \rightarrow C_6H_6O^-Na^+ + H_2$
$NaH + H_2O \rightarrow NaOH + H_2$

116. The most abundant element in the universe is thought to be

(a) carbon (b) oxygen
(c) hydrogen (d) nitrogen

UPTU/UPSEE-2009

Ans. (c) : Hydrogen is the most abundant element in the universe followed by Helium.

117. In context with the industrial preparation of hydrogen from water gas ($CO+H_2$), which of the following is the correct statement?

(a) CO and H_2 are fractionally separated using differences in their densities
(b) CO is removed by absorption in aqueous Cu_2Cl_2 solution
(c) H_2 is removed through occlusion with Pd
(d) CO is oxidised to CO_2 with steam in the presence of a catalyst followed by absorption of CO_2 in alkali.

[AIEEE-2008]

Ans. (d) : On the industrial scale hydrogen is prepared from water gas according to following reaction sequence:-

$$\underbrace{CO + H_2}_{\text{water gas}} + \underbrace{H_2O}_{\text{steam}} \xrightarrow{\text{Catalyst}} CO_2 + 2H_2$$

$$\xrightarrow[\text{(alkali)}]{2NaOH} \times Na_2CO_3 + H_2O$$

From the above reaction it is clear that CO is first oxidized to CO_2 which is then absorbed in NaOH.

118. Electronic configuration of hydride ion is

(a) $1s^0$ (b) $1s^1$
(c) $1s^2$ (d) $1s^1\ 2s^1$

UP CPMT-2005

Ans. (c) : The hydride ion is H^- and its electronic configuration is $1s^2$.

119. Which of the following could act as a propellant for rockets?

(a) Liquid hydrogen + liquid nitrogen
(b) Liquid oxygen + liquid argon
(c) Liquid hydrogen + liquid oxygen
(d) Liquid nitrogen + liquid oxygen

[AIEEE-2003]

Ans. (c) : The propellant is the mixture burned to produce thrust in rockets and consists of a fuel and an oxidizer.

Liquefied gases are cryogenic propellant in which liquid hydrogen act as the fuel and liquid oxygen act as the oxidizer.

120. Which of the following reaction produces hydrogen?

(a) $Mg + H_2O$ (b) $H_2S_2O_8 + H_2O$
(c) $BaO_2 + HCl$ (d) $Na_2O_2 + 2HCl$

(AIIMS-2002)

Ans. (a): Mg reacts with hot water to produce H_2 because it is more electropositive than hydrogen.

$Mg+H_2O \rightarrow MgO+H_2$

All other reactions are used to manufacture of H_2O_2

$H_2S_2O_8+2H_2O \rightarrow 2H_2SO_4+H_2O_2$
$BaO_2+2HCl \rightarrow BaCl_2+H_2O_2$
$Na_2O_2+2HCl \rightarrow 2NaCl+H_2O_2$

121. Bond dissociation energies of HF, HCl, HBr follow the order

(a) HCl > HBr > HF (b) HF > HBr > HCl
(c) HF > HCl > HBr (d) HBr > HCl > HF

AP EAMCET- 2001

@apna_pdf

Ans. (c) : Bond dissociation energy increase when bond length is decrease.
∴ Correct order of bond dissociation energy is –
HF > HCl > HBr

122. Hydrogen has high ionisation energy than alkali metals because it has :
(a) ionic bond (b) covalent bond
(c) large size (d) small size
(AIIMS-1999)

Ans. (d): Hydrogen has only one orbital which is strongly attracted by the nucleus. Thus it has very small size than the alkali metal and hence has high ionization enthalpy.

123. Hydrogen is not more reactive at ordinary temperature, because at ordinary temperature it is in its:
(a) gaseous state (b) liquid state
(c) molecular state (d) atomic state
(AIIMS-1997)

Ans. (c): Hydrogen is not reactive at ordinary temperature because it is in molecular state. i.e. as H_2 with its completes duplet which makes it stable and lesser reactive. At very high temperature, hydrogen exists in atomic form having one electron i.e, in complete duplet which makes it less stable and highly reactive.

124. Hydrogen gas may be readily prepared in the laboratory by reacting water with
(a) Silver (b) Copper
(c) Sodium (d) Barium peroxide
AP EAMCET- 1993

Ans. (c) : $2Na+2H_2O \rightarrow 2NaOH + H_2$
Hydrogen gas readily prepared in the laboratory by reacting water with sodium.

125. At its melting point, ice is lighter than water because
(a) H_2O molecules are more closely packed in solid state
(b) ice crystals have hollow hexagonal arrangement of H_2O molecules
(c) on melting of ice the H_2O molecules shrinks in size
(d) ice forms mostly heavy water on first melting.
NEET-1992

Ans. (b) : When ice melts, its molecules move into the holes or open spaces and comes closer to each other then they were in solid state. Thus, ice has lower density than water and there is contraction in volume.
Hence, ice crystals have hollow hexagonal arrangement of H_2O molecules.

126. The ionization of hydrogen atom would give rise to
(a) hydride ion (b) hydronium ion
(c) proton (d) hydroxyl ion
NEET-1990

Ans. (c) : The ionization energy of hydrogen is less due to low ionization energy. Hydrogen readily losses is one electron to produce H^+ ion. This H+ ion is commonly known as proton as it contains only one proton and no neutron.

127. Consider the water gas equilibrium reaction,
$$C(s)+H_2O(g) \rightleftharpoons CO(g)+H_2(g)$$
Which of the following statements is true at equilibrium?
(a) If the amount of C(s) is increased, less water would be formed
(b) If the pressure of C(s) is increased, more CO and H_2 would be formed
(c) If the pressure on the system is increased by halving the volume, more water would be formed
(d) If the pressure on the system is increased by halving the volume, more CO and H_2 would be formed

Ans. (c) : Given the water gas equilibrium reaction
$$C(s)+H_2O(g) \rightleftharpoons CO(g)+H_2(g)$$
$$K=\frac{[CO(g)][H_2(g)]}{[H_2O(g)]}$$
Concentration will increase, on halving the volume. There are two terms in numerator. So to keep K constant more water would be formed.

4. Hardness of Water

128. Boiling of hard water is helpful in removing the temporary hardness by converting calcium hydrogen carbonate and magnesium hydrogen carbonate to
(a) $CaCO_3$ and $Mg(OH)_2$
(b) $CaCO_3$ and $MgCO_3$
(c) $Ca(OH)_2$ and $MgCO_3$
(d) $Ca(OH)_2$ and $Mg(OH)_2$
JEE Main-26.06.2022, Shift-II

Ans. (a) : Boiling of hard water is helpful in removing the temporary hardness.
$$Mg(HCO_3) \xrightarrow{\text{Boiling}} Mg(OH)_2 + 2CO_2\uparrow$$
$$Ca(HCO_3) \xrightarrow{\text{Boiling}} CaCO_3\downarrow + H_2O + CO_2\uparrow$$

129. The temporary hardness of a water sample is due to compound X. Boiling this sample converts X to compound Y. X and Y, respectively, are
(a) $Mg(HCO_3)_2$ and Mg $(OH)_2$
(b) $Ca(HCO_3)_2$ and $Ca(OH)_2$
(c) $Mg(HCO_3)_2$ and $MgCO_3$
(d) $Ca(HCO_3)_2$ and CaO
[JEE Main-2019, 12 April Shift-II]
[JEE Main-2019, 9 Jan Shift-II]

Ans. (a) : Temporary hardness of water is due to soluble Mg $(HCO_3)_2$ and $Ca(HCO_3)_2$
$$Mg(HCO_3)_2 \xrightarrow{\text{Boil}} Mg(OH)_2\downarrow + 2CO_2\uparrow.$$
$$Ca(HCO_3)_2 \xrightarrow{\text{Boil}} CaCO_3\downarrow + H_2O + CO_2\uparrow$$

@apna_pdf

130. Permanent hardness cannot be removed by

(a) Using washing soda
(b) Calgon's method
(c) Clark's method
(d) Ion exchange method

Kerala-CEE-29.08.2021
JEE Main-2020, 5 Sep Shift-II

Ans. (c) : The hardness of water is due to the presence of soluble bicarbonates, chlorides and sulphates of calcium and magnesium. The permanent hardness of the water can be removed by Gan's Permutit method, the Ion exchange resin method, and the washing soda method. The uses of Clark's method is that to remove the temporary hardness in the water. So, this method can not remove permanent hardness.

131. Which compound among the following is used to remove the hardness of water?

(a) $Ca_3(PO_4)_2$ (b) Na_3PO_4
(c) $Na_6P_6O_{18}$ (d) Na_2HPO_4

AP EAPCET-6 Sep. 2021, Shift-II

Ans. (c) : Sodium-hexa-meta-phosphate ($Na_6P_6O_{18}$), commercially called 'calgon' is used for water softening.

- The hardness of water is due to the presence of soluble bicarbonates, chlorides and sulfates of calcium and magnesium.
- The hardness of water is removed by the adsorption of Ca^{++} and Mg^{++} ions.
- Hard water does not give lather with soap.
- The addition of calgon to hard water causes the calcium and magnesium ions of hard water to replace sodium ion from the anion of calgon this result in the removal of calcium and magnesium ions from hard water in the form of a complex with calgon.

132. In comparison to the zeolite process for the removal of permanent hardness, the synthetic resins method is

(a) More efficient as it can exchange only cations
(b) Less efficient as it exchanges only anions
(c) Less efficient as the resins cannot be regenerated
(d) More efficient as it can exchange both cations as well as anions

[JEE Main-2020, 7 Jan Shift-I]

Ans. (d) : The difference between the zeolite and ion exchange process is that the zeolite process uses the mineral zeolite as the exchanging resin for cations in the hard water whereas the ion exchange process include several different resins for the ion exchange.

∴ Synthetic resins method is more efficient as it can exchange both cations as well as anions.

133. The method used to remove temporary hardness of water is

(a) Synthetic resins method
(b) Calgon's method
(c) Clark's method
(d) Ion-exchange method

NEET-2019

Ans. (c) : Clark's method is used to remove the temporary hardness of water in which bicarbonates of calcium and magnesium are reacted with slaked lime $Ca(OH)_2$.

$Ca(HCO_3)_2 + Ca(OH)_2 \rightarrow 2CaCO_3\downarrow + 2H_2O$

134.Permanent hardness of water cannot be removed by which one of the following methods?

(a) Treatment with washing soda
(b) Calgon's method
(c) Boiling
(d) Ion exchange method

NDA (II)-2018

Ans. (c) : The permanent hardness of water can be removed by following methods–

(i) On treatment with washing soda
(ii) By calgon's method
(iii) By Ion exchange method.
Boiling does not remove permanent hardness of water.

135. Which of the following ions will cause hardness in water?

(a) Ca^{2+} (b) Na^+
(c) Cl^- (d) K^+

Karnataka-CET-2018

Ans. (a) : Presence of calcium and magnesium salts in the form of hydrogen carbonate chloride and sulphate in water makes water 'hard'.

136. Temporary hardness in water is due to which one of the following of Calcium and Magnesium?

(a) Hydrogencarbonates (b) Carbonates
(c) Chlorides (d) Sulphates

NDA (I)-2017

Ans : (a) Temporary hardness is due to the presence of magnesium and calcium hydrogencarbonates.

It can easily removed by heating.

$$Ca(HCO_3)_2 \xrightarrow{\text{Heat}} CaCO_3\downarrow + H_2O + CO_2\uparrow$$

$$Mg(HCO_3)_2 \xrightarrow{\text{Heat}} Mg(OH)_2\downarrow + CO_2\uparrow$$

137. When zeolite (hydrated sodium aluminium silicate) is treated with hard water the sodium ions are exchanged with

(a) H^+ ions (b) Ca^{2+}ions
(c) SO_4^{2-} ions (d) OH^- ions

(AIIMS-2017)

Ans. (b): When zeolite (hydrated sodium aluminium silicate) is treated with hard water, the sodium ions are exchanged with Ca^{2+} and Mg^{2+} ions hence making water soft. The reaction occurs as

$Na_2Al_2Si_2O_8.xH_2O + Ca^{2+} \rightarrow CaAl_2Si_2O_8.xH_2O$

Hard water contains dissolved salts of chlorides, sulphates and bicarbonates of calcium and magnesium.

138. Permanent hardness of water is due to the presence of:

(a) sulphates of sodium and potassium
(b) sulphates of magnesium and calcium
(c) carbonates of sodium and magnesium
(d) bicarbonates of magnesium and calcium

NDA (I)-2015

@apna_pdf

Ans : (b) It is due to the presence of chloride and sulphate of calcium and magnesium. These salts do not decompose on boiling. So, permanent hardness can't be removed easily. It can be removed by Soda(Na_2CO_3), surfactant (Na_3PO_4) or lime ($Ca(OH)_2$) when $MgSO_4$ is responsible for hardness.

139. Which one the following remove temporary hardness of water?

(a) Slaked lime (b) Plaster of pairs
(c) Epsom (d) Hydrolith

BITSAT-2015

Ans. (a) : This method is know as Clark's process. In this method temporary hardness is removed by adding lime water or milk of lime.

$Ca(OH)_2 + Ca(HCO_3)_2 \rightarrow 2CaCO_3\downarrow + 2H_2O$.

140. On which of the following principles hydrogen bomb is based?

(a) Nuclear fission
(b) Nuclear fusion
(c) Artificial radioactivity
(d) Natural radioactivity

CG PET -2004

Ans. (b) : A hydrogen bomb is based on the principle of uncontrollable nuclear fusion. Nuclear fusion is the process where the nuclei of two light atoms combine to form a new nucleus.

- No combustion occurs in nuclear power (fission or fusion), so there is no air pollution.
- Less nuclear waste - The fusion reactors will not produce high level nuclear wastes like their fission counterparts so that disposal will be less of a problem.

141. The hardness of water is estimated by :

(a) conductivity method (b) titrimetric method
(c) EDTA method (d) distillation method

BCECE-2003

Ans. (c) : Ethylene diamine tetra acetic acid (EDTA) when treated with water, forms stable complex with the metal ions present in the hard water. Since stability constants of calcium and magnesium complexes of EDTA are different even the selective estimation of these ions is possible.

142. Which one of the following processes will produce hard water?

(a) Saturation of water with $CaCO_3$
(b) Saturation of water with $MgCO_3$
(c) Saturation of water with $CaSO_4$
(d) Addition of Na_2SO_4 to water

[AIEEE-2003]

Ans. (c) : Permanent hardness of water is due to chlorides and sulphates of calcium and magnesium i.e $CaCl_2$, $CaSO_4$, $MgCl_2$ and Mg SO_4.

143. Which process is used for the removal of hardness of water?

(a) Calgon (b) Baeyer
(c) Serpeck (d) Hoope

AP EAMCET- 2001

Ans. (a) Calgon process is used for the removal of hardness of water**.**

- The Baeyer's process is used for leaching of Aluminium metal.
- Serpeck process is used for purification of bauxite ore containing silica (SiO_2) as the main impurity.
- The Hoope process is a metallurgical process, used to obtain the aluminium metal of very high purity.

144. Permanent hardness of water is due to

(a) The chlorides of Ca and Mg
(b) The sulphates of Ca and Mg
(c) Both chlorides and sulphates of Ca and Mg
(d) The bicarbonates of Ca and Mg

AP EAMCET- 1994

Ans. (c) : Permanent hardness of water is due to both chlorides and sulphates of Ca and Mg. We can remove this hardness by treating the water with washing soda (Na_2CO_3).

145. Temporary hardness of water is due to the presence of .... of calcium and magnesium in water.

(a) Chlorides (b) Sulphates
(c) Bicarbonates (d) Phosphates

AP EAMCET- 1993

Ans. (c) : Calcium and magnesium bicarbonates cause temporary hardness while chlorides and sulphates of calcium and magnesium are caused by permanent hardness of water.

146. The hardness of water samle containing 0.002 mol of magnesium sulphate dissolved in a litre of water is expressed as

(a) 20 ppm (b) 200 ppm
(c) 2000 ppm (d) 120 ppm
(e) 240 ppm

Kerala-CEE-2007

Ans. (b) : The hardness of water sample containing 0.002 mole of

$MgSO_4$ dissolved in 1 L of water.

$$\text{Number of moles } = \frac{\text{mass}}{\text{molecular mass}}$$

$$0.002 = \frac{\text{mass}}{120}$$

mass = 240×10^{-3} ie,

240×10^{-3} g mass of $MgSO_4$ in 1 L of water.

$\therefore$ 10^3g of H_2O contains = 0.240 g of $MgSO_4$

$\because$ 10^6 g of H_2O contains = $\frac{0.240\times10^6}{10^3}$ g of $MgSO_4$ =

0.240×10^3 g of $MgSO_4$

$\because$ 10^6 g of water contains = 240g of $MgSO_4$ 120g $MgSO_4 \equiv$ 100g fo $CaCO_3$ 240g of $MgSO_4$

$$= \frac{100\times240}{120} = 200\text{g of } CaCO_3$$

Hence, hardnes of H_2O = 200 ppm.

@apna_pdf

11.

The Main Group Elements

1. Alkali Metals

1. s-block element which cannot be qualitatively confirmed by the flame test is

(a) Li (b) Na

(c) Rb (d) Be

JEE Main-26.06.2022, Shift-II

Ans. (d) :

Li	Crimson Red
Na	Yellow
Rb	Red violet
Be	No color

Beryllium does not give flame test because of its small size and high ionization energy the energy of flame is not sufficient to provoke the elements to higher energy level.

2. Match List-I with List-II

List-I		List-II	
(Metal)		[Emitted light wavelength(nm)]	
a.	Li	I.	670.8
b.	Na	II.	589.2
c.	Rb	III.	780.0
d.	Cs	IV.	455.5

Choose the most appropriated answer from the options given below:

(a) (a)-(I), (b)-(II), (c)-(III), (d)-(IV)

(b) (a)-(III), (b)-(II), (c)-(I), (d)-(IV)

(c) (a)-(III), (b)-(I), (c)-(II), (d)-(IV)

(d) (a)-(IV), (b)-(II), (c)-(I), (d)-(III)

JEE Main-29.06.2022, Shift-I

Ans. (a)

Metal	Li	Na	K	Rb	Cs
Wavelength (λ) in nm.	670.8	589.2	766.5	780.0	455.5
Colour	Crimson-red	yellow	violet	Red Violet	Blue

3. Which of the following statements are correct?

(A) Both LiCl and $MgCl_2$ are soluble in ethanol.

(B) The oxides Li_2O and MgO combine with excess of oxygen to give superoxide.

(C) LiF is less soluble in water than other alkali metal fluorides.

(D) Li_2O is more soluble in water than other alkali metal oxides.

Choose the most appropriate answer from the options given below:

(a) (A) and (C) only

(b) (A), (C) and (D) only

(c) (B) and (C) only

(d) (A) and (D) only

JEE Main-24.06.2022, Shift-I

Ans. (a) : (a) Both LiCl and $MgCl_2$ are covalent in nature due to high polarizing power of Li^+ and Mg^{+2} ions so, they are soluble in ethanol.

(b) Lithium and magnesium ion is small in size it cannot stabilize larger peroxide. So, oxide of Li_2O and MgO do not form superoxide.

(c) LiF is comparatively less soluble among all other alkali metal fluoride due to high lattice energy of LiF.

(d) Li_2O have high lattice enthalpy than hydration enthalpy hence, it is less soluble among all other alkali metal oxide.

4. Which of the following is added to commercial salt to control hypothyroidism?

(a) Magnesium iodide (b) Potassium iodide

(c) Sodium iodide (d) Calcium iodide

(e) Lithium iodide

Kerala CEE -03.07.2022

Ans. (c) : Sodium iodide is added to commercial salt as sodium iodide is used to treat hypothyroidism (an overactive thyroid) and certain kind of thyroid cancer.

5. The correct order of hydration enthalpies of alkali is

(a) $Li^+ > Na^+ > K^+ > Rb^+$ (b) $Rb^+ > K^+ > Na^+ > Rb^+$

(c) $Na^+ > K^+ > Li^+ > Rb^+$ (d) $K^+ > Rb^+ > Na^+ > Li^+$

AIIMS-2000

Ans. (a): Hydration enthalpies– Energy released for the formation of new bonds between ions and water molecules is called hydration enthalpy. Hydration enthalpies of alkaline earth metal ions decreases top to bottom with the increasing ionic size.

The ionic size of the atom loses or gains electrons to become negatively charged or positively charged ions. When atoms lose or gain electrons, the size of the ion is not same as the parent atom. Thus, the correct order of hydration enthalpies are–

$Li^+ > Na^+ > K^+ > Rb^+$

6. Which property of hydrogen points its more resemblance with halogen family members as compared to alkali metals?

(a) Affinity for non-metals

(b) Ionization potential

(c) Electronic configuration

(d) Reducing nature

SCRA-2012

Ans. (d) The following properties of hydrogen points its more resemblance with halogen family members as compared to alkali metals are-

(i) It shows +1 oxidation state like alkali metal.

(ii) It is a strong reducing agent like other alkali metals.

(iii) It is librated at the cathode during electrolysis of compounds

@apna_pdf

7. **Consider the following statements:**
Statement- I Cesium is useful as electrodes in photoelectric cells
Statement-II Light energy absorbed by cesium is sufficient to make an atom of cesium lose an electron.
Which one of the following is correct in respect of the above statements?
(a) Both the statements are true and statement II is the correct explanation of statement-I
(b) Both the statements are true but statement I is true, but statement II is not the correct explanation of statement II is false
(c) Statement I is true but statement II is false
(d) Statement I is false but statement II is true

SCRA-2015

Ans. (a): Cesium is useful as electrodes in photoelectric cell because it can easily convert sunlight into electricity because it has low work function. Light energy absorbed by cesium is sufficient to make an atom lose their a valence electron.

8. **The alum used for purifying water is**
(a) Ammonium alum (b) Chrome alum
(c) Ferric alum (d) Potash alum

Ans. (d) : Alum helps in purifying water by potash alum which helps to coagulate the mud particles because of the high charge on the aluminium (Al^{3+}) ion.

9. **Which of the following sets of raw materials is used in the manufacture of Na_2CO_3 by Solvay process?**
(a) $Ca(OH)_2$, NH_3, CO_2 (b) $CaCl_2$, NH_3, CO_2
(c) $NaOH$, NH_3, CO_2 (d) $NaCl$, NH_3, CO_2

AP EAMCET- 1999

Ans. (d) : Solvay process is a manufacturing process of Na_2CO_3 in which soda from common salt by passing carbon dioxide into ammonical brine resulting in precipitation of sodium bicarbonate which is then calcined to carbonate.

$$NH_3 + H_2O + CO_2 \rightarrow NH_4HCO_3$$

$$NH_4HCO_3 + NaCl \rightarrow NaHCO_3 + NH_4Cl$$

$$2NaHCO_3 \xrightarrow{\text{roasting}} Na_2CO_3 + H_2O + CO_2$$

So, the raw material used is $NaCl$, NH_3, CO_2.

10. **In the Castner's process of extraction of sodium cathode is**
(a) Iron rod (b) Nickel rod
(c) Copper rod (d) Graphite rod

AP EAMCET- 2000

Ans. (a) : The Castner's process is a process for manufacturing of sodium metal by electrolysis of molten sodium hydroxide at 330°C.

In Castner's process, cathode is made by iron rod and anode is made by graphite rod.

11. **An element forms a solid oxide which when is dissolved in water to forms an acidic solution. The elements is**
(a) Neon (b) Sodium
(c) Phosphorus (d) Sulphur

MPPET- 2009

Ans. (c) : Phosphorus is forms solid oxide which dissolved in water to forms an acidic solution.

$P_4 + 5O_2 \rightarrow 2P_2O_5$

$P_2O_5 + 3H_2O \rightarrow 2H_3PO_4$

12. **Liquefaction of helium gives two phases called helium-I and helium-II. Consider the following statements :**
1. Helium-I is formed at 4.2 K.
2. Helium-II is formed at 4.2 K.
3. Helium-II is a superconductor.
4. Viscosity of Helium-II is nearly zero.

Which of the above statements are correct?
(a) 1 and 2 only (b) 1, 3 and 4 only
(c) 2, 3 and 4 only (d) 1, 2, 3 and 4

S. C. R. A - 2014

Ans. (b) : The correct statement of liquefaction of helium are–
- Helium-I is formed at 4.2 K
- Helium-II is a superconductor
- Viscosity of Helium-II is nearly zero

13. **Alkali metals are powerful reducing agents because_____**
(a) They are metals
(b) They are monovalent
(c) Their ionic radii are large
(d) Their ionization energies are low

AP EAPCET 23-08-2021 Shift-I

Ans. (d) : Alkali metals are powerful reducing agent because alkali metals have one valence electron which they lose to attain stability. Alkali metals have low ionization energies and easily lose an electron and therefore act as reducing agent.

14. **Orange red coloured monoxide**
(a) K_2O (b) Na_2O
(c) Cs_2O (d) Li_2O

AP EAMCET (Medical) - 2013

Ans. (c) : Cs_2O is orange red coloured.
Li_2O and N_2O are white solids as expected but surprisingly K_2O is pale yellow, Rb_2O is bright yellow. This is due to the gradually increasing ionic character from Li_2O to Cs_2O.

15. **Which factor makes Li the strongest reducing agent in aqueous solution?**
(a) Sublimation enthalpy
(b) Ionisation enthalpy
(c) Hydration enthalpy
(d) Electron gain enthalpy

AP EAMCET (Engg.) 21.09.2020, Shift-I

Ans. (c) : Lithium has highest hydration enthalpy, which accounts for its high negative E° value and its high reducing power. Hence, the correct option is (c).

16. **Assertion (A): Na^+ and Mg^{2+} ions are isoelectronic but the ionic radius of Na^+ is greater than that of Mg^{2+}**
Reason (R): The effective nuclear charge of Na^+ ion is less than that of Mg^{2+} ion
(a) Both (A) and (R) are correct but (R) is not the correct explanation of (A).
(b) Both (A) and (R) are correct and (R) is correct explanation of (A).

@apna_pdf

(c) (A) is not correct but (R) is correct
(d) (A) is correct but (R) is not correct

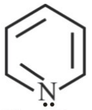
AP EAMCET-2017

Ans. (b) : The effective nuclear charge of Na^+ ion is less that of Mg^+ ion and Na^+ and Mg^{2+} ions are isoelectronic but the ionic radius of Na^+ is greater than that of Mg^{2+}.

17. Statement I : Sodium hydride can be used as an oxidising agent.
Statement II : The lone pair of electrons on nitrogen in pyridine makes it basic.
Choose the CORRECT answer from the options given below:
(a) Both statement I and statement II are true
(b) Both statement I and statement II are false
(c) Statement I is true but statement II is false
(d) Statement I is false but statement II is true

JEE Main 16.03.2021, Shift-II

Ans. (d) : The statement I is false because sodium hydride (NaOH) is the strong hydride donor (H^-) due to which they can not be used as oxidising agent. In pyridine, the lone pair of 'N' is localised makes it basic.



Pyridine

18. Which of the following pair has bleaching property
(a) O_3 and NO_2 (b) O_3 and H_2S
(c) SO_2 and Cl_2 (d) Cl_2 and NO_2

MPPET-2008

Ans. (c) : SO_2 and Cl_2. Bleaching action of Chlorine is the result of its oxidation and is permanent while bleaching action of sulphurdioxide is due to reduction and it is temporary.

19. The most electro + ve element in alkali metals is
(a) Na (b) K
(c) Rb (d) Cs

MPPET-2008

Ans. (d) : On moving from top to button in a group to alkali metals, electropositive character is increases.
Hence, Cs is most electropositive element.

20. Choose the alkali metal with highest reactivity among the following
(a) Cs (b) Li
(c) Na (d) Rb

AP EAMCET (Engg.) 18.9.2020 Shift-I

Ans. (a) : Among the alkali metals (group-1), Cs is most reactive because of its lowest ionization energy.
Reactivity order is Li < Na < K < Rb < Cs

21. Identify the products formed when chlorine reacts with cold and dilute sodium hydroxide solution.
(a) NaCl, $NaClO_3$, H_2O (b) NaCl, $NaClO_4$, H_2O
(c) NaCl, NaOCl, H_2O (d) NaCl, HCl, H_2O

AP EAMCET (Engg.) 18.9.2020 Shift-I

Ans. (c) :

$$Cl_2 + \underset{\substack{\text{Cold \& dilute}\\\text{sodium hydroxide}}}{2NaOH} \rightarrow \underset{\substack{\text{Sodium}\\\text{chloride}}}{NaCl} + \underset{\substack{\text{Sodium}\\\text{hydrochloride}}}{NaOCl} + H_2O$$

22. Assertion (A) : Helium and Beryllium have similar have similar outer electronic configuration ns^2
Reason (R) : Both are chemically inert
(a) Both (A) and (R) are correct and (R) is the correct explanation of (A)
(b) Both (A) and (R) correct but (R) is not the correct explanation of (A)
(c) (A) is correct but (R) is incorrect
(d) Both (A) and (R) are incorrect

AP EAPCET 24.08.2021 Shift-II

Ans. (c) : Helium is a inert element due to presence of $1s^2$ electronic configuration while Beryllium belongs from s-block element having $2s^2$ electronic configuration and it is chemically reactive.

23. Match the following species with the correct number of electrons present in them:

Species		Number of Electrons	
(i)	Be^{2+}	(a)	0
(ii)	H^+	(b)	10
(iii)	Na^+	(c)	2
(iv)	Mg^+	(d)	11
		(e)	4

(a) (i – d), (ii – c), (iii – b), (iv – a)
(b) (i – a), (ii – b), (iii – c), (iv – d)
(c) (i – e), (ii – d), (iii – a), (iv – c)
(d) (i – c), (ii – a), (iii – b), (iv – d)

AP EAPCET 20.08.2021 Shift-I

Ans. (d) : $_4Be : 1s^2\,2s^2$.
$Be^{2+} : 1s^2$
So, the no. of electron = 2
$_1H = 1s^1$
For, $H^+ : 1s^0$
So, the no. of electron = 0
For, $_{11}Na : 1s^2\,2s^2\,2p^6\,3s^1$
$Na^+ : 1s^2\,2s^2\,2p^6\,3s^0$
So, the no. of electron = 10
For $_{12}Mg : 1s^2\,2s^2\,2p^6\,3s^2$
$Mg^+ : 1s^2\,2s^2\,2p^6\,3s^1$
So, the no. of electron = 11

24. When borax is dissolved in water. It gives an alkaline solution. The alkaline solution consists the following products.
(a) NaOH & BH_3 (b) NaOH & H_3BO_3
(c) $NaHCO_3$ & H_3BO_3 (d) Na_2CO_3 & H_3BO_3

AP EAPCET 19-08-2021 Shift-I

Ans. (b) : Chemical Formula of borax is $Na_2\,B_4\,O_7\,10\,H_2O$.

$$Na_2B_4O_7 + 7H_2O \longrightarrow \underset{\substack{\text{Sodium hydroxide}\\\text{(Strong base)}}}{2NaOH} + \underset{\substack{\text{Boric acid}\\\text{(Weak acid)}}}{4H_3BO_3}$$

Alkaline Solution

@apna_pdf

25. Assertion (A) K, Rb and Cs form superoxides
Reason (R) The stability of superoxides increases from K to Cs due to decrease in lattice energy.

(a) Both A and R are true and R is a correct explanation for A
(b) Both A and R are true but R is not a correct explanation for A
(c) A is true, R is false
(d) A is false. R is true

AP EAPCET 19-08-2021 Shift-I
BITSAT-2009

Ans. (a) : K, Rb, Cs form superoxides when they are burned in the air. As we move down the group, the size of an atom from K to Cs increases so, lattice energy decreases and hence the stability of superoxide also increases.

26. Which one of the following elements forms highest number of compounds ?

(a) Oxygen (b) Hydrogen
(c) Chlorine (d) Carbon

NDA (I)-2017

Ans : (b) Hydrogen forms highest number of compounds because hydrogen can form bonds with all metals, metalloids, and non-metals except group 18.

27. In organic reactions, sodium in liquid ammonia is used as

(a) Reducing agent (b) Hydrating agent
(c) Oxidizing agent (d) Precipitating agent

AP EAMCET (Engg.) 2001

Ans. (a) : Na is a metal and the property of metal is to loose their valence electron, the substance which loose the electron is known as oxidation.
The substance which is oxidize act as reducing agent.

28. In photoelectric effect, if the energy required to overcome the attractive forces on the electron (work functions) of Li, Na and Rb are 2.41 eV, 2.30 eV and 2.09 eV respectively, the work function of 'K' could approximately be in eV

(a) 2.52 (b) 2.20
(c) 2.35 (d) 2.01

AP EAMCET (Engg.) 2012

Ans. (b) : As the size of atom increases energy required to overcome the attractive force on outermost electron decreases. Increasing the size of group-I

$\mathrm{Li < Na < K < Rb}$

Thus, the energy in case of K is intermediate of Rb, and Na i.e.

$2.30 < \mathrm{K} < 2.09$

$\therefore$ The energy of K is 2.20 eV.

29. Sodium dissolves in liquid NH_3 to give a deep blue solution. This is due to

(a) Ammoniated Na^+
(b) Ammoniated Na^-
(c) Formation of Na+/Na– pair
(d) Ammoniated electrons.

COMEDK-2014

Ans. (d) :

$$\mathrm{M + (a+b)NH_3 \rightarrow [M(NH_3)_x]^+ + [e(NH_3)_y]^-}$$

The deep blue colour of the solution is due to the ammoniated electron which absorbs energy in the visible region of light and thus imparts blue colour to the solution.

30. In Castner-Kellner cell for production of sodium hydroxide

(a) brine is electrolyzed using graphite electrodes
(b) molten sodium chloride is electrolyzed
(c) sodium amalgam is formed at mercury cathode
(d) brine is electrolyzed with Pt electrodes.

Karnataka NEET-2013

Ans. (c) : Sodium amalgam is formed at mercury cathode for the production of sodium hydroxide in Castner-Kellner cell.

31. The correct order of stability for the following superoxides is.

(a) $KO_2 > RbO_2 > CsO_2$
(b) $RbO_2 > CsO_2 > KO_2$
(c) $CsO_2 > RbO_2 > KO_2$
(d) $KO_2 > CsO_2 > RbO_2$

AP-EAMCET (Medical), 2008

Ans. (c) : As the size of alkali metal ions increases, the stability of superoxides increases. If the size of superoxides ion is large then large cation can be stabilised more by large anion. Hence, the order of stability of superoxides of alkali metal is:

$CsO_2 > RbO_2 > KO_2$.

32. Sodium metal reacts with Al_2O_3 at high temperature to give a sodium compound X. X reacts with carbon dioxide in water to form Y. Y is

(a) Na_2O_2 (b) Na_2O
(c) Na_2CO_3 (d) $NaAlO_2$

AP-EAMCET (Medical), 2002

Ans. (c) : Following reaction occur during the process –

$$\underset{\text{Sodium}}{\mathrm{Na}} + \underset{\text{Aluminium oxide}}{\mathrm{Al_2O_3}} \xrightarrow{\text{high temp.}} \underset{\text{'X'}}{\mathrm{Na_2O}} + \mathrm{Al} \xrightarrow[\text{water}]{\mathrm{CO_2}\text{ in}} \underset{\text{sodium carbonate 'Y'}}{\mathrm{Na_2CO_3}}$$

33. What are the products formed when Li_2CO_3 undergoes decomposition?

(a) $Li_23_2 + CO$ (b) $Li_2O + CO$
(c) $Li_2O + CO_2$ (d) $LiO_2 + CO$

AP-EAMCET (Medical), 2002

Ans. (c) : The thermal decomposition of lithium carbonate gives lithium oxide and carbon dioxide.

$$\underset{\text{Lithium carbonate}}{\mathrm{Li_2CO_3}} \xrightarrow{\Delta} \underset{\text{Lithium oxide}}{\mathrm{Li_2O}} + \underset{\text{Carbondioxide}}{\mathrm{CO_2}}$$

34. The correct order of electrical conductivity of alkali metals ions in their aqueous solution for Cs^+, K^+, Na^+ and Li^+ is

(a) $Cs^+ > K^+ > Na^+ > Li^+$
(b) $K^+ > Cs^+ > Li^+ > Na^+$
(c) $Cs^+ > K^+ > Li^+ > Na^+$
(d) $Li^+ > Na^+ > K^+ > Cs^+$

TS EAMCET 04.08.2021, Shift-I

@apna_pdf

Ans. (a) : Smaller the ion, greater is the degree of hydration and hence lesser is the ionic mobility. Since, Li^+ ion has the maximum degree of hydration, so it has lowest ionic mobility. Since, the degree of hydration decrease from Li^+ to Cs^+. Therefore, ionic conductance increases from Li^+ to Cs^+.

35. One of the by-products formed during the recovery of NH_3 from Solvay process is:

(a) NH_4Cl (b) $Ca(OH)_2$
(c) $CaCl_2$ (d) $NaHCO_3$

JEE Main 17.03.2021, Shift-II

Ans. (c) : By Solvay process, we can make the Na_2CO_3. The recovery of ammonia from Solvay process is given as-

$$\underset{\text{Calcium hydroxide}}{Ca(OH)_2(s)} + \underset{\text{Ammonium Chloride}}{2NH_4Cl(aq)} \longrightarrow \underset{\text{Ammonia}}{2NH_3(g)} + \underset{\text{Calcium Chloride}}{CaCl_2(aq)} + \underset{\text{Water}}{2H_2O}$$

36. Assertion: The alkali metal dissolves in liquid NH_3 giving deep blue solution.

Reason: Blue color of the solution is due to the ammoniated electron which absorbs energy in visible region of light.

(a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS 25 May 2019 (Morning)

Ans. (a): The alkali metals dissolve in liquid NH_3 giving deep blue solution. This blue colour of the solution is due to the ammoniated electron which absorbs energy in the visible region of light.

37. Which of the following is a strong reducing agent?

(a) Cr (b) Cl
(c) Na (d) Ca

AIIMS-1994

Ans. (c) : Sodium (Na) element is a good reducing agent because it belongs to I-group and have only one valence electron which is easy to loose and attain noble gas electronic configuration.

38. Which of the following metal reacts with water?

(a) copper (b) nickel
(c) sodium (d) silver

AIIMS-1994

Ans. (c): Sodium

Sodium will react with water yielding NaOH and H_2 gas.

$$2H_2O + 2Na \longrightarrow 2NaOH + H_2$$

39. Assertion: NaCl (aq) electrolysis produces Na metal.

Reason: Na^+ is obtained at cathode.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

(AIIMS-27 May, 2018-Evening)

Ans. (a): On electrolysis of NaCl (aq), Na^+ is obtained at cathode because we know that cathode is –ve charge and Na^+ is +ve charge.

Therefore, they attract each other due to presence of opposite charge.

So, both (A) and (R) are correct and (R) is the correct explanation of (A).

40. Assertion: K, Rb and Cs (all belonging to group 1) can also form superoxides.

Reason: The ionic radii of K, Rb and Cs show the following trend $Cs^+ < Rb^+ < K^+$.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

(AIIMS-2014)

Ans. (c): K, Rb and Cs belongs to I-group of s-block element and also forms superoxide.

The correct order of the ionic radii of K, Rb and Cs is -

$Cs^+ > Rb^+ > K^+$

So, (A) is correct but (R) is not correct.

41. Assertion: Lithium carbonate is not so stable to heat.

Reason: Lithium being very small in size polarizes large CO_3^{2-} ion leading to the formation of more stable Li_2O and CO_2.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

(AIIMS-2017)

Ans. (a): Lithium carbonate (Li_2CO_3) is not thermally stable because the size of Li is very small due to which polarises large CO_3^{--} ion leading to the formation of more stable Li_2O and CO_2.

So, both (A) and (R) are correct and the (R) is the correct explanation of (A).

42. The decarboxylating agent is

(a) sodamide (b) sodium peroxide
(c) sodalime (d) sodium hydride.

COMEDK-2011

@apna_pdf

Ans. (c) : Sodalime is a mixture of sodium hydroxide and CaO. It is called decarboxylating agent (NaOH+CaO).

43. On heating sodium metal in dry ammonia, the compound formed is

(a) sodium hydride
(b) sodium azide
(c) sodium nitride
(d) sodium amide.

COMEDK-2019

Ans. (d) : $2Na + 2NH_3 \xrightarrow{300°C} 2NaNH_2 + H_2$

In this reaction, sodium amide is formed.

44. Sodium is not ordinarily observed in the +2 oxidation state because of its

(a) High first ionization potential
(b) High second ionization potential
(c) High ionic radius
(d) High electronegativity.

COMEDK-2017

Ans. (b) : High second ionisation potential

$$Na_{11} = 1s^2, 2s^2, 2p^6, 3s^1$$

$$\overset{+}{Na} = 1s^2, 2s^2, 2p^6$$

After removal of one valence electron of Na it is converted into p^6 electronic configuration, which have completely filled p-orbital, which would required very high energy to form $\overset{2+}{Na}$.

45. Which one of the following is used for reviving the exhausted 'permutit'?

(a) HCl solution
(b) 10% $CaCl_2$ solution
(c) 10% $MgCl_2$ solution
(d) 10% NaCl solution

AP-EAMCET (Medical), 2003

Ans. (d) : As we used the permutit to remove the hardness of water, by using it over time to time, it gets exhausted because whole of the sodium zeolite or sodium permutit gets converted into Ca or Mg permutit. Thus, if we want to revive the exhausted permutit, we need to treat with 10% NaCl solution.

$$CaZ + 2NaCl \rightarrow Na_2Z + CaCl_2$$

46. The alkali metals have relatively low melting point. Which one of the following alkali metals is expected to have highest melting point?

(a) Li
(b) Na
(c) K
(d) Rb

NDA (II)-2015

Ans : (a) Lithium is a following alkali metal is excepted to have highest melting point.

- Atomic number of Lithium is 3.
- It have low density as well as viscosity but vigrously react with water.

47. The chemical name of baking soda is

(a) Na_2CO_3
(b) $NaHCO_3$
(c) $CaCO_3$
(d) NaOH

NDA (I)-2017

Ans : (b) The chemical name of baking soda is sodium hydrogen carbonate ($NaHCO_3$). It is sometimes added for faster cooking. It is also an ingredient in antacids. Being alkaline, it neutralizes excess acid in the stomach and provides relief.

48. Which one of the following elements is least reactive with water?

(a) Lithium
(b) Sodium
(c) Potassium
(d) Cesium

NDA (I)-2017

Ans : (a) All of the alkali metals react with water to form hydrogen and hydroxide ion, Li, Na, K, Rb and Cs react in order of reactivity. Lithium is least reactive with water.

49. Which one of the following alkali metals has lowest melting point?

(a) Sodium
(b) Potassium
(c) Rubidium
(d) Caesium

NDA (I)-2018

Ans. (d) : Caesium has the lowest melting point in alkali metals. As going downward to the group, the atomic size increase, this means the atomic size of caesium is highest due to its highest size its melting point is lowest in alkali metals.

50. Which one of the following metals is alloyed with sodium to transfer heat in a nuclear reactor?

(a) Potassium
(b) Calcium
(c) Magnesium
(d) Strontium

NDA (I)-2018

Ans. (a) : Sodium-Potassium (NaK) is the alloyed used to transfer heat in a nuclear reactor.

51. Which one of the following is the chemical formula of Washing Soda?

(a) $NaHCO_3$
(b) $Na_2CO_3 . 10H_2O$
(c) $Na_2CO_3 . 5H_2O$
(d) NaOH

NDA (I)-2018

Ans. (b) : The chemical formula of washing soda is $Na_2CO_3.10H_2O$ and the common name is washing soda. The recrystallization of sodium carbonate from water produces washing soda.

52. Assertion: LiCl is predominantly a covalent compound.

Reason: Electronegativity difference between Li and Cl is too small.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

(AIIMS-2012)

Ans. (c): LiCl is predominantly a covalent compound due to the bonding between electropositive and electronegative element while the electronegativity difference between Li and Cl is quite large.

So, (A) is correct but (R) is not correct.

@apna_pdf

53. Assertion: Potassium and cesium are used in photoelectric cells.

Reason: Potassium and cesium emit electrons on exposure to light.

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

(AIIMS-2002)

Ans. (a): Potassium and Cesium are used in photoelectric cells because Potassium and Cesium lose their valence electron in the presence of light which carry the electric current. K and Cs are operated in photoelectric cells which are careful to blue light.

So, (A) and (R) are correct and (R) is the correct explanation of (A).

54. In the following sequence of reaction, identify the compounds (A), (B) (C) and (D) :

$$\underset{\text{Solution}}{Na_2CO_3} \xrightarrow{SO_2} (A) \xrightarrow{Na_2CO_3}$$

$$(B) \xrightarrow[\text{Heat}]{S} (C) \xrightarrow{AgNO_3} (D)$$

(a) Na_2SO_3, $NaHSO_3$, Na_2S, Ag_2S
(b) $NaHSO_3$, Na_2SO_3, $Na_2S_2O_3$, Ag_2S
(c) $NaHSO_3$, Na_2SO_4, Na_2S, Ag_2O
(d) Na_2SO_3, Na_2SO_4, $Na_2S_2O_3$, Ag

(AIIMS-27 May, 2018-Evening)

Ans. (b) : The complete reaction is as follows-

$$Na_2CO_3 \xrightarrow{SO_2} \underset{\substack{\text{Sodium hydrogen}\\ \text{(A) Sulphide}}}{NaHSO_3} \xrightarrow{Na_2CO_3} \underset{\substack{\text{Sodium}\\ \text{Sulphide}\\ \text{(B)}}}{Na_2So_3} \xrightarrow[\text{heat}]{S} \underset{\substack{\text{Sodium}\\ \text{Thio-Sulphide}\\ \text{(C)}}}{Na_2S_2O_3}$$

$$\text{(C)} \xrightarrow{AgNO_3} \underset{\substack{\text{(D) Silver}\\ \text{Sulphide}}}{Ag_2S}$$

Hence, $NaHSO_3$, Na_2SO_3, $Na_2S_2O_3$, Ag_2S are A, B, C, D respectively.

55. Which of the following is commercially known as oxone?

(a) Na_2O_2+HCl
(b) Na_2O + HCl
(c) Na_2O_2 + Na_2
(d) None of these

(AIIMS-2014)

Ans. (a): Sodium peroxide (Na_2O_2) and hydrochloride acid (HCl) is commercially known as oxone. Na_2O_2 is act as oxidizing agent while HCl is act as reducing agent.

Hence, Na_2O_2 + HCl is correct.

56. Which of the following is not correct?

(a) $2Li_2O \xrightarrow[673K]{heat} Li_2O_2 + 2Li$
(b) $2K_2O \xrightarrow[673K]{heat} K_2O_2 + 2K$
(c) $2Na_2O \xrightarrow[673K]{heat} Na_2O_2 + 2Na$
(d) $2Rb_2O \xrightarrow[673K]{heat} Rb_2O_2 + 2Rb$

(AIIMS-2016)

Ans. (a): $2Li_2O \xrightarrow[673k]{heat} Li_2O_2 + 2Li$ (Reaction not possible)

Since, lithium does not forms peroxide. So, option (a) is not correct.

57. Brine is an aqueous solution of

(a) NaCl
(b) NaOH
(c) $NaHCO_3$
(d) Na_2CO_3

NDA (I)-2018

Ans. (a) : Brine is an aqueous solutions of Sodium Chloride (NaCl). Brine naturally occurs on the Earth's surface (salt lakes), crust and within brine pools on the ocean bottom.

58. Which of the following statement is wrong for Solvay process?

(a) NH_3 is regenerated.
(b) $CaCl_2$ is one of the by product.
(c) $CaCO_3$ is used completely in reaction.
(d) Na_2CO_3 is partially converted into bi-carbonate.

(AIIMS-27 May, 2018-Morning)

Ans. (d): Solvay process is the industrial process for the production of sodium carbonate.

$$NaCl + NH_3 + CO_2 + H_2O \longrightarrow NaHCO_3(s) + NH_4Cl$$

$$NaHCO_3 + heat \longrightarrow \underset{\substack{\text{Sodium}\\ \text{Carbonate}}}{Na_2CO_3} + H_2O + CO_2$$

So, Na_2CO_3 is partially converted into bicarbonate.

Hence, option (d) is correct.

59. The order of solubility of lithium halides in non polar solvents follows the order:

(a) LiI > LiBr > LiCl > LiF
(b) LiF > LiI > LiBr > LiCl
(c) LiCl > LiF > LiI < LiBr
(d) LiBr > LiCl > LiF > LiI

(AIIMS-2012)

Ans. (a): A covalent compound is more soluble is non polar solvents.

As the size of the anion increases from F^- to I^- the covalent character increases and hence the solubility of lithium halides in non polar solvent is

: LiI > LiBr > LiCl > LiF

So, option (a) is correct.

60. Which property of sodium is being used in street lights?

(a) It shows photoelectric effect.
(b) It has low melting point.
(c) Sodium atom emits photons in the yellow region of visible spectrum, due to electrically stimulated transitions.
(d) Sodium vapours show golden colour.

(AIIMS-2011)

@apna_pdf

Ans. (c): Sodium is belongs from the I-group, s-block elements it emits photons in the yellow region of visible spectrum due to electricity stimulated transition is operated in street lights. So, option (c) is correct.

61. The commercial salt is purified by passing
(a) H_2S gas through an alkaline solution of salt.
(b) HCl gas through a saturated solution of salt.
(c) H_2 gas through a saturated of salt.
(d) Cl_2 gas through a saturated of salt.

(AIIMS-2009)

Ans. (b): The common table salt is prepared by passing HCl gas through a saturated solution of salt. The precipitation is due to common ion effect. The salt of Ca and Mg remains in the solution due to their higher solubility.

$$NaCl + H^+Cl^- \longrightarrow \underset{ppt}{NaCl}$$

So, option (b) is correct.

62. Na_2CO_3 reacts with SO_2 in alkaline medium to from:
(a) Na_2SO_3
(b) $NaHSO_3$
(c) Na_2SO_4
(d) $NaHSO_4$

(AIIMS-2010)

Ans. (d): Sodium carbonate reacts with SO_2 in alkaline medium to form sodium bisulphate ($NaHSO_4$).

$$Na_2CO_3 + 2H_2O \longrightarrow 2NaOH + H_2CO_3$$

$$2NaOH + 2SO_2 \longrightarrow 2NaHSO_4 + H_2O$$

63. Largest difference in radii is found in case of the pair
(a) Li, Na
(b) Na, K
(c) K, Rb
(d) Rb,Cs

(AIIMS-2007)

Ans. (b): Radii of atoms increase as we go down the group due to the addition of extra energy shell.

The nuclear charge also increases on moving down the group but the influence of addition of energy shell predominates.

Element →	Li	Na	K	Rb	Cs
Metallic Radius/pm	152	186	227	248	265

From above data it is clear that largest difference in radii is found in Na & K.

64. On dissolving moderate amount of sodium metal in liquid NH_3 at low temperature, which one of the following does not occur?
(a) Blue colored solution is obtained.
(b) Na^+ ions are formed in the solution.
(c) Liquid NH_3 become good conductor of electricity.
(d) Liquid ammonia remains diamagnetic.

(AIIMS-2003)

Ans. (d) : The alkali metals dissolve in liquid ammonia without evolution of hydrogen the colour of the liquid solution is blue and is paramagnetic in nature.

$$2M + NH_3 \longrightarrow 2MNH_2 + H_2$$

Similarly sodium also possesses the same properties when dissolved in liquid ammonia.

$$2Na + 2NH_3 \longrightarrow 2NaNH_2 + H_2$$

So, Liquid ammonia remains diamagnetic.

65. Sodium carbonate is soluble in water because of
(a) High lattice energy
(b) Low lattice energy
(c) Low molecular weight
(d) High molecular weight

(AIIMS-1997)

Ans. (b): Na_2CO_3 is soluble in water because low lattice enthalpy

Lattice enthalpy < Hydration → soluble

Sodium carbonate ionizes in aqueous solution. It is soluble in water because of low lattice energy. Low lattice energy helps in solubility.

$$\text{Solubility} \propto \frac{1}{\text{molar mass}}$$

66. Assertion (A) : K. Rb and Cs form superoxides.
Reason (R) : The stability of the superoxides increases from 'K' to 'Cs' due to decrease in lattice energy.
The correct answer is
(a) Both (A) and (R) are true and (R) is the correct explanation of (A)
(b) Both (A) and (R) are true and (R) is not the correct explanation explanation of (A)
(c) (A) is true but (R) is not true
(d) (A) is true but (R) is true

VITEEE- 2009, BITSET-2009

Ans. (a) : K, Rb, Cs from superoxide when they are burned in the air as we more down the group the size of an atom from K to Cs increases. So lattice energy decrease and hence, the stability of superoxide also decreases.

The species having an O–O bond and O in an oxidation state of $-\frac{1}{2}$ are super oxides and is represented as O_2^-.

Usually these are formed by active metals such as KO_2, RbO_2 and CsO_2. For the salts of larger anions (like O_2^-), lattice energy increases in a group. Since, lattice energy is the driving force for the formation of an ionic compound and its stability, the stability of the superoxides from 'K' to 'Cs' also decreases.

67. Excess of NaOH reacts with Zn to form
(a) ZnH_2
(b) Na_2ZnO_2
(c) ZnO
(d) $Zn(OH)_2$

VITEEE- 2006

Ans. (b) : When NaOH reacts with Zn metal it forms $Zn(OH)_2$ and it can be shown by the following reaction–

$$Zn(s) + 2NaOH(aq) \longrightarrow Zn(OH)(s)$$

$$Zn(OH)_2(s) + 2NaOH \longrightarrow Na_2ZnO_2 + 2H_2O$$

68. Consider the following statements.
I. Cs^+ ion is more highly hydrated than other alkali metal ions.
II. Among the alkali metals, only lithium forms a stable nitride by direct combination with nitrogen.
III. Among the alkali metals Li, Na, K, Rb, the metal, Rb has the highest melting point.

@apna_pdf

IV. Among the alkali metals Li, Na, K, Rb, only Li forms peroxide when heated with oxygen.
Select the correct statement is
(a) I (b) II
(c) III (d) IV

AP-EAMCET – 2016

Ans. (b) : $N_2 + 6Li \rightarrow 2\ Li_3N$ (Nitride)
Lithium (Li) is the only alkali metal which reacts directly with N_2 to give nitride (Li_3N) which is more stable.

- Li^+ ion is more highly hydrated than other alkali metal ions due high polarising power of Li^+.
- Li has the higher melting point among the alkali metals because on going from top to bottom melting point decreases due to increase in the size of monovalent cations.
- Lithium can not form peroxide because there is located over a small size of lithium which will attracted negative ions. So, strongly it does not permit the oxide ion to combine with other oxide ion.

69. Assertion (A) : Alkali metals are soft and have low melting and boiling points.
Reason (R) : This is because inter atomic bonds are weak.
(a) Both (A) and (R) are not true
(b) (A) is true, but (R) is not the correct explanation of (A)
(c) (A) is true, but (R) is false.
(d) Both (A) and (R) are true and (R) is the correct explanation of (A).

AP-EAMCET (Engg.) 2015

Ans. (d) : Alkali metals are soft and have low melting and boiling point because of inter atomic bonds are weak.

70. Which of the following is not correct ?
(a) In Nelson method of NaOH preparation, Cl_2 is liberated at anode
(b) With hot and concentrated NaOH, Cl_2 gas gives NaOCl
(c) NaOH reacts with white phosphorus giving phosphine
(d) NaOH is used in rayon industry

AP - EAMCET (Medical) - 2007

Ans. (b) : • In Nelson method of NaOH preparation, Cl_2 is produced at the anode. Hydrogen and sodium hydroxide both are produced at the cathode. Hence, statement (a) is true.

• With hot and concentrated NaOH, chlorine gives the sodiumchlorate.

$$6NaOH + 3Cl_3 \rightarrow 5NaCl + \underset{\text{Sodium chlorate}}{NaClO_3} + 3H_2O$$

So, statement (b) is not true.

• NaOH reacts with white phosphorus giving phosphine.

$$\underset{\substack{\text{White}\\\text{phosphrous}}}{P_4} + 3NaOH + 3H_2O \rightarrow PH_3 + \underset{\text{Sodium hypophosphite}}{3NaH_2PO_2}$$

So, Statement (c) is true.

• NaOH is used in rayon industry. Hence, this statement is true.

71. Which of the following carbonates decomposes readily at low temperatures ?
(a) Na_2CO_3 (b) K_2CO_3
(c) Li_2CO_3 (d) Rb_2CO_3

AP - EAMCET (Medical) - 2007

Ans. (c) : The stability of alkali carbonate increases down the group due to increases of electropositive character. All carbonates of the alkali group are thermally stable with an exception of lithium and readily decomposes at low temperature.

72. Sodium reacts with water to give H_2 gas and the solution contains substance 'A'. Zinc metal reacts with solutions of 'A' to give the same H_2 gas. Compound 'A' is
(a) Na_2O (b) NaOH
(c) Na_2CO_3 (d) $NaHCO_3$

SRMJEEE – 2013,2012

Ans. (b) : Sodium reacts with H_2O to give NaOH and H_2 gas. This is an exothermic reaction and high amount of heat generated. After that NaOH reacts with zinc metal to form the Na_2ZnO_2 and H_2 gas librated.

$$2Na + 2H_2O \longrightarrow \underset{\text{A}}{2NaOH} + H_2\uparrow$$

$$2NaOH + Zn \longrightarrow Na_2ZnO_2 + H_2\uparrow$$

73. Which of the following statements is false for alkali metals?
(a) Lithium is the strongest reducing agent.
(b) Na is amphoteric in nature.
(c) Li^+ is exceptionally small.
(d) All alkali metals give blue solution in liq. ammonia.

AMU-2016

Ans. (b) : Sodium is not amphoteric in nature. It is basic in nature. It forms strong bond like sodium hydroxide (NaOH).
So, Na is amphoteric in nature is wrong statement.

74. Which of the following metals is most reactive towards water?
(a) Na (b) K
(c) Rb (d) Cs

AMU-2005

Ans. (d) : The reactivity of alkali metals towards water increases from Li to Cs. Hence the order of reactivity of alkali metals towards water is Li < Na < K < Rb < Cs
Hence, option (d) is correct.

75. In Castner-Kellner cell for the manufacture of sodium hydroxide, the anode is made up of
(a) iron (b) copper
(c) graphite (d) aluminium

AMU–2003

Ans. (c) : In Castner–Kellner cell, the anode is made up of graphite.

76. Which of the alkali metals is smallest in size?
(a) Rb (b) K
(c) Na (d) Li

AMU–2003

Ans. (d) : The atomic radius increase on moving from top to the bottom in a group while going from top to bottom in a group due to increase in the number of shell. Hence Li is the smallest alkali metal.

@apna_pdf

77. The standerd reduction potential of Li^+/Li, Ba^{2+}/Ba, Na^+/Na and Mg^{2+}/Mg are –3.05, –2.73, –2.71 and –2.37 volt respectively. Which one of the following is strongest oxidizing agent?

(a) Ba^{2+} (b) Mg^{2+}
(c) Na^+ (d) Li^+

AMU 2002

Ans. (b) : Mg^{2+}/Mg has highest reduction potential so it is strongest oxidizing agent.

78. Which of the following does not react with AgCl?

(a) Na_2CO_3 (b) $Na_2S_2O_2$
(c) NH_4OH (d) $NaNO_3$

AMU 2002

Ans. (d) :

$4AgCl + 2Na_2CO_3 \rightarrow 4Ag + 4NaCl + 2CO_2 + O_2$

$AgCl + 2Na_2S_2O_3 \rightarrow NaCl + Na_3[Ag(S_2O_3)_2]$

$AgCl + 2NH_4OH \rightarrow [Ag(NH_3)_2]\,Cl + 2H_2O$

$NaNO_3$ does not react with Agcl.

79. Which is the strongest reducing agent?

(a) Mg (b) Rb
(c) Na (d) K

AMU 2002

Ans. (b) : Alkali metals act as strong reducing agents. On going from top to bottom in a group, reducing power increases. Hence, Rb is present at the bottom of IA group. Hence, Rb is strongest reducing agent.

80. The alkali metal which acts as a nutrient for plants is

(a) Rb (b) Li
(c) K (d) Na

AMU–2001

Ans. (c) : Potassium (K) is an essential nutrient for plant growth.

KNO_3, KCl, K_2SO_4 are used as fertilizers as source of potassium. Potassium is needed by plants for early root formation, ripening of seed and formation of chlorophyll.

81. Which is the lightest gas?

(a) Helium (b) Oxygen
(c) Hydrogen (d) Nitrogen

AMU–2001

Ans. (c) : Hydrogen is lightest gas because its atomic number and atomic mass is one. It has only one electron and one proton and there is no neutron.

82. Which alkali metal forms metal nitride by reacting with nitrogen of air?

(a) Li (b) Na
(c) K (d) Cs

Assam CEE-2020
CG PET-2005

Ans. (a) : Alkali metal that react with nitrogen directly to form nitride is Li. This anomalous behaviour is due to its small size and high polarizing power.

$$6Li + N_2\,(g) \rightarrow 2\,Li_3N$$

Hence, option (a) is correct.

83. Alkali metal hydrides follow the thermal stability order

(a) LiH < NaH < KH < CsH
(b) RbH < KH < NaH < LiH
(c) NaH < LiH < KH < RbH
(d) RbH < KH < LiH < NaH

Assam CEE-2018

Ans. (b) : The thermal stability of hydrides decreases from LiH to CsH in the order of LiH > NaH > KH > RbH > CsH.

The hydride ion is small size lithium ion.The stability decreases as the size of the cation decreases.

So, option (b) is correct.

84. A white substance having alkaline nature in solution is :

(a) $NaNO_3$ (b) NH_4Cl
(c) Na_2CO_3 (d) Fe_2O_3

BCECE-2006

Ans. (c) : $\underset{\substack{\text{Sodium}\\\text{carbonate}}}{Na_2CO_3} + 2H_2O \longrightarrow \underset{\substack{\text{Sodium}\\\text{hydrooxide}\\\text{(Strong base)}}}{2NaOH} + \underset{\substack{\text{Hydrogen}\\\text{carbonate}\\\text{(Weak acid)}}}{H_2CO_3}$

85. Most powerful reducing agent is :

(a) Li (b) Na
(c) Ca (d) Mg

BCECE-2005

Ans. (a) : Due to smallest reduction potential lithium is strongest reducing agent.

Since, $Li \rightarrow Li^+ + e^-$

So, option (a) is correct.

86. Which of the following is not soluble in NaOH?

(a) $Fe(OH)_3$ (b) $Zn(OH)_2$
(c) $Al(OH)_3$ (d) $Sn(OH)_2$

BCECE-2004

Ans. (a) : $Fe(OH)_3$ does not dissolve in NaOH. All other hydroxide are amphoteric in nature and dissolve in NaOH.

$Al(OH)_3 + NaOH \rightarrow NaAlO_2 + 2H_2O$
(soluble)

$Zn(OH)_2 + 2NaOH \rightarrow Na_2ZnO_2 + 2H_2O$
(soluble)

$Sn(OH)_2 + 2NaOH \rightarrow Na_2SnO_2 + 2H_2O$
(soluble)

87. Glauber's salt is :

(a) $Na_2CO_3.10H_2O$ (b) $Na_2SO_4.10H_2O$
(c) $MgSO_4.7H_2O$ (d) $CaSO_4.5H_2O$

BCECE-2009, 2003

Ans. (b) : Glauber's salt is the decahydrate form of sodium sulphate. It is also known as mirabilite. The chemical formula of Glauber's salt can be written as $Na_2SO_4.10H_2O$.

88. A solution of Na in liquid NH_3 is

(a) green (b) blue
(c) pink (d) yellow

BCECE-2009

Ans. (b) : When sodium is added to liquid ammonia, sodium amide compound is obtained and the blue colour formed is associated with the ammoniated electrons also known as solvated electrons.

@apna_pdf

89. **The oxide which gives H_2O_2 on treatment with dilute acid is–**

(a) PbO_2 (b) TiO_2
(c) MnO_2 (d) Na_2O_2

BCECE-2009

Ans. (d) : The oxide that gives H_2O_2 on treatment with a dilute acid is Na_2O_2. Only true peroxides which have O – O bond give hydrogen peroxide with dilute acid

$$Na_2O_2 + H_2SO_4 \longrightarrow Na_2SO_4 + H_2O_2$$

90. **Which of the following pairs of atomic numbers represents s-block elements?**

(a) 7, 15 (b) 6, 12
(c) 9, 17 (d) 3, 12

BCECE-2009

Ans. (d) : Atomic number 3 is Lithium which belongs to I-A group of s-block elements and atomic number 11 is Sodium which is also belongs to I-A group of s-block elements.

91. **Which one of the following alkali metals gives hydrated salts?**

(a) Li (b) Na
(c) K (d) Cs

BCECE-2012

Ans. (a) : Among alkali metal ions, Li^+ is the smallest. Hence, Li^+ has the maximum degree of hydration than any other alkali metal cation.

92. **Which of the following ions show maximum hydration in water ?**

(a) Li^+ (b) Na^+
(c) K^+ (d) Cs^+

BCECE-2017

Ans. (a) : As small size of ions has high hydration energy. Therefore, Li^+ ion has the maximum charge density due to its small ionic size among the given ions.

93. **In the reaction, $M + O_2 \rightarrow MO_2$ (superoxide) the metal M is**

(a) Lithium (b) Sodium
(c) Potassium (d) Barium

BCECE-2018

Ans. (c) : Formation of oxides, peroxides and superoxide depend on the size of alkali metal. An atom with larger size produces super oxide. Thus, Lithium (Li) forms oxide, sodium (Na) forms peroxide whereas K, Rb and Cs forms superoxide.

94. **$LiAlH_4$ is used as:**

(a) An oxidizing agent (b) A reducing agent
(c) A mordant (d) A water softener

BITSAT-2005

Ans. (b) : Lithium aluminium hydride ($LiAlH_4$) is used as reducing agent in organic synthesis due to presence of weak bonding in Al-H bond which can easily provide hydrogen.

95. **Sodium peroxide in contact with moist air turns white due to formation of:**

(a) Na_2CO_3 (b) Na_2O
(c) NaOH (d) $NaHCO_3$

BITSAT-2010

Ans. (c) : Sodium on reaction with air first forms sodium peroxide as;

$$2Na + O_2 \longrightarrow Na_2O_2$$

On further exposure to air, it reacts with water following the equation :

$$Na_2O_2 + 2H_2O \longrightarrow 2NaOH + H_2O_2$$

96. **Which of the following among alkali metal is most reactive?**

(a) Na (b) K
(c) Rb (d) Cs

BITSAT-2014

Ans. (d) : On moving from top to bottom in alkali metal group, reactivity of alkali metals increases due to their larger size and low ionization enthalpy. Since, Cs is present at the bottom of 1-A group (alkali metal group), therefore, its reactivity is higher among the given alkali metals.

97. **The alkali metals form salt-like hydrides by the direct synthesis at elevated temperature. The thermal stability of these hydrides decreases in which of the following orders?**

(a) CsH > RbH > KH > NaH > LiH
(b) KH > NaH > LiH > CsH > RbH
(c) NaH > LiH > KH > RbH > CsH
(d) LiH > NaH > KH > RbH > CsH

BITSAT-2013
NEET-2008

Ans. (d) : The thermal stability of hydrides of alkali metals decreases down the group as the size of the alkali metals increases, they can be decomposed easily. Smaller is the size of the cation and larger is the size of the anion, stronger is the covalent bond (Fajan's rule). So, the correct order of thermal stability of hydrides of alkali metals is

LiH > NaH > KH > RbH > CsH

98. **Two elements A and B have similar chemical properties. They don't form solid hydrogencarbonates, but react with nitrogen to form nitrides. A and B, respectively, are :**

(a) Na and Rb (b) Na and Ca
(c) Cs and Ba (d) Li and Mg

BITSAT-2021

Ans. (d) : Lithium (Li) and magnesium (Mg) shows several similar properties due to the diagonal relationships. Both, Li and Mg when combine directly with N_2 gives nitrides like Li_3N_2 and Mg_3N_2.

All alkali metals forms solid hydrogen carbonates except Li due to its exceptionally smaller size and high polarizing power. Since, Li and Mg have diagonal relationship, therefore both Li and Mg does not form solid hydrogen.

99. **Which one of the following elements belongs to s- block?**

(a) Aluminium (b) Chromium
(c) Carbon (d) Potassium

CG PET -2008, 2005

Ans. (d) : Potassium has atomic number 19. It is belongs to 1-A group of s-block elements.

@apna_pdf

100. The colour of the flame of sodium is

(a) deep red (b) blue
(c) green (d) golden yellow

CG PET- 2012

Ans. (d) : The colour of the flame of sodium is golden yellow.

101. Pure nitrogen gas is obtained from

(a) NH_3+NaNO_2 (b) $NH_4Cl+NaNO_2$
(c) N_2O+Cu (d) $(NH_4)_2Cr_2O_7$

CG PET- 2012

Ans. (b) : In case of NH_4Cl and $NaNO_2$ both are in the aqueous phase and form a crystalline solid. NH_4NO_2 which on further heating gives N_2 gas and water in liquid form, hence we get the purest form of nitrogen gas because it is not dissolved in H_2O.

$$NH_4Cl\,(aq.) + NaNO_2\,(aq.) \rightarrow NH_4NO_2\,(s) + NaCl\,(aq.)$$

$$NH_4NO_2\,(s) \xrightarrow{heat} N_2\,(g) + H_2O\,(l)$$

102. The reactivity of the alkali metal sodium with water, is made use of

(a) in drying of alcohols
(b) in drying of benzene
(c) in drying of organic amines
(d) as a general drying agent

CG PET -2004

Ans. (d) : The reactivity of the alkali metal sodium with water, is made use of in drying of alcohols in drying of benzene in drying of ammonia solution.
Hence, it act as general drying agent.

103. Alkali metals in each period have

(a) smallest size
(b) lowest ionisation potential
(c) highest ionisation potential
(d) highest electronegativity

CG PET -2004

Ans. (b) : Alkali metals possesses one valence electron in their outermost shell. If they were to lose this electron, they can attain noble gas configuration.
Hence, the ionization energy is the lowest.

104. With the increase in atomic weights, melting points of the alkali metals

(a) increase
(b) decrease
(c) remain constant
(d) do not show definite trend

CG PET -2004

Ans. (b) : On moving from top to bottom in a group, atomic weight and atomic size increases and melting point of alkali metals decreases due to increase in kernel size and decrease in strength of metallic bond.

105. Which of the following represents the electronic configuration of the most electropositive element?

(a) $[He]2s^1$ (b) $[He]2s^2$
(c) $[Xe]6s^1$ (d) $[Xe]2s^2$

CG PET -2005

Ans. (c) : Elements having lower value of ionization potential are called electropositive elements. Ionization potential of element increases from left to right is a period and decreases from top to bottom in group.
So, element belonging to higher period of group I- A group most electropositive.
$[X_e]$ $6s^1$ represent the electronic configuration of the most electropositive element such as cesium.

106. Which one of the following is an s-block element?

(a) Aluminum (b) Chromium
(c) Niobium (d) Potassium

CG PET -2005

Ans. (d) : The atomic number of potassium is 19 and its electronic configuration is.
$1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 4s^1$. As the last electron is going in the S – orbital, hence K is belongs to s-block element.

107. Neon atom requires energy to remove one electron from its outermost orbit, so also to add one electron into the outermost orbit. Which of the following is correct about fluorine?

I. Fluorine releases energy when an electron is removed.

II. Fluorine requires energy to add one electron.

(a) (I) and (II) are correct
(b) (I) is correct, (II) is false
(c) (I) is false, (II) is correct
(d) (I) and (II) are false

CG PET- 2015

Ans. (d) : If we want to add any electron in the valence shell of any atom, then some energy is released and this energy is known as electron gain enthalpy. Whereas, energy required to remove one electron from the valence shell of an atom is known as ionization energy.

108. The alkali metals are low melting. Which of the following alkali metals is expected to melt if the room temperature rises to $30^\circ C$?

(a) Na (b) K
(c) Rb (d) Cs

HP CET-2018

Ans. (d) : On going from top to bottom of alkali metals group, atomic size of metals increases that causes lower strength of metallic bonding which further leads to decrease in melting point. Since, Cs is present at the bottom of the group therefore, it can easily melt at temperature of $30^\circ C$.

109. A metal on combustion in excess air forms X. X upon hydrolysis with water yields H_2O_2 and O_2 along with another product. The metal is

(a) Li (b) Mg
(c) Rb (d) Na

[JEE Main-2019, 12 Jan Shift-I]

Ans. (c) : In excess of air, the reaction involved are as follows;
$Rb + O_2$ (excess) $\rightarrow$ Rb O_2 (x) (Superoxide)
$2\ RbO_2 + 2H_2O \rightarrow 2RbOH + H_2O_2 + O_2$.
Thus, the metal (x) is rubidium (Rb).

@apna_pdf

110. A hydrated solid X on heating initially gives a monohydrated compound Y. Y upon heating above 373 K leads to an anhydrous white powder Z. X and Z, respectively, are

(a) baking soda and soda ash
(b) washing soda and soda ash
(c) baking soda and dead burnt plaster
(d) washing soda and dead burnt plaster

[JEE Main-2019, 10 April Shift-II]

Ans. (b) : The reaction involved is as follows;

$$Na_2CO_3.10H_2O(s) \xrightarrow{\Delta} Na_2CO_3.\ H_2O \xrightarrow[T>373K]{\Delta} Na_2CO_3$$

Washing Soda (Y) Soda ash
(X) (Z)

Thus, the compounds X and Z are washing soda and soda ash respectively.

111. The metal mainly used in devising photoelectric cells is

(a) Na (b) Li
(c) Cs (d) Rb

[JEE Main-2020, 2 Sep Shift-I]

Ans. (c) : Cs is used in the photoelectric cell because the ionization energy of Cs is lowest among alkali metals.

112. On combustion of Li, Na and K in excess of air, the major oxides formed, respectively, are

(a) Li_2O, Na_2O and K_2O_2
(b) Li_2O, Na_2O_2 and K_2O
(c) Li_2O, Na_2O_2 and KO_2
(d) Li_2O_2, Na_2O_2 and K_2O_2

[JEE Main-2020, 4 Sep Shift-I]

Ans. (c) : Due to small size, Li forms oxide, sodium form peroxide and potassium and all alkali metals form superoxide.

113. Reaction of an inorganic sulphite X with dilute H_2SO_4 generates compound Y. Reaction of Y with NaOH gives X. Further , the reaction of X with Y and water affords compound Z. Y and Z respectively, are

(a) SO_2 and Na_2SO_3 (b) SO_3 and $NaHSO_3$
(c) SO_2 and $NaHSO_3$ (d) S and Na_2SO_3

[JEE Main-2020, 6 Sep Shift-II]

Ans. (c) :

$$-Na_2SO_3 \xrightarrow{dil.H_2SO_4} SO_2 \xrightarrow{NaOH} Na_2SO_3 \xrightarrow{SO_2+H_2O} NaHSO_3$$

Sodium sulphite Sulphur Sodium Sodium
(X) dioxide Sulphite sulphite
(Y) (X) (Z)

Hence, the compounds Y and Z are SO_2 and $NaHSO_3$ respectively.

114. Among the statements (A)-(D), the correct ones are

(A) Lithium has the highest hydration enthalpy among alkali metals.
(B) Lithium chloride is insoluble in pyridine.
(C) Lithium cannot form ethynide upon its reaction with ethyne.
(D) Both lithium and magnesium react slowly with H_2O.

(a) (A) and (D) only
(b) (B) and (C) only
(c) (A), (C) and (D) only
(d) (A), (B) and (D) only

[JEE Main-2020, 9 Jan Shift-II]

Ans. (c) : Among the above statements only B statement is not true because of small size of Li. The salvation energy of Li is greater than the other salts of the same group.

115. The correct order of hydration enthalpies of alkali metal ions is

(a) $Li^+ > Na^+ > K^+ > Cs^+ > Rb^+$
(b) $Na^+ > Li^+ > K^+ > Rb^+ > Cs^+$
(c) $Na^+ > Li^+ > K^+ > Cs^+ > Rb^+$
(d) $Li^+ > Na^+ > K^+ > Rb^+ > Cs^+$

[JEE Main-2019, 8 April Shift-I]
AIIMS 25 May 2019 (Morning)

Ans. (d) : The hydration enthalpy of alkali metals decreases from top to bottom in 1-A group. Hence hydration enthalpy decreases from Li^+ to Cs^+ due to increase in atomic size.

116. The incorrect statement is

(a) Lithium is the strongest reducing agent among the alkali metals.
(b) Lithium is least reactive with water among the alkali metals.
(c) $LiNO_3$ decomposes on heating to give $LiNO_2$ and O_2.
(d) LiCl crystallise from aqueous solution as $LiCl\text{-}2H_2O$.

[JEE Main-2019, 12 April Shift-II]

Ans. (c) : The statement (c) is not correct because, on heating of $LiNO_3$ it decomposes into Li_2O, NO_2 and O_2 respectively.

$$4LiNO_3 \xrightarrow{\Delta} 2Li_2O + 4NO_2 + O_2.$$

117. Sodium metal on dissolution in liquid ammonia gives a deep blue solution due to the formation of

(a) Sodium ammonia complex
(b) Sodium ion-ammonia complex
(c) Sodamide
(d) Ammoniated electrons

[JEE Main-2019, 10 Jan Shift-II]

Ans. (d) : Alkali metals dissolve in liquid ammonia giving deep blue solution which are conducting in nature. The blue colour of the solution is due to ammoniated electrons which absorb energy in the visible region of light.

118. NaH is an example of

(a) Metallic hydride
(b) Electron-rich hydride
(c) Saline hydride
(d) Molecular hydride

[JEE Main-2019, 11 Jan Shift-I]

@apna_pdf

Ans. (c) : NaH is an example of ionic hydride which is also known as saline hydride. Metals having electronegativity lower than hydrogen form such hydride. All elements of group-I and group-II when heated, form ionic hydride.

119. The correct statement(s) among I to III with respect potassium ions that are abundant within the cell fluids is/are

(I) They activate many enzymes.
(II) They participate in the oxidation of glucose to produce ATP.
(III) Along with sodium ions, they are responsible for the transmission of nerve signals.

(a) I, and III only
(b) I, II and III
(c) I and II only
(d) III only

[JEE Main-2019, 12 Jan Shift-II]

Ans. (b) : All statements regarding potassium ion are correct because potassium is active metal in many enzymes. They participate in oxidation of glucose to produce ATP and they are responsible for the transmission of nerve signals along with sodium ion.

120. Sodium salt of an organic acid 'X' produces effervescence with conc. H_2SO_4 'X' reacts with the acidified aqueous $CaCl_2$ solution to give a white precipitate which decolourises acidic solution of $KMnO_4$. 'X' is

(a) C_6H_5COONa
(b) $HCOONa$
(c) CH_3COONa
(d) $Na_2C_2O_4$

[JEE Main-2017]

Ans. (d) : Sodium salt of an organic acid X is sodium oxalate $Na_2C_2O_4$. It gives effervescence of CO_2 gas with conc. H_2SO_4

$$Na_2C_2O_4 + H_2SO_4 \rightarrow Na_2SO_4 + H_2O + CO\uparrow + CO_2\uparrow$$

Sodium oxalate reacts with the acidified aqueous $CaCl_2$ solution to give a white precipitate of Calcium oxalate

$$Na_2C_2O_4 + CaCl_2 \rightarrow CaC_2O_4\downarrow + 2NaCl$$

Sodium oxalate decolorizes acidic solution of $KMnO_4$

$$5C_2O_4^{2-} + 16H^+ + 2MnO_4^- \rightarrow 2Mn^{2+} + 10CO_2 + 8H_2O$$

121. The main oxides formed on combustion of Li, Na and K in excess of air respectively are

(a) LiO_2, Na_2O_2 and K_2O
(b) Li_2O_2, Na_2O_2 and KO_2
(c) Li_2O, Na_2O_2 and KO_2
(d) Li_2O, Na_2O_2 and KO_2

[JEE Main-2016]

Ans. (c) : The combustion of Li, Na and K, in excess of air, gives lithium oxide (Li_2O), sodium peroxide (Na_2O_2) and potassium superoxide (KO_2). Thus, Li_2O, Na_2O_2 and KO_2 are main oxides of Li, Na and K.

122. The products obtained on heating $LiNO_3$ will be

(a) $LiNO_2 + O_2$
(b) $Li_2O+NO_2+O_2$
(c) Li_3N+O_2
(d) $Li_2O+OH+O_2$

[AIEEE-2011]

Ans. (b) : $4\ LiNO_3 \rightarrow 2Li_2O + 4\ NO_2 + O_2$

Lithium nitrate on thermal decomposition produces metal oxide, NO_2 and O_2. While other alkali metal nitrates on heating, produces metal nitrite and oxygen.

123. What is the best description of the change that occurs when Na_2O (s) is dissolved in water?

(a) Oxidation number of sodium decreases
(b) Oxide ion accepts a shared pair of electrons
(c) Oxide ion donates a pair of electrons
(d) Oxidation number of oxygen increases

[AIEEE-2011]

Ans. (c) : When Na_2O(s) is dissolved in water, oxide ion donates a pair of electrons.

124. KO_2 is used in space and submarines because it

(a) absorbs CO_2 and increases O_2 concentration
(b) absorbs moisture
(c) absorbs CO_2
(d) Produces ozone

[AIEEE-2002]

Ans. (a) : The main reason behind using potassium superoxide (KO_2) in oxygen cylinder in space and submarines that, it absorbs CO_2 and increases O_2 concentration according to the following reaction;

$4KO_2 + 2CO_2 \rightarrow 2\ K_2\ CO_3 + 3O_2$.

125. The correct order of conductivity of ions in water is

(a) $Na^+ > K^+ > Rb^+ > Cs^+$
(b) $Cs^+ > Rb^+ > K^+ > Na^+$
(c) $K^+ > Na^+ > Cs^+ > Rb^+$
(d) $Rb^+ > Na^+ > K^+ > Li^+$

[JEE Main-2021, 17 March Shift-I]

Ans. (b) : As the size of gaseous ion decreases, it get more hydrated in water and hence the size of aqueous ion increases. When this bulky ion move in solution, it experience greater resistance and hence lower conductivity.

Size of gaseous ion : $Cs^+ > Rb^+ > K^+ > Na^+$

Conductivity : $Cs^+ > Rb^+ > K^+ > Na^+$

126. Match List-I with List-II

List-I (Salt)	**List-II (Flame colour wavelength)**
A. LiCI	1. 455.5 nm
B. NaCl	2. 670.8 nm
C. RbCl	3. 780.0 nm
D. CsCl	4. 589.2 nm

Choose the correct answer from the options given below.

	A	B	C	D
(a)	4	2	3	1
(b)	1	4	2	3
(c)	2	1	4	3
(d)	2	4	3	1

[JEE Main-2021, 24 Feb Shift-II]

Ans. (d) : The correct matching of salt and flame colour wavelength is as follows:

@apna_pdf

Salt	Flame colour	Wavelength (in nm)
A . LiCl		670.8
B. NaCl		589.2
C. RbCl		780.0
D. CsCl.		455.5

127. Given below are two statemens: One is labelled as Assertion (A) and the other is labelled as Reason (R).

Assertion (A) Lithium salts are hydrated.

Reason (R) Lithium has higher polarizing power than other alkali metal group members.

In the light of the above statements, choose the most appropriate answer from the options given below

(a) Both (A) and (R) are true but (R) is not the correct explanation of (A).
(b) (A) is true but (R) is not true.
(c) (A) is false but (R) is true.
(d) Both (A) and (R) are true (R) is the correct explanation of (A).

[JEE Main-2021, 31 Aug Shift-II]

Ans. (a) : Lithium salts are generally trihydrated due to its smaller size. The polarizing power of Li is his higher than other alkali metals due to its smaller size because, as size of the ions increases, their polarizing power decreases.

128. Choose the correct statement from the following.

(a) The standard enthalpy of formation for alkali metal bromides becomes less negative on descending the group.
(b) The low solubility of Csl in water is due to its high lattice enthalpy.
(c) Among the alkali metal halides, LiF is least soluble in water.
(d) LiF has least negative standard enthalpy of formation among alkali metal fluorides.

[JEE Main-2021, 27 Aug Shift-II]

Ans. (c) : Hydration energy of lithium is higher than the other alkali metals. Hence, the solubility of LiF in water is lesser.

129. Match List I with List II.

List I	List II
A. Li	I. Photoelectric cell
B. Na	II. Absorbent of CO_2
C. K	III. Coolant in fast breeder nuclear reactor
D. Cs	IV. Treatment of cancer
	V. Bearings for motor engines

Choose the correct answer from the options given below.

	A	B	C	D
(a)	V	I	II	IV
(b)	V	II	IV	I
(c)	IV	III	I	II
(d)	V	III	II	I

[JEE Main-2021, 27 July Shift-II]

Ans. (d) : The correct matching is–
Li – Bearings for motor engines
Na – coolant in fast breeder nuclear reactor
K – Absorbent of CO_2
Cs – Photoelectric cell

130. Given below are two statements. One is labelled as Assertion A and the other labelled as Reason R.

Assertion (A) Lithium halides are some what covalent in nature.

Reason (R) Lithium possess high polarization capability.

According the above statements,

Choose the most appropriate answer from the options given below

(a) A is true but R is false
(b) A is false but R is true
(c) Both A and R are true but R is not the correct explanation of A
(d) Both A and R are true and R is the correct explanation of A

[JEE Main-2021, 27 July Shift-I]

Ans. (d) : Lithium halides are more covalent in nature than other alkali halides due to smaller size. According to Fajan's rule, due to smaller size of lithium, it has high polarizing power which makes LiCl more covalent in nature.

131. Lithium shows diagonal relationship with

(a) Sodium
(b) Magnesium
(c) Calcium
(d) Aluminium.

J & K CET-(2014)

Ans. (b) : In the periodic table, a diagonal relationship is seen between few pairs of nearby elements which are diagonally presents in the second period and third period. The pairs of the elements which show identical properties are Lithium and Magnesium, Boron and Silicon, and Beryllium and Aluminium

132. What colour is imparted into the flame when lithium is burnt?

(a) Golden yellow
(b) Brick red
(c) Crimson red
(d) Grassy green

J & K CET-(2014)

Ans. (c)

Cation	Colour
Na^+	Golden yellow
Ca^{2+}	Brick red
Li^+	Crimson red
$Cu^{2+}, BO_3^{3-}, Ti^{3-}$	Grassy green

133. 'The compound formed upon combustion of potassium metal in excess air is

(a) K_2O_2
(b) KO_2
(c) K_2O
(d) KOH

J & K CET-(2015)

Ans. (b) : Burning potassium in excess of O_2 gives the superoxide (KO_2) reaction with large excess of metal with form the oxide K_2O.

$$K \xrightarrow{O_2} \underset{\text{oxide}}{K_2O} \xrightarrow{O_2} \underset{\text{peroxide}}{K_2O_2} \xrightarrow{O_2} \underset{\text{superoxide.}}{KO_2}$$

@apna_pdf

134. Which of the following statements is false regarding alkali metals?
- (a) Alkali metals are soft and can be cut with the help of knife.
- (b) Alkali metals do not occur in free state in nature.
- (c) Alkali metals are highly electropositive elements.
- (d) Alkali metal hydrides are covalent in character.

J & K CET-(2013)

Ans. (d) : Alkali metal hydrides are covalent in character. Generally hydrides of alkali metals are ionic in nature except Lithium hydride due to its smaller size.

135. Lowest melting point chloride is :
- (a) LiCl
- (b) NaCl
- (c) KCl
- (d) CsCl

JCECE - 2006

Ans. (a) : Lithium chloride has lowest melting point among the alkali metal chlorides. This is because lithium chloride is covalent in nature whereas other alkali metal chlorides are ionic in nature.

136. Alkali metals have high oxidation potential and hence, they behave as:
- (a) Oxidizing agents
- (b) Lewis bases
- (c) Reducing agents
- (d) Electrolytes

JCECE - 2005

Ans. (c) : The substance which oxidized easily behaves like reducing agent since alkali metals have only one valence electron. Hence they act as strong reducing agent.

137. BaO_2 and ozone reacts to produce
- (a) Ba
- (b) Ba_2O_3
- (c) BaO
- (d) $Ba(OH)_3$

JCECE - 2007

Ans. (c) : BaO_2 and ozone reacts to produce BaO and oxygen.

$$BaO_2 + O_3 \rightarrow BaO + 2O_2 \uparrow$$

138. Among the alkali metals cesium is the most reactive because
- (a) its incomplete shell is nearest to the nucleus
- (b) it has a single electron in the valence shell
- (c) it is the heaviest alkali metal
- (d) the outermost electron is more loosely bound than the outermost electron of the other alkali metals

JCECE - 2009

Ans. (d) : On going down the group atomic size increases and hence effective nuclear charge decreases resulting removal of e^- will be more easy, the outermost electron is more loosely bound than the outermost electron of the other alkali metals.

139. Sodium reacts with water more vigorously than Li because it has
- (a) higher atomic mass
- (b) more electropositive character
- (c) metallic nature
- (d) more eletronegative character

JCECE - 2011

Ans. (b) : Sodium is more electropositive than Li, so react more vigorously with water. As the electropositive character increases reactivity of alkali metals increases.

140. When sodium is treated with sufficient oxygen/air, the product obtained is
- (a) Na_2O
- (b) Na_2O_2
- (c) NaO_2
- (d) NaO

JCECE - 2011

Ans. (b) : When sodium is treated with sufficient oxygen it forms sodium peroxide.

$$2Na + O_2 \xrightarrow{\Delta} \underset{\text{Sodium peroxide}}{Na_2O_2}$$

141. Alcoholic KOH is used for
- (a) dehydration
- (b) dehydrogenation
- (c) dehydrohalogenation
- (d) dehalogenation

JCECE - 2012

Ans. (c) : Alcoholic solution of KOH is used for dehydrohalogenation of an haloalkane and results in the formation of Alkenes.

142. The ion which show maximum value of hydration energy is
- (a) Li^+
- (b) K^+
- (c) Na^+
- (d) Cs^+

JCECE - 2016

Ans. (a) : Smaller be the size of cation, more be its effective nuclear charge. Will hydrate more and has more hydration energy.

143. Which of the following atomic and physical properties of hydrogen is false?
- (a) Hydrogen > Deuterium > Tritium; (melting point/K)
- (b) Hydrogen < Deuterium <Tritium; (boiling point/K)
- (c) Hydrogen < Deuterium < Tritium; (density/gL^{-1})
- (d) Hydrogen > Deuterium > Tritium; (%relative abundance)

JIPMER-2015

Ans. (a) : With increase in atomic mass. The melting and boiling point is increases.

144. Sodium sulphite is used in preserving squashes and other mildly acidic foods due to
- (a) Potassium salt has preservative action
- (b) Potassium metabisulphite prevents oxidation
- (c) Potassium metabisulphite is not influcenced by acid
- (d) Sulphur dioxide and sulphurous acid formed kill bacteria and germs

JIPMER-2015

Ans. (d) : Sodium sulphite is used in preserving squashes and other mildly acidic foods due to sulphur dioxide and sulphurous acid kill bacteria and germs. sodium sulphite is anti microbial agent and antioxidant.

145. Among the following the least thermally stable is
- (a) K_2CO_3
- (b) Na_2CO_3
- (c) $BaCO_3$
- (d) Li_2CO_3

JIPMER-2014, 2009

@apna_pdf

Ans. (d) : Thermal stability of carbonates increases on moving down a group. Thus Lithium carbonate is least thermally stable

$Li_2CO_3 \xrightarrow{\Delta} Li_2O + CO_2 \uparrow$

146. The metal that produces red-violet colour in the non-luminous flame is

(a) Ba (b) Ag
(c) Rb (d) Pb

JIPMER-2011

Ans. (c) : Alkali metals and their salts impart characteristic colour to flame. The reason for flame colouration is that the energy of the flame causes an excitation of the outermost electrons which when return to their original position, give out the energy absorbed in the visible region.

147. The most stable compound is

(a) LiF (b) LiCl
(c) LiBr (d) LiI

JIPMER-2008

Ans. (a) : LiF is most stable because of the small size of Li and F. It has highest lattice enthalpy and hence most stable.

148. The oxide of potassium that does not exist is

(a) K_2O (b) KO_2
(c) K_2O_2 (d) K_2O_3

Karnataka-CET-2020

Ans. (d) : Potassium generally forms three oxides. K_2O, K_2O_2 and KO_2. K_2O_3 is not formed in normal condition.

149. An alkali metal hydride (NaH) reacts with diborane in A to give a tetrahedral compound B which is extensively used as reducing agent in organic synthesis. The compounds A and B respectively are

(a) C_2H_6 and C_2H_5Na
(b) CH_3COCH_3 and $B_3N_3H_6$
(c) C_6H_6 and $NaBH_4$
(d) $(C_2H_5)_2$ O and $NaBH_4$

Karnataka-CET-2015

Ans. (d) : When alkali metals hydride (NaH) react with diborane (B_2H_6) in the presence of ether $(C_2H_5)_2O$ a tetrahedral compound (metal borohydride) is formed which act as a reducing agent in organic synthesis.

$$2NaH + B_2H_6 \xrightarrow{(C_2H_5)_2O} \underset{\text{Sodium borohydride}}{2NaBH_4}$$

150. Alkali metals have negative reduction potential and hence they behave as

(a) oxidising agents (b) Lewis bases
(c) reducing agents (d) electrolytes

Karnataka-CET-2013

Ans. (c) : Alkali metals have negative reduction potential so that they oxidize easily and act as reducing agents.

151. For alkali metals, which one of the following trends is incorrect?

(a) Hydration energy : Li > Na > K > Rb
(b) Ionization energy : Li > Na > K > Rb
(c) Density : Li < Na < K < Rb
(d) Atomic size : Li < Na < K < Rb

KARNATAKA-CET, 2010

Ans. (c) : In general density increases on moving downward in a group but density of potassium is lesser than that of sodium. This is because of the abnormal increase in atomic size on moving from Na to K. Hence the correct order of density is Li < Na < K < Rb.

152. The oxide of an element whose electronic configuration is $1s^2, 2s^2, 2p^6, 3s^1$ is

(a) Neutral (b) Amphoteric
(c) Basic (d) Acidic

KARNATAKA-CET, 2009

Ans. (c) : $_{11}Na = 1s^2, 2s^2, 2p^6, 3s^1$
It is an alkali metal. Alkali metal oxides are basic in nature.

153. The characteristic not related to alkall metal is

(a) high ionisation energy
(b) their ions are isoelectronic with noble gases
(c) low melting point
(d) low electro negativity

KARNATAKA-CET, 2009

Ans. (a) : Alkali metals have low ionization energy. They posses minimum value of ionisation energy in their period.

154. Which one of the following statements is true for all the alkali metals?

(a) Their nitrates decompose on heating to give NO_2 and O_2
(b) Their carbonates decompose on heating to give CO_2 and the metal oxide
(c) They react with oxygen to give mainly the oxide M_2O
(d) They react with halogens to give the halides MX
(e) They react with nitrogen to give the halides MX

Kerala-CEE-2005

Ans. (d) : All the alkali, metals react with halogen to give halides of general formula MX type. Where M is alkali metals and X is halogen.

155. The low solubility of LiF and that of CsI in water are respectively due to which of the following properties of the alkali metal ions?

(a) Higher hydration enthalpy of Li^+, highter lattice enthalpy of Cs^+
(b) Smaller hydration enthalpy of Li^+, highter lattice enthalpy of Cs^+
(c) Smaller lattice enthalpy of Li^+ highter hydration enthalpy of Cs^+
(d) Smaller hydration enthalpy of Li^+, smaller lattice enthalpy of Cs^+
(e) Higher lattice enthalpy of Li^+, smaller hydration enthalpy of Cs^+

Kerala-CEE-2016

Ans. (e) : Low solubility of LiF and that of CsI in water is due to the fact that though Li^+ is having high hydration energy but it has higher lattice enthalpy when present in LiF, this lattice enthalpy is higher than hydration energy due to which its solubility is less.

156. Li occupies higher position in the electrochemical series of metals as compared to Cu since

@apna_pdf

(a) The standard reduction potential of Li^+/Li is lower than that of Cu^{2+}/Cu
(b) The standard reduction potential of Cu^{2+}/Cu is lower than that of Li/Li
(c) The standard oxidation potential of Li/Li^+ is lower than that of Cu / Cu^{2+}
(d) Li is smaller in size as compared to Cu

WB-JEE-2012

Ans. (a) : In the electrochemical series, metals are arranged in increasing order of their standard reduction potential. The standard reduction potential of Li^+/Li and $Cu^{++}/$ Cu are – 3.05 V and + 0.034 V respectively. Therefore Li occupies higher position in as compared to Cu.

157. Match List-I with List-II and choose correct Answer from the code given below :

List-I	**List-II**
(A) $NaNO_3$	(1) Baking soda
(B) Na (NH_4) HPO_4	(2) Chile salt petre
(C) $NaHCO_3$	(3) Microcosmic salt
(D) $Na_2CO_3 . 10H_2O$	(4) Washing soda

Codes :

	A	**B**	**C**	**D**
(a)	1	2	3	4
(b)	2	3	1	4
(c)	3	1	2	4
(d)	4	1	2	3

Manipal-2020

Ans. (b) : A. $NaNO_3$ – Chile saltpeter
B. Na (NH_4) HPO_4 – Microcosmic salt
C. $NaHCO_3$ – Baking soda
D. $Na_2CO_3.10H_2O$ – Washing soda

158. Which of the following is an organometallic compound?
(a) Lithium acetate
(b) Methyl lithium
(c) Lithium dimethyl amide
(d) Lithium methoxide

Manipal-2020

Ans. (b) : Organometallic compounds is a member of a class of substance containing at least one metal to carbon bond. Methyl lithium is the simplest organolithium and its empirical formula is CH_3Li.

159. In the following reaction
$NaOH + S \rightarrow A + Na_2S + H_2O$; A is :
(a) Na_2SO_4 (b) Na_2SO_3
(c) Na_2S (d) $Na_2S_2O_3$

Manipal-2019

Ans. (d) :

$$\underset{\text{Sodiumhydroxide}}{6NaOH} + \underset{\text{Sulphur}}{4S} \rightarrow \underset{\underset{\text{Sodium Sulphite}}{(A)}}{Na_2S_2O_3} + \underset{\text{Sodium Sulphide}}{2Na_2S} + \underset{\text{Water}}{3H_2O}$$

160. All the s-block elements of the periodic table are placed in the groups ....
(a) IA and IIA (b) IIIA and IVA
(c) B sub groups (d) VA to VIIA

Manipal-2019

Ans. (a) : S –block elements have only two group IA and II–A. In group IA– Alkali metals are present while in II A group alkaline earth metals are present.

161. Which of the following element has maximum photoelectric effect?
(a) Li (b) Na
(c) K (d) Cs

Manipal-2016

Ans. (d) : Cs has maximum photoelectric effect because it has minimum ionization energy (work function). On moving down the group of alkali metals, the ionization potential decreases.

162. What happens when ionic hydrides of s-block elements in molten state are electrolysed?
(a) Hydride ion migrates at cathode
(b) Dihydrogen is liberated at cathode
(c) Hydride ion reforms metal hydride
(d) Dihydrogen is liberated at anode

MHT CET-02.05.2019, SHIFT-III

Ans. (d) : When ionic hydrides of s-block elements are subjected to electrolysis, dihydrogen gas is liberated at anode which confirms the existence of hydrogen in the form of hydride ion (H^-). Following reactions takes place.

$$MH(l) \rightleftharpoons M^+(aq) + H^-(aq)$$

At cathode

$$M^+(aq) + e^- \rightarrow M(s)$$

At anode

$$2H^-(aq) - 2e^- \rightarrow 2H(g)$$

163. Which of following elements does not form amide when reacted with ammonia?
(a) Li (b) Na
(c) K (d) Rb

MHT CET-02.05.2019, SHIFT-II

Ans. (a) : Lithium doesn't form amide when reacted with ammonia. It forms tetraamminelithium, $Li(NH_3)_4$
The equation for the reaction is as follows

$$Li + 4NH_3 \longrightarrow \underset{\text{tetraamminelithium}}{[Li(NH_3)_4]}$$

164. Solubility of which among the following substances in water increases slightly with rise in temperature?
(a) Potassium bromide (b) Potassium chloride
(c) Potassium nitrate (d) Sodium nitrate

MHT CET-2014

Ans. (b) Potassium chloride (KCl) has large hydration energy than its lattice energy so it evolves energy on dissolving in water consequently with rise in temperature its solubility increase.

165. Ionic mobility of which of the following alkali metal ions is lowest when aqueous solution of their salts are put under an electric field?
(a) K (b) Rb
(c) Li (d) Na

NEET-2017

Ans. (c) : Li^+ being smallest has maximum charge density

∴ Li^+ is most heavily hydrated among all alkali metal ions. The effective size of Li^+ in aqueous solution is therefore, largest

∴ Moves slowest under the electric field.

@apna_pdf

166. Which one of the alkali metals, forms only, the normal oxide, M_2O on heating in air?

(a) Rb (b) K
(c) Li (d) Na

NEET-2012

Ans. (c) : Li exist as Li_2O (oxide) due to small size it will pack efficiency with small O^{2-}. Na exist as Na_2O_2 (peroxide) due to large size it can pack efficiency with larger O_2^{2-}

- K exist as KO_2 (superoxide) due to best packing efficiency with O_2^-. Rb also exists as RbO_2.

167. The ease of adsorption of the hydrated alkali metal ions on an ion-exchange resin follows the order

(a) $Li^+ < K^+ < Na^+ < Rb^+$
(b) $Rb^+ < K^+ < Na^+ < Li^+$
(c) $K^+ < Na^+ < Rb^+ < Li^+$
(d) $Na^+ < Li^+ < K^+ < Rb^+$

NEET-2012

Ans. (b) : Smaller is the size of a cation, higher is the charge density on it and thus, higher is the number of water molecules that attach to it.

The ease of adsorption of the hydrated alkali metal ions on as ion-exchange resin follows the order–

$Rb^+ < K^+ < Na^+ < Li^+$

168. The sequence of ionic mobility in aqueous solution is

(a) $Rb^+ > K^+ > Cs^+ < Na^+$
(b) $Na^+ > K^+ > Rb^+ < Cs^+$
(c) $K^+ > Na^+ > Rb^+ < Cs^+$
(d) $Cs^+ > Rb^+ > K^+ > Na^+$

NEET-2008

Ans. (d) : Smaller the size of cation higher will be hydration and its effective size will increase and mobility of aqueous solution will decrease. Hence, small size cation, high degree of hydration, low ionic mobility and large size cation, low degree of hydration high ionic mobility.

So, the correct order is –

$Cs^+ > Rb^+ > K^+ > Na^+$

169. When a substance (A) reacts is with water it produces a combustible gas (B) and a solution of substance (C) in water. When another substance (D) reacts with this solution of (C), it also produces the same gas (B) on warming but (D) can produce gas (B) on reaction with dilute sulphuric acid at room temperature. Substance (A) imparts a deep golden yellow colour to a smokeless flame of Bunsen burner. Then (A), (B), (C) and (D) respectively are

(a) Ca, H_2, $Ca(OH)_2$, Sn
(b) K, H_2, KOH, Al
(c) Na, H_2, NaOH, Zn
(d) CaC_2, C_2H_2, $Ca(OH)_2$, Fe

NEET-1998

Ans. (c) : Substance A is sodium metal. It reacts with water to produce hydrogen (gas B) and sodium hydroxide (compound C).

$2Na + 2H_2O \longrightarrow 2NaOH + H_2 \uparrow$

Another substance D is Zinc
is reacts with solution of sodium hydroxide it produces hydrogen gas on warming.

$Zn + 2NaOH \longrightarrow Na_2ZnO_2 + H_2$

Zinc also reacts with sulphuric acid at room temperature to produce hydrogen gas

$Zn + H_2SO_4 \xrightarrow{\text{room temperature}} ZnSO_4 + H_2 \uparrow$

Thus, substance A, B, C and D respectively are
Na, H_2, NaOH, Zn.

170. Which one of the following properties of alkali metals increases in magnitude as the atomic number rises?

(a) Ionic radius
(b) Melting point
(c) Electronegativity
(d) First ionization energy

NEET-1989

Ans. (a) : With the increase in the atomic number of alkali metals, the ionic radius increases due to the increase in the number of the shell, whereas
the electronegativity, melting point and first ionization potential decrease.

171. In the case of alkali metals, the covalent character decreases in the order

(a) $MF > MCl > MBr > MI$
(b) $MF > MCl > MI > MBr$
(c) $MI > MBr > MCl > MF$
(d) $MCl > MI > MBr > MF$

NEET-2009

Ans. (c) : The covalent character of any compound in general depends upon size of the anion. The larger the anion greater is its polarizability.

Therefore $MI > MBr > MCl > MF$

172. Which compound will show the highest lattice energy?

(a) RbF (b) CsF
(c) NaF (d) KF

NEET-1993

Ans. (c) : NaF compound will be show the highest lattice energy because Na^+ is smallest in size and lattice energy increases as the size of cation decreases.

173. Which of the alkali metal chloride (MCl) forms its dihydrate salt ($MCl.2H_2O$) easily?

(a) LiCl (b) CsCl
(c) RbCl (d) KCl

NEET-Odisha 2019

Ans. (a) : Li^+ having maximum hydration tendency, due to this LiCl forms dehydrated salt $LiCl.\ 2H_2O$ where as other metal chlorides do not form hydrates.

174. The highly reactive alkali metals are kept in

(a) Air (b) Water
(c) Kerosene (d) All of these

UP CPMT-2010

Ans. (c) : Kerosene

Alkali metals are highly reactive, react with air as well as water.

These being unreactive towards Kerosene, are kept in Kerosene.

@apna_pdf

175. The formula of Calgon, used for water softening is

(a) $Na_2[Na_4(PO_3)_6]$ (b) $Na_4[Na_2(PO_3)_6]$

(c) $Na_2[Na_4(PO_4)_5]$ (d) $Na_4[Na_4(PO_4)_6]$

UP CPMT-2008

Ans. (a): Calgon is used for water softening. Its formula is $Na_2[Na_4(PO_3)_6]$.

176. Which of the following is a false statement?

(a) Fluorine is more electronegative than chlorine

(b) Nitrogen has greater IE_1 than oxygen

(c) Lithium is amophoteric

(d) Chlorine is an oxidising agent

UP CPMT-2004

Ans. (c) : Key Idea Analyse each of the statement-

(c) Lithium is basic in nature. It has tendency to give out electron. It is not amophoteric. This statement is wrong.

(d) Chlorine is an oxidizing agent due to its tendency to accept electron.

(b) Nitrogen has greater IE_1 than oxygen due to its stable valence shell configuration ($2s^2, 2p^3$).

(a) Fluorine is more electronegative than chlorine because of its smaller size.

177. The formula of potash alum is:

(a) $K_2SO_4.\ Al_2(SO_4)_3.\ 24H_2O$

(b) $K_2SO_4.\ Al(SO_4)_3.18H_2O$

(c) $K_2SO_4.\ (NH_4)_2SO_4.18H_2O$

(d) $Na_2SO_4.\ Al_2(SO_4)_3.\ 24H_2O$

UPTU/UPSEE-2004

Ans. (a) : $K_2SO_4.\ Al_2(SO_4)_3 24H_2O$

$K_2SO_4.\ Al_2(SO_4)_3 24H_2O$: Potash alum or potassium aluminium sulphate.

178. Which is most basic in character?

(a) CsOH (b) KOH

(c) NaOH (d) LiOH

UPTU/UPSEE-2004

Ans. (a) : CsOH

Going from top to bottom in alkali metals the size of atom increases and since removal of OH ion becomes more easy. Hence, CsOH will be most basic.

179. The element which on burning in air gives peroxide is

(a) lithium (b) sodium

(c) rubidium (d) caesium

UPTU/UPSEE-2008

Ans. (b) : Sodium

$$2Na + O_2 \longrightarrow \underset{\text{(Sodium peroxide)}}{Na_2O_2}$$

180. All the following substances react with water. The pair that gives the same gaseous product is

(a) K and KO_2 (b) Na and Na_2O_2

(c) Ca and CaH_2 (d) ba and BaO_2

NEET-1994

Ans. (c) : $Ca + H_2O \longrightarrow CaO + H_2\uparrow$

$$CaH_2 + 2H_2O \longrightarrow Ca(OH) + 2H_2\uparrow$$

Hence, Ca and CaH_2 is the pair that gives same gaseous product (H_2) reaction with water.

181. The function of "Sodium pump" is a biological process operating in each and every cell of all animals. Which of the following biologically important ions is also a constituent of this pump?

(a) K^+ (b) Fe^{2+}

(c) Ca^{2+} (d) Mg^{2+}

NEET-2015, cancelled

Ans. (a) : The function of sodium pump is a biological process in each and every cell of all animals. K^+ ion a biologically important ions is also a constitution of this pump.

Na^+ is a major cation present in blood plasma outside the cells.

K^+ is major cation present in cytoplasm (inside the cells) higher concentration of K^+ and lower concentration of Na^+ ion is present inside cell and tissue.

Lower concentration of K^+ and higher concentration of Na^+ ion is present in fluid. Bathing cells and tissues (Blood plasma).

182. In which of the following processes, fused sodium hydroxide is electrolysed at a 330 ^{0}C temperature for extraction of sodium?

(a) Castner's process (b) Down's process

(c) Cyanide process (d) Both (b) and (c)

NEET-2000

Ans. (a) : In Castner's processes for production of sodium metal, sodium hydroxide (NaOH) is electrolyzed of temperature 330°.

183. Which of the following is known as fusion mixture?

(a) Mixture of $Na_2CO_3 + NaHCO_3$

(b) $Na_2CO_3.10H_2O$

(c) Mixture of $K_2CO_3 + Na_2CO_3$

(d) $NaHCO_3$

NEET-1994

Ans. (c) : A fusion mixture consists of a sodium salt and a potassium salt. The fusion mixture is very much effective for the qualitative analysis for the organic compound for different group.

184. Washing soda has formula

(a) $Na_2CO_3.7H_2O$ (b) $Na_2CO_3.10H_2O$

(c) $Na_2CO_3.3H_2O$ (d) Na_2CO_3

NEET-1990

Ans. (b) : Washing soda: $Na_2CO_3.10H_2O$ (Sodium carbonate decahydrate).

2. Alkaline Earth Metals

185. In the flame test of a mixture of salts, a green flame with blue centre was observed. Which one of the following cations may be present?

(a) Cu^{2+} (b) Sr^{2+}

(c) Ba^{2+} (d) Ca^{2+}

JEE Main-24.06.2022, Shift-II

@apna_pdf

Ans. (a) : Cupric salts give green flame with blue center and the color of other salt are as follows.

Sr^{2+}	Crimson red
Ca^{2+}	Brick red
Ba^{2+}	Green

186. The correct order of melting point is:
(a) Be > Mg > Ca > Sr (b) Sr > Ca > Mg > Be
(c) Be > Ca > Mg > Sr (d) Be > Ca > Sr > Mg
JEE Main-26.06.2022, Shift-I

Ans. (d) : The melting point of Be, Mg, Ca and Sr are 1560K, 924K, 1124K and 1062K respectively.
So, the correct order is
Be>Ca>Sr>Mg.

187. The metal which dissolves in liquid ammonia to give a blue-black solution due to formation of solvated electron is
(a) aluminum (b) gallium
(c) calcium (d) silicon
(e) germanium
Kerala CEE -03.07.2022

Ans. (c) : Alkali metals dissolved in anhydrous liquid ammonia to give a blue color solution which are conducting in nature. The blue color of the solution is due to the ammoniated electron which absorbs energy in the visible region of light and thus imports blue color to the solution.

188. Nitrogen gas is obtained by thermal decomposition of
(a) $Ba(NO_3)_2$ (b) $Ba(N_3)_2$
(c) $NaNO_2$ (d) $NaNO_3$
JEE Main-28.06.2022, Shift-I

Ans. (b) : Nitrogen gas is obtained by thermal decomposition of Barium azide [$Ba(N_3)_2$]

$$Ba(N_3)_2 \xrightarrow{\Delta} Ba + 3N_2$$

189. Which one of the following elemental forms is not present in the enamel of the teeth?
(a) Ca^{2+} (b) P^{3+}
(c) F^- (d) P^{5+}
JEE Main-24.06.2022, Shift-I

Ans. (b) : In enamel on the surface of the teeth the compound present is [$3Ca_3(PO_4)_2.CaF_2$] Which contain Ca^{+2}, P^{+5} and F^-.
P^{+3} is not present in enamel of teeth.

190. Addition of H_2SO_4 to BaO_2 produces:
(a) BaO, SO_2 and H_2O (b) $BaHSO_4$ and O_2
(c) $BaSO_4$, H_2, and O_2 (d) $BaSO_4$ and H_2O_2
JEE Main-27.06.2022, Shift-I

Ans. (d) :
$BaO_2.8H_2O(s)+H_2SO_4(aq) \rightarrow BaSO_4+H_2O_2(aq)+8H_2O(l)$

191. $BeCl_2$ reacts with $LiAlH_4$ to give:
(a) Be + Li[$AlCl_4$] + H_2
(b) Be + AlH_3 + LiCl + HCl
(c) BeH_2 + LiCl + $AlCl_3$
(d) BeH_2 + Li[$AlCl_4$]
JEE Main-27.06.2022, Shift-I

Ans. (c) : The reaction using $LiAlH_4$ is an important preparation method for production of hydrides
$2BeCl_2 + LiAlH_4 \rightarrow 2BeH_2 + LiCl + AlCl_3$

192. Which one of the following alkaline earth metal ions has the highest ionic mobility in its aqueous solution?
(a) Be^{2+} (b) Mg^{2+}
(c) Ca^{2+} (d) Sr^{2+}
JEE Main-25.06.2022, Shift-I

Ans. (a) : Ionic mobility of a metal is depend upon its size
$\therefore$ ionic mobility $\propto \frac{1}{\text{size}}$ it denotes that smaller the size of hydrated ions, higher will be the ionic mobility.
$Be^{2+}(aq), Mg^{+2}(aq), Ca^{+2}(aq), Sr^{+2}(aq)$ size of aqueous solution decreases then ionic mobility increases.

193. A white precipitate was formed when $BaCl_2$ was added to water extract of an inorganic salt. Further, a gas 'X' with characteristic odour was released' when the formed white precipitate was dissolved in dilute HCl. The anion present in the inorganic salt is.
(a) I^- (b) SO_3^{2-}
(c) S^{2-} (d) NO_2^-
JEE Main-29.06.2022, Shift-II

Ans. (b) :

$$BaCl_2 + SO_3^{2-} \longrightarrow BaSO_3 \downarrow \xrightarrow{\text{dil.HCl}} \underset{X(gas)}{SO_2} \uparrow$$

Anion is SO_3^{2-}
X (gas) is released with smell of burning sulphur.

194. Anhydrone is :
(a) $KClO_4$ (b) $NaClO_4$
(c) $Mg(ClO_4)_2$ (d) $HClO_4 + H_2SO_4$
CG PET-22.05.2022

Ans. (c) : Anhydrone is $Mg(ClO_4)_2$ i.e. Magnesium Per chlorate. It is an water absorber used in dry batteries.

195. Among the following, basic oxide is :
(a) SO_3 (b) SiO_2
(c) CaO (d) Al_2O_3
JEE Main-28.06.2022, Shift-II

Ans. (c) :

SO_3	Acidic Oxide
SiO_2	Acidic Oxide
CaO	Basic Oxide
Al_2O_3	Amphoteric Oxide

So, option 'c' is correct
Oxide of metal → Basic

196. Besides SiO_2 and Al_2O_3, the other major ingredient in portland cement is
(a) $CaCO_3$ (b) $MgCO_3$
(c) Lime (d) Sodium peroxide
AP EAMCET- 1991

Ans. (c) : Lime
Besides SiO_2 and Al_2O_3 the other major ingredient in Portland cement is nearly 60–62% lime.
Portland cement is obtained by heating limestone and clay or other silicate mixture at high temperature (> 1500°C) in a rotating kiln.

@apna_pdf

197. Mg is mainly extracted from

(a) Magnesite (b) Rutile
(c) Diaspore (d) Cryolite

AP EAMCET- 1992

Ans. (a) Magnesite ($MgCO_3$) is an ore of magnesium. The mineral magnesium carbonate ($MgCO_3$) a member of the calcite group of carbonate minerals that is a principal source of magnesium.

198. The chemical formula of bleaching powder is

(a) CaO_2Cl (b) $Ca(OCl)Cl$
(c) $Ca(OH)_2Cl$ (d) $CaCl_2$

AP EAMCET- 1993

Ans. (b) : Ca(OCl) Cl

The chemical formula of bleaching powder is Ca(OCl)Cl

It is known as calcium chlorohypochlorite. Bleaching powder is basic in character.

Calcium chloride and water are formed when bleaching powder reacts with hydrochloric acid.

199. The chemical formula of plaster of Paris is

(a) $CaSO_4 \cdot H_2O$ (b) $CaSO_4 \cdot 2H_2O$
(c) $2CaSO_4 \cdot 2H_2O$ (d) $2CaSO_4 \cdot H_2O$

AP EAMCET- 1993

Ans. (d) : $2CaSO_4.\ H_2O$ –

The chemical formula of plaster of Paris is

$CaSO_4.\frac{1}{2}H_2O$. or $2CaSO_4.\ H_2O$ plaster is a mixture of powdered calcium sulphate (commonly known as gypsum) and water that hardens quickly.

200. Quicklime is represented by the formula

(a) $Ca(OH)_2$ (b) CaO
(c) $CaCO_3$ (d) $CaHCO_3$

AP EAMCET- 1993

Ans. (b) : CaO –

The formula of quicklime is CaO. It is a good dehydrating reagent.

201. The compound formed during the setting of the plaster of Paris is

(a) Cement (b) Gypsum
(c) Anhydrite (d) Morton

AP EAMCET- 1995

Ans. (b) : Gypsum

$$CaSO_4 \cdot \frac{1}{2}HO + \frac{3}{2}H_2O \longrightarrow \underset{\text{Gypsum}}{CaSO_4 \cdot 2H_2O}$$

∴ The setting of the plaster of Paris is gypsum.

202. Beryllium shows diagonal relationship with aluminium. Which one of the following similarity is not correct?

(a) Be_2C like Al_4C_3 yields methane on hydrolysis
(b) Be like Al is rendered passive by HNO_3
(c) $Be(OH)_2$ like $Al(OH)_3$ is strongly basic
(d) Be forms berylliates and Al forms aluminates

AP EAMCET- 1995

Ans. (c) : $Be(OH)_2$ like $Al(OH)_3$ is strongly basic

Beryllium shows diagonal relationship with aluminum.

$Be(OH)_2$ and $Al(OH)_3$ both are amphoteric in nature i.e. they react with acid as well as alkalies.

203. Super phosphate is a mixture of

(a) $Ca(H_2PO_4)_2.H_2O+CaCl_2.2H_2O$
(b) $Ca(H_2PO_4)_2.H_2O+2CaSO_4.2H_2O$
(c) $Ca_3(PO_4)_2\ .H_2O+2CaSO_4.2H_2O$
(d) $Ca_3(PO_4)_2\ .\ H_2O+CaCl_2.2H_2O$

AP EAMCET- 1996

Ans. (b) : $Ca(H_2PO_4)_2 \cdot H_2O + 2(CaSO_4 \cdot 2H_2O)$ –

Superphosphate is mixture of $Ca(H_2PO_2)$ with calcium sulphate and small quantities of other.

204. The compound formed, when gypsum is dissolved in aqueous ammonium sulphate solution, is?

(a) $CaSO_4.NH_4Cl.H_2O$
(b) $CaCl_2.\ (NH_4)2SO_4.H_2O$
(c) $CaSO_4.\ (NH_4)_2SO_4.2H_2O$
(d) $CaCl_2.NH_4Cl.2H_2O$

AP EAMCET- 2002

Ans. (c) : When gypsum is dissolved in aqueous ammonium sulphate solution then the double salt of calcium is formed.

$$\underset{\text{Gypsum}}{CaSO_4.2H_2O} + (NH_4)_2SO4 \rightarrow \underset{\text{double salt}}{CaSO_4(NH_4)_2SO_4.2H_2O}$$

205. What are the products formed, when an aqueous solution of magnesium bicarbonate is boiled?

(a) $MgO,\ H_2O,\ CO_2$ (b) $Mg(HCO_3)_2,\ H_2O$
(c) $Mg(OH)_2,\ H_2O$ (d) $Mg,\ H_2O,\ CO_2$

AP EAMCET- 2003

Ans. (a) : When an aqueous solution of magnesium bicarbonate is boiled the magnesium oxide (MgO) is formed.

$$\underset{\substack{\text{Magnesium}\\\text{bicarbonate}}}{Mg(HCO_3)_2(aq)} \xrightarrow{\Delta} \underset{\substack{\text{Magnesium}\\\text{oxide}}}{MgO} + H_2O + 2CO_2$$

206. In the hardening stage of plaster of Paris, the compound formed is?

(a) $CaSO_4$
(b) Orthorhombic $CaSO_4 \cdot 2H_2O$
(c) $CaSO_4 \cdot H_2O$
(d) Monoclinic $CaSO_4 \cdot 2H_2O$

AP EAMCET- 2004

Ans. (d) : Monoclinic $CaSO_4.2H_2O$.

$$CaSO_4.\frac{1}{2}H_2O \xrightarrow{3/2 H_2O} \underset{\text{monoclinic calcium sulphate}}{CaSO_4.2H_2O}$$

plaster of Paris absorbs water to form monoclinic gypsum is a hardening substance. In these reactions, MgO is not formed.

207. Observe the following statements :

I. Bleaching powder is used in the preparation of chloroform.

II. Bleaching powder decomposes in the presence of $CoCl_2$ to liberate O_2.

III. Aqueous KHF_2 is used in the preparation of fluorine.

The correct combination is

(a) I, II and III are correct
(b) only II is correct
(c) only I and III are correct
(d) only I and II are correct

AP EAMCET- 2006

@apna_pdf

Ans. (d) : (i) Bleaching powder is used in the preparation of chloroform.

$$\underset{\text{Bleaching powder}}{CaOCl_2} + H_2O \rightarrow Ca(OH)_2 + Cl_2$$

$$CH_3COCH_3 + 3Cl_2 \rightarrow CCl_3COCH_3 + 3HCl$$

$$2CCl_3COCH_3 + Ca(OH)_2 \rightarrow \underset{\text{Chloroform}}{2CHCl_3} + (CH_3COO)_2Ca$$

Hence, statement is true.

(ii) In the presence of cobalt chloride it loses its oxygen.

$$2CaOCl_2 \xrightarrow{CoCl_2} 5CaCl_2 + \underset{\text{'Oxygen'}}{O_2(g)}$$

(iii) Fused KHF_2 is used in the preparation of fluorine.

208. Which one of the following cations gives a brick red flame by flame test

(a) Ba^{2+} (b) Sr^{2+}

(c) Ca^{2+} (d) Zn^{2+}

MPPET- 2009

Ans. (c) : When calcium ion undergoes flame test the electrons of the calcium emits brick red colour. It is due to the excitation of electrons by the thermal energy which is then followed by de-excitation of an electron to ground state along with the libration of light in the visible range.

Ba^{2+} → Light yellow Sr^{2+} → Crimson red

Ca^{2+} → Brick red Zn^{2+} → Colourless

209. Consider the following statements with regard to magnesium sulphate :

(a) It is sparingly soluble in water.

(b) Its solubility in water is less than calcium sulphate.

(c) When heated to 900°C, it gives magnesium oxide.

Which of the above statements is/are correct?

(a) 1 and 3 (b) 2 only

(c) 3 only (d) 2 and 3

S. C. R. A - 2014

Ans. (c) : When magnesium sulphate is heated to 900°C. It gives a magnesium oxide.

210. Partial dehydration of gypsum at around 150°C affords mainly

(a) $CaSO_4$ (b) $CaSO_4.2H_2O$

(c) $CaSO_4.\frac{1}{2}H_2O$ (d) $CaSO_4.H_2O$

S. C. R. A - 2014

Ans. (c) : Partial dehydration of gypsum at around 150°C turns into the Plaster of Paris whose chemical formula is $CaSO_4.\frac{1}{2}H_2O$

211. Bubbling of CO_2 through lime water results in a turbid solution. This is due to formation of

(a) $Ca(HCO_3)_2$ (b) $CaCO_3$

(c) $Ca(OH)_2$ (d) CaO

S. C. R. A - 2014

Ans. (b) : In the calcinations reaction, $CaCO_3$ decompose in CaO(s) and CO_2(g). The following reaction take place-

$$CaCO_3(s) \rightarrow CaO(s) + CO_2(g)$$

212. Consider the following compounds :

1. $CaCl_2$ **2. $BeCl_2$**

3. $BaCl_2$ **4. $SrCl_2$**

5. $MgCl_2$

What is the correct order of melting point for the above compounds?

(a) 1 > 2 > 3 > 4 > 5 (b) 3 > 4 > 1 > 5 > 2

(c) 2 > 5 > 1 > 4 > 3 (d) 4 > 2 > 5 > 1 > 3

S. C. R. A - 2014

Ans. (b) : The given species are $CaCl_2$, $BeCl_2$, $BaCl_2$, $SrCl_2$ and $MgCl_2$. As we know that melting point is inversely proportional to the polarization i.e.

$$\text{Polarization} \propto \frac{1}{\text{Melting point}}$$

Polarization effect decreases down the group due to increase the size of alkali earth metal. $BaCl_2$ show the least polarization effect and having the high melting point. So, we can say that the melting point increases down the group in alkali earth metal.

213. Which one among the following chemicals is used as washing soda?

(a) Calcium carbonate

(b) Calcium bicarbonate

(c) Sodium carbonate

(d) Sodium bicarbonate

NDA (II)-2017

Ans. (c) : The chemical formula for washing soda is Na_2CO_3 or sodium carbonate. It is used in manufacturing of detergents, soaps, paper.

214. In cement manufacturing, gypsum is added to clinker. Which one of the following is not the function of gypsum?

(a) It decreases the rate of setting of cement

(b) It makes the clinker more brittle

(c) It helps in binding the silicate particles

(d) It helps in facilitating the formation of colloidal gel

SCRA-2010

Ans. (b) : Gypsum is called the retarding agent of cement which is mainly use for regulating the setting time of cement without gypsum. Cement clinker can condense immediately by mixing with water and release heat. So, main purpose of adding gypsum are-

(i) decrease the rate of setting of cement.

(ii) Bind the particles of calcium silicate.

(ii) Facilitate the formation of colloidal gel.

215. When gypsum is heated between 100° C to 120° C, it losses

(a) three-fourth of its water of crystallization

(b) half of its water of crystallization

(c) two-third of its water of crystallization

(d) whole water of crystallization

SCRA-2010

@apna_pdf

Ans. (a) : When gypsum is heated to a temperature of 100°C. It losses $\frac{3}{4}$th of its water of crystallization and form Plaster of Paris.

$$\underset{\text{(Gypsum)}}{CaSO_4 \cdot 2H_2O} \xrightarrow{100^\circ C} \underset{\text{(Plaster of Paris)}}{CaSO_4 \cdot \frac{1}{2}H_2O} + \frac{3}{4}H_2O$$

216. The metal constituent of chlorophyll is

(a) Iron (b) potassium
(c) Manganese (d) Magnesium

NDA (II)-2011

Ans : (d) The metal constituent of chlorophyll is magnesium.

- Chlorophyll is a shade that gives establishes their green colour, and it assists plants with making their own food through photosynthesis.

217. Match List-I with List-II and select the correct answer using the code given below the Lists:

	List-I (Compound)		**List-II (Nature)**
A.	**Sodium hydroxide/**	**1.**	**Strong acid**
B.	**Calcium oxide/**	**2.**	**Alkali**
C.	**Acetic acid/**	**3.**	**Weak acid**
D.	**Hydrochloric acid/**	**4.**	**Base**

Code:

	A	**B**	**C**	**D**
(a)	2	3	4	1
(b)	2	4	3	1
(c)	1	4	3	2
(d)	1	3	4	2

NDA (I)-2015

Ans : (b) :

Compound	**Nature**
1. Sodium hydroxide	Alkali
2. Calcium oxide	Base
3. Acetic acid	Weak acid
4. Hydrochloric acid	Strong acid.

218. Which one of the following is NOT true for bleaching powder?

(a) It is used as a reducing agent in chemical industries
(b) It is used for bleaching wood pulp in paper factories
(c) It is used for disinfecting drinking water
(d) It is used for bleaching linen in textile industry

NDA (I)-2018

Ans. (a) Bleaching powder is used in various industries and manufacturing units as an oxidizing agent. It is used for bleaching wood pulp in paper factories and for disinfecting drinking water. Bleaching powder is not used as a reducing agent in chemical industries.

219. Which one of the following is the chemical formula of gypsum?

(a) $CaSO_4.2H_2O$ (b) Ca_2SiO_4
(c) $2CaSO_4.H_2O$ (d) $CaSO_4$

NDA (II)-2018

Ans. (a) : The chemical formula of Gypsum is $CaSO_4$. $2H_2O$. Gypsum is a mineral found in various parts of the world, but it is also produced as a byproduct of flue gas desulfurization in some coal-fired electric power plants.

220. Which one of the following metals does not react with cold water?

(a) Calcium (Ca) (b) Potassium (K)
(c) Magnesium (Mg) (d) Sodium (Na)

NDA (I)-2019

Ans : (c) Magnesium does not react with cold water it reacts with hot water to form magnesium hydroxide and hydrogen.

$$Mg + 2H_2O \rightarrow \underset{\text{Magnesium hydroxide}}{Mg(OH)_2} + H_2$$

221. Which one of the following does not represent the salt, Calcium carbonate?

(a) Lime water (b) Limestone
(c) Chalk (d) Marble

NDA (II)-2019

Ans : (a) Limewater does not represent Calcium carbonate. It contain lime or citrus.

Calcium carbonate ($CaCO_3$) is also called limestone. It is found in nature in the form of chalk, limestone and marble etc.

222. The raw materials used for the manufacture of Portland cement are

(a) Lime, silica and sulphur dioxide
(b) Lime, silica and carbon dioxide
(c) Lime, silica and alumina
(d) Lime, silica and boric acid

NDA (II)-2019

Ans : (c) : Lime, silica and alumina are the raw materials used for the manufacture of Portland cement.

Portland cement is made up of four main compounds are–

(i) tricalcium silicate ($3CaO.\ SiO_2$)
(ii) dicalcium silicate ($2CaO.\ SiO_2$)
(iii) tricalcium aluminate ($3CaO.\ Al_2O_2$)
(iv) tetra-calcium aluminoferrite ($4CaO.\ Al_2O_3Fe_2O_3$)

223. In the following reaction
$I_2 + H_2O + Cl_2 \rightarrow X + Y$, the products X and Y respectively are ______

(a) $HClO_4$, HI (b) I_2O_7 , HCl
(c) HIO_3 , HCl (d) ICl_3 & HCl

AP EAPCET 23-08-2021 Shift-I

Ans. (c) : Chlorine react with iodine and water to produce periodic acid and hydrogen chloride.

$$I_2 + H_2O + Cl_2 \rightarrow \underset{\text{Periodic acid}}{HIO_3} + \underset{\text{Hydrochloric acid}}{HCl}$$

Where, X = HIO_3
Y = HCl

224. Which of the following pairs of reactions give H_2 gas as a product upon hydrolysis?

(a) $Ba \xrightarrow{H_2O} \text{products}$
$BaO_2 \xrightarrow{H_2O} \text{products}$

@apna_pdf

(b) $Ca \xrightarrow{H_2O} \text{products}$
$CaH_2 \xrightarrow{H_2O} \text{products}$

(c) $K \xrightarrow{H_2O} \text{products}$
$K_2O \xrightarrow{H_2O} \text{products}$

(d) $Na \xrightarrow{H_2O} \text{products}$
$Na_2O_2 \xrightarrow{H_2O} \text{products}$

AP-EAMCET 25-08-2021 Shift - I

Ans. (b) : (a) $Ba \xrightarrow{2H_2O} Ba(OH)_2 + H_2(g)$
$BaO_2 \xrightarrow{2H_2O} Ba(OH)_2 + H_2O$

(b) $Ca \xrightarrow{H_2O} Ca(OH)_2 + H_2(g)$
$CaH_2 \xrightarrow{H_2O} Ca(OH)_2 + H_2(g)$

(c) $2K \xrightarrow{2H_2O} KOH + H_2(g)$
$K_2O \xrightarrow{H_2O} 2KOH$

(d) $Na \xrightarrow{H_2O} NaOH + H_2(g)$
$2Na_2O_2 \xrightarrow{2H_2O} 4NaOH + O_2$

225. Which of the following metals produces Hydrogen gas on reacting with cold dilute Nitric acid

(a) Al (b) Fe
(c) Mg (d) Cu

AP-EAMCET 25-08-2021 Shift - I

Ans. (c) : $3Al \xrightarrow{dil.8HNO_3} 3Al(NO_3)_2 + 2NO + 4H_2O$

$3Fe \xrightarrow{dil.8HNO_3} 3Fe(NO_3)_2 + 4H_2O + 2NO$

$Mg \xrightarrow{dil.2HNO_3} Mg(NO_3) + H_2(g)$

$3Cu \xrightarrow{dil.8HNO_3} 3Cu(NO_3)_2 + 2NO + 4H_2O$

In the given metal, only Mg reacts with cold dilute nitric acid to evolve the hydrogen gas.

226. Which one of the following will not give flame test?

(a) Ca (b) Ba
(c) Sr (d) Be

TS-EAMCET-2016

Ans. (d) : Be and Mg do not give flame test because the electrons are strongly bound that it cannot get excited by flame. Except Be and Mg, other alkali and alkaline earth metals give flame test.

227. The alkaline earth sulphate, which has its hydration enthalpy greater than its lattice energy is

(a) $BeSO_4$ (b) $BaSO_4$
(c) $CaSO_4$ (d) $SrSO_4$

TS-EAMCET (Engg.), 05.08.2021 Shift-II

Ans. (a) : Beryllium sulphate $BeSO_4$ has its hydration enthalpy greater than its lattice enthalpy. Hence, it is highly soluble in water.

When we are moving from top to bottom in the periodic table the size of the atom increases means Beryllium has low atomic size. So, because of less atomic size Beryllium sulphate breaks easily and has less lattice enthalpy. Therefore, beryllium sulphate has high hydration and less lattice energy.

228. Tincture of iodine is the common name for

(a) iodoform
(b) 2-iodopropane
(c) 2-3% iodine solution in alcohol-water
(d) iodobenzene

AP EAMCET (Engg.) 21.09.2020, Shift-I

Ans. (c) : Tincture of iodine is usually 2-3% elemental iodine, alongwith potassium iodide or sodium iodide, dissolved in a mixture of ethanol and water. Tincture solutions are characterised by the presence of alcohol.

229. The tendency of forming chloride hydrates of alkaline earth metals is in the order of ———

(a) Ba > Sr, Ca > Mg (b) Sr > Ba, Mg > Ca
(c) Mg > Ca, Sr > Ba (d) Mg > Sr > Ca > Ba

AP EAPCET 25.08.2021, Shift-II

Ans. (c) : On going from top to bottom in alkaline earth metal the tendency of chloride is decreases.
So, the order is – Mg > Ca, Sr > Ba

230. Choose the smallest ion from the following.

(a) Mg^{2+} (b) S^{2-}
(c) Na^{+} (d) Cl^{-}

AP EAMCET (Engg.) 17.09.2020 Shift-I

Ans. (a) : Mg^{2+}
For is electronic ions, size $\propto$ charge on anion $\propto \frac{1}{\text{charge on cation}}$.
$\therefore$ Mg^{2+} is the smallest out of given.

231. Consider the following compounds :
1. $Ba(OH)_2$ 2. $Mg(OH)_2$ 3. $Ca(OH)_2$
What is the correct order of their alkalinity ?

(a) $Ba(OH)_2 > Mg(OH)_2 > Ca(OH)_2$
(b) $Mg(OH)_2 > Ca(OH)_2 > Ba(OH)_2$
(c) $Mg(OH)_2 > Ba(OH)_2 > Ca(OH)_2$
(d) $Ba(OH)_2 > Ca(OH)_2 > Mg(OH)_2$

SCRA - 2009

Ans. (d) : The increasing order of basic character of alkaline earth metals Mg, Ca and Ba are Ba > Ca > Mg
So, correct order of their alkalinity-

$$\boxed{Ba(OH)_2 > Ca(OH)_2 > Mg(OH)_2}$$

232. Reaction of calgon with hard water containing Ca^{2+} ions produce

(a) $[Na_2CaP_6O_{18}]^{2-}$ (b) $Ca_2(PO_4)_3$
(c) $CaCO_3$ (d) $CaSO_4$

TS EAMCET-2017

Ans. (a): Calgon is the name of complex salt, sodium hexametaphosphate $(NaPO_3)_6$. It is give a complex anion.

$$Na_2(Na_4P_6O_{18}) \longrightarrow 2Na^+ + \underset{\text{(Complex anion)}}{Na_4P_6O_{18}^{2-}}$$

$$\underset{\text{(Hard water)}}{Ca^{2+}} + \underset{\text{(anion of Calgon)}}{Na_4P_6O_{18}^{2-}} \longrightarrow CaNa_2P_6O_{18}^{2-} + 2Na^+$$

@apna_pdf

233. Bleaching powder can be obtained by which of the following reactions ?

(a) $Mg(OH)_2 + F_2 \xrightarrow{\Delta} MgOF_2 + H_2O$

(b) $Ca(OH)_2 + Cl_2 \xrightarrow{\Delta} CaOCl_2 + H_2O$

(c) $Ba(OH)_2 + Br_2 \xrightarrow{\Delta} BaOBr_2 + H_2O$

(d) $Ca(OH)_2 + F_2 \xrightarrow{\Delta} CaOF_2 + H_2O$

AP EAPCET 24.08.2021 Shift-II

Ans. (b): Calcium hydroxide react with chlorine in presence of heat. It will produce bleaching powder ($CaOCl_2$).

$Ca(OH)_2 + Cl_2 \xrightarrow{\Delta} CaOCl_2 + H_2O$ (Bleaching powder)

234. $CaOCl_2 + H_2O \rightarrow Ca(OH)_2 + X$

$X + CH_3CHO \rightarrow Y$

$Y + Ca(OH)_2 \rightarrow CHCl_3$

What is 'Y'?

(a) $CH_3CH(OH)_2$ (b) CH_2Cl_2

(c) CCl_3CHO (d) CCl_3COCH_3

AP EAMCET (Engg.) -2007

Ans. (c) : The basic method of formation of chloroform:

$$CaOCl_2 + H_2O \longrightarrow Ca(OH)_2 + \underset{X}{Cl_2}$$

$$\underset{Y}{CH_3CHO} + 3Cl_2 \longrightarrow CCl_3CHO + 3HCl$$

$$3CCl_3CHO + (aCOH) \longrightarrow 2CHCl_3\,(Chloroform)$$

x = Cl_2

y = CCl_3 CHO.

235. Which of the following metal ion play an important role in muscle contraction ?

(a) Fe^{2+} (b) Ca^{2+}

(c) Au^{+} (d) Na^{+}

AP EAPCET 24.08.2021, Shift-I

Ans. (b) : The Ca^{2+} metal ion plays an important role in muscle contraction due to which will charge thin filement into activated state. The binding of calcium to the troponin charges its shape so that the myosin binding sites on the actin are exposed causing a muscle contraction.

236. The main constituent of enamel on the surface of teeth is:

(a) $[3\,Ca_3\,(PO_4)_2 \cdot CaF_2]$

(b) $Ca_3\,(PO_4)_2 \cdot H_2O$

(c) $[3Ca_3(PO_4)_2 \cdot Ca\,(OH)_2]$

(d) CaF_2

AP EAPCET 20.08.2021 Shift-II

Ans. (c): The main constituent of enamel on the surface of teeth is $[3Ca_3(PO_4)_2.\ Ca(OH)_2]$

237. The experimentally determined molar mass of a non-volatile solute, $BaCl_2$ in water by Cottrell's method, is

(a) equal to the calculated molar mass

(b) more than the calculated molar mass

(c) less than the calculated molar mass

(d) double of the calculated molar mass

AP EAMCET (Engg.) 2012

Ans. (c) : The calculated molar mass of $BaCl_2$ is greater than the experimentally determined molar mass of $BaCl_2$ because $BaCl_2$ is ionised in water.

So, option 'c' is correct.

238. Which of the following substances is used, in laboratory, for fast drying of neutral gases?

(a) Phosphorus pentoxide

(b) Anhydrous calcium chloride

(c) Active charcoal

(d) Sodium phosphate

COMEDK 2016

Ans. (b) : Anhydrous calcium chloride ($CaCl_2$) is commonly used dehydrating agent in laboratory for drying of neutral gases.

239. Which of the following has correct increasing basic strength?

(a) MgO < BeO<CaO<BaO

(b) BeO<MgO<CaO<BaO

(c) BaO<CaO<MgO<BeO

(d) CaO<BaO<BeO<MgO

COMEDK 2016

Ans. (b) : The basic strength of oxides increases gradually from top to bottom.

BeO < MgO < CaO < SrO < BaO

240. Mg is an important component of

(a) haemoglobin (b) chlorophyll

(c) ATP (d) florigen.

COMEDK-2015

Ans. (b) : Chlorophyll molecule consists of a central magnesium atom surrounded by a nitrogen-containing structure called a prophyrin ring.

Chlorophyll also known as the green pigment. It harvests light for photosynthesis.

241. Which of the following is an epsom salt?

(a) $MgSO_4.2H_2O$ (b) $2CaSO_4.\ H_2O$

(c) $BaSO_4.\ 2H_2O$ (d) $MgSO_4.\ 7H_2O$

COMEDK-2020

Ans. (d) : Chemical formula of Epsom salt is $MgSO_4.7H_2O$.

242. Which one of the following compounds helps in achieving equilibrium between O_2 and $CO_2(g)$ in atmosphere?

(a) Chlorophyll

(b) Vitamin-B_{12}

(c) Porphyrin

(d) Acetyl salicylic acid

AP-EAMCET (Medical), 2008

Ans. (a) : In atmosphere, the equilibrium between oxygen (O_2) and carbon dioxide (CO_2) is maintained by photosynthesis and chlorophyll is necessary green pigment (present in plants) for photosynthesis thus, chlorophyll help in achieving equilibrium between O_2 and CO_2 in atmosphere.

243. $$\underset{(dry)}{Ca(OH)_2} \xrightarrow[-H_2O]{Cl_2} A \xrightarrow{\text{Auto-oxidation}} CaCl_2 + B$$

Identify B in the above reaction.

(a) $CaOCl_2$ (b) $Ca\,(ClO_3)_2$

(c) $Ca\,(OH)_2$ (d) $Ca\,(ClO_2)_2$

AP-EAMCET (Medical), 2008

@apna_pdf

Ans. (b) : When calcium hydroxide $Ca(OH)_2$ reacts with Cl_2 to give bleaching powder ($CaOCl_2$). Bleaching powder on auto-oxidation gives calcium chlorate $[Ca(ClO_3)]$

$$\underset{\text{Bleaching powder 'A'}}{Ca(OH)_2} \xrightarrow[-H_2O]{Cl_2} CaOCl_2 \xrightarrow{\text{auto-oxidation}} 5CaCl_2 + \underset{\text{Calcium chlorate 'B'}}{Ca(ClO_3)_2}$$

244. Which one of the following is the correct order for the decomposition temperature of $CaCO_3$(X), $MgCO_3$(Y) and $BaCO_3$ (Z)?

(a) Z > X > Y
(b) X > Y > Z
(c) Y > Z > X
(d) X > Z > Y

AP-EAMCET (Medical), 2002

Ans. (a) : The stability of carbonate of alkaline earth metal increases from top to bottom due to increase of atomic size. So, the correct decreasing order of stability is : $BaCO_3 > CaCO_3 > MgCO_3$

245. Powdered Berilium burns in air to give

(a) BeO; Be_2N_2
(b) Be_2O_3;Be_3N_2
(c) BeO; Be_3N_2
(d) BeO; Be_2N

TS EAMCET 05.08.2021, Shift-I

Ans. (c) : When powdered berilium burns in air. It give BeO, Be_3N_2.

$Be (s) + 1/2O_2 (g) \rightarrow BeO (s)$ (Beryllium oxide)

$3Be (s) + N_2(g) \rightarrow Be_3N_2 (s)$ (Beryllium nitride)

246. Assertion: Among alkaline earth metals, Be predominantly forms compounds with covalent bond.

Reason: Be is larger in size and hence has greater polarizing power.

(a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS 25 May 2019 (Evening)

Ans. (c): Covalent nature is determined by polarization power.

Covalent nature ∝ polarization property

$$\propto = \frac{\text{Charge on cation}}{\text{Size of cation}}$$

Be has smaller size among the alkaline earth metals and hence has greater polarizing power. Hence (A) is correct but (R) is incorrect.

247. $MgCl_2$. $6H_2O$ when heated gives

(a) Magnesium dichloride
(b) Magnesium oxide
(c) Magnesium oxychloride
(d) Magnesium chloride

AIIMS-1994

Ans. (b): When $MgCl_2.6H_2O$ is heated then it will give magnesium oxide.

$MgCl_2.6H_2O \xrightarrow{heat} MgO + 5H_2O + 2HCl$.

248. Hydrolysis of beryllium carbide produces

(a) acetylene
(b) methane
(c) ethene
(d) none of these

AIIMS-1996

Ans. (b): The reaction can be written as –

$$Be_2C + 4H_2O \longrightarrow 2Be(OH)_2 + \underset{\text{(Methane)}}{CH_4}$$

249. In the reaction sequence: $CaC_2 \xrightarrow{H_2O} A \xrightarrow[H_2SO_4]{dil.H_2SO_4} B \xrightarrow{H_2/Ni} C$, the term 'C' is

(a) CH_3CHO
(b) HCHO
(c) C_2H_5OH
(d) CH_3OH

AIIMS-1996

Ans.(c) **(c):**

$$CaC_2 \xrightarrow{H_2O} \underset{\substack{\text{(A)}\\\text{Acetlylene}}}{CH \equiv CH} \xrightarrow[HgSO_4]{dil.H_2SO_4} \underset{\substack{\text{(B)}\\\text{Acetaldehyde}}}{CH_3CHO} \xrightarrow{H_2/Ni} \underset{\substack{\text{(C)}\\\text{Ethanol}}}{CH_3CH_2OH}$$

Calcium carbide reacts with water to form acetylene. Acetylene reacts with dil H_2SO_4 in the presence of $HgSO_4$ to form Acetaldehyde and Acetaldehyde reacts with H_2/Ni to form ethanol and it is the final product (i.e. CH_3CH_2OH).

250. Match List -I with List -II for the compositions of substances and select the correct answer using the code given below the lists:

	List -I **Substances**		**List -II** **Composition**
(A)	Plaster of paris	**(i)**	$CaSO_4.2H_2O$
(B)	Epsomite	**(ii)**	$CaSO_4.{}^1/_2H_2O$
(C)	Kieserite	**(iii)**	$MgSO_4.7H_2O$
(D)	Gypsum	**(iv)**	$MgSO_2.H_2O$
		(v)	$CaSO_4$

Code:

	(A)	**(B)**	**(C)**	**(D)**
(a)	(iii)	(iv)	(i)	(ii)
(b)	(ii)	(iii)	(iv)	(i)
(c)	(i)	(ii)	(iii)	(v)
(d)	(iv)	(iii)	(ii)	(i)

(AIIMS-2015), VITEEE-2012

Ans. (b):

Plaster of paris	$CaSO_4.\frac{1}{2}H_2O$
Epsomite	$MgSO_4.7H_2O$
Kieserite	$MgSO_4.\ H_2O$
Gypsum	$CaSO_4.\ 2H_2O$

251. Assertion: $Mg(CH)_3$ behave as a polymer.

Reason: CH_3 can form a very good bridge bond.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

(AIIMS-27 May, 2018-Morning)

@apna_pdf

Ans. (d):– Mg(CH)$_3$ does not behave as a polymer and CH$_3$ is a monovalent and does not acts as bridge bond.

252. Assertion: Of the various chlorides of alkaline earth metals BeCl$_2$ is covalent in nature, whereas MgCl$_2$ and CaCl$_2$ are ionic compounds.

Reason: Be is the first member of group 2.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

(AIIMS-2012)

Ans. (b): The ionic nature of MgCl$_2$ and CaCl$_2$ is due to the large difference in electro negativity values of Mg. Ca to that of Chlorine.

253. Assertion: Best diagonal relationship is shown between Be and Al.

Reason: Ionization energy of Be is almost the same as that of Al.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

(AIIMS-2013)

Ans. (a): On moving diagonally in the modern periodic table the elements show contain similarities. This is due to the fact that on moving across a period from left to right electro negativity of the atom decreases. On the other hand on moving down the group electro positivity increases.

Hence the elements present diagonally show similar properties. As a result diagonal elements have same ionization energy.

254. Assertion: Both Be and Al can form complexes such as BeF_4^{2-} and AlF_6^{3-} respectively, BeF_6^{3-} is not formed.

Reason: In case of Be, no vacant d-orbitals are present in its outermost shell.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

(AIIMS-2009)

Ans. (a): Due to absence of d-orbitals in Be, it does not BeF_6^{3-} Whereas AlF_6^{3-} is formed due to presence of d-orbitals in Al.

255. Which one of the following hydrides is more acidic?

(a) H_2S (b) H_2O
(c) H_2Se (d) H_2Te

AP EAMCET (Medical) -1998

Ans. (d): Stability of hydride decreases down the group and electropositive character increases down the group. Therefore, acidic character increases down the group. Hence, the order is $H_2O < H_2S < H_2Se < H_2Te$.

256. Assertion: Barium is not required for normal biological function in human

Reason: Barium does not show variable oxidation sate.

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

(AIIMS-2003)

Ans. (b): For biological function of the human body, we need monovalent Na and K ions and divalent Mg and Ca ions, which are found in large properties in biological fluids.

257. Assertion: BaCO$_3$ is more soluble in HNO$_3$ than in plain water.

Reason: Carbonate is a weak base and reacts with the H$^+$ from the strong acid, causing the barium salt to dissociate.

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

(AIIMS-2003)

Ans. (a): Barium carbonate is more soluble in water because carbonate is a weak base and reacts with the H$^+$ ion of HNO$_3$ causing the barium salt to dissociate.

258. Assertion: Mg is not present in enamel of human teeth.

Reason: Mg is an essential element for biological functions of human.

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but incorrect.

@apna_pdf

(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

(AIIMS-2004)

Ans. (e): Enamel is the hardest substance in the human body and contains the highest percentage of minerals. with water and organic minerals composing the rest the primary mineral is hydroxyapatite which is a crystalline calcium phosphate.

Magnesium is not present in human enamel. However magnesium is an essential mineral for human health magnesium is a cofactor for more than 300 enzyme systems and is involved in both aerobic and anaerobic energy generation and in glycol sis, either directly as an enzyme activator or as a part of the magnesium is required for mitochondria to carry out oxidative. Phosphory lation. It plays areole in regulating potassium fluxes and in the metabolism of calcium.

259. Nitrolium is a mixture of :
(a) Ca $(CN)_2$ and graphite
(b) Ca C_2 and graphite
(c) Ca CN_2 and graphite
(d) Ca CN_2 and N_2

AP EAMCET (Medical) -1998

Ans. (c): Nitrolium is used as fertilizer. It is prepared when calcium carbide is heated with N_2 at 1000ºC.

$$CaC_2 + N_2 \xrightarrow{1000°C} \underbrace{CaCN_2 + C}_{\text{Nitrolium}}$$

Nitrolium is a mixture of calcium cyanamide and carbon $\left(CaCN_2 + C\right)$

260. What is product of reaction:

$$\mathbf{Ba(OH)_2 + H_2O_2 + ClO_2 \longrightarrow}\text{(dilute)}$$

(a) HOCl (b) $Ba(OCl)_2$
(c) $Ba(ClO_3)_2$ (d) $Ba(ClO_2)_2$

(AIIMS-27 May, 2018-Morning)

Ans. (d): Product of reaction–

$$Ba(OH)_2 + H_2O_2 + ClO_2 \longrightarrow Ba(ClO_2)_2 + O_2 + 2H_2O.$$

261. The following compounds have been arranged in order of their increasing thermal stabilities. Identify the correct order.
(I) K_2CO_3 (II) $MgCO_3$
(III) $CaCO_3$ (IV) $BeCO_3$
(a) I < II < III < IV (b) IV < II < III < I
(c) IV < II < I < III (d) II < IV < III < I

(AIIMS-2012)
J&K CET-1999

Ans. (b): According to Fajan's rule, the thermal stability is inversely proportional to the no. of charge on cation and directly proportional to the size of cation.

$BeCO_3 < MgCO_3 < CaCO_3 < K_2CO_3$

For particulars set of group (i.e. 1 or 2) the thermal stability increases form top to bottom of the group.

262. A metal salt solution forms a yellow precipitate with potassium chromate in acetic acid, a white precipitate with dil H_2SO_4, but given no precipitate with NaCl. The metal salt solution will consist of
(a) $PbCO_3$ (b) $BaCO_3$
(c) $MgCO_3$ (d) $CaCo_3$

(AIIMS-2011)

Ans. (b): The white precipitate obtained when sodium carbonate is added to the metal salt solution consists of barium carbonate.

Potassium chromate (K_2CrO_4) solution gives a yellow precipitate of barium chromate when the solution of fifth group precipitate in acetic acid is treated with it.

$$BaCO_3 + 2CH_3COOH \rightarrow Ba(CH_3COO)_2 + CO_2 + H_2O$$
$$Ba(CH_4COO)_2 + K_2CrO_4 \rightarrow BaCrO_4 + 2KCH_3COOK$$
$$BaCO_3 + H_2SO_4 \rightarrow BaSO_4 \downarrow + 2CO_2 + 2H_2O$$

263. The correct sequence of increasing melting points of $BeCl_2$, $MgCl_2$, $CaCl_2$, $SrCl_2$ and $BaCl_2$ is
(a) $BaCl_2 < SrCl_2 < CaCl_2 < MgCl_2 < BaCl_2$
(b) $BeCl_2 < MgCl_2 < CaCl_2 < SrCl_2 < BaCl_2$
(c) $BeCl_2 < CaCl_2 < MgCl_2 < SrCl_2 < BaCl_2$
(d) $MgCl_2 < BeCl_2 < SrCl_2 < CaCl_2 < BaCl_2$

(AIIMS-2011)

Ans. (b): Large the size of cation and smaller the size of anion. more will be the electronegative difference. More will be the ionic character and more will be the melting point.

$BeCl_2 < MgCl_2 < CaCl_2 < SrCl_2 < BaCl_2$

264. Which one of the alkaline earth metals shows some anomalous behaviour and has the same electronegativity as aluminium?
(a) Sr (b) Ca
(c) Ba (d) Be

(AIIMS-2011)

Ans. (d): Due to diagonal relationship Be shows similar properties to Al.

265. Among the following components of cement which is present in highest amount?
(a) Ca_2SiO_4 (b) Ca_3SiO_5
(c) Al_2O_3 (d) $Ca_3Al_2O_6$

(AIIMS-2007)

Ans. (b): A cement is a binder, a substance used for construction that sets, hardness and adheres to other materials to bind them together.

The amount of component of cement depends upon its type. Portland cement is most common kind and contains 51%, tricalcium silicate, 24% of dicalcium silicate and 6% of tricalcium aluminate.

266. Which one of the following hydroxide is insoluble in water?
(a) $Ca(OH)_2$ (b) $Ba(OH)_2$
(c) $Be(OH)_2$ (d) $Mg(OH)_2$

(AIIMS-2001)

Ans. (c): Solubility of alkaline earth metal hydroxide increases down the group. $Be(OH)_2$ is insoluble in water while hydroxide of other alkaline earth metals are soluble.

267. Chemical 'A' is used for softening of water to remove temporary hardness. A reacts with sodium carbonate to produce caustic soda. When CO_2 is bubbled through 'A' it turns cloudy. Chemically 'A' is:

@apna_pdf

(a) CaO (b) $CaCO_3$
(c) $Ca(HCO_3)_2$ (d) $Ca(OH)_2$

(AIIMS-1999, 2013)

Ans. (d): The Chemical A is calcium hydroxide $Ca(OH)_2$ used to water softening to remove tempory hardness. It reacts with sodium carbonate to form caustic soda.

$$Na_2CO_3 + Ca(OH)_2 \longrightarrow \frac{1}{\text{molar mass}}$$

with carbon dioxide gas it forms calcium carbonate which turns lime water milky.

$$Ca(OH)_2 + CO_2 \longrightarrow CaCO_3 \downarrow + H_2O.$$

268. Match List-I with List-II for the compositions of substances and select the correct answer using the codes given below the lists.

List-I (Substances)	**List-II (Composition)**
A. Plaster of Paris	**1. $CaSO_4.2H_2O$**
B. Epsomite	**2. $CaSO_4.\frac{1}{2}H_2O$**
C. Kieserite	**3. $MgSO_4.7H_2O$**
D. Gypsum	**4. $MgSO_4.H_2O$**
	5. $CaSO_4$

Codes :

	A	B	C	D
(a)	3	4	1	2
(b)	2	3	4	1
(c)	1	2	3	5
(d)	4	3	2	1

VITEEE- 2012

Ans. (b) : Plaster or Paris $= CaSO_4 \cdot \frac{1}{2}H_2O$

Epsomite $= MgSO_4 \cdot 7H_2O$

Kieserite $= MgSO_4 \cdot H_2O$

Gypsum $= CaSO_4 \cdot 2H_2O$

269. Mg is an important component of which biomolecule occurring extensively in living world?

(a) Haemoglobin (b) Chlorophyll
(c) Florigen (d) ATP

VITEEE- 2010

Ans. (b) : Chlorophyll is a fundamental component of PSI. Chlorophyll is a porphyrin complex of magnesium and is responsible for the green colors of leaves. It plays an important role in receiving light energy and transferring it to redox reaction systems.

270. Diamond is hard because

(a) all the four valence electrons are bonded to each carbon atoms by covalent bonds
(b) it is a giant molecule
(c) it is mode up of carbon atoms
(d) it cannot be burnt

VITEEE- 2008

Ans. (a) : In the structure of diamond each carbon atom in sp^3 hybridised & is covalently bonded with four other carbon atom held at the corners of a regular tetrahedron by covalent bonds. This results in a very big three dimensional polymeric structure in which C–C distance is 154 pm and bond angle is 109.5°. Owing to very strong covalent bonds by which atoms are held to greater, diamond is the hardest substance known.

271. Which one of the following reactions does not occur?

(a) $BaO + O_3 \longrightarrow BaO_2 + O_2$
(b) $PbS + 4O_3 \longrightarrow PbSO_4 + 4O_2$
(c) $H_2O_2 + O_3 \longrightarrow H_2O + 2O_2$
(d) $2Hg + O_3 \longrightarrow Hg_2o + O_2$

AP - EAMCET(MEDICAL) - 2009

Ans. (a) : BaO is not react with O_3 only BaO_2 reacts with O_3. Here (— O — O —) acts as oxidising as well as reducing agent.

$$BaO_2 + O_3 \longrightarrow BaO + 2O_2$$

272. $BaSO_4$ is insoluble in water due to its

(a) high hydration energy
(b) high lattice energy
(c) high ionisation energy
(d) high kinetic energy

AP - EAMCET(MEDICAL) - 2009

Ans. (b) : Barium sulphate ($BaSO_4$) has the high lattice enthalpy due to which $BaSO_4$ is insoluble in water.

273. Element with atomic number 38, belongs to

(a) II A group and 5th period
(b) II A group and 2nd period
(c) V A group and 2nd period
(d) III A group and 5th period

AP - EAMCET (Medical) - 2007

Ans. (a) : The electronic configuration of atomic number 38 is :

$${}_{38}X = [Kr], 5s^2$$

Hence, two electron present in outer shell of s-orbital. It is belongs to IIA group and 5th period. It's name is strontium (Sr). It's an alkaline metal and is located in group-II of periodic table.

274. Which of the following is incorrect?

(a) In the Castner's process of sodium extraction, NaCl is used as an electrolyte
(b) Sodium reduces CO_2 to carbon
(c) Mg reacts with cold water and liberate hydrogen gas
(d) Magnesium is an alloy of Mg and Zn

AP-EAMCET (Engg.)-2005

Ans. (c) : Magnesium does not react with cold water. It reacts with hot water to form magnesium hydroxide and hydrogen.

$$Mg + 2H_2O \xrightarrow{\text{Hot water}} Mg(OH)_2 + H_2$$

Hence, statement is false.

- The Castner's Kellner process is a method of electrolysis of sodium chloride solution to produce alkali hydroxide. It uses electrolyte of NaCl solution graphite anode and mercury cathode. Hence, statement is true.

@apna_pdf

- When alkali metal reacts with CO_2 then carbon is formed.

  $4Na + CO_2 \longrightarrow 2Na_2O + C$
- Magnesium alloys are mixtures of magnesium with other metals often Aluminium, Zinc, Manganese, Silicon, Copper, rare earths and Zirconium.

275. Philosopher's wool when heated with BaO at 1100°C gives a compound. Identify the compound.

(a) $BaZnO_2$ (b) $Ba + ZnO_2$
(c) $BaCdO_2$ (d) $BaO_2 + Zn$

SRMJEEE-2014

Ans. (a) : ZnO is called philoshper wool which is heated with BaO at 1100ºC gives the $BaZnO_2$

$$\underset{\text{philospher's wool}}{ZnO} + BaO \xrightarrow{1100^\circ C} BaZnO_2$$

276. Which of the following oxides is most acidic in nature ?

(a) BeO (b) MgO
(c) CaO (d) BaO.

AMU – 2009

Ans. (a) : Acidity of oxides increases with decrease in electropositive character of central atom. Be is least electropositive. So, It will produce most acidic oxide.

277. Zinc phosphide and barium carbonate are well known

(a) germicides (b) fungicides
(c) herbicides (d) rhodenticides

AMU–2003

Ans. (d) : Rhodenticides are chemicals used for killing rodents.
(e.g., rats, mice etc)

278. Dolomite constitutes

(a) Fe_2O_3, FeO (b) $CaCO_3$, $Ca(OH)_2$
(c) CuS, FeS (d) $MgCO_3$, $CaCO_3$

AMU–2003

Ans. (d) : Dolomite is a magnesium are with general formula $MgCO_3CaCO_3$

279. The wire in the flash bulbs is made up of

(a) Ag (b) Cu
(c) Ba (d) Mg

AMU 2002

Ans. (d) : Mg (Magnesium) is used to make the wire of flash bulb.

280. Which out of the following is called 'Blue john'?

(a) CaF_2 (b) CaO
(c) CaH_2 (d) Ca_3P_2

AMU 2002

Ans. (a) : Blue John is a semi-precious mineral, a rare form of fluorite with bands of a purple-blue or yellowish color CaF_2 is called as Blue John.

281. Mortar is a mixture of slaked lime and sand in the ratio

(a) 1:4 (b) 2:3
(c) 1:3 (d) 3:1

AMU 2002

Ans. (c) : Mortor is a mixture of 1 part of slaked lime, 3 parts of sand and water.

282. Which of the following carbonates is least soluble in water?

(a) $NaHCO_3$ (b) $CaCO_3$
(c) $MgCO_3$ (d) $NaCO_3$

AMU 2002

Ans. (b) : As we know the solubility of carbonates in water depends upon the lattice energy. The calcium carbonate has the high lattice energy due to the big size of metal among the options. Hence $CaCO_3$ is least soluble in water due to high lattice energy.

283. The order of hydration enthalpies of alkaline earth metal ions

(a) $Be^{2+} > Mg^{2+} > Ca^{2+} > Sr^{2+}$
(b) $Sr^{2+} > Ca^{2+} > Mg^{2+} > Be^{2+}$
(c) $Mg^{2+} > Be^{2+} > Ca^{2+} > Sr^{2+}$
(d) $Be^{2+} > Mg^{2+} > sr^{2+} > Ca^{2+}$

Assam CEE-2019

Ans. (a) : The hydration enthalpy of ion is more when the size of cation is smaller. When we move top to bottom in the group the size of the atom increases so, hydration enthalpy decreases.
So, the increasing order of the size of the ions is as follows.
$Be^{2+} < Mg^{2+} < Ca^{2+} < Sr^{2+}$
And reversing of this order is true for the hydration enthalpy.
$Be^{2+} > Mg^{2+} > Ca^{2+} > Sr^{2+}$

284. On heating ammonium dichromate and barium azide separately, we get

(a) N_2 in both cases
(b) N_2 from ammonium dichromate and NO from barium azide
(c) N_2O form ammonium dichromate and N_2 from barium azide
(d) N_2O from ammonium dichromate and NO_2 from barium azide

Assam CEE-2018

Ans. (a) : When we supplied heat to ammonium dichromate and barium azide separately we get N_2 in both cases.
$(NH_4)_2 Cr_2O_7 \rightarrow Cr_2 O_3 + 4H_2O + N_2$
$Ba(N_3)_2 \rightarrow Ba + 3N_2$
The correct option is (a).

285. The chemical formula of Plaster of Paris is–

(a) $CaSO_4 \cdot \frac{1}{2} H_2O$ (b) $CaSO_4 \cdot H_2O$
(c) $CaSO_4 \cdot 2H_2O$ (d) $CaSO_4 \cdot 3H_2O$

JIPMER-2008, 2018
Karnataka-CET-2017
BCECE-2007, 2010
JCECE-2007
UPTU/UPSEE-2005
(AIIMS-2000)

Ans. (a) : Plaster of Paris- $CaSO_4 \frac{1}{2} H_2O$ (Calcium sulphate hemidaydrate)

@apna_pdf

286. Which of the following radicals gives the apple green flame during flame test?

(a) Ba^{2+} (b) Sr^{2+}
(c) Ca^{2+} (d) Cr^{3+}

BCECE-2006

Ans. (a) :
$Ba^{2+} \rightarrow$ apple green
$Ca^{2+} \rightarrow$ brick red
$Sr^{2+} \rightarrow$ crimson red
$Cr^{2+} \rightarrow$ Green

287. Important ore of Mg is :

(a) Gypsum (b) Carnallite
(c) Magnatide (d) Carnolite

BCECE-2005

Ans. (b) : formula- $KCl.MgCl_2.6H_2O$ carnallite ore.

288. On strong heating $MgCl_2.6H_2O$, the product obtained is :

(a) $MgCl_2$ (b) MgO
(c) $MgCl_2.2H_2O$ (d) $MgCl_2.4H_2O$

BCECE-2004

Ans. (b) : On strong heating $MgCl_2.6H_2O$, is hydrolysed by its own of crystallization.

$MgCl_2.6H_2O \xrightarrow{\Delta} MgO + 2HCl + 5H_2O$

289. The salt responsible for permanent hardness of H_2O is–

(a) Na_2SO_4 (b) $MgHCO_3$
(c) $NaCl$ (d) $MgCl_2$

BCECE-2009

Ans. (d) : The salt responsible for permanent hardness of H_2O is $MgCl_2$.

- Permanent hardness of water is caused by the presence of soluble salts like calcium and magnesium in the form of chlorides and sulphides in water.

290. The least ionic chloride is formed by

(a) Mg (b) Ca
(c) Be (d) Sr

BCECE-2009

Ans. (c) :Be^{2+} ion is small in size and has high charge. Therefore, it has high polarizing power and it forms covalent halides. Thus, $BeCl_2$ is covalent in nature. Other alkaline earth metals form ionic halides.

291. Colemanite is

(a) $Na_2B_4O_7 \cdot 10H_2O$ (b) $Ca_2B_6O_{11} \cdot 5H_2O$
(c) $NaBO_2$ (d) H_3BO_3

BCECE-2011

Ans. (b) : Colemanite ($Ca_2B_6O_{11}.5H_2O$) is a borate mineral found in evaporate deposits of alkaline lacustrine environments. It is also an ore of boron.

Calemanite is a secondary mineral that forms by alteration of borax and ulexite.

292. The value of x is maximum for

(a) $MgSO_4.xH_2O$ (b) $CaSO_4.xH_2O$
(c) $BaSO_4.xH_2O$
(d) All have the same value of x

BCECE-2011
BITSAT-2009

Ans. (a) : As the size of the metal atom increases, the degree of hydration decreases. Thus small sized Mg^{2+} ion gets more hydrated. Hence, x is maximum for $MgSO_4.xH_2O$.

$MgSO_4$ has 7 moles of water of hydration. Thus the value of x is 7 which is greater than other.

293. When NH_3 is passed over heated metal A. Its amide is formed. The metal is

(a) Mg (b) K
(c) Al (d) Pb

[BITSAT-2013]

Ans. (b) : As NH_3 passed over heated Potassium than Potassium amide is obtained.

$K + NH_3 \longrightarrow KNH_2 + \frac{1}{2}H_2$

294. Portland cement does not contain

(a) Ca_2SiO_4 (b) Ca_2SiO_5
(c) $Ca_2Al_2O_6$ (d) $Ca_3(PO_4)_2$

BITSAT-2008, 2017

Ans. (d) : Portland cement does not contain calcium phosphate. The composition of Portland cement is 62% calcium oxide, 22% silica, 7.5% alumina, 2.5% magnesia and 2.5% ferric oxide calcium oxide is present in the form of calcium silicates and calcium aluminates.

295. Which of the following has correct increasing basic strength?

(a) $MgO < BeO < CaO < BaO$
(b) $BeO < MgO < CaO < BaO$
(c) $BaO < CaO < MgO < BeO$
(d) $CaO < BaO < BeO < MgO$

BITSAT-2012

Ans. (b) : On moving down the group the basic nature of oxides increases.

Therefore, the correct order of increasing basic strength $BeO < MgO < CaO < BaO$

296. BeF_2 is soluble in water whereas fluorides of other alkaline earth metals are insoluble because of

(a) Ionic nature of BeF_2
(b) Covalent nature of BeF_2
(c) Greater hydration energy of Be^{2+} ion as compared to its lattice energy
(d) None of these

BITSAT-2020

Ans. (c) : BeF_2 is soluble in water because it has greater hydration energy of Be^{2+} ion as compared to the crystal lattice. The other fluorides are almost insoluble in water. Since, on descending the group lattice energy decreases more rapidly than the hydration energy.

297. Which of the following alkaline earth metal hydroxides in amphoteric in character?

(a) $Be(OH)_2$ (b) $Ca(OH)_2$
(c) $Sr(OH)_2$ (d) $Ba(OH)_2$

BITSAT-2019

Ans. (a) : $Be(OH)_2$ (Beryllium hydroxide) is an amphoteric hydroxide which dissolve in both acids and alkalis.

@apna_pdf

298. Dead burnt plaster is

(a) $CaSO_4.2H_2O$ (b) $MgSO_4.7H_2O$
(c) $CaSO_4.½H_2O$ (d) $CaSO_4$

Karnataka-CET-2018
BITSAT-2017

Ans. (d) : Dead burnt plaster is known as anhydrous calcium sulphate ($CaSO_4$). It is called as dead burnt because it does not set like Plaster of Paris when it is moisten with water.

299. The substance not likely to contain $CaCO_3$ is

(a) Marble statue (b) Calcined gypsum
(c) Sea shells (d) Dolomite

CG PET- 2013

Ans. (b) : The chemical formula of calcined gypsum is $CaSO_4.2H_2O$. Here, the chemical formula is not contains $CaCO_3$ group.

- The chemical name of marble statue is calcium carbonate ($CaCO_3$).
- The sea shells are made of calcium carbonate ($CaCO_3$)
- The chemical formula of dolomite is $CaCO_3.MgCO_3$.

300. The molecular formula of bleaching powder is

(a) $CaCl_2$ (b) Ca_2OCl_2
(c) $CaOCl_2$ (d) $CaCl_2.CaOCl$

CG PET -2007
JIPMER-2006

Ans. (c) : Calcium hypochlorite ($CaOCl_2$) is commonly known as bleaching powder.

301. Calcium carbide reacts with water to produce

(a) Methane (b) Ethane
(c) Ethylene (d) Acetylene

CG PET -2004

Ans. (d) : acetylene

$CaC_2 + 2H_2O \longrightarrow CH \equiv CH + Ca\,(OH)_2$

Calcium carbide on reacting with water gives acetylene.

302. In the reaction $3Mg + N_2 \rightarrow Mg_3N_2$

(a) Magnesium is reduced
(b) Magnesium is oxidised
(c) Nitrogen is oxidised
(d) None of the above

CG PET -2004

Ans. (b) : For the reaction–

$$3\overset{0}{Mg} + \overset{0}{N_2} \rightarrow \overset{+2}{Mg_3}\overset{-3}{N_2}$$

Let, x b the O.S. of Mg.

$\therefore\ 3x + 2\,(-3) = 0$

$x = +2$

And let, y be the O.S of N.

$\therefore 3(2) + 2x = 0$

or $x = -3$

Here, Mg is oxidized because oxidation state of Mg changes from 0 to +2. Nitrogen is reduced because oxidation state of N changes from 0 to –3.

303. When Zeolite which is hydrated sodium aluminum silicate is treated with hard water, the sodium ions are exchanged with which of the following ions?

(a) H^+ (b) Mg^{2+}
(c) Cu^{2+} (d) SO_4^{2-}

HP CET-2018

Ans. (b) : The chemical formula of zeolite is $Na_2Al_2Si_2O_8$

Zeolite is treated with hard water. In reaction the sodium ions are exchange with Ca^{2+} and Mg^{2+} ions (present in hard water).

304. Which one of the following alkaline earth metal sulphates has its hydration enthalpy greater than its lattice enthalpy?

(a) $CaSO_4$ (b) $BeSO_4$
(c) $BaSO_4$ (d) $SrSO_4$

[JEE Main-2015]

Ans. (b) : $BeSO_4$

Lattice energy of $BeSO_4$ is less than its hydration enthalpy. Hence, it is highly soluble in water.

On moving down the group, the solubility of alkaline earth metal sulphates decreases. Thus barium sulphate and radium sulphate are practically insoluble.

305. Which of the following on thermal decomposition yields a basic as well as acidic oxide?

(a) $NaNO_3$ (b) $KClO_3$
(c) $CaCO_3$ (d) NH_4NO_3

[AIEEE-2012]

Ans. (c) $CaCO_3$ is the only compound which on thermal decomposition gives both acidic as well as basic compound. Here CaO is basic oxide.

It is processed in which a compound breaks into two or more products when the heat is supplied.

This reaction is used for the production of oxygen.

This reaction is also used for production of acidic as well as basic oxides

$$CaCO_3 \xrightarrow{\Delta} \underset{\text{(Basic oxide)}}{CaO} + \underset{\text{(Acidic oxide)}}{CO_2}$$

306. One mole of magnesium nitride on reaction with an excess of water gives

(a) One mole of ammonia
(b) One mole of nitric acid
(c) Two moles of ammonia
(d) Two moles of nitric acid

[AIEEE-2004]

Ans. (c) : Two moles of ammonia

Formula of magnesium nitride

The formula for magnesium nitride will be $Mg_3\,N_2$

Reaction of magnesium nitride with excess of water

$Mg_3N_2 + 6H_2O \longrightarrow 3Mg\,(OH)_2 + 2NH_3$

307. The solubilities of carbonates decrease down the magnesium group due to a decrease in

(a) Lattice energies of solids
(b) Hydration energies of cations
(c) Inter ionic attraction
(d) Entrophy of solution formation

[AIEEE-2003]

@apna_pdf

Ans. (b) : Hydration energy should be greater than lattice energy.
The solubilities of carbonates decrease down the magnesium group due to a decrease in the hydration energy of the cation.

308. The substance used in Holmes signals of the ship is a mixture of
(a) $CaC_2 + Ca_3P_2$ (b) $Ca_3(PO_4)_4 + Pb_3O_4$
(c) $H_3PO_4 + CaCl_2$ (d) $NH_3 + HOCl$
[AIEEE-2003]

Ans. (a) : $CaC_2 + Ca_3P_2$
The spontaneous combustion of phosphine is technically used in holme's signals. Containers containing CaC_2 & Ca_3P_2 are pierced and thrown in the sea when the gases evolved burn and serve as a signal. It is also used in smoke screens.

309. A metal M forms water soluble sulphate MSO_4 and inert MO. MO in aqueous solution forms insoluble $M(OH)_2$, which is soluble in NaOH. Metal M is
(a) Be (b) Mg
(c) Ca (d) Sr
[AIEEE-2002]

Ans. (a) Beryllium form Berillium sulfate ($Be(OH)_2$) which is water insoluble
Berillium form Berillium oxide (BeO) which becomes inert on heating $Be(OH)_2$ being amphoteric reacts with NaOH

310. The correct sequence of thermal stability of the following carbonates is
(a) $BaCO_3 < CaCO_3 < SrCO_3 < MgCO_3$
(b) $MgCO_3 < CaCO_3 < SrCO_3 < BaCO_3$
(c) $MgCO_3 < SrCO_3 < CaCO_3 < BaCO_3$
(d) $BaCO_3 < SrCO_3 < CaCO_3 < MgCO_3$
[JEE Main-2019, 12 April Shift-I]

Ans. (b) : $MgCO_3 < CaCO_3 < SrCO_3 < BaCO_3$
The thermal stability of alkaline earth metals carbonates increases down the group because down the group polarizing power of cation decreases, So thermal stability increases.

311. The alkaline earth metal nitrate that does not crystallise with water molecules, is
(a) $Ca(NO_3)_2$ (b) $Sr(NO_3)_2$
(c) $Ba(NO_3)_2$ (d) $Mg(NO_3)_2$
[JEE Main-2019, 9 Jan Shift-I]

Ans. (c) : Smaller the size of alkaline earth metals, greater is the tendency of their nitrate to crystallise with water molecule. Since Ba is the biggest among alkaline earth metal so its nitrate does not crystallse with water molecule.

312. The metal used for making X-ray tube window is
(a) Na (b) Be
(c) Mg (d) Ca
[JEE Main-2019, 10 Jan Shift-I]

Ans. (b) : Be metal is used in X-ray window because it is transparent to X-rays.

313. The amphoteric hydroxide is
(a) $Be(OH)_2$ (b) $Ca(OH)_2$
(c) $Sr(OH)_2$ (d) $Mg(OH)_2$
[JEE Main-2019, 11 Jan Shift-I]

Ans. (a) : $Be(OH)_2$
An amphoteric hydroxide is one that can react with acid as well as a base
Metal hydroxides are usually basic where as that of non-metals are acidic.
Beryllium shows the diagonal relationship with Aluminium.
Therefore, like Aluminium its hydroxide is also amphoteric in nature.

314. When gypsum is heated to 393 K, it forms :
(a) Dead burnt plaster (b) $CaSO_4. 0.5H_2O$
(c) $CaSO_4.5H_2O$ (d) Anhydrous $CaSO_4$
[JEE Main-2020, 8 Jan Shift-I]

Ans. (b) : The chemical formula of gypsum is $CaSO_4. 2H_2O$.
When gypsum is heated to 393K, it forms, plaster of Paris $CaSO_4.0.5H_2O$
The reaction is as follows
$CaSO_4. 2H_2O \xrightarrow[393K]{\Delta} CaSO_4.0.5H_2O$

315. A metal (A) on heating in nitrogen gas gives compounds B. B on treatment with H_2O gives a colourless gas, which when passed through $CuSO_4$ solution gives a dark blue-violet coloured solution. A and B respectively, are
(a) Na and Na_3N (b) Mg and Mg_3N_2
(c) Mg and $Mg(NO_3)_2$ (d) Na and $NaNO_3$
[JEE Main-2020, 8 Jan Shift-II]

Ans. (b) : The given metal is Mg. It gives Mg_3N_2 when heated with nitrogen gas.
$3Mg + N_2 \xrightarrow{\Delta} Mg_3N_2$
Mg_3N_2 on treating with water gives colourless ammonia.
$Mg_3N_2 + 6H_2O \longrightarrow 3Mg(OH)_2 + 2NH_3$
Ammonia reacts with $CuSO_4$ to form blue complex $\left[Cu(NH_3)_4\right]SO_4$.
$CuSO_4 + 4NH_3 \longrightarrow \left[Cu(NH_3)_4\right]SO_4$

316. The covalent alkaline earth metal halide (X = Cl, Br, I) is
(a) SrX_2 (b) CaX_2
(c) MgX_2 (d) BeX_2
[JEE Main-2019, 8 April Shift-II]

Ans. (d) : According to the Fajan's rule, the covalent character is directly proportional to the no. of charge of cation and inversely proportional to size of cation.
As we move down the group in the alkaline earth metal the ionic characteristics increases and the covalent characteristics decreases.

317. Magnesium powder burns in air to give
(a) MgO and Mg_3N_2
(b) $Mg(NO_3)_2$ and Mg_3N_2
(c) MgO only
(d) MgO and $Mg(NO_3)_2$
[JEE Main-2019, 9 April Shift-I]

@apna_pdf

Ans. (a) : MgO and Mg_3N_2 Magnesium powder burns in air to give MgO and Mg_3N_2 MgO does not combine with excess oxygen to given any superoxide. Mg reacts with nitrogen to form magnesium nitride (Mg_3N_2)

$Mg + O_2 \rightarrow MgO$

$3Mg + N_2 \rightarrow Mg_3N_2$

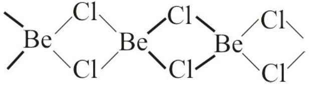
318. The structures of beryllium chloride in the solid state and vapour phase, respectively are

(a) dimeric and dimeric (b) chain and chain

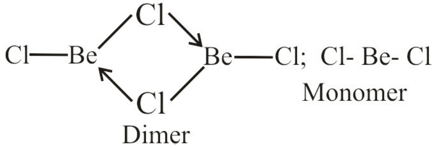
(c) dimeric and chain (d) chain and dimeric

[JEE Main-2019, 9 April Shift-II]

Ans. (d) In solid state, $BeCl_2$ has polymeric chain structure with chlorine bridge.



In vapour phase, it forms a chloro bridged dimer which dissociates into the linear monomer at high temperature (at nearly 1200K).



319. The major component/ ingredient of Portland cement is

(a) tricalcium aluminate (b) tricalcium silicate

(c) dicalcium aluminate (d) dicalcium silicate

[JEE Main-2021, 31 Aug Shift-I]

Ans. (b) : Major component of portland cement is "Tricalcium silicate (51%, 3 CaO. SiO_2)

320. The number of water molecules in gypsum, dead burnt plaster and plaster of Paris, respectively are

(a) 2,0 and 1 (b) 0.5, 0 and 2

(c) 5, 0 and 0.5 (d) 2, 0 and 0.5

[JEE Main-2021, 27 Aug Shift-I]

Ans. (d) : (i) Gypsum $-CaSO_4.2H_2O$

(ii) Dead burnt plaster – $CaSO_4$

(iii) Plaster of Paris $-CaSO_4\frac{1}{2}H_2O$

$\therefore$The number of water molecules in gypsum, dead burnt plaster and plaster of Paries are respectively. 2,0 and 0.5,

321. Given below are two statements: One is labelled as Assertion (A) and the other is labelled as Reason (R).

Assertion (A): Barium carbonate is insoluble in water and is highly stable.

Reason (R): The thermal stability of the carbonates increases with increasing cationic size.

(a) Both (A) and (R) are true and (R) is the correct explanation of (A).

(b) (A) is true but (R) is false.

(c) Both (A) and (R) are true and (R) is not the true explanation of (A).

(d) (A) is false but (R) is true.

[JEE Main-2021, 26 Aug Shift-II]

Ans. (a) : Carbonates of alkaline earth metals are insoluble in water and can be precipitated by addition of a sodium or ammonium carbonate solution to a solution of a soluble salt of these metals. The solubility of carbonates in water decreases as the atomic number of the metal ion increases. Beryllium carbonate is unstable and can be kept only in the atmosphere of CO_2. The thermal stability increases with increasing cationic size.

322. What are the products formed in sequence when excess of CO_2 is passed in slaked lime?

(a) $Ca(HCO_3)_2$, $CaCO_3$

(b) $CaCO_3$, $Ca(HCO_3)_2$

(c) CaO, $Ca(HCO_3)_2$

(d) CaO, $CaCO_3$

[JEE Main-2021, 26 Aug Shift-I]

Ans. (b) : $CaCO_3, Ca(HCO_3)_2$

$$Ca(OH)_2 + CO_2 \longrightarrow CaCO_3 \downarrow + H_2O$$

$$CaCO_3\downarrow + CO_2 + H_2O \longrightarrow \underset{\text{Water soluble}}{Ca(HCO_3)_2}$$

323. The conversion of hydroxyapatite occurs due to presence of F^- ions in water. The correct formula of hydroxyapatite is

(a) $[3Ca_3(PO_4)_2Ca(OH)_2]$ (b) $[3Ca(OH)_2CaF_2]$

(c) $[Ca_3(PO_4)_2CaF_2]$ (d) $[3Ca_3(PO_4)_2CaF_2]$

[JEE Main-2021, 26 Aug Shift-I]

Ans. (a) : $\left[3Ca_3(PO_4)_2Ca(OH)_2\right]$

The F^- ions make the enamel on teeth much harder by Converting hydroxyapatite, $\left[3(Ca_3(PO_4)_2\right].Ca(OH)_2\right]$, the enamel on the surface of the teeth into much hander fluroappatite. $\left[3Ca_3(PO_4)_2.CaF_2\right]$

324. Match list- with List-II.

	List-I		List-II
A.	$Ca(OCl)_2$	(i)	Antacid
B.	$CaSO_4 . \frac{1}{2} H_2O$	(ii)	Cement
C.	CaO	(iii)	Bleach
D.	$CaCO_3$	(iv)	Plaster of Paris

Choose the most appropriate answer from the options given below.

	A	B	C	D
(a)	(i)	(iv)	(iii)	(ii)
(b)	(iii)	(ii)	(iv)	(i)
(c)	(iii)	(iv)	(ii)	(i)
(d)	(iii)	(ii)	(i)	(iv)

[JEE Main-2021, 18 March Shift-I]

Ans. (c) :

S.no.	List-I	S.no.	List-II
(A)	$Ca(OCl)_2$	(i)	Bleach
(B)	$CaSO_4\frac{1}{2}H_2O$	(ii)	Plaster of Paris
(C)	CaO	(iii)	Cement
(D)	$CaCO_3$	(iv)	Antacid

@apna_pdf

325. One of the by-products formed during the recovery of NH_3 from solvay process is

(a) $Ca(OH)_2$ (b) $NaHCO_3$

(c) $CaCl_2$ (d) NH_4Cl

JEE Main-2021, 17 March Shift-II

BITSAT-2015

Ans. (c) : Calcium hydroxide is reacted with the ammonium chloride separated out of the carbonating tower by filtration.

$$Ca(OH)_2 + 2NH_4Cl \longrightarrow CaCl_2 + 2H_2O + 2NH_3$$

- This process is also termed as ammonia recovery. Ammonia is recycled back into the process to form ammoniated brine.
- $CaCl_2$ is formed as a by-product of the Solvay process.

326. Given below are two statements.

Statement I Both $CaCl_2.6H_2O$ and $MgCl_2.8H_2O$ undergo dehydration on heating.

Statement II BeO is amphoteric, whereas the oxides of other elements in the same group are acidic.

In the light of the above statements, choose the correct answer from the options given below.

(a) Statement I is false but statement II is true

(b) Both statement I and statement II are false

(c) Both statement I and statement II are true

(d) Statement I is true but statement II is false

[JEE Main-2021, 16 March Shift-I]

Ans. (b) : Both statement I and statement II are false.

$$CaCl_2.6H_2O \xrightarrow{\Delta} CaCl_2 + 6H_2O$$

$$MgCl_2.6H_2O \longrightarrow MgCl(OH) + HCl + 5H_2O$$

The dehydration of $CaCl_2.\ 6H_2O$ can be achieved on heating undergoes hydrolysis $MgCl_2.\ 8H_2O$ on heating suffer hydrolysis.

Among alkaline earth metal, BeO is amphoteric and the rest are basic oxides.

327. Number of amphoteric compounds among the following is.......

(a) BeO (b) BaO

(c) $Be(OH)_2$ (d) $Sr(OH)_2$

[JEE Main-2021, 24 Feb Shift-I]

Ans. (a) : Both Beryllium compounds (BeO) and $Be(OH)_2$ are amphoteric in nature and compounds BaO and $Sr(OH)_2$ are basic in nature, they form alkaline solution in water.

328. The element with Z = 120 (not yet discovered) will be an/a

(a) transition metal

(b) inner-transition metal

(c) alkaline earth metal

(d) alkali metal

(JEE Main 2019, 12 Jan Shift-I)

Ans. (c) : The element with Z = 120 will be an alkaline earth metal. Recently oganesson (Og) with atomic number 118 is named by IUPAC is a noble gas and placed just two places before 120.

Z = 120 exist as an alkaline earth metal.

329. The alkaline earth metal sulphate which is most soluble in water among the following is

(a) $BaSO_4$ (b) $CaSO_4$

(c) $SrSO_4$ (d) $BeSO_4$

J & K CET-(2016)

Ans. (d) : Alkaline earth metal are also capable to form sulphates such as $BeSO_4$, $MgSO_4$. Beryllium sulphate and magnesium sulphate is soluble in water as compared to other sulphates of alkaline earth metals.

$BeSO_4$ is most soluble. As the size of the metal atom is less its solubility is more.

330. When powdered plaster of Paris is mixed with correct amount of water it sets into a solid mass of

(a) $CaSO_4.\ 5H_2O$ (b) $CaSO_4.\ 3H_2O$

(c) $CaSO_4.\ 2H_2O$ (d) $CaSO_4.1/2H_2O$

J & K CET-(2015)

Ans. (c) : The formula of plaster of Paris is $CaSO_4{\cdot}2H_2O$.

On mixing with water, plaster of paris takes up water of crystallization to form orthorhombic calcium sulphate dehydrate. This sets to a hard mass which is monoclinic calcium sulphate dehydrate on gypsum. This is the final product of setting of Plaster of Paris. Its composition is $CaSO_4.2H_2O$.

331. Calcium carbide on reaction with water yields

(a) Methane (b) ethane

(c) ethene (d) Acetylene

J & K CET-(2005)

J & K CET-(2014)

Ans. (d) : $CaC_2 + 2H_2O \rightarrow \underset{\text{Acetylene}}{CH \equiv CH} + Ca\ (OH)_2$

Calcium carbide on reacting with water gives Acetylene.

332. $CaC_2 + 2H_2O \rightarrow X + Ca(OH)_2$.

$$X + H_2O \xrightarrow{H_2SO_4 + HgSO_4 (60°C)} Y$$

Identify X and Y in the above reaction sequence.

(a) CH_4 and $H_2C = O$

(b) C_2H_2 and CH_3CHO

(c) C_2H_4 and CH_3COOH

(d) C_2H_4 and HCOOH

J & K CET-(1998)

Ans. (b) : $CaC_2 + 2H_2O \rightarrow C_2H_2 + Ca(OH)_2$

$$C_2H_2 + H_2O \xrightarrow{H_2SO_4 + HgSO_4 (60^\circ C)} CH_3CHO$$

333. Bleaching powder is obtained by treating chlorine with:

(a) $CaCO_3$ (b) $Ca(OH)_2$

(c) CaO (d) none of these

JIPMER-2008

JCECE-2007, 2003

NEET-1988

Ans. (b): Bleaching powder is obtained by treating chlorine with dry slaked lime on $Ca(OH)_2$.

$$\underset{\text{Dry slaked lime}}{Ca\ (OH)_2} + Cl_2 \rightarrow \underset{\text{Bleaching powder}}{CaOCl_2} + H_2O$$

@apna_pdf

334. Epsom salt is:

(a) $MgSO_4.2H_2O$ (b) $BaSO_4.2H_2O$
(c) $MgSO_4.7H_2O$ (d) $CaSO_4.2H_2O$

JCECE - 2003, 2007

Ans. (c): It is often encountered as the heptahydrate sulfate mineral epsomite commonly called Epsom salt $MgSO_4.\ 7H_2O$. It has enormous health benefits.

335. Which of the following carbonate decompose most easily on heating?

(a) Rb_2CO_3 (b) K_2CO_3
(c) Na_2CO_3 (d) $MgCO_3$

JCECE - 2003

Ans. (d): Alkali metal carbonates are not decomposed on heating

$$MgCO_3 \xrightarrow{\Delta} MgO + CO_2$$

336. Gypsum is :

(a) $CaSO_4 \cdot 2H_2O$ (b) $CaSO_4.\frac{1}{2}H_2O$
(c) $MgSO_4 \cdot 2H_2O$ (d) $CuSO_4$

JCECE - 2006
MHT CET-2012

Ans. (a) : The molecular formula of gypsum salt $CaSO_4.\ 2H_2O$. Gypsum is a soft sulfate mineral composed of calcium sulfate dehydrate, with the chemical formula $CaSO_4.2H_2O$. It is widely mined and is used as a fertilizer and as the main constituent in many forms of plaster, blackboard / sidewalk chalk, and drywall.

337. $CaC_2 + N_2 \rightarrow A$, product A is

(a) $CaCN_2$ (b) $CaCN_2$ and C
(c) $CaCN_2 + N_2$ (d) None of these

JCECE - 2008

Ans. (b) : The product obtained as a result of a reaction of nitrogen with the calcium carbide (CaC_2) is Calcium cyanide

The reaction takes place of temperature around 300°C to 350°C.

$$CaC_2 + N_2 \xrightarrow{300-350°C} Ca(CN)_2 + C$$

338. A nuclide of an alkaline earth metal undergoes radioactive decay by emission of three α-particles in succession. The group of the periodic table to which the resulting daughter element would belong is

(a) group 14 (b) group 16
(c) group 4 (d) group 6

JCECE - 2012

Ans. (a) : After decay of radioactive element, the last element (stable) Pb is obtained which belongs to group 14 of periodic table.

339. The difference of water molecules in gypsum and plaster of Paris is

(a) $\frac{5}{2}$ (b) 2
(c) $\frac{1}{2}$ (d) $1\frac{1}{2}$

JCECE - 2015

Ans. (d) : Formula of gypsum = $CaSO_4 \cdot 2H_2O$

Formula of Plaster of Paris = $CaSO_4 \cdot \frac{1}{2}H_2O$

Thus, difference of water molecule in gypsum and plaster of Paris

$$= 2H_2O - \frac{1}{2}H_2O = 1\frac{1}{2}H_2O$$

340. Which of the following alkaline earth metal sulphates has hydration enthalpy higher than the lattice enthalpy?

(a) $SrSO_4$ (b) $CaSO_4$
(c) $BeSO_4$ (d) $BaSO_4$

JCECE - 2015

Ans. (c) : Hydration energy decreases down the group, whereas lattice energy remains almost constant. Thus, hydration enthalpy is higher than the lattice enthalpy in the case of $BeSO_4$.

341. Which one of the following is present as an active ingredient in bleaching powder for bleaching action?

(a) $Ca(OCl)_2$ (b) CaO_2Cl
(c) $CaCl_2$ (d) $CaOCl_2$

JIPMER-2014

Ans. (a) : The molecular formula of bleaching powder is $Ca(ClO_2)_2$ Calcium hypochlorite is an inorganic compound with formula $Ca(OCl)_2$. It is the main active ingredient of commercial products called bleaching powder, chlorine powder, or chlorinated lime, used for water treatment as a bleaching agent.

$$3Ca(OH)_2 + 2Cl_2 \xrightarrow[35^{o}C]{below}$$

$$\underset{\text{Bleaching powder}}{Ca(OCl)_2.CaCl_2.Ca(OH)_2.2H_2O}$$

342. Which of the following compounds has the lowest melting point?

(a) $CaBr_2$ (b) CaI_2
(c) CaF_2 (d) $CaCl_2$

JIPMER-2014

Ans. (b) : As the size of the halogen increases from F to I covalent character increases from CaF_2 to CaI_2 and melting point decreases. So, CaI_2 has the lowest melting point.

Melting Points.	
CaF_2	1360°C
$CaBr_2$	730°C
$CaCl_2$	772°C
CaI_2	740°C

343. Which of the following metal carbonates decomposes on heating?

(a) $MgCO_3$ (b) Na_2CO_3
(c) K_2CO_3 (d) Rb_2CO_3

JIPMER-2012

Ans. (a) : $MgCO_3 \xrightarrow{Heat} MgO + CO_2$

The metal whose oxide is stable, it's carbonate is unstable.

@apna_pdf

344. BaO_2 and ozone reacts to produce

(a) Ba (b) Ba_2O_3

(c) BaO (d) $Ba(OH)_3$

JIPMER-2008

Ans. (c) : BaO_2 and ozone reacts to produce BaO and oxygen gas is liberated.

$$BaO_2 + O_3 \longrightarrow BaO + 2O_2$$

345. Which of the following ions, has smallest Size?

(a) Ca^{2+} (b) Cl^-

(c) S^{2-} (d) K^+

JIPMER-2004

Ans. (a) : In isoelectronic species ion with higher positive charge is considered to be the smallest in size and ion with highest negative charge is considered to be highest in size.

Hence, option (a) is the correct answer.

346. Which one of the following elements, is a component of a compound essential for photosynthesis?

(a) Iron (b) Calcium

(c) Barium (d) Magnesium

JIPMER-2004

Ans. (d) : Magnesium is found in chlorophyll, the green pigment, essential for photosynthesis. Chlorophyll is a green coloured pigment that is found in plants and help in photosynthesis.

347. Beryllium differs in properties from other elements of its own group but shows resemblance with aluminium because of

(a) relatively bigger ionic radius and high polarising power of Be

(b) relatively smaller ionic radius and high polarising power of Be

(c) relatively bigger ionic radius is the only reason behind this

(d) None of the above

JIPMER-2016

Ans. (b) : Relatively smaller ionic radius and high polarising power of Be because Beryllium (Be) differ in properties from elements of its own group due to relatively smaller ionic radius and high polarising power. Polarising powers of Be^{2+} and Al^{3+}.ions are almost the same, thus they show similarities in their properties.

348. The third ionization enthalpy is highest in

(a) Alkali metals

(b) Alkaline earth metals

(c) Chalcogens

(d) Pnictogens

Karnataka-CET-2021

Ans. (b) : Alkaline earth metal have ns^2 configuration. And after the removal of 2^{nd} electron, they get stable noble gas configuration.

349. The characteristic colours given by calcium, strontium and barium in the flame test are respectively:

(a) Brick red, apple green, crimson

(b) Crimson, apple green, brick red

(c) Crimson, brick red, apple green

(d) Brick red, crimson, apple green

(e) Applel green, brick red, crimson

Kerala-CEE-2004

Ans. (d) In flame the electrons are excited to higher energy levels and when they drop back to the ground state energy is emitted in the form of visible light. Hence, The characteristic colours given by calcium, strontium and barium in the flame test are respectively. Brick red, crimson, apple green

Calcium → Brick red
Strontium → Crimson
Barium → Apple green

350. The alkaline earth metal with the least density value is

(a) Mg (b) Be

(c) Sr (d) Ca

(e) Ba

Kerala-CEE-2012

Ans. (d) : Since Ca is a elements of II A group, the density of elements of II A group first decreases from Be to Ca and then steadily increases from Ca to Ba. Thus, Ca has the least density.

351. The carbon atoms in calcium carbide are held by

(a) Ionic bonds

(b) Two sigma bonds

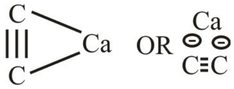
(c) Tow sigma and one coordinate bond

(d) One sigma and two π bonds

(e) One sigma and one π bond

Kerala-CEE-2019

Ans. (d) : The carbon atom in Calcium carbide (CaC_2). held together by one sigma and two π-bonds.



352. Which of the following statement is incorrect about beryllium?

(a) Beryllium hydroxide is amphoteric

(b) Beryllium compounds are largely covalent

(c) Beryllium is not easily attacked by acids

(d) Beryllium exhibit coordination number of six

(e) Beryllium hydroxide dissolves in excess of alkali to give a beryllate ion.

Kerala-CEE-2020

Ans. (d) : Be $(OH)_2$ is an amphoteric hydroxide, reacts with both acid and base. Beryllium is having only 4 valency in its valence orbital. Hence, it can not exceed to octet and show only six coordination number.

353. When CO_2 is passed through solution of calcium hydroxide, which one of the following compound is precipitated?

(a) $Ca(HCO_3)_2$ (b) CaO

(c) $CaCO_3$ (d) $Ca(OH)_2$

Manipal-2019

@apna_pdf

Ans. (c) :

$$\mathrm{Ca(OH)_2(aq) + CO_2(g) \longrightarrow CaCO_3(s) + H_2O}$$

When carbon dioxide is passed through lime water, it turns milky due to formation of white precipitate in form of calcium carbonate.

354. The property of the alkaline earth metals which increases with their atomic number?

(a) Ionisation energy
(b) Electronegativity
(c) Solubility of their hydroxides in water
(d) Solubility of their sulphates in water

Manipal-2016
NEET-2010
Karnataka-CET-2021
Kerala-CEE-29.08.2021

Ans. (c) : The alkaline earth metal contains the following element such as Be, Mg, Ca, Sr, Ba, Ra. In the group, when we move up to down the ionization potential, electronegativity decreases with increasing the atomic number but the solubility of their hydroxide increases in water.

355. Which among the following elements of group-2 exhibits anomalous properties?

(a) Be (b) Mg
(c) Ca (d) Ba

MHT CET-2018

Ans. (a) : Beryllium (Be) because of its exceptionally small atomic and ionic size, high ionisation enthalpy and non-availability of d-orbital in its valence shell represents anomalous behavior than rest of the members of group-2.

Some anomalous properties of Be –

- It forms bonds having appreciable covalent character.
- It forms amphoteric hydroxide while other elements form basic hydroxide.
- It forms coordination complexes .

356. Which of the following statements if false?

(a) Ca^{2+} ions are not important in maintaining the regular beating of the heart.
(b) Mg^{2+} ions are important in the green parts of the plants
(c) Mg^{2+} ions form a complex with ATP.
(d) Ca^{2+} ions are important in blood clotting.

NEET-I 2016

Ans. (a) : Ca^{2+} ions are not important in maintaining the regular beating of the heart.

- Calcium ions play on important role in muscle contraction that is why it is important for maintaining heartbeats.
- Ca^{2+} ion are required to trigger the contraction of muscles and to maintain the regular beating of the heart.

Option (b)

- Magnesium ions are centrally located in the chlorophyll structure, that is why magnesium is important in the green parts of plants and plays an important role in photosynthesis.

Option (c)

- Magnesium ions are associated with ATP to form a complex which together makes adenosine triphosphate stable.

Option (d)

- Calcium ions play an important role in the pathway of activation of protein factors responsible for blood clotting.

357. Which of the following metal ions play an important role in muscle contraction?

(a) K^+ (b) Na^+
(c) Mg^{2+} (d) Ca^{2+}

NEET-1994

Ans. (d) : Muscle contraction is regulated by Ca^{2+} ion, which will change thin filament into activated state. The binding of calcium to the troponin changes its shape so that the myosin binding sites on the actin (thin filaments) are exposed causing a muscle contraction.
Hence, calcium ion Ca^{2+} play an important role in muscles contraction.

358. Among the statements (I-IV), the correct ones are:

(I) Be has smaller atomic radius compared to Mg.
(II) Be has higher ionisation enthalpy than Al.
(III) Charge/radius ratio of Be is greater than that of Al.
(IV) Both Be and Al form mainly covalent compounds.

(a) (II), (III) and (IV) (b) (I), (II) and (IV)
(c) (I), (III) and (IV) (d) (I), (II) and (III)

[JEE Main-2020, 3 Sep Shift-II]

Ans. (b) : Charge / radius ratio of Be and Al is same because of diagonal relationship.

359. An alkaline earth metal 'M' readily forms water soluble sulphate and water insoluble hydroxide. Its oxide MO is very stable to heat and does not have rock-salt structure. M is

(a) Sr (b) Ca
(c) Be (d) Mg

[JEE Main-2020, 4 Sep Shift-II]

Ans. (c) : Water soluble sulphate and water insoluble hydroxide is 'Be'. BeO does not have rock-salt structure.

360. Among the sulphates of alkaline earth metals, the solubilities of $BeSO_4$ and $MgSO_4$ in water, respectively, are

(a) poor and poor (b) high and poor
(c) high and high (d) poor and high

[JEE Main-2020, 6 Sep Shift-I]

Ans. (c) : Due to high hydration energy of $BeSO_4$ and $MgSO_4$, their solubility in water will be high.
Order of solubility of sulphate of alkaline earth metals are–

$$\mathrm{BeSO_4 > MgSO_4 > CaSO_4 > SrSO_4 > BaSO_4}$$

@apna_pdf

361. The product obtained as a result of a reaction of nitrogen with CaC_2 is

(a) $CaCN_3$ (b) Ca_2CN
(c) $Ca(CN)_2$ (d) $CaCN$

NEET-I 2016

Ans. (c): A reaction of nitrogen with calcium carbide (CaC_2) is calcium cyanide [$Ca(CN)_2$].

$$CaC_2 + N_2 \xrightarrow{300°C-350°C} Ca(CN)_2$$

362. Which one of the following is present as an active ingredient in bleaching powder for bleaching action?

(a) $CaOCl_2$ (b) $Ca(OCl)_2$
(c) CaO_2Cl (d) $CaCl_2$

NEET-2011

Ans. (b) : $Ca(OCl)_2$ is present as an active ingredient in bleaching power for bleaching action.

• The hypochlorite ion- OCl^- is the active ingredient in bleach/bleaching powder.

363. Match List-I with List-II for the compositions of substances and select the correct answer using the code given :

	List - I (Substances)	**List - II (Composition)**
(A)	**Plaster of Paris**	**(i) $CaSO_4 . 2H_2O$**
(B)	**Epsomite**	**(ii) $CaSO_4 . 1/2H_2O$**
(C)	**Kieserite**	**(iii) $MgSO_4 . 7H_2O$**
(D)	**Gypsum**	**(iv) $MgSO_4 . H_2O$**
		(v) $CaSO_4$

(a) (A)-(iii), (B)-(iv), (C)-(i) (D)-(ii)
(b) (A)-(ii), (B)-(iii), (C)-(iv) (D)-(i)
(c) (A)-(i), (B)-(ii), (C)-(iii) (D)-(v)
(d) (A)-(iv), (B)-(iii), (C)-(iii) (D)-(i)

NEET-2011

Ans. (b) : Correctly matched.

• Plaster of Paris → $CaSO_4 . ½ H_2O$
• Epsomite → $MgSO_4 . 7H_2O$
• Kieserite → $MgSO_4 . H_2O$
• Gypsum → $CaSO_4 . 2H_2O$

364. The compound A on heating gives a colorless gas and a residue that is dissolved in water to obtain B. Excess of CO_2 is bubbled through aqueous solution of B, C is formed which is recovered in the solid form. Solid C on gentle heating gives back A. The compound is

(a) $CaCO_3$ (b) Na_2CO_3
(c) K_2CO_3 (d) $CaSO_4 . 2H_2O$

NEET-2010

Ans. (a) : This is possible only when the compound a is $CaCO_3$ and the reactions are as follows:

$$CaCO_3 \xrightarrow{\Delta} \underset{\text{(Colourless gas)}}{CO_2} + \underset{\text{(residue)}}{CaO}$$

$$CaO + H_2O \longrightarrow \underset{(B)}{Ca(OH)_2} \xrightarrow[\text{(excess)}]{CO_2} \underset{(C)}{Ca(HCO_3)_2} \xrightarrow{\Delta} CaCO_3$$

The compound is calcium carbonate ($CaCO_3$)

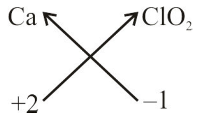
365. Which of the following represents calcium chlorite?

(a) $Ca(ClO_3)_2$ (b) $Ca(ClO_2)_2$
(c) $CaClO_2$ (d) $Ca(ClO_4)_2$

NEET-1996

Ans. (b) : The valency of calcium is 2 and a chlorite ion is ClO_2^- (–1).

We can use criss-cross method to write the chemical formula.



The Chemical formula of calcium chlorite is $Ca(ClO_2)_2$

366.Which of the following statement is false?

(a) Strontium decomposes water readily than beryllium
(b) Barium carbonate melts at a higher temperature than calcium carbonate.
(c) Barium hydroxides is more soluble in water than magnesium hydroxide.
(d) Beryllium hydroxide is more basic than barium hydroxide

NEET-1994

Ans. (d) : $Be(OH)_2$ is amphoteric, but the hydroxides of other alkaline earth metals are basic. The size of beryllium is very small and the hydroxide formed by it. So its hydroxide is less basic than barium hydroxide.

367. Magnesium reacts with an element (X) to form an ionic compound. If the ground state electronic configuration of (X) is $1s^2 2s^2 2p^3$, the simplest formula for this compound is

(a) Mg_2X_3 (b) MgX_2
(c) Mg_2X (d) Mg_3X_2

NEET-2018

Ans. (d) : Magnesium is an alkaline earth metal and forms Mg^{2+}ion.

Element (X) electronic configuration is $1s^2$, $2s^2$, $2p^3$.

The charges on cation and anion will be balanced when $3Mg^{2+}$ ions will combine with $2X^{-3}$ ions to form Mg_3X_2.

368. Compared with the alkaline earth metals, the alkali metals exhibit

(a) Smaller ionic rain
(b) Highest boiling points
(c) Greater hardness
(d) Lower ionization energies.

NEET-1990

Ans. (d) : Alkali metals have the lowest ionisation enthalpy in each period because alkali metals are largest in their respective periods and therefore the valency electrons are loosely held by the nucleus. Their atomic size is greater and hence, it is easy to pull out an electron from outer-most shell.

369. Which of the following atoms will have the smallest size?

(a) Mg (b) Na
(c) Be (d) Li

NEET-1989

Ans. (c) : The atomic size increases down the group and decreases in period from left to right.

Therefore, Li > Be and Na > Mg. Overall order Na > Mg > Li > Be. Thus, Be has smallest size.

370. The structures of beryllium chloride in solid state and vapour phase are

@apna_pdf

(a) Chain in both
(b) Chain and dimer, respectively
(c) Linear in both
(d) Diner and linear, respectively

NEET-2021

Ans. (b) : The structure of beryllium chloride in the solid state and vapour phase, respectively are chain and dimeric.

- $BeCl_2$ exist as $(BeCl_2)_n$ polymeric chain in solid form, while $BeCl_2$ exist as dimer $(BeCl_2)_2$ in vapour phase.

371. Among the following alkaline earth metal halides one which is covalent and soluble in organic solvents is

(a) Beryllium chloride
(b) Calcium chloride
(c) Strontium chloride
(d) Magnesium chloride

NEET-2021

Ans. (a) : Except for beryllium chloride, all other chloride of alkaline earth metals are ionic in nature. Due to high polarising power of Be^{2+} ion, all beryllium halides are predominantly covalent. They are soluble in organic solvents.

372. HCl was passed through a solution of $CaCl_2$, $MgCl_2$ and NaCl. Which of the following compound(s) crystallize(s)?

(a) Both $MgCl_2$ and $CaCl_2$
(b) Only NaCl
(c) Only $MgCl_2$
(d) NaCl, $MgCl_2$ and $CaCl_2$

NEET-2020

Ans. (b) : On the passing HCl through the mixture Cl^- ion concentration increases.

So, ionic product $[Na^+]$ $[Cl^-]$ becomes more than solubility product and NaCl will precipitate out.

Filtrate $\xrightarrow{\text{Ha gas passed}}$ Pure NaCl precipitation (common ion effect)

Calcium and magnesium chloride being more soluble than NaCl remain in the solution.

373. Which of the following is an amphoteric hydroxide?

(a) $Be(OH)_2$
(b) $Sr(OH)_2$
(c) $Ca(OH)_2$
(d) $Mg(OH)_2$

NEET-2019

Ans. (a) : $Be(OH)_2$ is amphoteric hydroxide, dissolving in both acids and alkalis.

$Be(OH)_2 + 2HCl \longrightarrow BeCl_2 + 2H_2O$ [Acid]

$Be(OH)2 + 2NaOH \longrightarrow Na_2[Be(OH)_4]$ [Base]

374. Among CaH_2, BeH_2, BaH_2, the order of ionic character is

(a) $BeH_2 < CaH_2 < BaH_2$
(b) $CaH_2 < BeH_2 < BaH_2$
(c) $BeH_2 < BaH_2 < CaH_2$
(d) $BeH_2 < BeH_2 < CaH_2$

NEET-2018

Ans. (a) : The order of ionic character is $BeH_2 < CaH_2 < BaH_2$

- For 2nd group hydrides, on moving down the group metallic character of metals increases. So ionic character of metal hydride increases.

375. On heating which of the following release CO_2 most easily?

(a) Na_2CO_3
(b) $MgCO_3$
(c) $CaCO_3$
(d) K_2CO_3

NEET-2015

Ans. (b) : On heating, $MgCO_3$, CO_2 released most easily. This is due to the small size of the resulting oxide ion.

$$MgCO_3 \xrightarrow{\Delta} MgO + CO_2$$

376. Solubility of the alkaline earth metal sulphates in water decreases in the sequence

(a) Sr > Ca > Mg > Ba
(b) Ba > Mg > Sr > Ca
(c) Mg > Ca > Sr > Ba
(d) Ca > Sr > Ba > Mg

NEET-2016

Ans. (c) : The solubility of the sulphates decreases as we go down the group of alkaline earth metals.
The decreasing order of sulphates is Mg > Ca > Sr > Ba.

377. Which of the following compounds has the lowest melting point?

(a) $CaCl_2$
(b) $CaBr_2$
(c) CaI_2
(d) CaF_2

NEET-2011

Ans. (c) : When the size of anion increases then covalent character also increases, so their melting points decreases. Melting point $CaF_2 > CaCl_2 > CaBr_2 > CaI_2$
Therefore, CaI_2 has the lowest melting point.

378. Which of the following alkaline earth metal sulphates has hydration enthalpy higher than its lattice enthalpy?

(a) $CaSO_4$
(b) $BeSO_4$
(c) $BaSO_4$
(d) $SrSO_4$

NEET-2010

Ans. (b) : Among alkaline earth metals, lattice enthalpy remain almost constant but hydration enthalpy decrease down the group. In case of large size anion such as SO_4^{2-} and the small changes in cation size does not alter the lattice energy, i.e. lattice energies are about the same. Thus $BasO_4$ has higher hydration energy as compared to lattice enthalpy.

379. Which one of the following compounds is a peroxide?

(a) KO_2
(b) BaO_2
(c) MnO_2
(d) NO_2

NEET-2010

Ans. (b) : In peroxides, the oxidation state of O is –1 and they give H_2O_2, with dilute acids, and have peroxide linkage.

In BaO_2, $+ 2 + (x \times 2) = 0$
$x = -1$

Thus, it is peroxide only it gives H_2O_2 when reacts with dilute acids and has peroxide linkage as Ba^{2+}[O-O].

380. Which of the following oxides is not expected to react with sodium hydroxide?

(a) CaO
(b) SiO_2
(c) BeO
(d) B_2O_3

NEET-2009

Ans. (a) : Generally acids react with bases and bases react with acids.

@apna_pdf

Among give options BeO is an amphoteric oxide while B_2O_3 and SiO_2 are acidic oxides.
Thus all of them react with NaOH to form salts. CaO on the other hand is a basic oxide and hence with NaOH.

381. The correct order of increasing thermal stability of K_2CO_3, $MgCO_3$, $CaCO_3$ and $BeCO_3$ is

(a) $BeCO_3 < MgCO_3 < CaCO_3 < K_2CO_3$
(b) $MgCO_3 < BeCO_3 < CaCO_3 < K_2CO_3$
(c) $K_2CO_3 < MgCO_3 < CaCO_3 < BeCO_3$
(d) $BeCO_3 < MgCO_3 < K_2CO_3 < CaCO_3$

NEET-2007

Ans. (a) : The thermal stability of carbonate increases down the group and decreases as we move from left to right in a period, so the correct order is:

$$BeCO_3 < MgCO_3 < CaCO_3 < K_2CO_3$$

382. In which of the following the hydration energy is higher than the lattice energy?

(a) $MgSO_4$ (b) $BaSO_4$
(c) $SrSO_4$ (d) $CaSO_4$

NEET-2007

Ans. (a) : $MgSO_4$ has a higher hydration energy than lattice energy and is thus the most soluble out of the given alkaline earth metal sulphates.

383. The solubility in water of sulphate down the Be group is Be > Mg > Ca > Sr > Ba. This is due to

(a) Decreasing lattice energy
(b) High heat of salvation for smaller ions like Be^{2+}
(c) Increase in melting points
(d) Increasing molecular weight

NEET-1995

Ans. (b) : The solubility of an ionic compound depends upon two factor, lattice energy and hydration energy. The hydration energy decreases from Be^{2+} to Ba^{2+} due to decreases in charge density. This cause the decrease in the solubility's of the sulphate in this order.

In order words the solubility's decreases with increase in the ionic size. So we can say that the solubility in water of sulphate down the be group.

Be > Mg > Ca > Sr > Ba is due to the high heat solvation for smaller ions like Be^{2+}.

384. Crude sodium chloride obtained by crystallization of brine solution does not contain

(a) $MgSO_4$ (b) Na_2SO_4
(c) $MgCl_2$ (d) $CaSO_4$

NEET-Odisha 2019

Ans. (a) : Crude NaCl obtained by crystallization of brine solution contains.

Na_2SO_4, $CaCl_2$, $MgCl_2$, and $CaSO_4$.

Crude sodium chloride obtained by crystallization of brine solution does not contain $MgSO_4$.

385. Which of the following groups of ions makes the water hard?

(a) Sodium and bicarbonate
(b) Magnesium and chloride
(c) Potassium and sulphate
(d) Ammonium and chloride

NEET-1994

Ans. (b) : Hard water has high mineral content it is formed when water percolates through the deposits of chalk and limestone which are made up of magnesium and calcium carbonates. It does not lather with soap.

386. Which of the following metal evolves hydrogen on reacting with cold dilute HNO_3?

(a) Mg (b) Al
(c) Fe (d) Cu

NEET-1989

Ans. (a) : Magnesium metal reacts with dilute nitric acid to form magnesium nitrate and hydrogen gas.

$$Mg + HNO_3 \rightarrow Mg(NO_3)_2 + H_2(g)$$

387. Electronic configuration of calcium atom can be written be

(a) $[Ne]4p^2$ (b) $[Ar]4s^2$
(c) $[Ne]4s^2$ (d) $[Kr]4p^2$

NEET-1992

Ans. (b) : To write an electronic configuration of an atom, it is better if we remember the atomic number of noble gases and the orbital's follow the noble gas.

An atomic number of calcium = 20

The nearest noble configuration of calcium is $1s^2$ $2s^2$ $2p^6$ $3s^2$ $3p^6$ = 18 (Argon)

Hence, the electronic configuration of Ca = $[Ar]4s^2$

388. Which of the following compounds contains Mg ion?

(a) Haemoglobin (b) Vitamin B_{12}
(c) Ascorbic acid (d) Chlorophyll

Tripura JEE-2019

Ans. (d) : The chlorophyll molecule the central ion is magnesium and the large organic molecule is a porphyrin.

The porphyrin contains four nitrogen atoms that form bonds to magnesium in a square planer arrangement.

389. In aqueous solution, the most stable sulphate is

(a) $BeSO_4$ (b) $MgSO_4$
(c) $CaSO_4$ (d) $BaSO_4$

UP CPMT-2010

Ans. (d): Solubility of any salt is governed by two factors;

(i) Lattice energy, (ii) Hydration energy.

Among the sulphates of alkaline earth metals, the magnitude of lattice energy remains almost constant because of the large size of sulphates ion. The hydration energy, however, decreases from Be^{2+} to Ba^{2+}. Thus, the solubility of sulphates of alkaline earth metals decreases from Be^{2+} to Ba^{2+}. In other words, $BaSO_4$ is most stable in aqueous solution.

390. Element with atomic number 38. Belongs to

(a) II A group and 5th period
(b) II A group and 2nd period
(c) V A group and 2nd period
(d) III A group and 5th period

UP CPMT-2008

Ans. (a): The electronic configuration = 38

X (38) : $1s^2$, $2s^2$, $2p^6$, $3s^2$ $3p^6$, $4s^2$ $3d^{10}$ $4p^6$, $5s^2$

Or $1s^2$, $2s^2$, $2p^6$, $3s^2$, $3p^6$, $3d^{10}$,$4s^2$ $4p^6$, $5s^2$

Hence, it is belongs to II A group and 5th period. It is strontium (Sr).

@apna_pdf

391. Blue vitriol is

(a) $MgSO_4 \cdot 5H_2O$ (b) $CuSO_4 \cdot 5H_2O$
(c) $CaSO_4 \cdot 5H_2O$ (d) $ZnSO_4 \cdot 5H_2O$

UP CPMT-2006

Ans. (b) : $CuSO_4 \cdot 5H_2O$ is blue vitriol. It is a blue crystalline substance soluble in water.

- The blue vitriol is also known as the Cu(II) sulphate pentahydrate or crystalline copper sulphate.

392. Bleaching action of $CaOCl_2$ is due to

(a) Nascent oxygen (b) Chlorine
(c) HClO (d) HCl

UPTU/UPSEE-2014, UP CPMT-2006

Ans. (a) :

$$2CaOCl_2 + H_2SO_4 \text{ (limited)} \rightarrow CaCl_2 + CaSO_4 + 2HClO$$

$$HClO \rightarrow HCl + [O]$$

On account of evalution of nascent oxygen. It acts as an oxidizing and bleaching agent.

393. Which has smallest size?

(a) Na^+ (b) Mg^{2+}
(c) Ne (d) O^{2-}

UP CPMT-2005

Ans. (b): Among isoelectronic species decreases with increase in nuclear charge.

	Mg^{2+}	Na^+	Ne	O^{2-}
No. of electron	10	10	10	10
Nuclear charge	+12	+11	+10	+8

$\therefore Mg^{2+} < Na^+ < Ne < O^{2-}$

$\therefore$ Mg^{2+} has smallest size.

394. Which alkaline earth metal compound is volatile?

(a) Mg_3N_2 (b) Ca_3N_2
(c) Be_3N_2 (d) None of the option

UPTU/UPSEE-2017

Ans. (c) : Be_3N_2 is volatile due to greater tendency of covalent character in Be and N atoms.

395. Alkaline earth's metals are denser than alkli metals, because metallic bonding in alkaline earth's metal is

(a) Stronger (b) Weaker
(c) Volatile (d) Not present

UPTU/UPSEE-2012

Ans. (a) : Alkaline earth's metals are denser than alkli metals, because metallic bonding in alkaline earth's metal is stronger.

396. You may have noticed that chicken-egg is very strong along its long axis so much so that it does not break even when pressed very hard. Which of the following is the main constituent of egg-shell?

(a) $CaSO_4.2H_2O$ (b) $CaSO_4.\frac{1}{2}H_2O$
(c) $CaSiO_3$ (d) $CaCO_3$

UPTU/UPSEE-2011

Ans. (d) : The chicken egg shell is 95-97% calcium carbonate crystals, which are stabilized by protein matrix.

Chicken egg is very strong along its long axis with $CaCO_3$ as main constituent.

397. The chemical which is used for plastering the broken bones is

(a) $(CaSO_4)_2\, H_2O$ (b) $MgSO_4 \cdot 7H_2O$
(c) $FeSO_4 \cdot 7H_2O$ (d) $CuSO_4 \cdot 5H_2O$

UPTU/UPSEE-2009

Ans. (a) : Plaster of Paris $(CaSO_4)_2\, H_2O$ is a chemical compound. It is used to joint fracture bones and keeping them immobilize. A compound of calcium is used for immobilizing the fractured bones of body.

398. Diacidic base is

(a) $CH_2(OH)_2$ (b) $Ca(OH)_2$
(c) $CH_3CH(OH)_2$ (d) All of these

UPTU/UPSEE-2009

Ans. (b) : A diacidic base is a base that produces two hydroxide ions when one of its molecules undergoes complete ionization.

Only $Ca(OH)_2$ has two hydroxide ions. Thus, $Ca(OH)_2$ is a diacidic base.

399. Plaster of Paris on making paste with little water sets to hard mass due to formation of

(a) $CaSO_4$ (b) $CaSO_4 \cdot 1/2H_2O$
(c) $CaSO_4 \cdot H_2O$ (d) $CaSO_4 \cdot 2H_2O$

UPTU/UPSEE-2008

Ans. (d) : Plaster of Paris (Calcium sulphate) is not water soluble. So, when the Plaster of Paris comes in contact with water it sets to a hard mass.

$$\underset{\text{(Plaster of Paris)}}{CaSO_4 \frac{1}{2}H_2O} + \frac{3}{2}H_2O \rightarrow \underset{\text{Gypsum (Hard mass)}}{CaSO_4.2H_2O}$$

400. Which one of the following processes is used for the manufacture of calcium?

(a) Reduction of CaO with carbon
(b) Reduction of CaO with hydrogen
(c) Electrolysis of a mixture of anhydrous $CaCl_2$ & KCl
(d) Electrolysis of molten $Ca(OH)_2$

WB-JEE-2008

Ans. (c) : Calcium is obtained by electrolysis of a fuse of $CaCl_2$ and KCl at nearly 700°C is an electrolytic cell made of graphite anode and iron cathode.

$$CaCl_2 \rightleftharpoons Ca^{2+} + 2Cl$$

At anode-

$$2Cl^- \rightarrow Cl_2 + 2e^-$$

At cathode-

$$Ca^{2+} + 2e^- \rightarrow Ca$$

401. Chlorine gas reacts with red hot calcium oxide to give

(a) Bleaching powder and dichlorine monoxide
(b) Bleaching powder and water
(c) Calcium chloride and chlorine dioxide
(d) Calcium chloride and oxygen

WB-JEE-2013

Ans. (d) $2CaO + 2Cl_2 \xrightarrow{\text{red hot}} 2CaCl_2 + O_2 \uparrow$.

Chlorine gas reacts with red hot calcium oxide to give Calcium Chloride and Oxygen gas.

402. The decreasing order of basic character of K_2O, BaO, CaO and MgO is

@apna_pdf

(a) $K_2O > BaO > CaO > MgO$
(b) $K_2O > CaO > BaO > MgO$
(c) $MgO > BaO > CaO > K_2O$
(d) $MgO > CaO > BaO > K_2O$

WB-JEE-2015

Ans. (a) : On the basis of electropositivity of metal the order of basic character is-

$K_2O > BaO > CaO > MgO$

With increase in the charge of the metal cation or with decrease in the size of metal cation , the basic character of its oxide decreases.

This is due to increase in charge density.

403. In aqueous alkaline solution, two electrons reduction of HO_2^- gives

(a) HO^-
(b) H_2O
(c) O_2
(d) O_2^-

WB-JEE-2015

Ans. (a) : In aqueous alkaline solution, two electron reduction of HO_2^- gives HO^-.

$$H_2O_2 \rightleftharpoons H^+ + HO_2^-$$

We can write HO_2^- as H^+ anion. The two electron reduction of HO_2^- in an aqueous alkaline solution, we get the product HO^-. So, we can write the equation as,

$$HO_2^- + H_2O + 2e^- \rightarrow 3OH^-$$

404. Match the flame colours of the alkaline earth metal salts in the Bunsen burner.

A. Calcium	p. Brick red
B. Strontium	q. Apple green
C. Barium	r. Crimson

	A	B	C
(a)	p	r	q
(b)	r	p	q
(c)	q	r	p
(d)	p	q	r

WB-JEE-2015

Ans. (a)

(a).Calcium	-	Brickred
(b).Strontium	-	Crimson
(c).Barium	-	Applegreen

405. If radium and chlorine combine to form radium chloride, the compound would be

(a) Half as radioactive as radium
(b) Twice as radioactive
(c) As radioactive as radium
(d) Not radioactive

WB-JEE-2016

Ans. (c) : Radioactive is independent of the chemical environment of an ion or atom.

When radium and chlorine combine to form compound then the structure of nucleus does not changed.

Compound involves with unstable nuclei and that will become stable by emission of α, β, γ radiation.

Radium chloride will be as radioactive as radium itself.

406. Which of the following is least thermally stable?

(a) $MgCO_3$
(b) $CaCO_3$
(c) $SrCO_3$
(d) $BeCO_3$

WB-JEE-2018

Ans. (d) : Ionic character and thermal stability are directly proportional to each other.

$$\xrightarrow[\text{Ionic character}\uparrow\ \text{thermal stability}\uparrow]{BeCO_3\ \ MgCO_3\ \ CaCO_3\ \ SrCO_3}$$

The thermal stability order of carbonate of alkaline Earth metal will be –

$BeCO_3 < MgCO_3 < CaCO_3 < SrCO_3 < BaCO_3$

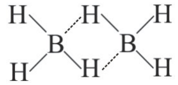
3. Boron Family

407. Which of the following statement is not correct about diborane?

(a) Both the Boron atoms are sp^2 hybridised
(b) There are two 3-centre-2-electron bonds.
(c) The four terminal B–H bonds are two centre two electron bonds.
(d) The four terminal Hydrogen atoms and the two Boron atoms lie in one plane.

NEET-17.07.2022

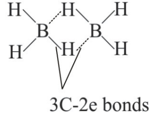
Ans. (b) : The structure of dibroane is



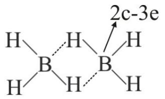
Structure of dibroane is dimeric structure atom are in different plane.

(ii) Both boron atom are sp^3 hybridired due to single covalent bond of (B – H)

(iii)



(iv)



In structure it is clearly visible there is four terminal - (B – H) bond are 2c - 2e bonds.

408. Which of the following hydrides is electron deficient ?

(a) CH_4
(b) B_2H_6
(c) NaH
(d) CaH_2

Karnataka CET-17.06.2022, Shift-II

Ans. (b) : In the molecule of B_2H_6 (diborane), there are 14 valence shell atomic orbitals that can be utilized for chemical bonding but there are only 12 valence electrons. Thus this molecule is electron deficient.

409. Given are two statements one is labelled as **Assertion A** and other is labelled as **Reason R.**

Assertion A : Magnesium can reduce Al_2O_3 at a temperature below 1350°, while above 1350°aluminium can reduce MgO.

Reason R : The melting and boiling points of magnesium are lower than those of aluminium.

In light of the above statements, choose most appropriate answer from the options given below:

(a) Both **A** and **R** are correct, and **R** is correct explanation of **A**
(b) Both **A** and **R** are correct, and **R** is NOT the correct explanation of **A**.

@apna_pdf

(c) **A** is correct **R** is not correct.
(d) **A** is not correct, **R** is correct.

JEE Main-28.06.2022, Shift-I

Ans. (b) : Melting point for aluminium is 933.47K and melting point of magnesium is 923K
The melting point of magnesium are lower than those of aluminium but it is not the correct reason

410. Identify the correct statement for B_2H_6 from those given below:

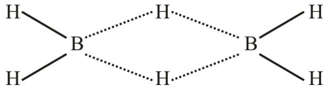
(A) In B_2H_6, all B-H bonds are equivalent.
(B) In B_2H_6, there are four 3-centre-2-electron bonds.
(C) B_2H_6 is a Lewis acid.
(D) B_2H_6 can be synthesized from both BF_3 and $NaBH_4$.
(E) B_2H_6 is a planar molecule.

Choose the most appropriate answer from the options given below:

(a) (A) and (E) only
(b) (B), (C) and (E) only
(c) (C) and (D) only
(d) (C) and (E) only

JEE Main-24.06.2022, Shift-I

Ans. (b) : B_2H_6 has two 3-centre-2-electron bonds and four 2-centre-2-electron bond hence, all B–H bonds are not equal.



Non planar bridge bond are different than terminal bond. So, it is an electron deficient compound as the octet of boron is incomplete hence, it act as Lewis acid
It can be synthesized from both BF_3 and $NaBH_4$

$$4BF_3 + 12NaH \xrightarrow{450K} 2B_2H_6 + 12NaF$$

$$4NaBH_4 + 2I_2 \longrightarrow 2B_2H_6 + 4NaI + H_2$$

So, it is a non-planar molecule.

411. Match List-I with List-II

List-I (Metal)		**List-II (Application)**	
a.	Cs	I.	High temperature thermometer
b.	Ga	II.	Water repellent sprays
c.	B	III.	Photoelectric cells
d.	Si	IV.	Bullet proof vest

Choose the most appropriate answer from the options given below:

(a) (a)-(III), (b)-(I), (c)-(IV), (d)-(II)
(b) (a)-(IV), (b)-(III), (c)-(II), (d)-(I)
(c) (a)-(II), (b)-(III), (c)-(IV), (d)-(I)
(d) (a)-(I), (b)-(IV), (c)-(II), (d)-(III)

JEE Main-29.06.2022, Shift-I

Ans. (a) : (a) Cesium (Cs) is used in photoelectric cell
(b) Generally Gallium (Ga) has high boiling point so, it is used in high temperature thermometer.
(c) Boron (B) liberate is a combination of high strength and high elastic modulus hence it is used in making bullet proof vest
(d) Silicon as silicones used for water proofing of fabrics.
Hence, option (A) is correct.

412. The process of converting hydrated alumina $Al(OH)_3$ into anhydrous alumina is called–

(a) Roasting
(b) Smelting
(c) Dressing
(d) Calcination

CG PET-22.05.2022

Ans. (d) : $Al_2O_3.2H_2O \xrightarrow[-2H_2O]{\Delta} Al_2O_3$
The process is known as calcination i.e. to heat a mineral below its melting point in absence of air in order to remove moisture, organic impurities and volatile impurities.

413. Which one of the following statements is not correct with respect to BF_3?

(a) It is an electron deficient compound
(b) It is a Lewis acid
(c) It is an ionic compound
(d) It forms adducts

AP EAMCET- 1995, 1996

Ans. (c) : BF_3 is a covalent compound and electron deficient. It behaves as Lewis acid.

$$NH_3 + BF_3 \rightleftharpoons NH_3 \rightarrow BF_3$$

It adduct to attain the stability.
BF_3 has boron bonded with three fluorine through covalent bond. It accept a pair of an electron to complete its octet. So, it is a Lewis acid.

414. Inorganic benzene contains

(a) C, H, Al
(b) C, H, B
(c) B, N, H
(d) C,N, H

AP EAMCET- 1999

Ans. (c) : Inorganic benzene is known as **borazole**. Borazine, also known as borazole is a polar inorganic compound with the chemical formula $B_3H_6N_3$. The molecular formula of borazole is $B_3N_3H_6$ and it contain's B, N and H. It is a colorless volatile liquid compound. In his cyclic compound, the three BH units and three NH units alternate.

415. Which of the following is not true?

(a) Aluminium liberates hydrogen on treating with a base
(b) Aluminium is used in the preparation of duralumin
(c) Aluminium is extracted by the electrolysis of alumina in presence of cryolite
(d) Aluminium is a strong oxidizing agent

AP EAMCET- 1999

Ans. (d) : Aluminium is a strong reducing agent not an strong oxidizing agent. Hence, statement is false.

- Hydrogen gas is liberated the action of aluminium with concentrated solution of sodium hydroxide. Hence, statement is true.
- Aluminium is used in the preparation of duralumin because duralumin is actually a metal, which is an alloy of aluminium, copper, magnesium and manganese. Hence, statement is true.
- In the electrolysis reaction of alumina, aluminium is extracted in the presence of cryolite. Hence, statement is true.

416. Which of the following reacts with BCl_3 to form diborane?

@apna_pdf

(a) NH_3 (b) $LiAlH_4$
(c) NaHg (d) $K_2Cr_2O_7$

AP EAMCET- 2000

Ans. (b) : $LiAlH_4$ reacts with BCl_3 to form diborane as represented as -

$$4BCl_3 + 3LiAlH_4 \rightarrow \underset{\text{(Diborane)}}{2B_2H_6} + 3LiCl + 3AlCl_3$$

417. The Chemical formula of feldspar is
(a) $KAlSi_3O_8$
(b) Na_3AlF_6
(c) $NaAlO_2$
(d) $K_2SO_4.Al_2(SO_4)_3.4Al(OH)_3$

AP EAMCET-2007

Ans. (a) : The chemical formula of feldspar is $KAlSi_3O_8$. Feldspars are a group of rock-forming aluminium tectosilicate minerals, containing sodium, calcium, potassium or barium. Feldspars make up about 60% of earth's crust and 41% of the earth's continental crust by weight.

418. Diethyl ether is prepared by passing ethyl alcohol vapours over a catalyst under high pressure and temperature. The catalyst is
(a) SiO_2 (b) CuO
(c) Al_2O_3 (d) Ag_2O

A.P.EAMCET/1996

Ans. (c) : Diethyl ether is prepared by passing ethyl alcohol vapours over a catalyst under high pressure and temperature. The catalyst is Al_2O_3.

$$CH_3CH_2OH + CH_3 - CH_2OH \xrightarrow[523K]{Al_2O_3} \underset{\substack{\text{Diethylether}\\ \text{or ethoxyethane}}}{CH_3CH_2OCH_2CH_3} + H_2O$$

419. Electrolytic reduction of Al_2O_3 to Al generally faces the difficulties like bad conductivity of Al_2O_3 and high fusion temperature. These difficulties are overcome buy the addition of
(a) Cryolite and CaF_2 to alumina
(b) Cryolite only to alumina
(c) CaF_2 only to alumina
(d) Cryolite and NaF to alumina

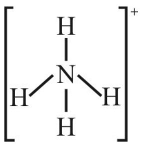
SCRA-2010

Ans. (a) : In the electrolysis of alumina it is mixed with cryolite (Na_3AlF_6) and Fluorspar (CaF_2) and Alumina become good electrical conductor.

420. Which one of the following statements is true for ammonium ion?
(a) All bonds are ionic
(b) All bonds are coordinate covalent
(c) H-atoms are situated at the corners of a square
(d) H-atoms are situated at the corners of tetrahedron

AP-EAMCET/1997

Ans. (d): The structure of ammonium ion-



In ammonium ion H-atoms are situated at the corners of tetrahedron.

421. Alkali metals are powerful reducing agents because_____
(a) They are metals
(b) They are monovalent
(c) Their ionic radii are large
(d) Their ionization energies are low

AP EAPCET 23-08-2021 Shift-I

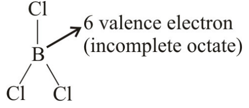
Ans. (d) : Alkali metals are powerful reducing agent because alkali metals have one valence electron which they lose to attain stability. Alkali metals have low ionization energies and easily lose an electron, therefore they act as reducing agent.

422. Boron compounds behave as Lewi's acid because of their______.
(a) Electron rich in nature
(b) Electron deficient in nature
(c) Ionization properties
(d) Proton donating nature

AP EAMCET- 2008

AP-EAMCET 25-08-2021 Shift - I

Ans. (b) : Boron halides behave as Lewis acids because of their electron deficient nature. It can accept a lone pair of electrons. Boron Compound-BCl_3



So it act as lewis acid.

423. Which element belongs to the family of elements, that also includes element Gallium?
(a) Carbon (b) Aluminum
(c) Iron (d) Arsenic

AP-EAMCET 25-08-2021 Shift - I

Ans. (b) : The elements of the 13th group element are boron (B), aluminium (Al), gallium (Ga), indium (In) and thallium (Tl). They all are metallic in nature except boron which is a metalloid.

424. A compound X, of boron reacts with NH_3 on beating to give another compound Y, which is called inorganic benzene. The compound X can be prepared by treating BF_3 with lithium aluminium hydride. The compounds X and Y are represented by the formulas.
(a) $B_2H_6, B_3N_3H_6$ (b) $B_2O_3, B_3N_3H_6$
(c) $BF_3, B_3N_3H_6$ (d) $B_3N_3H_6, B_2H_6$

AP EAMCET (Engg.) 17.09.2020, Shift-II

Ans. (a) : $$BF_3 \xrightarrow[-LiF,F_4]{LiAH_4} \underset{(X)}{B_2H_6} \xrightarrow[-H_2]{NH_3/\Delta} \underset{(Y)}{B_3N_3H_6}$$

(X) ⇒ B_2H_6 (Diborane)
(Y) ⇒ $B_3N_3H_6$ (Borazine or inorganic benzene)

425. Observe the following statements,
1. H_3BO_3 is used as antiseptic.
2. In B_2H_6, each boron is sp^2 hybridized.
3. Aqueous solution of borax is alkaline in nature.
The correct statements are
(a) 2 and 3 (b) 1, 2 and 3
(c) 1 and 3 (d) 1 and 2

AP EAMCET (Medical) - 2013

@apna_pdf

Ans. (c) : 1. H_3BO_3 is used as an antiseptic and eye wash under the name 'boric lotion'.

2. Diborane, B_2H_6 contains two electrons each, three centered bonds. Each boron atom is in a link with four hydrogen atoms. This makes tetrahedral geometry. Hence, each boron atom is sp^3-hybridized. Thus, the statement is false.

3. The aqueous solution of borax is weakly alkaline in nature due to hydrolysis of $B_4O_7^{2-}$ ions.

426. The highest E^0 (in V) value for $M^+ \rightarrow M$ among the group 13 elements is-

(a) – 0.55 (b) 0.55
(c) 0.34 (d) 0.92

TS EAMCET 10.08.2021, Shift-I

Ans. (b) : For 13 group elements

$M^+ \rightarrow M \qquad E^o_{max} = 0.55ev.$

427. The metal that forms a self protecting film of oxide to prevent corrosion, is

(a) Cu (b) Al
(c) Pt (d) Au

EAMCET-1994

Ans. (b) : Aluminum forms a thin layer of Al_2O_3 (oxide) on its surface to prevent itself from corrosion.

$$2Al + 3O_2 \longrightarrow 2Al_2O_3$$

Moisture, $H_2O \longrightarrow H^+ + OH^-$

428. Which of the following reduction CANNOT be carried out with coke?

(a) $Fe_2O_3 \rightarrow Fe$ (b) $ZnO \rightarrow Zn$
(c) $Cu_2O \rightarrow Cu$ (d) $Al_2O_3 \rightarrow Al$

JEE Main 16.03.2021, Shift-II

Ans. (d) : Fe_2O_3, ZnO & Cu_2O can be reduce by carbon. Reduction of $Al_2O_3 \longrightarrow Al$ is carried out by electrolytic reduction of its fused salts.

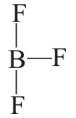
Reduction of $2Fe_2O_3\ (s) \rightarrow 4\ Fe\ (s) + 3O_2\ (g)$

429. BF_3 is used as a catalyst in several industrial processes due to its

(a) Strong reducing nature
(b) Weak reducing action
(c) Strong Lewis acid nature
(d) Weak Lewis acid character

AP EAMCET (Engg.) 17.09.2020 Shift-I

Ans. (c) : The lewis structure of BF_3 is



B has not been able to complete its octet (it has only 6 electrons around it). So, BF_3 is an electron deficient compound. All such electron deficient compounds are electron pair acceptors and so are Lewis acid.

BF_3 is acyclic because due to low is concept it concept a lone pair of electron.

430. Assertion (A) Boron has a smaller first ionisation enthalpy than beryllium.

Reason (R) The penetration of a 2s-electron to the nucleus is more than the 2p-electron hence, 2p-electron is more shielded by the inner core of electrons than 2s-electrons.

(a) Assertion and Reason both are correct statements but Reason is not correct explanation for Assertion.
(b) Assertion is correct statement but Reason is wrong statements.
(c) Assertion and Reason both are correct statements and Reason is correct explanation for Assertion.
(d) Assertion and Reason both are wrong statements.

AP EAMCET (Engg.) 17.09.2020 Shift-I

Ans. (c) : Assertion (A) Electronic configuration of boron (Z = 5) is [He] $2s^22p^1$. So in first ionisation (IE_1 or Δ_iH_1) removal will take place from unpaired p^1 -electrons which requires more energy.

Electronic configuration of Be (Z = 4) : (He) $2s^2$. So, the Assertion is a correct statement.

Reason (R) s-orbital is being symmetrical in shape (spherical), it shields nuclear force (nuclear charge) strongly. So, $2p^1$ electron of B is experiences lesser nuclear attractive force for ionisation. As a result

$$IE_1 \text{ or } \Delta_iH_1 : B < Be$$

So, the Reason is correct explanation for Assertion.

431. Which of the following compounds are formed, when boron trichloride is treated with water ?

(a) $H_3BO_3 + HCl$ (b) $B_2H_6 + HCl$
(c) $B_2O_3 + HCl$ (d) $HBO_3 + HCl$

AP EAMCET (Engg.) 18.09.2020, Shift-I

Ans. (a) : Boric acid and hydrochloric acid are formed when boron trichloride is treated with water.

$$\underset{\text{Boron trichloride}}{BCl_3} + 3H_2O \rightarrow \underset{\text{Boric acid}}{H_3BO_3} + 3HCl$$

432. Consider the following statements :

1. Zeolites are aluminosilicates.

2. Aluminium can occupy two adjacent sites in zeolites.

Which of the statements given above is/are correct ?

(a) 1 only (b) 2 only
(c) Both 1 and 2 (d) Neither 1 nor 2

SCRA - 2009

Ans. (a) : Zeolites are microspores, aluminosilicate minerals commonly used as commercial adsorbents and catalysts. Aluminium cannot occupy two adjacent in zeolites.

Zeolites are crystalline solids made up of silicon aluminium and O_2.

433. In borax bead test borax produces

(a) Metal metaborate (b) Metal oxide
(c) Metal orthoborate (d) Metal pyroborate

SCRA - 2009

Ans. (a) : In borax bead test, borax produces metal metaborate.

Borax bead test:

$Na_2B_4O_7 \longrightarrow 2\ NaBO_2 + B_2O_3$

$CuO + B_2O_3 \longrightarrow Cu\ (BO_2)_2$ (meta borate)

$CuO + NaBO_2 \longrightarrow NaCuBO_3$ (ortho borate)

434. The possible oxidation states of group 13 elements is/are

@apna_pdf

(a) +3 (b) +1, +3
(c) +1 (d) +1, +2, +3

AP EAMCET (Engg.) 21.09.2020, Shift-II

Ans. (b) : The general oxidation state exhibited by the group 13 elements in the group are +3 and +1 due to its general electronic configuration ns^2, np^2. As we go down the group of boron family, the tendency to form +1 ion increases. This is due to inert pair effect. Hence, the correct option is (b).

435. The bonding in diborane (B_2H_6) can be described by
(a) 4 two centre-two electron bonds and 2 three-centre-two electron bonds
(b) 3 two centre-two electron bonds and 3 three-centre-two electron bonds
(c) 2 two centre-two electron bonds and 4 three centre-two electron bonds
(d) 4 two centre-two electron bonds and 4 two centre-two electron bonds

TS EAMCET-2017

Ans. (a) : Diborane is the simplest boron hydride known. In the structure of diborane, the four hydrogen atoms and the two boron atoms lie in one plane. Above and below this plane, there are two bridging hydrogen atoms.

B_2H_6 (diborane)

Diborane has 4 two centre-two electron bonds and 2 three-centre-two electron bonds.

436. Dilute sodium hydroxide does not react with which of the following ?
(a) Ga (b) Al
(c) Ti (d) B

AP EAMCET (Engg.) 18.9.2020 Shift-I

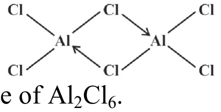
Ans. (d) : Boron does not react with dilute sodium hydroxide because it reacts with concentrated NaOH.

$$B + \underset{\text{Conc.}}{NaOH} + 3H_2O \rightarrow Na\left[B(OH)_4\right] + \frac{3}{2}H_2$$

437. Aluminium (III) chloride forms a dimer because aluminium _____
(a) Belong to boron family.
(b) Has a very high ionization enthalpy.
(c) Can have higher co-ordination number.
(d) Is next to Magnesium.

AP EAPCET 24.08.2021 Shift-II

Ans. (c) : $AlCl_3$ can form dimer and exists as Al_2Cl_6 aluminum has vacant. d-orbital accommodate electron from aluminium with the chlorine atom. $AlCl_3$ forms a dimer as there is unsaturation in coordination. $AlCl_3$ behaves as Lewis acid.



Structure of Al_2Cl_6.

438. AlF_3 is soluble in HF only in the presence of KF due to formation of—
(a) AlH_3 (b) $[AlH_6]^{3-}$
(c) $[AlF_6]^{3-}$ (d) $K[AlF_3H]$

AP EAPCET 20.08.2021 Shift-I

Ans. (c) : AlF_3 is soluble in HF due to the formation of $K_3[AlF_6]$.
Anhydrous HF is a covalent compound and is strongly H-bonded. So, it doesn't give F ions and hence AlF_3 doesn't dissolve in HF.

$AlF_3 + 3KF \xrightarrow{HF} K_3[AlF_6]$ or $3K^+ + [AlF_6]^{3-}$

439. What are the products formed when chlorine is passed through aqueous hypo solution?
(a) Na_2SO_3+HCl+S (b) Na_2SO_3+SO_3+HCl
(c) Na_2SO_4+HCl+S (d) Na_2SO_3+HCl+SO_2

AP EAMCET (Engg.) 2001

Ans. (c) : Hypo-solution is also called sodium thiosulphate solution $Na_2S_2O_3$
Products formed are sulphur, hydrochloric acid and sodium sulphate.

$Cl_2 + Na_2S_2O_3 + H_2O \longrightarrow Na_2SO_4 + HCl + S$

440. What is the molecular formula of borazole?
(a) B_2H_6 (b) $B_6N_6H_3$
(c) $B_3N_3H_6$ (d) $B_3N_3H_3$

AP EAMCET (Engg.) 2001

Ans. (c) : Borazine also known as Borazole –
$B_3N_3H_6$
(Inorganic benzene)

441. The stability of +1 oxidation state increases in the sequence ______
(a) Ga < In < Al < Tl (b) Al < Ga < In < Tl
(c) Tl < In < Ga < Al (d) In < Tl < Ga < Al

AP EAPCET 24.08.2021, Shift-I

Ans. (b) : The stability of +1 oxidation state increases in the 13 group of p-block element. The reason behind that due to the inert pair effect, as we move down the group then the order will be – Al < Ga < In < Tl.

442. H_3BO_3 or $B(OH)_3$ is considered as an acid because its molecule______
(a) Combines with proton form water molecule
(b) Accepts OH^- from water, releasing a proton
(c) Contains replaceable H^+ ion
(d) Can donate proton easily

AP EAPCET 20.08.2021 Shift-II

Ans. (b): Boric acid $B(OH)_3$ is an acid that acts as usual Barnsted – Lowry acids. It react with water according to

$B(OH)_3\,(aq) + 2H_2O\,(l) \rightleftharpoons B(OH)_4^-\,(aq) + H_3O^+(aq)$

So, $B(OH)_3$ accepts OH^- from water releasing a proton.

443. What is Z in the following reactions?

$$\mathbf{BCl_3 + H_2 \xrightarrow[450^0 C]{Cu\text{-}Al} X + HCl}$$

$$\mathbf{X \xrightarrow{methylation} Z}$$

(a) $(CH_3)BH_2$ (b) $(CH_3)_4B_2H_2$
(c) $(CH_3)_3B_2H_3$ (d) $(CH_3)_6B_2$

AP EAMCET (Engg.) 2012

Ans. (b) : $2BCl_3 + 6H_2 \xrightarrow[450°C]{Cu-Al} \underset{\underset{(X)}{\text{Diborane}}}{B_2H_6} + 6HCl$

$$\underset{(X)}{B_2H_6} + 4CH_3Cl \xrightarrow{\text{Methylation}} \underset{(Z)}{(CH_3)_4B_2H_2} + 4HCl$$

@apna_pdf

444. Zeolites are shape selective structures because of

(a) High adsorption capacity
(b) Three dimensional network of atoms
(c) Presence of aluminosilicates
(d) Honey comb like structure.

COMEDK-2015,2014

Ans. (d) : The shape selectivity of zeolites is based on the interaction of reactant with the well-defined pore system because of honey comb like structure.

Shape selective catalyst-
(i) Depends on pore's size and structure.
(ii) Depends on size of reactant and product.

445. Which one of the following pairs of atomic numbers represents elements belonging to the same group?

(a) 13 and 31 (b) 11 and 20
(c) 14 and 33 (d) 12 and 30

COMEDK-2016

Ans. (a) : Atomic number of aluminium (Al)= 13 and that of gallium (Ga) =31 . Both element belongs to IIIA group.

446. Which of the following is not correct?

(a) Al reacts with NaOH and liberate H_2
(b) $AlCl_3$ is a Lewis acid
(c) Al is used in the manufacture of electrical cables
(d) NaOH is used during Hall's process of purification of bauxite

AP-EAMCET (Medical), 2006

Ans. (d) :
(a) Aluminum reacts with NaOH and liberate H_2

$2Al + 2NaOH + 2H_2O \xrightarrow{\Delta} 2NaAlO_2 + 3H_2$

Thus, statement is true.
(b) $AlCl_3$ is a Lewis acid because Al have vacant orbital. Statement is true.
(c) Al has high melting point due to which it is uses in electrical cables. Thus, statement is true.
(d) NaOH is used in the Bayer's process It is not used in the Hall's process. Hence, the statement is false.

447. Aluminium reacts with concentrate HCI and concentrated NaOH to liberate the gases ...... respectively:

(a) H_2 and O_2 (b) O_2 and H_2
(c) H_2 and H_2 (d) O_2 and O_2

AP-EAMCET (Medical), 2001

Ans. (c) : When aluminium reacts with concentrated HCl , H_2 gas is evolved and when Al reacts with NaOH, H_2 gas is also evolved.

$$2Al + 6HCl \rightarrow 2AlCl_3 + 3H_2$$
$$2Al + 6NaOH \rightarrow 2Na_3AlO_3 + 3H_2$$

448. Which one of the following elements is a non-metal?

(a) Boron (b) Indium
(c) Sodium (d) Magnesium

AP-EAMCET (Medical), 2002

Ans. (a) : Non metal is an element that doesn't have the characteristics of metal including, ability to conduct heat or electricity, luster or flexibility.
The non-metals are given as follows –
H, B, C, N, O, F, Cl, Br etc.
Thus, the given elements only boron is the non-metal.

449. Which pair of oxides is acidic in nature?

(a) B_2O_3,SiO_2 (b) B_2O_3, CaO
(c) N_2O, BaO (d) CaO, SiO_2

JEE Main 26.02.2021, Shift-II

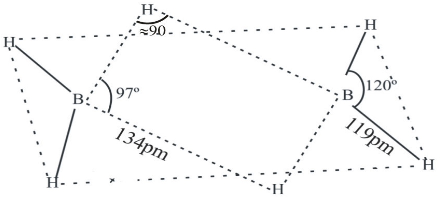
Ans. (a) : B_2O_3 and SiO_2 both are oxides of non-metal and hence are acidic in nature.
CaO, SiO_2= Basic Nature
N_2O = Neutral Oxide
B_2O_3,SiO_2 = Acidic nature

450. The correct statement about B_2H_6 is:

(a) All B-H-B angles are of 120º.
(b) Its fragment, BH_3, behaves as a Lewis base.
(c) Terminal B-H bonds have less p-character when compared to bridging bonds.
(d) The two B-H-B bonds are not of same length.

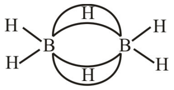
JEE Main 25-02-2021, Shift-I

Ans. (c) :



Structure of di-borane (B_2H_6)

The four terminal hydrogen atoms and two B atoms lie is one plane. Above and below this plane, there are two bridging hydrogen atoms. The four terminal B-H bonds are 2c – 2e⁻ bond while two bridging bonds are 3c –2e⁻ bond which is known as B–H–B bond.



The 3c – 2e⁻ bond are also referred as banana bonds.
Terminal bond angle is greater than that of bridge bond angle
Bond angle ∝ s- character

$$\text{Bond angle} \propto \frac{1}{p-\text{character}}$$

So, terminal B-H bond have less p-character when compared to bridge bonds.

451. The correct statements from below are

(I) H_3BO_3 is a liquid
(II) H_3BO_3 forms a layer structure
(III) In H_3BO_3, each BO_3 unit is joined by hydrogen bonds
(IV) H_3BO_3 is triacidic

(a) (I) and (II) (b) (II) and (III)
(c) (III) and (IV) (d) (II) and (IV)

TS-EAMCET 09.08.2021, Shift-I

Ans. (b) : H_3BO_3 (boric acid) is a colorless or white crystalline solid at room temperature.

- H_3BO_3 unit bonded together through hydrogen bonds to give a two- dimensional layered structure.

@apna_pdf

- H_3PO_4 and citric acid are triacidic acids while H_3BO_3 is a mono basic acid.

So, option II and III is correct.

452. Match the following :

Column-1 **Reaction**	**Column-2** **Main product**
(A) $B_2H_6 + 2CO \longrightarrow$	**(I)** B_2O_2
(B) $B_2H_6 + 3O_2 \longrightarrow$	**(II)** $2BH_3{\cdot}CO$
(C) $B_2H_6 + 6H_2O \longrightarrow$	**(III)** $2H_3BO_3$
	(IV) $2BH_2(CO)$
	(V) $2HBO_2$

	A	B	C
(a)	IV	I	III
(b)	II	III	V
(c)	IV	III	I
(d)	II	I	III

TS EAMCET 05.08.2021, Shift-I

Ans. (d) :

Reaction	**Product**
$B_2H_6 + 2CO \longrightarrow$	$2BH_3{\cdot}CO$
$B_2H_6 + 3O_2 \longrightarrow$	B_2O_2
$B_2H_6 + 6H_2O \longrightarrow$	$2H_3BO_3$

453. A group 15 element, which is a metal and forms a hydride with strongest reducing power among group 15 hydrides. The element is:

(a) Bi (b) P

(c) As (d) Sb

JEE Main 16.03.2021, Shift-I

Ans. (a) : BiH_3 is the strongest reducing agent among the hydrides of 15 group elements as Bi- H bond dissociation energy is very less. All the elements of group 15 form hydride of the type EH_3 where E= N, P, As, Sb, Bi. When we move from top to bottom then reducing power increases in group 15. Hence, ammonia is a mild reducing agent while BiH_3 is the strongest reducing agent amongst all the hydrides.

454. Number of water molecules in Mohr's salt is

(a) 7 (b) 5

(c) 8 (d) 6

AIIMS-1994

Ans. (d): $(NH_4)_2\,Fe(SO_4)_2.6H_2O$ contains $6H_2O$

455. Which of the following is an alum?

(a) $FeSO_4(NH_4)_2SO_4.6H_2O$

(b) $NaAlO_2$

(c) $Na_2SO_4.Al_2(SO_4)_3.24H_2O$

(d) $KCl.\ MgCl_2\ .\ 6H_2O$

AIIMS-1994

Ans. (c): $Na_2SO_4.Al_2(SO_4)_3.24H_2O$

Sodium alum – $Na_2SO_4.Al_2(SO_4)_3.24H_2O$

456. Bauxite, an ore of aluminium is purified by

(a) Hall's process (b) Serpek's process

(c) Bayer's process (d) all of these

AIIMS-1996

Ans. (d): Aluminium ore is called bauxite.

Ores of Aluminium–

- Bauxite – $Al_2O_3{\cdot}2H_2O$
- Corundum – Al_2O_3
- Cryolite – Na_3AlF_6

Bauxite, an ore of aluminium, is purified by either Hall's process, Bayer's process, Serpek's process.

457. Assertion : Borax bead test is not suitable for Al (III).

Reason : Al_2O_3 is insoluble in water.

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion

(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion

(c) If the Assertion is correct but Reason is incorrect

(d) If both the Assertion and Reason are incorrect

(e) If the Assertion is incorrect but the Reason is correct.

(AIIMS-2005)

Ans. (b): Borax bead test is not suitable for Al(III) because its oxidizing as well as reducing flame is colorless in both hot as well as cold. Alumina is insoluble in water as they exist in hydrated from like $Al_2O_3.\ 2H_2O$, $Al_2O_3.\ H_2O$ etc.

458. Thermite is a mixture of iron oxide and

(a) zinc powder (b) potassium metal

(c) sodium savings (d) aluminium powder

AIIMS-2002

Ans. (d): Thermite is the mixture of iron oxide Fe_2O_3 (rust) and aluminium powder.

$$Fe_2O_3 + 2Al \longrightarrow Al_2O_3 + 2Fe$$

459. Assertion: Atomic radius of gallium is higher than that of aluminium

Reason: The presence of additional d-electron offer poor screening effect for the outer electrons form increased nuclear charge.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.

(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.

(c) If Assertion is correct but Reason is incorrect.

(d) If both the Assertion and Reason are incorrect.

(AIIMS-2017)

Ans. (c): When moving a group from top to bottom, no. of shell increases hence atomic radius increases.

The presence of additional d-electron offer poor screening effect for the outer electrons form decrease nuclear change.

460. Assertion: Colored cations can be identified by borax bead test.

Reason: Transparent bead ($NaBO_2+B_2O_3$) forms colored bead with colored cation.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.

(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.

@apna_pdf

(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

(AIIMS-2009)

Ans. (a): We use borax bead test to detect coloured ions. When the salt under analysis is placed on the borax bead and heated, the boric anhydride reacts with the salts forming a metaborate of characteristic colour and we can identify the given radical.

$$Na_2B_4O_7.10H_2O \xrightarrow{\text{Heat}} \underset{\substack{\text{Sodium}\\\text{meta borate}}}{2NaBO_2} + \underset{\text{Boric anhydride}}{B_2O_2} + 10H_2O$$

461. Assertion: $Al(OH)_3$ is insoluble in NH_4OH but soluble in NaOH.
Reason: NaOH is strong alkali.

(a) If both Assertion and Reason are correct and Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

(AIIMS-1997)

Ans. (a): $Al(OH)_3$ is insoluble in NH_4OH but soluble in NaOH. NaOH is strong alkali. In presence of excess NaOH, $Al(OH)_3$ forms sodium meta aluminate which is soluble.

$$Al(OH)_3+NaOH \rightarrow \underset{\substack{\text{Sodium}\\\text{meta aluminate}}}{NaAlO_2}+2H_2O$$

462. Assertion: Boron is a metalloid.
Reason : Boron shows metallic nature.

(a) If both Assertion and Reason are correct and Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

(AIIMS-1997)

Ans. (c): Metalloids possess metallic as well as non-metallic nature. Hence, Assertion is true and Reason is false.

463. A neutral molecule XF_3 has zero dipole moment. The element X is most likely

(a) chlorine
(b) boron
(c) nitrogen
(d) carbon

(AIIMS-2016)

Ans. (b): Boron trifluoride has zero dipole moment although it has three polar B-F bonds. Because BF_3 is sp^2 hybridized and trigonal planar, the resultant bond moment of any two B-F dipoles is equal in magnitude but opposite in direction to third B-F bond. So the vector sum of three bond dipole moment is zero.

ClF_3 is T-shaped, and CF_3 is pyramidal, all these molecules are unsymmetrical and have finite dipole moment.

Therefore, element X is boron.

464. The correct formula of borax is

(a) $Na_2[B_4O_4(OH)_3].9H_2O$
(b) $Na_2[B_4O_5(OH)_4].8H_2O$
(c) $Na_2[B_4O_6(OH)_5].7H_2O$
(d) $Na_2[B_4O_7(OH)_6].6H_2O$

(AIIMS-2016)

Ans. (b): Formula of borax is $Na_2[B_4O_5(OH)_4]. 8H_2O$. Its widely used as a household cleaner and booster for laundry detergent.

465. Which of the following oxides is strongly basic?

(a) B_2O_3
(b) Al_2O_3
(c) Ga_2O_3
(d) Tl_2O_3

(AIIMS-2015)

Ans. (d): On moving from top to bottom in a group, basic character of metal increases.

The correct sequence of increasing basic strength is $B_2O_3 < Al_2O_3 < Ga_2O_3 < Tl_2O_3$.

466. Chemically borax is

(a) Sodium metaborate
(b) Sodium orthoborate
(c) Sodium tetraborate
(d) Sodium tetraborate decahydrate

(AIIMS-2015)

Ans. (d): $Na_2B_4O_7.10H_2O$ = Sodium teraborate decahydrate.

467. BCl_3 does not exists as dimer but BH_3 exists as dimer (B_2H_6) because

(a) chlorine is more electronegative than hydrogen.
(b) there is $p\pi$-$p\pi$ back bonding in BCl_3 but BH_3 does not contain such multiple bonding.
(c) large sized chlorine atoms do not fit in between the small boron atoms where as small sized hydrogen atoms get fitted in between boron atoms.
(d) none of the above.

(AIIMS-2012)

Ans. (c): BCl_3 does not exists as dimer but BH_3 exists as dimer (B_2H_6) because large sized chlorine atoms do not fit in between the small boron atoms whereas small sized hydrogen atoms get fitted in between boron atoms.

468. Borax is used as cleansing agent because on dissolving in water it gives

(a) alkaline solution
(b) acidic solution
(c) bleaching solution
(d) colloidal solution

(AIIMS-2006)

Ans. (a): Borax is $Na_2B_4O_7.10H_2O$. It gives alkaline solution on dissolution in water as it is a salt of strong base and weak acid and because of this it acts as cleansing agent.

$Na_2B_4O_7 + 7H_2O \rightarrow 4H_3BO_3+2NaOH$.

@apna_pdf

469. In diborane, the two H-B-H angles are nearly:

(a) $60^0, 120^0$ (b) $95^0, 120^0$
(c) $95^0, 150^0$ (d) $120^0, 180^0$

(AIIMS-2005)

Ans. (b): In diborane, the bonds between boran and the terminal hydrogen atoms are conventional two center-two electron ($2c–2e^-$) covalent Bonds. The two H–B–H angles are nearly 95^o and 120^o.

470. Which of the following is only acidic in nature?

(a) $Be(OH)_2$ (b) $Mg(OH)_2$
(c) $B(OH)_3$ (d) $Al(OH)_3$

(AIIMS-2004)

Ans. (c): $B(OH)_3$ is the hydroxide of non-metal which has acidic nature.

- All other except $B(OH)_3$ are metallic hydroxides have basic nature.

471. In lake test of Al^{3+} ion, there is a formation of colored floating. It is due to:

(a) adsorption of litmus by H_2O
(b) adsorption of litmus by $Al(OH)_3$
(c) adsorption of litmus by $Al(OH)_4^-$
(d) none of these

(AIIMS-2001)

Ans. (b): In lake test of Al^{3+} there is formation of coloured floating lake. It is due to the adsorption of litmus by $Al(OH)_3$.

472. Al_2O_3 on heating with carbon in an atmosphere of N_2 at high temperature produces:

(a) $Al + CO_2$ (b) $Al + CO_2 + NO$
(c) $Al_4C_3 + CO_2$ (d) $AlN + CO$

(AIIMS-1999)

Ans. (d):

$$Al_2O_3 + N_2 + 3C \longrightarrow 2AlN + 3CO$$

Group (IA) contains only metals called alkali metals and (III-A) also contains metals except boron, which is a metalloid. Group (VIII) contains transition elements which are metals. Group (VII A), contains only non-metals halogens (F, Cl, Br).

473. The most abundant metal in the earth crust is:

(a) Pb (b) Cu
(c) Al (d) Mg

(AIIMS-1998)

Ans. (c): The most abundant metals are 8.1% of aluminium 5.0% of iron and 3.6% of calcium followed closely by Na, K , Mg and Ti.

474. Which one of the following elements on doping with germanium, make it a p-type semiconductor?

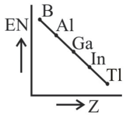
(a) Bi (b) Sb
(c) As (d) Ga

AP-EAMCET (Engg.) - 2014

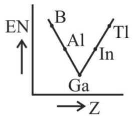
Ans. (d) : The group 14 element (germanium) is doped with group 13 element (gallium) to make p-type semiconductor.

475. Which one of the following correctly represents the variation of electronegativity (EN) with atomic number (Z) of group 13 elements?

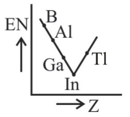
(a)



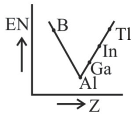
(b)



(c)



(d)



AP-EAMCET (Engg.) - 2014

Ans. (d): Correct order of electronegativity of group 13 elements are as follows-

Element	EN (Pauling scale)
B	2.0
Al	1.5
Ga	1.6
In	1.7
TI	1.8

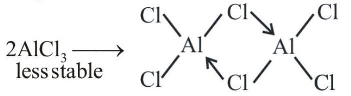
476. Assertion (A): $AlCl_3$ exists as a dimer through halogen bridged bonds.

Reason (R): $AlCl_3$ gets stability by accepting electrons from the bridged halogen.

(a) Both (A) and (R) are true and (R) is the correct explanation of (A)
(b) Both (A) and (R) true but (R) is not the correct explanation of (A)
(c) (A) is true, but (R) is false
(d) (A) is false, but (R) is true

AP-EAMCET – 2016

Ans. (a): $AlCl_3$ is a electron deficient species as Al possess only 6 electron in its outermost shell. It is exists as a dimer through halogen bridged bonds. Al_2Cl_6 forms from two $AlCl_3$ molecules. Since two Cl atom can act as a bridge to one pair to Al atom,



477. Which metal is protected by a layer of its own oxide?

(a) Al (b) Au
(c) Fe (d) Ag

AP- EAPCET- 07-09-2021, Shift-I

Ans. (a): Aluminium oxide layer serves as a protective barrier to the underlying aluminium itself and preventing chemical reactions with the metal, and hence A1 is protected from corrosion by a layer of its own oxide Al_2O_3.

478. What are X and Y respectively in the following reaction ?

$$\mathbf{B_2H_6 + 2KOH + 2X \rightarrow 2Y + 6H_2}$$

(a) K_2O, H_2O (b) H_2, H_2BO_3
(c) H_2, KBO_2 (d) B_2O_3, H_3BO_3

AP-EAMCET (Engg.)-2004

Ans. (c) : Diborane treated with strong alkali (KOH) giving the potassium metaborate and librating the hydrogen gas.

$$\underset{\text{Diborane}}{B_2H_6} + \underset{\text{Caustic potash}}{2KOH} + 2H_2O \longrightarrow \underset{\text{Potassium metaborate}}{2KBO_2} + \underset{\text{Hydrogen gas}}{6H_2\uparrow}$$

@apna_pdf

479. Aluminium metal becomes passive in

(a) conc. HNO_3 (b) dil. H_2SO_4
(c) very dil. HNO_3 (d) conc. H_2SO_4

AP- EAMCET(Medical) -2010

Ans. (a): Conc. $HNO_3 + Al \longrightarrow Al_2O_3$

Al metal becomes passive because Al_2O_3 layer forms a protective coating on the surface of the metal.

480. Diborane reacts with ammonia under different conditions to give a variety of products. Which one among the following is not formed in these reactions?

(a) $B_2H_6.2NH_3$ (b) $B_{12}H_{12}$
(c) $B_3N_3H_6$ (d) $(BN)_n$

AP-EAMCET- (Engg.) - 2010

Ans. (b) : (a) Normally it forms complex with $2NH_3$

$B_2H_6 + 2NH_3 \to B_2H_6.2NH_3$

(b) Diborane does not react with ammonia to give $B_{12}H_{12}$

(c) When it reacts with NH_3 at moderate temperature.

$3B_2H_6 + 6NH_3 \to 2B_3N_3H_6 + 12H_2$

(d) When it reacts with NH_3 at high temperature.

$B_2H_6 + NH_3 \to (BN)_n$

Thus, $B_{12}H_{12}$ is not the product of reaction between dibrone and ammonia

481. Diborane reacts with HCl in the presence of $AlCl_3$ and liberates

(a) H_2 (b) Cl_2
(c) BCl_3 (d) Cl_2 and BCl_3

AP-EAMCET (Engg.) 2013

Ans. (a) : Diborane reacts with HCl in presence of $AlCl_3$ and liberates hydrogen:

$$\underset{\text{diborane}}{B_2H_6} + HCl \xrightarrow{AlCl_3} B_2H_5Cl + H_2\uparrow$$

482. Except B and Al, all other III group element exhibit + 1 oxidation state. This is because

(a) they are p-block elements
(b) their first ionization energy is less
(c) they have low melting point
(d) due to inert pair effect

AP - EAMCET (Medical) - 2007

Ans. (d): Except B and Al, all other III group elements exhibit +1 oxidation state. This is because of inert pair effect.

483. In cigarette lighters ___ is used.

(a) misch metal (b) Mg - alloy
(c) CeO_2 (d) pyrophoric alloy

SRMJEEE – 2010

Ans. (d) : In cigarette lighters, pyrophoric alloy is used to emit spark when struck. Disposable lighters is made of pyrophoric alloy called ferrocerium.

484. The intermediate product (X) formed in the following reaction is

$$B_2H_6 + 6NH_3 \to 3X \xrightarrow{\text{heat}} 2B_3N_3H_6 + 12H_2$$

(a) $[BH(NH_3)_3]^+ [BH_4]^-$
(b) $[BH_2(NH_3)_4]^+ [BH_4]^-$
(c) $[BH(NH_3)_4]^+ [BH_4]^-$
(d) $[BH_2(NH_3)_2]^+ [BH_4]^-$

AMU-2018

Ans. (d):

$$3B_2H_6 + 6NH_3 \longrightarrow 3\left[BH_2\left(NH_3\right)_2\right]^+\left[BH_4\right]^-$$

$$\xrightarrow{\text{Heat}} 2B_3N_3H_6 + 12H_2$$

B_2H_6 and NH_3 react in the ratio of 1 : 2 to form borazine ($B_3N_3H_6$) and the intermediate product

$x = \left[BH_2\left(NH_3\right)_2\right]^+ \cdot \left[BH_4\right]^-$.

485. DIBAL-H is

(a) $AlH(i\text{-}Bu)_2$ (b) $Al(OC_2H_5)_3$
(c) $Al[(CH_3)_2CHO]_3$ (d) $AlCl_3$

AMU-2015

Ans. (a) : DIBAL-H: Diisobutylaluminium hydride

$AlH\ (i\text{-}Bu)_2$

486. Which of the following statements is not correct for boric acid?

(a) It is soluble in hot water
(b) It acts as a tribasic acid
(c) It has a planar structure
(d) It acts as a monobasic acid

Assam CEE-2019

Ans. (b): Boric acid does not act as a tribasic acid. Boric acid $B(OH)_3$ or H_3BO_3 is a weak monobasic acid.

487. Which of the following oxides is most acidic?

(a) Al_2O_3 (b) SiO_2
(c) P_2O_5 (d) MgO

BCECE-2003

Ans. (c) : On moving from left to right in a periodic table the acidic nature of oxides increases while on moving top to bottom the acidic nature of oxides decreases, hence P_2O_5 is most acidic among all given acids.

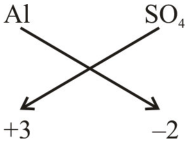
488. Value of x in potash alum, $K_2SO_4 . Al_x(SO_4)_3 . 24H_2O$ is–

(a) 4 (b) 1
(c) 2 (d) None of these

BCECE-2008

Ans. (c): Potash alum $K_2SO_4. Al_x (SO_4)_3. 24H_2O$.

It is a double salt



Therefore, $Al_2(SO_4)_3$ compound of Al^{3+} and SO_4^{2-} comparing x = 2.

489. Boric acid is polymeric due to

(a) Its acidic nature
(b) The presence of hydrogen bonds
(c) Its monobasic nature
(d) Its geometry

BCECE-2012

Ans. (b) : The presence of hydrogen bonds

Layer of boric acid is as a lattice and the units of boric acid are linked by hydrogen bonds. So we can say, Boric acid is polymeric due to the presence of hydrogen bonds.

@apna_pdf

490. What is Z in the following reactions?

$$\mathbf{BCl_3 + H_2 \xrightarrow[450^0 C]{Cu-Al} X + HCl}$$

$$\mathbf{X \xrightarrow{methylation} Z}$$

(a) $(CH_3)BH_2$ (b) $(CH_3)_4B_2H_2$
(c) $(CH_3)_3B_2H_3$ (d) $(CH_3)_6B_2$

BCECE-2014

Ans. (b) :

$$BCl_3 + H_2 \xrightarrow[450°C]{Cu-Al} \underset{\underset{X}{Diborane}}{B_2H_6} + HCl$$

$$\underset{X}{B_2H_6} + 4CH_3Cl \xrightarrow{methylation} \underset{Z}{(CH_3)_4B_2H_2}$$

491. The stability of the +1 oxidation state in Group 13 elements increases in the sequence

(a) $Al < Ga < In < Tl$ (b) $Tl < In < Ga < Al$
(c) $Tl < In < Al < Ga$ (d) $In < Tl < Ga < Al$

JEE Main-2019, 11 Jan Shift-II
BITSAT-2019
AMU–2006
NEET-2015, 2009

Ans. (a): The configuration of the outermost shell of group 13 element, is ns^2, np^1. Hence the expected oxidation states are +3 and +1. The stability of +1 oxidation state increases from aluminium to thallium and the stability of +3 oxidation state decreases form aluminium to thallium.

$B^+ < Al^+ < Ga^+ < In^+ < Tl^+$

492. Which of the following element has the highest ionization enthalpy?

(a) Boron (b) Aluminium
(c) Germanium (d) Thallium

BITSAT-2019
JEE Main 2019, 8 April shift-I

Ans. (a) : In the fifth group of periodic table as we go downward, ionization potential decreases, therefore boron has the highest ionization enthalpy among given options. The ionization enthalpy is directly proportional to the nuclear attraction and inversely proportional to the size of atom.

493. Diborane (B_2H_6) reacts independently with O_2 and H_2O to produce, respectively;

(a) B_2O_3 and H_3BO_3 (b) B_2O_3 and $[BH_4]^-$
(c) H_3BO_3 and B_2O_3 (d) HBO_2 and H_3BO_3

BITSAT-2021

Ans. (a) : B_2O_3 and H_3BO_3 the corresponding reactions are

$B_2H_6 + 3O_2 \longrightarrow B_2O_3 + 3H_2O$

$B_2H_6 + 6H_2O \longrightarrow 2B(OH)_3 + 6H_2$

494. Formula of diaspore is

(a) Al_2O_3 (b) $Al_2O_3\ H_2O$
(c) $Al_2O_3.2H_2O$ (d) $Al_2O_3.\ 3H_2O$

CG PET -2019

Ans. (b) : Diaspore is ore of alumiuium.
Formula of diaspore, $Al_2O_3 \cdot H_2O$

495. Aluminium is extracted by the electrolysis of

(a) alumina
(b) bauxite
(c) molten cryolite
(d) alumina mixed with molten cryolite

CG PET- 2013

Ans. (d) : Aluminium mixed with molten cryolite.

Aluminium is extracted by the electrolysis of purified Al_2O_3, and that is mixed with Na_3AlF_6 or CaF_2, which have low the melting point of the mixture, and it brings conductivity. Steel cathode and graphite anode are used. The graphite anode is useful here for reduction to metal.

$$Al_2O_3 + 3C \longrightarrow 4Al + 3CO_2.$$

This electrolysis process is known as Hall-Heroult process.

496. Cryolite is used in the electrolytic extration of aluminium

(a) to obtain more aluminium
(b) to decompose bauxite
(c) to protect anodes
(d) as a reducing agent

CG PET -2007

Ans. (b) : To decompose bauxite.

ionization of alumina: $2Al_2O_3 \longrightarrow 6O^{2-} + 4Al^{3+}$

Reaction at Cathode: $4Al^{3+} + 12e \longrightarrow 4Al$

Reaction at anode: $6O^{2-} \longrightarrow 3O_2 + 12e^-$

$$C + O_2 \longrightarrow CO_2.$$

497. The metal that does not give the borax bead test is

(a) Chromium (b) Nickel
(c) Lead (d) Manganese

CG PET -2005

Ans. (c) : The borax bead test is only for colored salts while Pb salts are white, hence they do not give borax bead test.

498. Corundum is

(a) SrO_2 (b) Al_2O_3
(c) $CaCl_2$ (d) Cu_2Cl_2

CG PET -2018

Ans. (b) : Corundum is the crystalline form of Aluminium oxide (Al_2O_3). It is the hardest known natural substance.

499. If we mix a pentavalent impurity in a crystal lattice of Ge, what type of semiconductor formation will occur?

(a) p- type (b) n- type
(c) Both (a) and (b) (d) None of these

CG PET- 2010

Ans. (b) : Pentavalent impurity atoms have five valance electrons hence they give one extra electron and form negative type or n-type semiconductor.

500. Zeiglar Natta catalyst is a mixture of _________.

(a) $TiCl_2\ \&\ (C_2H_5)_3Al$
(b) $TiCl_4\ \&\ (C_2H_5)_2Al$
(c) $TiCl_3\ \&\ (C_2H_5)_4Al$
(d) $(C_2H_5)_3Al\ \&\ TiCl_4$

GUJCET-2020

@apna_pdf

Ans. (d) : Zieglar–Natta catalyst $(C_2H_5)_3Al$ and $TiCl_4$ is the mixture of titanium tetra chloride and an alkyl aluminium derivative.

501. Among the halides of the elements of group 13, one which is most acidic is:

(a) BF_3 (b) $AlCl_3$

(c) BCl_3 (d) BBr_3

HP CET-2018

Ans. (d): BBr_3 is most acidic than other because it accepts electron most readily as it much more electron deficient than other.

502. The one that exist as dimer is:

(a) Aluminium iodide

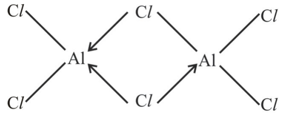
(b) Magnesium chloride

(c) Aluminium chloride

(d) Aluminium bromide

HP CET-2018

Ans. (c) $AlCl_3$ can form a dimer due to 3p → 3p overlap.



503. When metal 'M' is treated with NaOH, a white gelatinous precipitate 'X' is obtained, which is soluble in excess of NaOH. Compound 'X' when heated strongly gives an oxide which is used in chromatography as an adsorbent. The metal 'M' is

(a) Zn (b) Ca

(c) Al (d) Fe

(JEE Main 2018)

Ans. (c):

$$Al + NaOH \longrightarrow \underset{\text{Soluble}}{\left[Al(OH)_4\right]^-}$$

$$Al(OH)_3 + OH^- \longrightarrow \underset{\text{(White ppt)}}{Al(OH)_3}$$

$$2Al(OH)_3 \xrightarrow{heat} Al_2O_3 + 3H_2O$$

Al_2O_3 is used as an absorbent in column chromatography.

504. Boron can't form which one of the following anions?

(a) BF_6^{3-} (b) BH_4^-

(c) $B(OH)_4^-$ (d) BO_2^-

(AIEEE 2011)

Ans. (a) : Due to absence of vacant d-orbital in the outermost orbit, boron cannot form BF_6^{3-} ion.

505. Among the following, the maximum covalent character is shown by the compound.

(a) $SnCl_2$ (b) $AlCl_3$

(c) $MgCl_2$ (d) $FeCl_2$

(AIEEE 2011)

Ans. (b): Covalent character of an ionic compound is directly proportional to charge on ion, hence Al^{3+} possess maximum covalent character.

506. Which one of the following is the correct statement?

(a) Boric acid is a protonic acid

(b) Beryllium exhibits coordination number of six

(c) Chlorides of both beryllium and aluminium have bridged chloride structures in solid phase

(d) B_2H_6. $2NH_3$ is known as 'inorganic benzene'

(AIEEE 2007)

Ans. (c) : Chlorides of both beryllium and aluminium have bridged chloride structures in solid phase.

- Option (a) is wrong because Boric acid is a Lewis acid.
- Option (b) is wrong because, Beryllium exhibits co-ordination number of 4.
- Option (d) is also wrong because $B_3N_3H_6$ is known as inorganic benzene.

507. The type of hybridisation of boron in diborane is

(a) sp hybridisation (b) sp^2 hybridisation

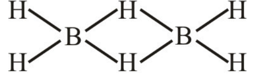
(c) sp^3 hybridisation (d) sp^3d^2 hybridisation

(AIEEE 2007), NEET-1999

AP EAMCET- 1992

Ans. (c) : Diborane (B_2H_6) has two electrons, each three centred bonds.

Each B atom is linked with four H-atom and posses tetrahedral geometry. Hence each Boran atom in diborane is sp^3 hybridised.



Diborane molecule

508. The structure of diborane (B_2H_6) contains

(a) four $2c–2e^-$ bonds and four $3c – 2e^-$ bonds

(b) two $2c–2e^-$ bonds and two $3c – 3e^-$ bonds

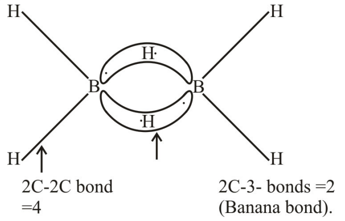
(c) two $2c–2e^-$ bonds and four $3c – 2e^-$ bonds

(d) four $2c–2e^-$ bonds and two $3c – 2e^-$ bonds

AMU-2011, UPTU/UPSEE-2007

(AIEEE 2005)

Ans. (d) : four $2C – 2C^-$ bonds and two $3C-2C^-$ bond.



509. Heating of an aqueous solution of aluminium chloride to dryness will give

(a) $Al(OH)Cl_2$ (b) Al_2O_3

(c) Al_2Cl_6 (d) $AlCl_3$

(AIEEE 2005)

Ans. (b) : Heating of an aqueous solution of aluminium chloride to dryness will give Al_2O_3.

$$AlCl_3 + 3H_2O \longrightarrow Al(OH)_3 + 3HCl$$

On strongly heating.

$$2Al(OH)_3 \longrightarrow Al_2O_3 + 3H_2O$$

@apna_pdf

510. Beryllium and aluminium exhibit many properties which are similar. But the two elements differ in

(a) exhibiting maximum covalency in compounds
(b) forming polymeric hydrides
(c) forming covalent halides
(d) exhibiting amphoteric nature in their oxides

(AIEEE 2004)

Ans. (a) : $BeCl_2$ and $AlCl_3$ have different covalent characters whereas they show many similar properties due diagonal relationship.
Hence, they differ in exhibiting maximum co-valancy in compounds.

511. Aluminium chloride exists as dimer, Al_2Cl_6 in solid state as well as in solution of non-polar solvents such as benzene. When dissolved in water, it gives

(a) $Al^{3+} + 3Cl^-$
(b) $[Al(H_2O)_6]^{3+} + 3Cl^-$
(c) $[Al(OH)_6]^{3-} + 3HCl$
(d) $Al_2O_3 + 6HCl$

(AIEEE 2004)

Ans. (b) : $AlCl_3$ is covalent but in water it becomes ionic due to large hydration energy of Al^{3+}.

$$AlCl_3 + 12H_2O \longrightarrow [Al(H_2O)_6]^{3+} + 12Cl^-$$

512. Alum is widely used to purify water since

(a) if forms complex with clay particles
(b) it coagulates the mud particles
(c) it exchanges Ca^{2+} ana Mg^{2+} ions present in hard water
(d) its sulphate ion is water purifier

(AIEEE 2002)

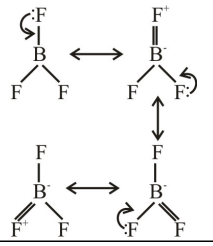
Ans. (b) : Mud is negatively charged colloidal particles hence it is coagulated with Al^{3+}. Ion exchange method is the best to purify water.

513. In which one of the following molecules strongest back donation of an electron pair from halide to boron is expected?

(a) BCl_3
(b) BF_3
(c) BBr_3
(d) BI_3

(JEE Main 2021, 27 Aug Shift-I)

Ans. (b) : Due to smaller size of F atom. BF_3 molecules has strongest back donation of an election pair.



514. Given below are the statements about diborane.

(A) Diborane is prepared by the oxidation of $NaBH_4$ and I_2.
(B) Each boron atom is in sp^2- hybridised state.
(C) Diborane has one bridged 3 centre-2-electron bond.
(D) Diborane is a planar molecule.

The option with correct statement(s) is

(a) (C) and (D) only
(b) (A) only
(c) (C) only
(d) (A) and (B) only

(JEE Main 2021, 22 July Shift-II)

Ans. (b) :

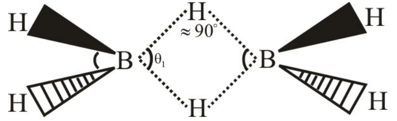
(A) $\underset{\text{Sodium borahydride}}{2NaBH_4} + I_2 \longrightarrow \underset{\text{diborane}}{B_2H_6} + 2NaI + H_2$
Hence (A) is true.
(B) each boron atom is in sp^3–hybridised state. hence (B) is wrong.
(c) Diborane has two bridged 3-centre-2- electron bond, hence (c) is wrong.
(D) Diborane is a tetrahedral molecule, hence (D) is wrong.

515. The correct statement about B_2H_6

(a) all B-H-B angles are of 120°
(b) the two B-H-B bonds are not of same length
(c) terminal B-H bonds have less p-character when compared to bridging bonds
(d) Its fragment, BH_3, behaves as a Lewis base

(JEE Main 2021, 25 Feb Shift-I)

Ans. (c) : Terminal B-H bonds have less p-character when companel to bridging bonds.



$\theta_2 > \theta_1$, B - H (terminal) having less p-character as compare to bridge bond.

517. The correct statements among I to III regarding group 13 element oxides are:

I. Boron trioxide is acidic.
II. Oxides of aluminium and gallium are amphoteric.
III. Oxides of indium and thallium are basic.

(a) I, II and III
(b) I and III only
(c) I and II only
(d) II and III only

(JEE Main 2019, 9 April Shift-II)

Ans. (a) : I, II and III.

B	Acidic oxides	On maxing top to
Al Ga	Amphoteric oxides	bottom in a group the basic character of oxides
In Th	Basic	increases

518. Aluminium is usually found in +3 oxidation state. In contrast, thallium exists in +1 and +3 oxidation states. This is due to

(a) lattice effect
(b) lanthanoid contraction
(c) inert pair effect
(d) diagonal relationship

(JEE Main 2019, 9 Jan Shift-I)

Ans. (c) : Due to the decrease in bond energies down a group, is called inert pair effect.

519. The electronegativity of aluminium is similar to

(a) lithium
(b) carbon
(c) beryllium
(d) boron

(JEE Main 2019, 10 Jan Shift-I)

@apna_pdf

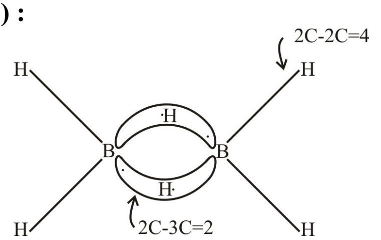
Ans. (c) : Al possess similar properties as Be due to diagonal relationship.

520. The number of 2-centre-2-electron and 3-centre -2-electron bonds in B_2H_6, respectively, are

(a) 4 and 2 (b) 2 and 4
(c) 2 and 2 (d) 2 and 1

(JEE Main 2019, 10 Jan Shift-II)

Ans. (a) :



521. The set in which compounds have different nature is

(a) $B(OH)_3$ and H_3PO_3
(b) $B(OH)_3$ and $A\ell(OH)_3$
(c) NaOH and $Ca(OH)_2$
(d) $Be(OH)_2$ and $A\ell(OH)_3$

JEE Main 03.08.2021 Shift-I

Ans. (b) : $B(OH)_3$ is acidic in nature where as $Al(OH)_3$ is amphoteric in nature.

522. The most stable oxidation state exhibited by Thallium is

(a) 0 (b) +1
(c) +2 (d) +3

J & K CET-(2012)

Ans. (b) : Due inert pair effect Thallium is most stable in oxidation state of + 1.

523. Boron is unable to form BF_6^{3-} because of

(a) High electro negativity of boron
(b) High electro negativity of fluorine
(c) Lack of d-orbital's in boron
(d) Less difference in electro negativity between B and F

J & K CET-(2012)

Ans. (c) : To form BF_6^{3-}, B should have d-orbital's, but Boron do not have d-orbital's hence do not form BF_6^{3-}.

524. What is the main product formed when iodine reacts with hypo?

(a) Na_2SO_4 (b) $Na_2S_4O_6$
(c) Na_2SO_3 (d) Na_2S

J & K CET-(2018)

Ans. (b) :

$$\underset{\text{Hypo}}{2Na_2S_2O_3} + F_2 \longrightarrow \underset{\text{Sodium tetrathianate}}{Na_2S_4O6} + 2NaI$$

525. Boron resembles carbon and silicon in many respects. However, one of the main differences of boron with carbon is that it

(a) has high ionization enthalpy
(b) has a low electronegativity
(c) has a small size
(d) form compounds which often behave as Lewis acids

J & K CET-(1997)

Ans. (d): B passes 3 electrons in outermost shell and has
6 electrons in compound state and has capacity to take lane pair of electron while carbon do not have.

526. The +1 oxidation state of thallium is more stable than its +3 oxidation state because of

(a) Its atomic size
(b) Its ionization potential
(c) Inert pair effect
(d) Diagonal relationship

J & K CET-(2013)

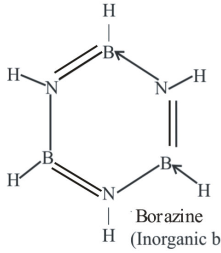
Ans. (c): Thallium (TI) shows +1 and +3 oxidation states because on moving down the group 13, the +1 state becomes more stable as compared to +3 due to inert pair effect.

527. Inorganic benzene is

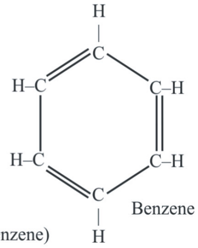
(a) $B_3H_3N_3$ (b) BH_3NH_3
(c) $B_3H_6N_3$ (d) $H_3B_3N_6$

Assam CEE-2020
AMU-2016, JCECE - 2010
UP CPMT-2010, JIPMER-2010

Ans. (c) : Borazine, known as inorganic benzene as its resemble in structure and properties, with benzene.



Borazine (Inorganic benzene)



Benzene

528. Arsenic sulphide is a negative sol. The reagent with least precipitating power is

(a) $AlCl_3$ (b) NaCl
(c) CaF_2 (d) Glucose

JCECE - 2011

Ans. (d) : Glucose carries no charge, thus has least precipitating power.
(Higher the charge of coagulating ion, higher is the precipitating power.)

529. Gallium arsenide is purified by

(a) Froth floatation process
(b) Van-Arkel method
(c) Zone refining method
(d) Electrolytic method

JCECE - 2011

Ans. (c) : Gallium arsenide is used as semiconductor and required in ultrapure form, so it is purified by zone refining method.

530. The hardest substance amongst the following is

(a) Be_2C (b) tritonium
(c) B_4C (d) graphite

JCECE - 2015

Ans. (c) : B_4C is the hardest substance along with diamond.

@apna_pdf

531. When ortho boric acid (H_3BO_3) is heated, the residue is

(a) Boron (b) Metaboric acid
(c) Boric anhydride (d) Borax

JCECE - 2015

Ans. (c) : When ortho boric acid (H_3BO_3) is heated, the residue is boric anhydride-

$$2H_3BO_3 \xrightarrow{\Delta(\text{redhot})} \underset{\text{Boric anhydride}}{B_2O_3} + 3H_2O$$

532. The process of converting hydrated alumina into anhydrous alumina is called

(a) Roasting (b) Smelting
(c) Dressing (d) Calcination

JCECE - 2016

Ans. (d) : The process of converting hydrated alumina into anhydrous alumina is called calcination.
Calcination is the process in which the ore of the metal is heated to high temperature in the absence or limited supply of oxygen.

533. H_3BO_3 is a

(a) Monobasic and Lewis acid
(b) Monobasic and Bronsted acid
(c) Tribasic and Lewis acid
(d) Tribasic and Bronsted acid

JCECE - 2016

Ans. (a) : Boric acid (H_3BO_3) is also called as hydrogen borate or orthoboric acid. H_3BO_3 accepts OH^- ion and acts as a weak monobasic Lewis acid.

$$H_3BO_3 + H_2O \longrightarrow B(OH)_4^- + H^+$$

$$K_a = 10^{-9}$$

Since, value of K_a is very small hence, H_3BO_3 is a weak acid.

534. In III group precipitation, NH_4CI is added before adding NH_4OH to

(a) Decrease conc. of OH^- ion
(b) Prevent interference of PO_4^{3-} ion
(c) Increase conc. of Cl^- ion
(d) Increase conc. of OH^- ion

JIPMER-2009

Ans. (a) : NH_4Cl is strong electrolyte, it decomposes completely, which the NH_4OH is weak base it does not ionizes completely. Thus due to presence of common ion NH_4^+ in NH_4Cl, it suppresses the ionization of weak base NH_4OH in order decrease the OH^- concentration so that higher group cations will not get precipitated.

Common ion effect-

$$NH_4OH \rightleftharpoons NH_4^+ + OH^-$$

$$NH_4Cl \rightleftharpoons NH_4^+ + Cl^-$$

535. Which of the following is the electron deficient molecule?

(a) B_2H_6 (b) C_2H_6
(c) PH_3 (d) SiH_4

JIPMER-2007

Ans. (a) : Diborane, B_2H_6 is an electron deficiant species, it contains less number of electron than required for bonding.
In diborane, 14 electrons are required to form 7 bonds however only 12 electrons are present.

536. Which of the following is correct statement?

(a) Aluminium dissolves in dilute mineral acids but is made passive by concentrated nitric acid.
(b) Aluminium vessel can be used as storage of NaOH.
(c) Aluminium chloride does not dissociate in water.
(d) AlF_3 is soluble in anhydrous HF.

JIPMER-2018

Ans. (a) : Aluminium dissolves in dilute mineral acids but is made passive by connected nitric acid.
Aluminium does not react with concentrated nitric acid. A layer of aluminium oxide is formed when aluminium reacts with the nitric acid because nitric acid is an oxidizing agent. Due to the layer of the aluminium oxide nitric acid cannot react with inner aluminium metal.

$$2Al + 6HCl \longrightarrow 2AlCl_3 + 3H_2$$

$$2Al + 3[O] \xrightarrow{HNO_3} Al_2O_3$$

$$2Al + 2NaOH + 2H_2O \longrightarrow 2NaAlO_2 + 3H_2$$

537. A Lewis acid 'X' reacts with $LiAlH_4$ in ether medium to give a highly toxic gas. This gas when heated with NH_3 gives a compound commonly known as inorganic benzene. The gas is

(a) B_2O_3 (b) B_2H_6
(c) $B_3N_3H_6$ (d) BF_3

Karnataka-CET-2020

Ans. (b) : Let's, Lewis acid 'X' = BCl_3

$$4BCl_3 + LiAlH_4 \longrightarrow \underset{\text{toxic gas}}{2B_2H_6} + 3AlCl_3 + 3LiCl$$

$$3B_2H_6 + 6NH_3 \longrightarrow 3\left[BH_2(NH_3)_2\right]^4\left[BH_4\right]^- \xrightarrow{\Delta} \underset{\text{inorganic benzene}}{2B_3N_3H_6} + 12H_2$$

538. Which of the following metallic oxide exhibit amphoteric nature?

(a) CaO (b) Al_2O_3
(c) Na_2O (d) BaO

Karnataka-CET-2017

Ans. (b) : Oxides of Al and Ga are amphoteric in nature.
Hence, Al_2O_3 exhibit in amphoteric nature.

539. The complex formed when Al_2O_3 is leached from bauxite using conc. NaOH solution is,

(a) $Na[Al(OH)_4]$ (b) $NaAl_2O_4$
(c) $Na_2[Al(OH)_3]$ (d) Na_2AlO_2

Karnataka-CET-2016

Ans. (a) : When bauxite is leached by NaOH it gives $Na[Al(OH)_4]$, dissolve in NaOH.

$$Al_2O_3 + 2NaOH + 3H_2O \longrightarrow \underset{\text{Bauxite}}{2Na\left[Al(OH)_4\right]}$$

540. Which of the following cations will have minimum flocculation value for arsenic sulphide sol?

(a) Na^+ (b) Mg^{2+}
(c) Ca^{2+} (d) Al^{3+}

Karnataka-CET-2013

@apna_pdf

Ans. (d) : According to Hardy Schulze law, Flocculation values will be minimum for the ion having higher coagulation power of an ion.

541. Boric acid is used in carom boards for smooth gliding of pawns because.

(a) H_3BO_3 molecules are loosely chemically bonded and hence soft
(b) Its low density makes it fluffy
(c) It can be powdered to a very small grain size
(d) It is chemically inert with the plywood
(e) H-bonding in H_3BO_3 gives it layered structure

Kerala-CEE-2006

Ans. (a): H-bonding in H_3BO_3 gives it layered structure. Because of this layered structure, the pawns can easily slip over the surface of boric acid.

542. Each B–H–B bridge in B_2H_6 is formed by the sharing of:

(a) 2 electrons
(b) 4 electrons
(c) 1 electron
(d) 3 electrons
(e) 8 electrons

Kerala-CEE-2004

Ans. (a): In B_2H_6, B–H–B bridge is formed by the sharing of 2 electron.

543. Be and Al exhibit diagonal relationship. Which of the following statements about them is/are not true?

I. Both react with HCL to liberate H_2
II. They are made passive by HNO_3
III. Their carbides given acetylene on treatment with water
IV. Their oxides are amphoteric

(a) III and IV
(b) I and III
(c) I only
(d) II and III
(e) III only

Kerala-CEE-2011

Ans. (e) : The carbides of both Be and Al liberate methane with water.

$$Be_2C + 2H_2O \longrightarrow 2BeO + CH_4$$

$$Al_4C_3 + 6H_2O \longrightarrow 2Al_2O_3 + 3CH_4$$

544. The correct formula of borax is

(a) $Na_2\,[B_4O_4(OH)_3].\,9H_2O$
(b) $Na_2\,[B_4O_5(OH)_4].\,8H_2O$
(c) $Na_2\,[B_4O_6(OH)_5].\,7H_2O$
(d) $Na_2\,[B_4O_7(OH)_6].\,6H_2O$
(e) $Na_2\,[B_4O_8(OH)_7].\,5H_2O$

Kerala-CEE-2013

Ans. (b): $Na_2\left[B_4O_5(OH)_4\right]\cdot 8H_2O$ - Borax formula

545. Oxyacids of phosphorus and the starting materials for their preparation are given below.

Oxyacid – Materials for preparation

(A) H_3PO_2 –	**(i) Red P + alkali**
(B) H_3PO_3 –	**(ii) P_4O_{10} + H_2O**
(C) H_3PO_4 –	**(iii) P_2O_3 + H_2O**
(D) $H_4P_2O_6$ –	**(iv) White P + alkali**

Choose the correct answer from the codes given below

(a) (A) – (iv); (B) – (iiii); (C) – (ii); (D) – (i)
(b) (A) – (i); (B) – (iii); (C) – (ii); (D) – (iv)
(c) (A) – (iv); (B) – (iii); (C) – (i); (D) – (ii)
(d) (A) – (ii); (B) – (iii); (C) – (i); (D) – (iv)
(e) (A) – (iiii); (B) – (i); (C) – (ii); (D) – (iv)

Kerala-CEE-2013

Ans. (a) :

	Material for preparation	Oxyacid
(i)	White P + Alkali	$\longrightarrow H_3PO_2$
(ii)	$P_2O_3 + 3H_2O$	$\longrightarrow 2H_3PO_3$
(iii)	$P_4O_{10} + 6H_2O$	$\longrightarrow 4H_3PO_4$
(iv)	Red P + Alkali	$\longrightarrow H_4P_2O_6$.

Hence, option (a) is the correct answer.

546. Choose the correct statements about diborane

(I) It is prepared by the oxidation of sodium borohydride with iodine.
(II) It undergoes cleavage reactions with Lewis bases to give borane adducts.
(III) It is produced on an industrial scale by a reaction of BF_3 with $LiAlH_4$.
(IV) It is readily hydrolysed by water to give borazine.
(V) It burns is oxygen and gives boron trioxide.

(a) I, II, III
(b) I, II, V
(c) I, II, IV
(d) II, III, IV
(e) I, III, V

Kerala-CEE-2020

Ans. (b) : (i) Diborane is prepared in the laboratory by oxidation of $NaBH_4$ with iodine in diglyme as solvent.

On industrial scale, diborane is obtained by the reaction of BF_3 with NaH.

Diborane readily hydrolysed by water to give boric acid. Diborane burns in oxygen to give Borontrioxide and water.

$$2NaBH_4 + I_2 \rightarrow \underset{\text{Diborane}}{B_2H_6} + 2NaI + H_2$$

547. Which of the following anions is present in the chain structure of silicates?

(a) $(Si_2O_5^{2-})_n$
(b) $(Si_2O_3^{2-})_n$
(c) $Si_2O_4^{4-}$
(d) $Si_2O_7^{6-}$

Manipal-2016

Ans. (b) :

Single chain $(SiO_3^{2-})_n$ Si : O → 1 : 3.
Double chain $(Si_4O_{11}^{6-})_n$ Si : O → 4 : 11
Silicate sheet $(Si_2O_5^{2-})_n$

Thus, anions present in chain structure of the silicate is $\left(SiO_3^{2-}\right)_n$

548. The diagonal relationship in Be and Al is due to

(a) Similar ionization enthalpy
(b) Similar metallic character
(c) Similar ionic size and charge/radius ratio
(d) Similar electronegativity

MHT CET-03.05.2019, SHIFT-I

@apna_pdf

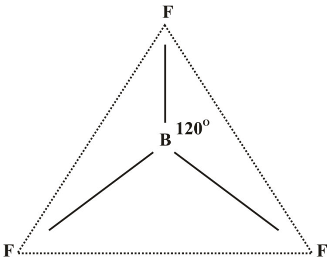
Ans. (c) : Be and Al have a diagonal relationship because their ionic sizes and charge/radius ratios are similar.

549. BF_3 is planar and electron deficient compound. Hybridization and number of electrons around the central atom, respectively are

(a) sp^2 and 8 (b) sp^3 and 4
(c) sp^3 and 6 (d) sp^2 and 6

NEET-2021

Ans. (d) :



- Hybridization = sp^2
- Number of electrons = 6
- Shape is trigonal planar

550. The correct order of atomic radii in group 13 element is

(a) B < Al < In < Ga < Tl
(b) B < Al < Ga < In < Tl
(c) B < Ga < Al < Tl < In
(d) B < Ga < Al < In < Tl

NEET-2018

Ans. (d): On moving down the group, the atomic radii increases. However, due to poor shielding of nuclear charges by 3d-elctrons $r_{Ga} < r_{Al}$. The electrons in outermost shell of Ga experience more force of attraction towards nucleus then Al which decreases atomic radius, as Ga has 10-d electrons which do not screen the nuclear charge in an effective manner. The order of atomic radii in group 13 element is-

B < Ga < Al < In < Tl

551. AlF_3 is soluble in HF only in presence of KI. It is the to the formation of

(a) $K_3[AlF_3H_3]$ (b) $K_3[AlF_6]$
(c) AlH_3 (d) $K[AlF_3H]$

NEET-II 2016

Ans. (b) : AlF_3 is insoluble in anhydrous HF because the F^- ions are not available in hydrogen bonded HF but it becomes soluble in presence of little amount of KF due to formation of soluble complex.

$$AlF_3 + 3KF \longrightarrow K_3\left[AlF_6\right].$$

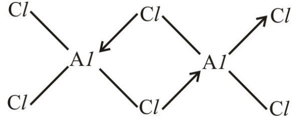
Hence, option (b) is the right answer.

552. Aluminium (III) chloride forms a dimer because aluminium

(a) Belongs to 3rd group
(b) Can have higher coordination number
(c) Cannot form a trimer
(d) Has high ionization energy

NEET-1995

Ans. (b): $AlCl_3$ forms a dimer as there is unsaturation in coordination. Also it enables Al atoms to complete their octets. Higher coordination can be achieved by Al due to its incomplete p-subshell.



553. Which one of the following elements is unable to form MF_6^{3-} ion?

(a) Ga (b) Al
(c) B (d) In

NEET-2018

Ans. (c): Boron does not have any vacant d-orbitals in its valence shell, so it cannot expand its covalency beyond 4. i.e. Boron cannot form the ion like MF_6^{3-} i.e. BF_6^{3-}.

554. The tendency of BF_3, BCl_3 and BBr_3 to behave as Lewis acid decreases in the sequence

(a) $BCl_3 > BF_3 > BBr_3$ (b) $BBr_3 > BCl_3 > BF_3$
(c) $BBr_3 > BF_3 > BCl_3$ (d) $BF_3 > BCl_3 > BBr_3$

NEET-2010

Ans. (b): Lewis acid has tendency to accept lone pair electron. In BF_3, boron has a vacant. 2p-orbital and each fluorine has fully filled unutilized 2p-orbitals. Fluorine transfers two electrons to vacant 2p-orbitals of boron, thus forming pπ– pπ bond.

The tendency to back donate decreases from F to 2 as energy level deference between B and halogen atom increases from F to I. So order of Lewis acid is-

$BBr_3 > BCl_3 > BF_3$

555. The relative Lewis acid character of boron trihalides is in the order

(a) $BI_3 > BBr_3 > BF_3 > BCl_3$
(b) $BI_3 > BBr_3 > BCl_3 > BF_3$
(c) $BF_3 > BCl_3 > BBr_3 > BI_3$
(d) $BCl_3 > BF_3 > BI_3 > BBr_3$

AMU-2019
JCECE-2015
J & K CET-2012
AMU-2005
Kerala CEE-2005

Ans. (b) : Boron halides are lewis acids. The order of acidic strength $BBr_3 > BF_3$, Less acidic nature of BF_3 is II-back bonding.

Thus, The Lewis acidity increases in the order

$BF_3 < BCl_3 < BBr_3 < BI_3$

556. Boric acid is an acid because its molecule

(a) Contains replaceable H^+ ion
(b) Gives up a proton
(c) Accepts OH^- from water releasing proton
(d) Combines with proton from water, molecules

NEET-II 2016
UP CPMT-2012

Ans. (c) : Accepts OH^- from water releasing a proton

$$H_3BO_3 + H_2O \rightleftharpoons [B(OH)_4]^- + H^+$$

when it reacts with water, boric acid accepts hydroxide to release a proton from water.

@apna_pdf

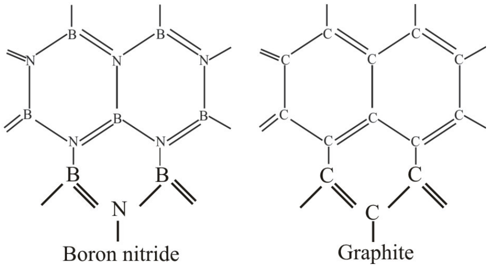
557. Which of the following structure is similar to graphite?

(a) B_4C (b) B_2H_6

(c) BN (d) B

NEET-2013

Ans. (c) : Boron Nitride (BN) has similar structure to graphite. Boron nitride sometimes also referred to as inorganic graphite.



558. Which of the following statements about H_3BO_3 is not correct?

(a) It has a layer structure in which planar BO_3 units are joined by hydrogen bonds

(b) It does not act as proton donor but acts as a Lewis acid by accepting hydroxyl ion

(c) It is a strong tribasic acid

(d) It is prepared by acidifying an aqueous solution of borax

NEET-1994

Ans. (c) : It is a strong tribasic acid.
H_3BO_3 is a weak monobasic acid.

559. Zeolite which is used for softening of hard water is

(a) hydrated sodium aluminium silicate

(b) Sodium calcium silicate

(c) sodium borosilicate

(d) calcium magnesium silicate

AMU–2003

Ans. (a) : Zeolite: $Na_2O.Al_2O_3.2SiO_2.xH_2O$
A zeolite is a hydrated sodium aluminium silicate which is used for softening of hard water through ion exchange.

560. Which of the following does not exhibit inert pair effect?

(a) Al (b) TI

(c) Pb (d) Bi

UP CPMT-2014

Ans. (a) : Inert pair effect is only exhibited by higher members of p–block elements. Thus, Al does not exhibit this effect.

561. Which of the following species does not exist?

(a) BF_3 (b) $B(OH)_6^{3-}$

(c) Al_2Cl_6 (d) $AlCl_3$

UP CPMT-2014

Ans. (b): $B(OH)_6^{3-}$ B because of the absence of d–orbitals, cannot extend its covalency beyond 4 and hence, $B(OH)_6^{3-}$ does not exist.

562. Which of these is least likely to act as a Lewis base?

(a) NH_3 (b) BH_3

(c) R– O –H (d) R_2O

UP CPMT-2014

Ans. (b) : BH_3, being electron deficient, have a tendency of gaining, not losing electrons, so it behaves like a Lewis acid that's why it is a least likely to act as a Lewis base.

563. Ammonal used in bombs is a mixture of

(a) Al + KNO_3 (b) Al + Al_2O_3 + B_2O_3

(c) Al + $Al(NO_3)_3$ (d) Al_2O_3 + C

UP CPMT-2011

Ans. (c) : Mixture of Al powder and $Al(NO_3)_3$, know as ammonal, it is used in explosive bombs.

564. The process of converting hydrated alumina into anhydrous alumina is called

(a) Roasting (b) Smelting

(c) Dressing (d) Calcination

UP CPMT-2009

Ans. (d): Concentrated hydroxide ores (hydrated alumina) are converted into their oxide (anhydrous alumina) by a process, called calcination, in which the concentrated ore is heated in a limited supply of air.

565. In solid CO_2, small molecules are held together by

(a) Electrical attraction

(b) Covalent bond forces

(c) Strong electrostatic attraction

(d) Vander Waal's forces.

AMU–2003

Ans. (d) : Vander Waals's forces.
The force of attraction between the molecules of CO_2 in solid state is Vander Waal's force of attraction.

566. Electron deficient molecule is

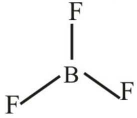
(a) CCl_4 (b) PCl_5

(c) BF_3 (d) SF_6

UP CPMT-2005

Ans. (c): Boron contains six electrons in its valence shell so, it is capable to accommodate one pair of electrons. Hence it acts as Lewis acid. As we know Lewis acid has tendency to accept a pair of electron.

BF_3



Boron (central atom) has 6 electrons in valence shell, 3 from boron and one each from three fluorine atoms.
∵ Boron in BF_3 has less than 8 electrons.
So, BF_3 is a electron deficient molecule.

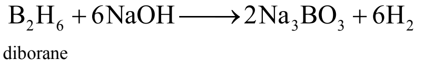
567. Fusion of boron with NaOH produces

(a) $B_2O_3 + H_2$ (b) $NaBO_2 + H_2$

(c) $Na_2B_4O_7 + H_2$ (d) $Na_3BO_3 + H_2$

UP CPMT-2001

Ans. (d): All the boron are decomposed by aqueous NaOH. Each B–B or B–H bond in a molecule of boron liberates one molecule of H_2.



$$\underset{\text{diborane}}{B_2H_6} + 6NaOH \longrightarrow 2Na_3BO_3 + 6H_2$$

@apna_pdf

568. Borax bead test of Cr (chromium) is:

(a) Green (b) Blue

(c) Violet (d) Brown

UPTU/UPSEE-2005

Ans. (a) : Borax bead test of Cr form Cr^{3+} (Dark green bead). In borax bead text, metal oxide reacts with a glass bead to form metaborates.

$$\underset{\text{}}{Cr_2O_3 + B_2O_3 \xrightarrow{\Delta} \underset{\text{Green colour}}{Cr(BO_2)_3}}$$

569. Inorganic graphite is

(a) B_2H_6 (b) BN

(c) BF_3 (d) $B_2N_3H_6$

UPTU/UPSEE-2017

BITSAT-2010

Ans. (b) : BN has similar structure to graphite, hence called inorganic graphite because it structure is like graphite with alternating boron and nitrogen atoms replacing the carbon atoms in the hexagonal structure.

570. When borax is heated strongly, it gives

(a) $BaBO_2$ (b) B_2O_3

(c) $B_3N_3H_6$ (d) $Na_2B_4O_7$

UPTU/UPSEE-2010

Ans.(b):

$$Na_2B_4O_7.10H_2O \xrightarrow[-10H_2O]{\text{heat}} Na_2B_4O_7 \xrightarrow{\text{heat}} 2NaBO_2 + B_2O_3$$

$NaBO_2 + B_2O_3$ is formed on heating borax.

571. The magnetic nature of boron molecule is same as the magnetic nature of

(a) nitrogen molecule

(b) carbon molecule

(c) unipositive nitrogen molecule

(d) oxide ion

UPTU/UPSEE-2010

Ans. (c): Unipositive nitrogen molecule.

Boron molecule and unipositive nitrogen molecule both are paramagnetic in nature.

572. $B(OH)_3$ is a

(a) Triacid base (b) Tribasic acid

(c) Monoacid base (d) Monobasic acid

Assam CEE-2014

Ans. (d) : $B(OH)_3$ is weak mono basic acid and lewis acid. It takes OH^- ion from water and leaves H^+ ion.

$$B(OH)_3 + H_2O \rightleftharpoons [B(OH)_4]^- + H^+$$

573. The correct statement about B_2H_6 is/are:

(a) All B atoms are sp^3 hybridised

(b) It is paramagnetic

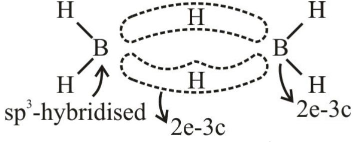
(c) It contains 3C – 4e bonding

(d) There are two types of H present

WB-JEE-30.04.2022

Ans. (a, d) : All B atoms are hybridised sp^3.

There are two types of H-bonds are presents.



3. H_b....B....H_b....bond angle is 130°

4. All H in B_2H_6 in the same plane.

574. Which of the following metals has the largest abundance in the earth's crust?

(a) Aluminium (b) Calcium

(c) magenesium (d) sodium

WB-JEE-2010

Ans. (a): Aluminium metal has the largest abundance in the earth crust.

Aluminium	82000 ppm	(8.3%)
Calcium	50000 ppm	(4.15%)
Magnesium	23,300 ppm	(2.33%)
Sodium	23600 ppm	(2.36%)

575. Which of the following contains P-O-P bond?

(a) Hypophosphorous acid

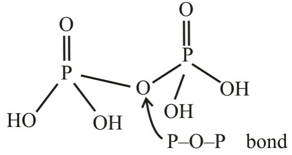
(b) Phosphorous acid

(c) Pyrophosphoric acid

(d) Orthophosphoric acid

WB-JEE-2010

Ans. (c): Pyrophosphoric acid



P–O–P contains in pyro phosphoric acid

576. In borax the number of B —O—B links and B—OH bonds present are, respectively

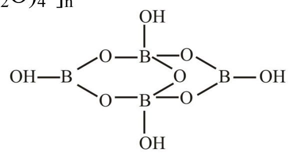
(a) five and four (b) four and five

(c) three and four (d) five and five

WB-JEE-2013

Ans. (a) : Five and four.

Borax : $[Na(H_2O)_4^+]_n$



Number of B–OH Bonds = 4

Number of B–O–B bonds = 5

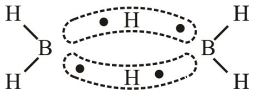
577. In diborane, the number of electrons that accounts for bonding in the bridges is

(a) six (b) two

(c) eight (d) four

WB-JEE-2013

Ans. (d) :



Four electrons accounts for bonding in the bridges.

B–H–B→3C–2e⁻

bond = $2e^-$

B–H–B = $2\times2e^- = 4e^-$

578. Which of the following oxides is the most acidic?

(a) BeO (b) MgO

(c) Al_2O_3 (d) Cl_2O_7

AMU-2013

Ans. (d) : Oxides of chlorine are acidic

The acidic nature increases as % of oxygen incenses.

Thus, Cl_2O_7 is the most acidic oxide. .

@apna_pdf

579. The reducing power of Al, Ga, In and Tl follows the sequence

(a) Al > Ga > In > Tl (b) Tl > In > Ga >Al
(c) Al > In > Ga > Tl (d) In > Ga > Al > Tl

AMU-2007

Ans. (b): Tl > In > Ga > Al.
- Reducing power increases down the group and decreases along the period.

4. Carbon Family

580. Match List-I with List – II

List – I (Si-Compounds)		**List - II (Si-Polymeric/other Products)**	
(A)	**$(CH_3)_4Si$**	**(I)**	**Chain Silicon**
(B)	**$(CH_3)Si(OH)_3$**	**(II)**	**Dimeric Silicon**
(C)	**$(CH_3)_2Si(OH)_2$**	**(III)**	**Silane**
(D)	**$(CH_3)_3Si(OH)$**	**(IV)**	**2D Silicon**

Choose the correct answer from the option Given below:

(a) (A)-(III), (B)-(II), (C)-(I), (D)-(IV)
(b) (A)-(IV), (B)-(I), (C)-(II), (D)-(III)
(c) (A)-(II), (B)-(I), (C)-(IV), (D)-(III)
(d) (A)-(III), (B)-(IV), (C)-(I), (D)-(II)

JEE Main-27.06.2022, Shift-I

Ans. (d) :
$Si(CH_3)_4 \rightarrow$ Silane
$Si(CH_3)(OH)_3 \rightarrow$ 2D Silicon
$Si\ (CH_3)_2(OH)_2 \rightarrow$ Chain silicon
$Si\ (CH_3)_3OH \rightarrow$ Dimeric silicones

581. Which of the following elements is considered as a metalloid?

(a) Sc (b) Pb
(c) Bi (d) Te

JEE Main-26.06.2022, Shift-II

Ans. (d) : Scandium (Sc), Lead (Pb) and Bismuth are metal Tellurium (Te) is metalloid.

582. Which one of the following statements is not correct?

(a) Application of lime makes the soil acidic
(b) High acidity in soil is typical of humid climate
(c) Increasing soil acidity results in declining soil fertility
(d) Arid climate is characterized by alkaline soil

NDA (II)-2015

Ans : (a) Application of lime don't make soil acidic because lime is a strong base.

583. Which one of the following elments is used in pencil-lead?

(a) zinc (b) Lead
(c) Carbon (Graphite) (d) Tin

NDA (I)-2017

Ans : (c) Graphite is a allotropes of carbon which is used in pencil lead. Graphite molecules are made up of layered layers of flat clusters of carbon atoms.

584. Glass is a

(a) liquid
(b) colloid
(c) non-crystalline amorphous solid
(d) crystalline solid

NDA (I)-2017

Ans : (c) Glass is an non-crystalline amorphous solid material that exhibits a glass transition, which is the reversible transition in amorphous materials from hard and relatively brittle state into a molten or rubber-like state.

585. Consider the following reaction:

$$CH_4 + 2O_2 \longrightarrow CO_2 + 2H_2O$$

Which of the following about the reaction given above is/are correct?
1. Carbon is oxidized.
2. Hydrogen is oxidized.
3. Hydrogen is reduced.
4. Carbon is reduced.
Select the correct answer using the code given below.

(a) 1 only (b) 1 and 2 only
(c) 2 and 3 only (d) 2 and 4 only

NDA (II)-2017

Ans. (b) : $CH_4 + 2O_2 \rightarrow CO_2 + H_2O$ is the combustion of methane.
In the combustion of methane, carbon loses hydrogen and gains oxygen, so it is being oxidized. Oxygen gains hydrogen (and carbon), so it is being reduced. Hydrogen gains oxygen (and loses carbon), so it is being oxidized.

586. Molecules of which of the following has cage like structure?
1. Diamond
2. Graphite
3. Fullerenes
Select the correct answer using the code given below:

(a) 1, 2, and 3/1 (b) 2 and 3 only
(c) 2 only (d) 3 only

NDA (I)-2017

Ans : (d) Fullerenes has cage like structure. Fullerenes are molecules composed entirely of carbon with spherical (buckyballs), ellipsoid, tubular or a combination shape.

587. How is carbon black obtained?

(a) By heating wood at high temperature in absence of air
(b) By heating coal at high temperature in absence of air
(c) By burning hydrocarbons in a limited supply of air
(d) By heating coal at high temperature in presence of air

NDA (I)-2018

Ans. (c) : Carbon black is obtained from burning hydrocarbons in a limited supply of air

$$CH_4 + \underset{\text{(limited supply)}}{O_2} \rightarrow \underset{\text{Carbon Black}}{C} + 2H_2O$$

588. Which one of the following properties is NOT true for graphite?

@apna_pdf

(a) Hybridisation of each carbon atom is *sp^3*
(b) Hybridisation of each carbon atom is *sp^2*
(c) Electrons are delocalized over the whole sheet of atoms
(d) Each layer is composed of hexagonal rings

NDA (I)-2018

Ans. (a) : In Graphite, the hybridization of each carbon atom is not sp^3. A graphite crystal consist of layers of carbon atoms or sheets of carbon atoms. Every carbon atom in a graphite is layered joined to the other three carbon atoms by strong covalent bonds to form flat hexagonal rings.

589. Which one of the following is the purest form of Carbon?
(a) Charcoal
(b) Coke
(c) Fullerene
(d) Carbon black

NDA (I)-2018

Ans. (c) Fullerene is the purest form of carbon. Fullerene have smooth structure without having changing bonds. The pure solid form of pure or mixed fullerenes is called fullerite.

590. The Poisonous nature of Carbon monoxide (CO) is due to its
(a) insolubility in water
(b) ability to form a complex with haemoglobin
(c) ability to reduce some metal oxides
(d) property of having one sigma bond

NDA (I)-2018

Ans. (b) : The poisonous nature of Carbon Monoxide (CO) is due to its ability to reduce some metal oxide. Carbon monoxide gas is poisonous because it combines with haemoglobin in the blood of human body.

591. Which one of the following statements is not correct?
(a) All carbons in diamond are linked by carbon-carbon single bond
(b) Graphite is layered structure in which layers are held together by weak van der Waals forces
(c) Graphite layers are formed by hexagonal rings of carbon atoms
(d) Graphite layers are held together by carbon-carbon single bond

NDA (II)-2018

Ans. (d) : Graphite is layered structure in which layers are hold together by van der Waals force and not by carbon-carbon single bond.

592. Which one of the following is called 'syngas'?
(a) $C(s) + H_2O(g)$
(b) $CO(g) + H_2O(g)$
(c) $CO(g) + H_2(g)$
(d) $NO_2(g) + H_2(g)$

NDA (II)-2018

Ans. (c) : Syngas is a mixture of carbon monoxide and dihydrogen. Since the mixture of the two gases is used for the synthesis of methanol, it is called syngas.
Hence, $CO(g)+H_2(g)$ is called syngas.

593. Which one of the following is termed as 'Dry ice'?
(a) Ice present in ice-cream
(b) Solid water at Antarctica
(c) Solid state of carbon dioxide
(d) Solid water of ionosphere

NDA (II)-2019

Ans : (c) Solid Carbon dioxide (CO_2) is also called dry ice because on decreasing pressure it converts directly into solid state without coming in liquid state.

594. SiO_2 is soluble in;
(a) H_2SO_4
(b) HNO_3
(c) HF
(d) HCl

AP-EAMCET (Med.)-1999

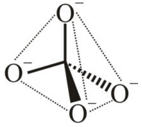
Ans. (c) : Silica (SiO_2) is soluble in HF due to the formation of H_2SiF_6 the two steps reaction shown below-

$$SiO_2+4HF \rightarrow SiF_4+2H_2O$$
$$SiF_4+2HF \rightarrow H_2SiF_6$$

595. Which one of the following is not correct in respect of ortho -silicates?
(a) They are not formed by discrete SiO_4^{4-} unit
(b) The unit SiO_4^{4-} makes a cyclic frame work.
(c) There is no double bond between Si and O atoms
(d) They are used as gem-stone

SCRA 2012

Ans. (c) : Ortho silicates are the simplest silicates which contain discrete SiO_4^{4-} tetrahedral units. The basic structure of ortho silicate unit is shown below. No double bond between Si-O is present.



596. The process of slow cooling of glass is called
(a) Annealing
(b) Hardening
(c) Tempering
(d) None of these

AP EAMCET- 1991

Ans. (a) : The process of slow cooling of glass is called **annealing**. The process of annealing glass relieves internal stresses, which could otherwise leave it susceptible to cracking or shattering in response to minor mechanical or thermal shock. The annealing temperature range is 454-482°C.

597. The reagent that has action on glass is
(a) Aqua regia
(b) Hydrofluoric acid
(c) Oleum
(d) Fuming HNO_3

AP EAMCET- 1991

Ans. (b) : The reagent that has action on glass is hydrofluoric acid. Glass is supercooled liquid. It is soluble in HF due to formation of H_2SiF_6.
$6HF + SiO_2 \rightarrow H_2SiF_6 + 2H_2O$

598. The melting point of diamond is very high since the type of bonding in it is
(a) Two dimensional network
(b) Metallic
(c) Covalent coordinate
(d) Three dimensional giant network

AP EAMCET- 1993

Ans. (d) : Diamond is a three dimensional gaint network due to which its melting point is extremely high. Diamond are made of carbon so they form as carbon atoms under a high temperature and pressure.

@apna_pdf

599. Glass is soluble in a solution of
(a) Hydrochloric acid (b) Hydrofluoric acid
(c) Sulphuric acid (d) Nitric acid

AP EAMCET- 1993

Ans. (b) : Glass is soluble in a solution of HF. This property is made use in the process of etching.

$$4HF + SiO_2 \rightarrow SiF_4 + 2H_2O$$

SiO_2 present in glass reacts with HF to form SiF_4. Therefore glass is soluble in HF.

600. Ordinary glass is a combination of the following
(a) SiO_2, Na_2SiO_3, $CaSiO_3$
(b) SiO_2,Na_2CO_3,$CaCO_3$
(c) Na_2CO_3,K_2CO_3,SiO_2
(d) SiO_2, $PbCO_3$, $CaSiO_3$

AP EAMCET- 1995

Ans. (a) : The ordinary glass is a composition of SiO_2, Na_2SiO_3 and $CaSiO_3$. Ordinary glass is used for making bottles, windows, pans, ordinary glass tubes, glass sheets etc.

601. The glass which contains PbO mainly is
(a) Soda glass (b) Flint glass
(c) Pyrex glass (d) Borosil

AP EAMCET- 1995

Ans. (b) : The glass which contains PbO is mainly is flint glass. The molecular formula of flint glass is $K_2O.PbO. 6SiO_2$

602. The inert form of carbon is
(a) Diamond (b) Graphite
(c) Coal (d) Charcoal

AP EAMCET- 1995

Ans. (a) : The inert form of carbon is diamond because they do not react with acids or bases.
Diamond and Graphite are the inert allotropic form of carbon.

603. Silica is soluble in
(a) HCl (b) HNO_3
(c) H_2SO_4 (d) HF

AP EAMCET- 1998
Haryana PMT-2009

Ans. (d) : Silica is soluble in HF due to formation of H_2SiF_6 according to the two steps reaction shown.

$$SiO_2 + 4HF \rightarrow SiF_4 + 2H_2O$$
$$SiF_4 + 2HF \rightarrow H_2SiF_6$$

604. Carbogen is
(a) Pure form of carbon
(b) $COCl_2$
(c) Mixture of CO and CO_2
(d) Mixture of O_2 and CO_2

AP EAMCET- 1998

Ans. (d) : Carbogen is a mixture of 90% O_2 an 10% CO_2. It's also called Meduna's mixture after its inventer Ladislas Meduna.

605. During Serpeck's process, silica is eliminated as
(a) Si (solid) (b) SiO_2(vapour)
(c) SiO_2(solid) (d) Si (vapour)

AP EAMCET- 2000

Ans. (d) : In Serpeck's Process is used for the purification of bauxite ore containing silica (SiO_2) as the main impurity. Therefore, Serpeck's process silica is eliminated as Si (vapor).

$$SiO_2 + 2C \xrightarrow{1800^0C} Si + 2CO$$

606. Which of the following is not correct?
(a) SiO_2 is used as acid flux.
(b) The distance between the layers in graphite is $3.35X10^{-8}$cm
(c) SiO_2 reacts with Na_2CO_3 and Liberates CO
(d) The hybridization of C in graphite is sp^2

AP EAMCET- 2005

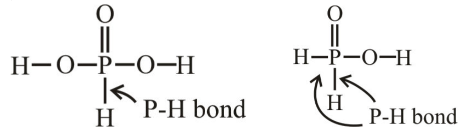
Ans. (c) : Silica (SiO_2) reacts with sodium carbonate to form the sodium meta silicate and carbon dioxide gas liberate. Hence, the statement c is false.

$$SiO_2 + Na_2CO_3 \rightarrow \underset{\text{Sodium silicate}}{Na_2SiO_3} + CO_2\uparrow$$

607. Which pair of oxyacids of phosphorus contains 'P — H' bonds?
(a) H_3PO_4, H_3PO_3 (b) $H_3PO_5, H_4P_2O_7$
(c) H_3PO_3, H_3PO_2 (d) H_3PO_2, HPO_3

AP EAMCET (Engg.)-2009

Ans. (c): H_3PO_3, H_3PO_2



608. Which of the following species do not exist ?
(a) $[SiF_6]^{2-}$ (b) $[SiCl_6]^{2-}$
(c) $[GeCl_6]^{2-}$ (d) $[SiF_5]$-

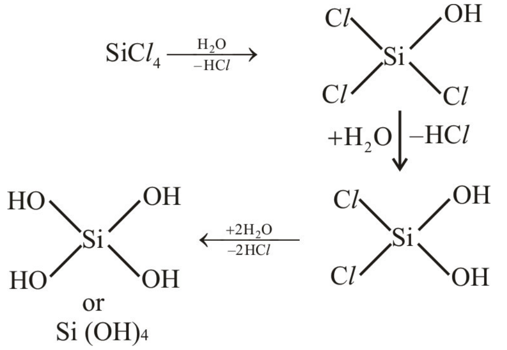
AP EAPCET 24.08.2021 Shift-II

Ans. (b): $[SiF_6]^{2-}$ has F atoms are 2p orbital and smaller size and interaction of F lone pair electron with d-orbitals of silicon are stronger in F. $[SiCl_6]^{2-}$ has Cl atoms are 3p orbital and larger size so interaction of Cl lone pair electron with d-orbitals of silicon are not stronger so do not exist.

609. What would be the product of following reaction $SiCl_4 \xrightarrow{\text{excess of } H_2O}$? (Major Product)
(a) $SiCl_3(OH)$ (b) $Si(OH)_4$
(c) $SiCl_3(OH)_2$ (d) $SiCl_4$(no reaction)

AP EAPCET 20.08.2021 Shift-I

Ans. (b):



@apna_pdf

610. Identify (P) and (Q) in the following reaction:

$$\mathbf{CH_3Cl + Si \xrightarrow[570K]{Cu-powder} (P) \xrightarrow{H_2O} (Q) \longrightarrow}$$

Straight chain polymer

(a) P: $(CH_3)_3\,SiCl$ Q: $(CH_3)_3SiOH$
(b) P: $(CH_3)_2\,SiCl_2$ Q: $(CH_3)_2Si(OH)_2$
(c) P: $(CH_3)_2SiCl_2$ Q: $(CH_3)_2Si(OH)Cl$
(d) P: $(CH_3)_2SiCl_2$ Q: $(CH_3)_2\,SiO$

AP EAPCET 19-08-2021 Shift-I

Ans. (b): Mechanics

$$\begin{tikzcd} CH_3Cl+Si \arrow[r, "Cu-powder", "570K"'] & (P) \arrow[r, "H_2"] & (Q) \arrow[d] \\ & & \text{Straight chain polymer} \end{tikzcd}$$

$$2CH_3Cl+Si \xrightarrow[570K]{Cu-powder} \underset{(P)}{(CH_3)_2SiCl_2} \xrightarrow{H_2O} \underset{(Q)}{(CH_3)_2Si(OH)_2} + 2HCl$$

In the second process dimethyl dichlorane react with water to produce dimethyl dihydroxysilane and hydrogen chloride this is called the hydrolysis of dimethyldichloro

611. The catenation tendency of C, Si and Ge is in the order Ge < Si < C. The bond energies (in kJ mol^{-1}) of C–C, Si–Si and Ge–Ge bonds, respectively are

(a) 348, 180, 167	(b) 180, 167, 348
(c) 148, 167, 380	(d) 148, 180, 367

AP EAMCET (Engg.) 2001

Ans. (a): C–C, Si – Si and Ge – Ge are 348, 180 and 167 kJ/mol respectively.

612. What would be the products for the following reactions respectively? (water molecules would be the expected biproduct)

(i) $SiO_2 + 2NaOH \rightarrow ?$
(ii) $SiO_2 + 4HF \rightarrow ?$

Options

(a) SiONa & SiOF	(b) Na_2SiO_3 & SiF_4
(c) Na_3SiO_4 & $SiOF_2$	(d) $Na_2Si_2O_7$ & Si_2OF_2

AP EAPCET-6 Sep. 2021, Shift-II

Ans. (b): SiO_2 reacts with hot and concentrated sodium hydroxide (NaOH) to form sodium silicate and water.

SiO_2 + 2Conc.NaOH → Na_2SiO_3+H_2O

Hydrofluoric acid (HF) reacts with silicon dioxide (SiO_2) to produce silicon tetra fluoride (SiF_4) and water.

$SiO_2 + 4HF \rightarrow SiF_4 + 2H_2O$

613. Among the following oxides, which one is weakly basic and yet a powerful oxidant ?

(a) CO_2	(b) SnO_2
(c) SiO_2	(d) PbO_2

AP EAMCET (Engg.) 17.09.2020 Shift-I

Ans. (d) : For the dioxides of group - 14 elements (CO_2, SiO_2, GeO_2 and PbO_2 is most basic in nature. Again, in oxidation state Pb in + 4 which is less PbO_2 stable than its + 2 state because of inert pair effect.

So Pb^{4+} of PbO_2 has a tendency to be reduced into more stable Pb^{2+} (PbO) showing strong oxidising nature of PbO_2.

614. The acidic character of the group-15 elements in the increasing order is _____

(a) $As_2O_3 < P_2O_3 < Bi_2O_3 < Sb_2O_3$
(b) $As_2O_3 < P_2O_3 < Sb_2O_3 < Bi_2O_3$
(c) $Bi_2O_3 < Sb_2O_3 < As_2O_3 < P_2O_3$
(d) $Sb_2O_3 < As_2O_3 < P_2O_3 < Bi_2O_3$

AP EAPCET 24.08.2021, Shift-I

Ans. (c) : The acidic character of the oxides decreases down the group because the electro negativity is the property of the element to attract electron pairs. The correct order of acidic character is $Bi_2O_3 < Sb_2O_3 < As_2O_3 < P_2O_3$.

615. Identify the incorrect statement about SiO_2 (silica) from the following:

(a) It is highly reactive due to low Si – O bond enthalpy
(b) It is a covalent three-dimensional network solid
(c) Quartz the crystalline form of silica, is used as a piezoelectric material
(d) An amorphous form of silica is used in filtration plants

AP EAPCET 24.08.2021, Shift-I

Ans. (a): (1) Silicon dioxide is not very reactive compound due to the polarity of molecule is zero. So, the first statement is false.

(2) The silicon atom in SiO_2 shows tetrahedral co-ordination, with four oxygen atoms surrounding a central Si atom. Hence, the second statement is true.

(3) The third statement is also true because the crystal quartz is used as pieozoelectric material.

(4) This statement is true because amorphous form of SiO_2 is used in filtration plants.

616. The element with maximum bond-energy_____.

(a) C	(b) Pb
(c) Ge	(d) Si

AP EAPCET 20.08.2021 Shift-II

Ans. (a): Bond energy is defined as measure of bond strength of a chemical bond. On going from top to bottom on group, bond energy decrease due to bond strength decrease.

So, carbon has maximum bond energy.

617. Which one of the following elements reduces NaOH to Na ?

(a) Si	(b) Pb
(c) C	(d) Sn

AP EAMCET (Engg.) 2012

Ans. (c) : NaOH when heated with coke, gets reduced to Na.

$$6NaOH + 2C \xrightarrow{\Delta} 2Na + 2Na_2CO_3 + 3H_2\uparrow$$

Here C behaves as reducing agent.

618. Which one of the following elements, when present as an impurity in silicon makes it a p-type semiconductor?

(a) As	(b) P
(c) In	(d) Sb

AP EAMCET (Engg.) 2012

@apna_pdf

Ans. (c) : Semiconductors like germanium or silicon depend with any of the trivalent atoms like boron, indium or gallium are called p-type semiconductors. The impurity atom is surrounded by four silicon atoms.

Valency of As, P and Sb is +5 and of In is +3. Thus, 'In' is the impurity which when added to Si gives p-type semi-conductor.

619. Which one of the following elements reacts with steam?

(a) C (b) Ge

(c) Si (d) Sn

AP EAMCET (Engg.) -2014

Ans. (d) : C, Si, Ge do not react with water (steam) while Sn reacts with steam to form SnO_2 and H_2.

$Sn(s) + 2H_2O(g) \rightarrow SnO_2(g) + 2H_2\ (g)$

620. $H_2S_2O_7$ has a commercial name as

(a) oil of vitriol (b) hypo

(c) oil of sulphur (d) oleum.

COMEDK-2019

Ans. (d) : In practice, when a pressure of 2 bar and a temperature of 720 K operated, the SO_3 gas from the catalytic converter is absorbed in concentrated H_2SO_4 to produce oleum ($H_2S_2O_7$). Sulfuric acid, sulfuric also spelled sulfuric (H_2SO_4) also called oil of vitriol or hydrogen sulfate, dense, colorless oily, corrosive liquid.

621. Which of the following is not hydrolysed easily?

(a) CCl_4 (b) $SiCl_4$

(c) $GeCl_4$ (d) $SnCl_4$

COMEDK-2016

Ans. (a) : CCl_4 is not hydrolyzed because of two reasons-

1. Carbon does not have d-orbitals because it is found in 2nd period i.e. second shell so as the 3d-orbitals are not available and so it can not expand its co-ordination no. above 4.

Since, in carbon tetrachloride (CCl_4) all the valencies are satisfied, so it can not add any water molecule by any mean so the reaction becomes

$CCl_4 + H_2O \rightarrow$ No reaction.

2. Due, to smaller size of C-atom it is shielded by the larger Cl-atoms it is shielded by the larger Cl-atoms so attach of water is not possible for hydrolysis.

622. Carbogen is

(a) pure form of carbon

(b) $COCl_2$

(c) mixture of CO and CO_2

(d) mixture of O_2 and CO_2.

COMEDK 2019

Ans. (d) : Carbogen is a mixture of 95% (O_2) and 5% (CO_2).

623. The chemical formula of zeolite is:

(a) $K_2Al_2Si_2O_8.xH_2O$ (b) $CaAl_2Si_2O_8$

(c) $Na_2Al_2Si_2O_8.xH_2O$ (d) $Na_2[Na_4\ (PO_3)_6]$

AP-EAMCET (Medical), 2003

Ans. (c) : The chemical formula of Zeolite is $Na_2Al_2Si_2O_8.xH_2O$. It is used in the softening of hard water.

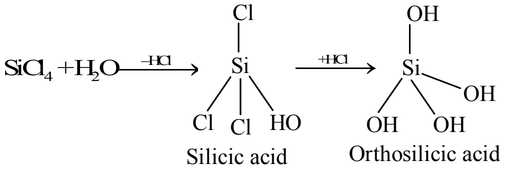
624. Hydrolysis of $SiCl_4$ gives compound X and HCl. On heating to 1000°C, X loses water and forms Y. Indentify X and Y, respectively

(a) SiO_2 and Si (b) H_4SiO_4 and SiO_2

(c) SiO_2 and SiC (d) H_4SiO_4 and SiC

AP-EAMCET (Medical), 2008

Ans. (b) : The hydrolysis of $SiCl_4$ gives compounds silicic acid and HCl.



Orthosilicic acid (H_4SiO_4), on heating at high temperature, loses two water molecules and gives silica (SiO_2).

$$\underset{\text{Orthosilicic acid}}{H_4SiO_4} \xrightarrow[-2H_2O]{1000^\circ} \underset{\text{Silica}}{SiO_2}$$

625. Which one of the following is used to remove silicon dioxide in Serpeck's process of purification of bauxite?

(a) CaO (b) Na_2CO_3

(c) Coke (d) Nickel

AP-EAMCET (Medical), 2001

Ans. (c) : Silicon dioxide (SiO_2) is removed by coke in Serpeck's process. In Serpeck's process is used when silica is present in considerable amounts in bauxite ore. The ore is mixed with coke and heated at 1800°C in the presence of nitrogen. Silica is reduced to silicon which volatilizes off at this temperature.

$$SiO_2 + 2C \longrightarrow Si(\uparrow) + 2CO(\uparrow)$$

626. Which of the following is a correct set for SiO_2?

(a) Linear, acidic (b) Linear, basic

(c) Tetrahedral, acidic (d) Angular, basic

AP-EAMCET (Medical), 2002

Ans. (c) : SiO2 is a covalent, 3-D network solid. Each Si atom is covalently bonded in a tetrahedral manner to four oxygen atoms. Each oxygen atom in turn covalently bonded to another silicon atoms. Each corner is shared with another tetrahedron.

627. How many O-atoms are shared per SiO_4 tetrahedral in silicate anion of beryl mineral?

(a) 4 (b) 3

(c) 2 (d) 1

GUJCET-2007

Ans. (c) : Beryl is cyclic silicate with $[Si_6O_{18}]^{12-}$ anion. There are two oxygen atoms are shared per SiO_4 tetrahedral in silicate anion of beryl mineral. The cyclic structure of $Si_6O_{18}^{12-}$. So the number of O- atoms shared per SiO_4 tetrahedral in silicate anion of beryl mineral are 2.

The chemical formula of beryl mineral $Be_3Al_2Si_6O_{18}$.

628. Calgon is used for water treatment. Which of the following statement is NOT true about Calgon?

(a) Calgon contains the 2nd most abundant element by weight in the Earth's crust.

@apna_pdf

(b) It is polymeric compound and is water soluble.
(c) It is also known as Graham's salt.
(d) It does not remove Ca^{2+} ion by precipitation.

JEE Main 26.02.2021,Shift-II

Ans. (a) : Calgon contains the 2nd most abundant element by weight in the Earth's crust.

- 2nd most abundant element is 'Si' and it is not present in calgon.
- $Na_6P_6O_{18}$ = (Graham's salt) (Sodium hexa meta phosphate)
- It exist in polymeric form as $(NaPO_3)_6$ and water soluble compound.
- It removes Ca^{2+} in soluble ion but not by precipitation.

Hence, all the statements are correct.

629. The 'dry ice' is ....

(a) dry CO_2 gas
(b) solid CO_2
(c) dry SO_2 gas
(d) Solid NH_3

AP EAMCET (Engg.) 18.09.2020, Shift-I

Ans. (b): Dry ice is solid CO_2 which is a molecular crystal.

630. Consider the following statements about glass :

1. Glass is a solid solution and its composition may vary.
2. For making silica glass very high temperature is required. This can be reduced by adding oxides to the melt.
3. Normal domestic glass for windows is calcium alkali silicate.
4. Al_2O_3 is added to glass to give ruby red colour to it.

Which of the statements given above are correct?

(a) 1, 2 and 4
(b) 2, 3 and 4
(c) 1, 2 and 3
(d) 1, 3 and 4

SCRA - 2009

Ans. (b): Glass is actually neither a liquid-super cooled or otherwise-nor a solid. It is an amorphous solid. A state somewhere between those two states of matters exists.

Rest of the 3 points which are given is correct.

631. Assertion: $SiCl_4$ gets easily hydrolysed, while CCl_4 does not.

Reason: Carbon cannot extend its covalency due to the absence of d-orbitals but Si can extend its covalency.

(a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS 25 May 2019 (Evening)

Ans. (a): Both Assertion and Reason are correct and Reason is the correct explanation of Assertion.

- $SiCl_4$ can accept lone pair given by H_2O molecule due to presence of d-orbitals whereas CCl_4 has no d-orbitals hence it do not hydrolised.
- CCl4 does not undergo hydrolysis by water because the carbon atom is small and is shielded by larger chlorine atoms. Carbon does not have 3d atomic orbitals that water can use to form co-ordinate bonds. In SiCl4, the silicon atom is larger than the carbon atom and also has available 3d atomic orbitals for bonding.

632. Which of the following is a formula of methanides?

(i) Be_2C
(ii) CaC_2
(iii) Mg_2C_3
(iv) SiC

(a) only (i), (iv)
(b) only (i), (ii)
(c) only (iii), (iv)
(d) only (ii), (iv)

AIIMS 25 May 2019 (Morning)

Ans. (a): Methanides are the metal carbides in which carbon atom acts as anion :

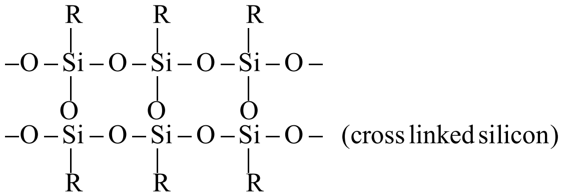
633. Which of the following shows bond in silicon?

(a) Si-C-Si-C-Si
(b) Si-Si-Si-Si
(c) -Si-O-Si-O-Si-
(d) Si-C-Si-O-Si.

AIIMS-1994

Ans. (c): – Si – O – Si – O – Si –

Silicon:



R
R
R
–O – Si – O – Si – O – Si – O –
O
O
O
–O – Si – O – Si – O – Si – O –
R
R
R
(cross linked silicon)

634. Silicon is an important constituent of

(a) alloys
(b) rocks
(c) vegetables
(d) animals

AIIMS-1996

Ans. (b): Silicon is the important constituent of rock in form of silica (SiO_2).

635. In processing of steel which of the following allotropes of carbon is used?

(a) Carbon black
(b) Charcoal
(c) Coke
(d) Graphones

AIIMS 26 May 2019 (Morning)

Ans. (c): Coke is an allotrope of carbon used for the processing of steel.

636. Assertion: Silicones are hydrophobic in nature.

Reason: Si – O – Si linkages are moisture sensitive.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

[AIIMS-2006, 2015]

@apna_pdf

Ans. (c)

- Silicons are insoluble in water and does not react with it. So they are hydrophobic in nature.
- The crystal structure of silica has Si—O—Si linkage and it is extremely stable and considerable energy is required to break the silicon oxygen bonds in it. So silicons are hard and have high melting point and it is moisture resistant. Hence, reason is false.

637. **Assertion:** Pb_3O_4 react with HNO_3 and form PbO_2

Reason: Lead is stable in +4 oxidation state.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

(AIIMS-26 May, 2018-Evening)

Ans. (c): Assertion is correct but Reason is incorrect.

- $Pb_3O_4 + HNO_3 \rightarrow PbO_2\,(Solid) + Pb\,(NO_3)_2 + H_2O$

but Pb^{2+} is more stable due to inert pair effect.

638. **Assertion:** Pb^{4+} compounds are stronger oxidizing agents than Sn^{4+} compounds.

Reason: The higher oxidation states for the group 14 elements are more stable for the heavier members of the group due to 'inert pair effect'.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

(AIIMS-2014, 2016)

Ans. (c): Assertion is correct but Reason is incorrect.

- Pb^{4+} is less stable than Pb^{2+} hence it has tendency to reduce hence it is a good oxidising agent than Sn^{4+}.
- p-block, on moving top to bottom, the stability of lower oxidation state increases due to inert pair effect. Pb^{4+} is less stable than Sn^{4+}, making it a better oxidizing agent.
- The oxidation state +2 is more stable on moving down the group 14 element (for heavier atom) from top to bottom. Hence, reason is false.

639. **Assertion:** PbI_4 is a stable compound.

Reason: Iodide stabilizes higher oxidation state.

(a) If both Assertion and Reason are correct and Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

(AIIMS-2003)

Ans. (d): If assertion and Reason both are incorrect. PbI_4 is not a stable compound because Pb shows (II) oxidation state more frequently than Pb (IV) due to inert pair effect. Iodide cannot stabilize higher oxidation states. Thus, assertion is true but reason is false.

640. **Assertion:** SiF_6^{2-} is known but $SiCl_6^{2-}$ is not

Reason: Size of fluorine is small and its lone pair of electrons interacts with d-orbitals of Si strongly.

(a) If both Assertion and Reason are correct and Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

(AIIMS-2005)

Ans. (a): SiF_6^{2-} is known because F has small size therefore can be easily arranged around silicon to form SiF_6^{2-}. The ion is quite stable unlike $SiCl_6^{2-}$ in which size of Cl atom is large which destabilize it and create steric hindrance to each other therefore cannot be arranged around silicon in excess.

641. **Why is graphite used as a dry lubricant in machinery**

(a) Each carbon atom undergoes sp^3 hybridization
(b) Graphite has layered structure and cleaves easily between the layers and therefore it is very soft and slippery
(c) Graphite is a non-conductor of electricity
(d) Graphite has two sigma bonds and two pi bonds

SCRA-2015

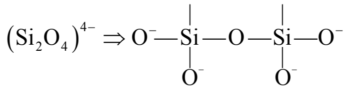
Ans. (b): Graphite used as a dry lubricant in machinery because graphite has hexagonal ring layered structure and it cleaves easily between the layers and therefore it is very soft and slippery.

642. **Name the kind of silicate formed, when two silicate units $(SiO_4)^{4-}$ share one oxygen atom.**

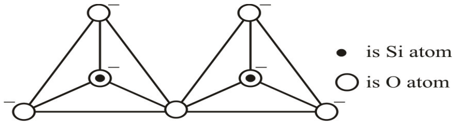
(a) Chain silicate (b) Cycle (ring) silicate
(c) Pyrosilicate (d) Sheet silicate

AP EAMCET (Engg.) 17.09.2020, Shift-II

Ans. (c) : In pyrosilicate $(Si_2O_7)^{4-}$, two silicate units $(SiO_4)^{4-}$ share one oxygen atom.



$$(Si_2O_4)^{4-} \Rightarrow O^-—\overset{\overset{O^-}{|}}{\underset{\underset{O^-}{|}}{Si}}—O—\overset{\overset{O}{|}}{\underset{\underset{O^-}{|}}{Si}}—O^-$$



@apna_pdf

643. **Assertion:** NH_3 is absorbed more readily over activated charcoal than CO_2.

Reason: NH_3 is non-polar.

(a) If both Assertion and Reason are correct and Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

(AIIMS-2000)

Ans. (c): If Assertion is correct but reason is incorrect.

- NH_3 absorbs more readily over activated charcol than CO_2 because of its polar nature. It is correct reason because NH_3 has polar nature.

644. **Assertion:** Stannous chloride gives grey precipitate with mercuric chloride, but stannic chloride does not do so.

Reason: Stannous chloride is a powerful oxidising agent which oxidises mercuric chloride to metallic mercury.

(a) If both Assertion and Reason are correct and Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

(AIIMS-2002)

Ans. (c): If assertion is true but reason is false.

- Sn^{4+} is more stable than Sn^{2+}. So, Sn^{2+} is oxidised to Sn^{4+} by losing 2e when it reacts with mercuric chloride i.e. $SnCl_2$ is reducing agent.

$SnCl_2$ (Stannous chloride) on reaction with mercuric chloride ($HgCl_2$), oxidizes to $SnCl_4$ (Stannic chloride)

$$SnCl_2 + 2HgCl_2 \rightarrow SnCl_4 + \underset{\text{(Greyish)}}{Hg_2Cl_2}$$

So, in this reaction, stannous chloride is acting as reducing agent that, reduces Hg(II) to Hg(I) then to Hg(0)

$$SnCl_2 + Hg_2Cl_2 \rightarrow 2Hg + SnCl_4.$$

645. **Which compound do not react with dilute HCl at high temperature?**

(a) $SnSO_4$
(b) $PbSO_4$
(c) BiOCl
(d) $CdSO_4$

(AIIMS-27 May, 2018-Morning)

Ans. (b): $PbSO_4$ does not react with dilute HCl even at high temperature. $PbSO_4$ belongs to group-I so, it is insoluble in HCl.

646. **Ge(II) compounds are powerful reducing agents whereas Pb(IV) compounds are strong oxidants. It can be due to**

(a) Pb is more electropositive than Ge
(b) Ionization potential of lead is less than that of Ge
(c) Ionic radii of Pb^{2+} and Pb^{4+} are larger than those of Ge^{2+} and Ge^{4+}
(d) More pronounced inert pair effect in lead than in Ge

(AIIMS-2012)

Ans. (d): Ge^{4+} is more stable than Ge^{2+} as a result of which Ge^{2+} has a tendency to be oxidized to Ge^{4+} so, Ge^{2+} compounds act as powerful reducing agents. But Pb^{2+} is more stable than Pb^{4+} because of pronounced inert pair effect as a result of which Pb^{4+} has a tendency to get reduced to Pb^{2+} so, Pb^{4+} compounds act as strong oxidizing agents (i.e. oxidants).

647. **Carbon cannot be used to produce magnesium by chemical reduction of MgO because:**

(a) carbon is not a powerful reducing agent.
(b) magnesium reacts with carbon to from carbides.
(c) carbon does not react with magnesium.
(d) carbon is a non-metal.

(AIIMS-2014)

Ans. (b): Magnesium reacts with carbon to form carbides.

Carbon cannot be used to produce magnesium by chemical reduction of MgO because magnesium reaction with carbon from carbides.

$$2Mg + 3C \xrightarrow{2000^{o}C} Mg_2C_3$$

648. **Carborundum is obtained when silica is heated at high temperature with**

(a) carbon
(b) carbon monoxide
(c) carbon dioxide
(d) calcium carbonate

(AIIMS-2014)

Ans. (a): Silica on heating with carbon at high temperature gives carborundum (SiC).

$$\underset{\text{Silica}}{SiO_2} + \underset{\text{Carbon}}{3C} \xrightarrow{\Delta} \underset{\text{Carborundum}}{SiC} + 2CO$$

649. **Which of the following product is formed when SiF_4 reacts with water?**

(a) SiF_3
(b) H_4SiO_4
(c) H_2SO_4
(d) H_2SiF_4

(AIIMS-2010)

Ans. (b): SiF_4(like $SiCl_4$) get hydrolised to form H_4SiO_4(Silicic acid)

$$SiF_4 + 4H_2O \longrightarrow \underset{\text{Ortho Silicic acid}}{Si(OH)_4 \text{ or } H_4SiO_4} + 4HF\ .$$

650. **The chemical formula of' tear gas" is**

(a) $COCl_2$
(b) CO_2
(c) Cl_2
(d) CCl_3NO_2

(AIIMS-2008)

Ans. (d): Tear gas is also called lachrymator gas. It is not a gas but an aerosol. The actual formula of tear gas is $C_{10}H_5ClN_2$(2-chlorobenzalomalononitirle).

@apna_pdf

651. The energy gaps (E_g) between valence band and conduction band, for diamond, silicon and germanium are in the order:

(a) E_g (diamond) > E_g (silicon) > E_g (germanium)
(b) E_g (diamond) < E_g (silicon) < E_g (germanium)
(c) E_g (diamond) = E_g (silicon) = E_g (germanium)
(d) E_g (diamond) > E_g (germanium) > E_g (silicon)

(AIIMS-2006)

Ans. (a): E_g (diamond) > E_g (silicon) > E_g (germanium) because diamond is on insulator and non-metallic character decrease down the group.

- Ionization energy is the energy required to pull away an electron. So if the atomic radius is small the electron "feels" stronger to pull from the positive nucleus. Thus, that electron is harder to pull off. Therefore it decreases with an increase in atomic radii.

652. The repeating unit in silicone is

(a) SiO_2 (b) R_2SiO

(c) $R-O-\underset{R}{\underset{|}{Si}}-O-$

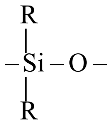
(d) $–R_2–Si–O–O–R$

(AIIMS-2007)

Ans. (b):



$-\underset{R}{\underset{|}{\overset{R}{\overset{|}{Si}}}}-O-$

Silicone is : $-\underset{R}{\underset{|}{\overset{R}{\overset{|}{Si}}}}-O-\underset{R}{\underset{|}{\overset{R}{\overset{|}{Si}}}}-O-\underset{R}{\underset{|}{\overset{R}{\overset{|}{Si}}}}-O-$

653. The liquefied metal expanding on solidification is:

(a) Ga (b) Al
(c) Zn (d) Cl

(AIIMS-2004)

Ans. (a): Gallium is soft, silvery metal. Its melting point is 30°C. This metal expanded by 3.1% when it solidifies and hence it should not be stored in glass or metal containers.

654. The electrical conductivity of semiconductors:

(a) decreases with temperature
(b) increases with temperature
(c) remains constant on heating
(d) none of the above

(AIIMS-2001)

Ans. (b): On increasing the temperature of semiconductor the electron get free from covalent bond hence conductivity increases.

655. Producer gas is a mixture of:

(a) $CO + H_2$ (b) $H_2 + CH_4$
(c) $CO + N_2$ (d) $CO + H_2O$

(AIIMS-1998, 2000)

Ans. (c): Producer gas is a mixture of carbon monoxide and nitrogen ($CO + N_2$). It is produced by passing air mixed with little steam over a red hot coke bed maintained at a temperature of about 1100°C. Its calorific value is very low. Among all gaseous fuels, producer gas is the cheapest.

656. Solid CO_2 is known as dry ice:

(a) It melts at 0^0C
(b) Its B.P. is more than 199^0C
(c) It evaporates at -78^0C without melting
(d) None of the above

(AIIMS-2000)

Ans. (c): Dry ice is frequently used as a substitute for refrigeration for groceries and medical supplies due to its exceptionally low temperature of –78°C. Dry ice is made by compressing and cooling gaseous CO_2 under high pressure, resulting in liquid CO_2. Dry ice is often used as an alternative to refrigeration for foodstuffs and medical supplies.

657. Water glass is:

(a) Na_2SiO_3 (b) Mg_2Si
(c) $SiCl_4$ (d) $Ca(H_2PO_4)_2$

(AIIMS-2001)
BCECE-2007

Ans. (a): Water glass, also called sodium silicate or soluble glass, a compound containing sodium oxide (Na_2O) and silica (silicon dioxide, SiO_2) that forms a glassy solid with the very useful property of being soluble in water.

658. Water gas is produced by:

(a) Passing steam over red hot coke
(b) Passing steam and air over red hot coke
(c) burning coke in excess of air
(d) burning coke in limited supply of air

(AIIMS-2001)

Ans. (a): Water gas is produced by passing steam over a bed of red hot coke at 1000- 1400°C

$$\underset{\text{Coke}}{C} + H_2O \longrightarrow \underset{\text{water gas}}{CO + H_2}\ ;\ \Delta H = +28 \text{ kcal}$$

659. Bell metal is an alloy of:

(a) Sn and Pb (b) Cu and Pb
(c) Sn and Cu (d) In, Sn and Cu

(AIIMS-1999)

Ans. (c): Bell metal is an alloy of Tin and Copper in 1 : 4 ratio.

660. The approximate percentage of silica in cement is:

(a) 5 - 10% (b) 15 - 20%
(c) 20 - 25% (d) 25 - 30%

(AIIMS-1998)

Ans. (c): Cement consists of lime mixed with silica and alumina. The approximate percentage of silica in cement is 20-25% or 17 to 25%.

661. The incorrect statement among the following is/are ____

(a) NCl_5 does not exist while PCl_5 does
(b) Pb prefers to form tetravalent compounds
(c) The three C - O bonds are equal in the CO_3^{2-} ion
(d) Both O_2^+ and NO are paramagnetic

AP EAPCET 19-08-2021, Shift-II

@apna_pdf

Ans. (b) :
- (a) NCl_5 does not exist because there are no d-orbital in second energy level. Whereas the PCl_5 exist due to presence of d-orbitals. This is correct.
- (b) Pb prefers to form bivalent compounds due to inert pair effect. Hence it is incorrect.
- (c) The three C – O bond are equal in CO_3^{2-} ion so the statement is true.
- (d) Both O_2^+ and NO are paramagnetic because both contains unpaired electrons. Hence this statement is true.

662. Assertion (A) : The colour of old lead paintings can be restored by washing them with a dilute solution of H_2O_2.
Reason (R) : Hydrogen peroxide reduces PbS to Pb.
(a) Both A and R are true and R is a correct explanation for A
(b) Both A and R are true but R is not a correct explanation for A
(c) A is true. R is false
(d) A is false. R is true

AP EAPCET 19-08-2021, Shift-II

Ans. (c): When the old lead painting are kept in the atmosphere for a long period, the traces of H_2S gas present in the atmosphere converts lead oxide (PbO) in to lead sulphide (PbS) which is black in colour. It can be restored by keeping then in H_2O_2 solution for sometime as a result of which lead sulphide is oxidized to lead sulphate.

$$PbO + H_2S \longrightarrow \underset{\text{(Black)}}{PbS} + H_2O$$

The H_2O_2 reduces the PbS to $PbSO_4$, Which is white.

$$\underset{\text{(Black)}}{PbS} + 4H_2O_2 \rightarrow \underset{\text{(White)}}{PbSO_4} + 4H_2O$$

The Hydrogen peroxide reduces the PbS to $PbSO_4$. Hence the second statement will be false.

663. $SiCl_4$ on hydrolysis forms 'X' and HCl. Compound 'X' loses water at 1000°C and gives 'Y'. Compounds 'X' and 'Y' respectively are
(a) H_2SiCl_6, SiO_2
(b) H_4SiCl_4, Si
(c) SiO_2, Si
(d) H_4SiO_4, SiO_2

VITEEE- 2009

Ans. (d) : $SiCl_4 + 4H_2O \longrightarrow H_4SiO_4 + 4HCl$

$$H_4SiO_4 \xrightarrow[1000^\circ C]{\Delta} SiO_2 + 2H_2O$$

664. Which one of the following elements reacts with steam?
(a) C
(b) Ge
(c) Si
(d) Sn

AP-EAMCET (Engg.) - 2014

Ans. (d) : Among the given element, only Sn reacts with water to form SnO_2 and H_2.

$$Sn(s) + 2H_2O(g) \xrightarrow{\Delta} SnO_2(g) + 2H_2(g)$$

665. Which one of the following is a correct set?
(a) Diamond, sp^2
(b) Graphite, sp^3
(c) Diamond, sp
(d) Graphite, sp^2

AP-EAMCET- (Engg.)-2011

Ans. (d): Graphite is an allotrope of carbon and two dimensional sheet like structure. The adjacent layers of sheet are held together by Van der Waal's forces. In graphite each carbon atom is present in sp^2 hybridised state.

666. Chemically zeolites are _______
(a) Calcium silicates
(b) Sodium silicates
(c) Hydrates aluminosilicates
(d) Magnesium silicates

AP- EAPCET- 07-09-2021, Shift-I

Ans. (c):
Chemically Zeolite ($Na_2Al_2Si_2O_8.xH_2O$) are hydrated aluminosilicates with three dimensional network of silicates in which one silicon atom replaced by aluminum atom giving Al– O – Si framwork.

667. Silica (SiO_2) reacts with Mg to form a magnesium compound X. X reacts with dilute HCl and forms Y. Y is :
(a) MgO
(b) $MgCl_2$
(c) MgSiO
(d) $SiCl_4$

AP-EAMCET (Engg.)-2004

Ans. (b): Silica (SiO_2) reacts with Mg to form a magnesium compound i.e. magnesium oxide (MgO). Magnesium oxide reacts with dilute HCl and forms the magnesium chloride.

$$\underset{\text{Silica}}{SiO_2} + \underset{\text{Magnesium}}{2Mg} \longrightarrow \underset{\substack{\text{Magnesium}\\ \text{oxide}\\ \text{(X)}}}{2MgO} + \underset{\text{Silicon}}{Si}$$

$$\underset{\substack{\text{Magnesium}\\ \text{oxide}}}{MgO} + 2HCl \longrightarrow \underset{\substack{\text{Magnesium}\\ \text{chloride}\\ \text{(Y)}}}{MgCl_2} + H_2O$$

668. Assertion (A) : GeF_4 and $SiCl_4$ act as Lewis bases.
Reason (R) : Ge and Si have d-orbital's to accept electrons.
The correct answer is
(a) Both (A) and (R) are correct, (R) is not the correct explanation of (A)
(b) (A) is correct but (R) is not correct
(c) (A) is not correct but (R) is correct
(d) Both (A) and (R) are correct, (R) is the correct explanation of (A)

AP EAMCET (Medical) - 2013

Ans. (c) : GeF_4 and $SiCl_4$ act as Lewis acid because the tetra halides of Si, Ge, Sn and Pb form hexahalo complexes like $[SiF_6]^{2-}$, $[GeF_6]^{2-}$, $[SiCl_6]^{2-}$, $[SnCl_6]^{2-}$, $[PbCl_6]^{2-}$, with the corresponding halide ions by increasing their co-ordination number from 4 to 6 due to the availability of d-orbital's.

669. How many corners of SiO_4 units are shared in the formation of three dimensional silicates?
(a) 3
(b) 2
(c) 4
(d) 1

AP-EAMCET (Engg.) 2013

@apna_pdf

Ans. (c) : Four oxygen atoms of each tetrahedral (SiO_4) are shared with other tetrahedral, three dimensional network structure is obtained in silicates.

670. $SiCl_4 \xrightarrow{H_2O} X \xrightarrow{1000°C} Y$

In the above reaction, X and Y respectively are

(a) SiO_2 and Si (b) H_4SiO_4 and SiO_2

(c) H_2SiCl_6 and SiO_2 (d) H_4SiO_4 and Si

AP - EAMCET (Medical) - 2007

Ans. (b) : Silicon tetrachloride reacts with water to formed the silicic acid and further heated at 1000°C to give the silicondioxide (SiO_2).

$$\underset{\text{Silicon tetrachloride}}{SiCl_4} \xrightarrow{H_2O} \underset{\substack{\text{Silicic acid}\\(X)}}{H_4SiO_4} \xrightarrow{1000°C} \underset{\substack{\text{Silicon dioxide}\\(Y)}}{SiO_2}$$

671. SiO_2 is reacted with sodium carbonate. What is the gas liberated?

(a) CO (b) O_2

(c) CO_2 (d) O_3

AP-EAMCET (Engg.)-2005

Ans. (c) : Silica is reacted with sodium carbonate (Na_2CO_3), sodium silicate is formed. This reaction is the basic reaction in the manufacture of glass.

$$SiO_2 + Na_2CO_3 \longrightarrow Na_2SiO_3 + CO_2(\uparrow)$$

Hence, carbondioxide (CO_2) gas is released.

672. Silica is attacked by

(a) conc. HNO_3 (b) conc. H_2SO_4

(c) aqua regia (d) hydrofluoric acid.

AMU-2013

Ans. (d) : HF (Hydrofluoric acid).

$$\underset{\text{Silica}}{SiO_2} + 4HF \xrightarrow[-2H_2O]{} SiF_4 \xrightarrow{+2HF} H_2SiF_6$$

673. Which of the following has least tendency to undergo catenation ?

(a) C (b) Si

(c) Ge (d) Sn

AMU-2010

Ans. (d) : The linking of identical atoms with each other to form long chains is called catenation. All the elements of group 14 have the property to catenate. This property decreases from carbon to lead. Carbon has the maximum property to catenate. The decrease of this property is associated with M-M bond energy which decreases from carbon to lead.

674. Which of the following dihalides will be most stable?

(a) SiX_2 (b) GeX_2

(c) SnX_2 (d) PbX_2

AMU-2006

Ans. (d) : The stability of the dihalides increases in going from Ge to Pb due to inert pair effect.

675. Lassaigne's test is not used for the detection of

(a) carbon (b) halogen

(c) nitrogen (d) sulphur

AMU-2005

Ans. (a) : For the detection of halogens, nitrogen and sulphure lassaigne's test is used.

676. Which of the following elements has the lowest melting point ?

(a) Sn (b) Pb

(c) Si (d) Ge

TS EAMCET-2017

Ans. (a) : On decreasing down the group of carbon family melting point decreases generally.

$$\underset{4373}{C} > \underset{1693}{Si} > \underset{1218}{Ge} > \underset{600}{Pb} > \underset{505K}{Sn}$$

677. Which gas is used in aerated water?

(a) CO_2 (b) SO_2

(c) CO (d) Water vapours

BCECE-2006

Ans. (a): Any water artificially impregnated with a large amount of gas (CO_2) is aerated water. This gas is either artificially injected under pressure or occurring due to natural geological processes.

678. Carbon can reduce ferric oxide to iron at a temperature above 983K because

(a) carbon monoxide formed is thermodynamically less stable than ferric oxide

(b) carbon has a higher affinity towards oxidation than iron

(c) free energy change for the formation of carbon dioxide is less negative than that for ferric oxide

(d) iron has a higher affinity towards oxygen than carbon

BCECE-2014

Ans. (b): Carbon has a higher affinity towards oxidation than iron.

Above 983K, free energy change for the formation of CO_2 is more negative than that of ferric oxide. Thus above this temperature, carbon has a higher affinity towards oxidation than iron.

679. Which of the following statement are correct?

(a) CO_2 and SiO_2 both are gases

(b) CO_2 is gas and SiO_2 is liquid

(c) CO_2 is a gas but SiO_2 is a solid

(d) Carbon and Si both form oxides of similar reactions

BCECE-2015

Ans. (c) : SiO_2 is a giant molecular structure but CO_2 is simple molecular structure due to this reason CO_2 is a gas but SiO_2 is a solid.

680. For making good quality mirrors, plates of float glass are used. These are obtained by floating molten glass over a liquid metal which does not solidify before glass. The metal used can be

(a) Tin (b) Sodium

(c) Magnesium (d) Mercury

BITSAT-2009

Ans. (d): Among the given metals, mercury has lowest melting point, which means the lowest freezing point. So, mercury is used.

@apna_pdf

681. Ordinary glass is:

(a) Sodium silicate
(b) Calcium silicate
(c) Sodium and calcium silicate
(d) Mixed salt of Na and Ca

BITSAT-2015

Ans. (c) : Ordinary glass which is also known as soda glass or soft glass is a mixture of sodium silicate (Na_2SiO_3), calcium silicate ($CaSiO_3$) and silica (SiO_2).

682. Identify the incorrect statement:

(a) In $(Si_3O_9)^{6-}$, tetrahedral SiO_4 units share two oxygen atoms
(b) Trialkylchlorosilane on hydrolysis gives R_3SiOH
(c) $SiCl_4$ undergoes hydrolysis to give H_4SiO_4
(d) $(Si_3O_9)^{6-}$ has cyclic structure

BITSAT-2020

Ans. (b) : Trialkylchlorosilane on hydrolysis gives R_3SiOH,

$$R_3SiCl \xrightarrow{H_2O} R_3Si\boxed{OH + H-O}SiR_3 \longrightarrow R_3SiO-O-Si-R_3$$

683. Doping of silicon with boron leads to

(a) n- type semiconductor
(b) p- type semiconductor
(c) superconductor
(d) insulator

CG PET- 2011

Ans. (b) : Doping of divalent impurity to semiconductor leads to formation of p-type semiconductor.

684. Number of carbon atoms in kerosene is

(a) C_{17-20}
(b) C_{12-16}
(c) C_{20-25}
(d) C_{25-30}

Manipal-2020, CG PET- 2015
UPTU/UPSEE-2005

Ans. (b): Kerosene is a mixture of hydrocarbons. The chemical composition depends on its source of isolation usually, it consists of about 10 different hydrocarbons, each containing 11 to 16 carbon atoms per molecule.

685. Which method is used to get very pure germanium used in semiconductor?

(a) Electrolysis
(b) Vapour-phase refining
(c) Liquation
(d) Zone-refining

GUJCET-2015, 2016

Ans. (d): Zone refining is used to obtain metal of very high purity. It is based on principle that an impure molten metal on gradual cooling will deposit its crystals of pure metal, while the impurities will be left in the remaining part of the molten metal. Germanium metal can be purified by this method.

686. The correct statement among the following is

(a) $(SiH_3)_3N$ is planar and less basic than $(CH_3)_3N$
(b) $(SiH_3)_3N$ is pyramidal and more basic than $(CH_3)_3N$.
(c) $(SiH_3)_3N$ is pyramidal and less basic than $(CH_3)_3N$.
(d) $(SiH_3)_3N$ is planar and more basic than $(CH_3)_3N$

(JEE Main 2019, 12 April Shift-I)

Ans. (a): $(SiH_3)_3N$ is planar and less basic than $(CH_3)_3N$. In $(SiH_3)_3N$ the lone pairs of nitrogen is delocalized to the empty orbitals of the silicon due to which it is planar and less basic when compared with $(CH_3)_3N$.

687. The one that is extensively used as a piezoelectric material is

(a) quartz
(b) tridymite
(c) amorphous silica
(d) mica

(JEE Main 2019, 9 Jan Shift-I)

Ans. (a) : Quartz is used as piezoelectric material. It produces electricity when any mechanical stress in forms of pressure applied on it. Thus it is also used in watches and oscillators.

688. Correct statements among (I) to (IV) regarding silicones are:

I. They are polymers with hydrophobic character.
II. They are biocompatible.
III. In general, they have high thermal stability and low dielectric strength.
IV. Usually, they are resistant to oxidation and sued as greases.

(a) I and II only
(b) I, II, III only
(c) I II, III and IV
(d) I, II and IV only

(JEE Main 2019, 9 Jan Shift-I)

Ans. (d) : Silicones are the polymer of silicon-containing [–(R)$_3$Si–O–]n linkage.

(i) It is a polymer with hydrophobic character thus used in making water resistant seals.

(ii) They are biocompatible silicon rubber have good mechanical properties, are low cost and are nontoxic and non-irritant materials because of these desirable characteristics it considered as biocompatible.

(iii) They have high thermal stability and low dielectric strength which is not correct.

(iv) They are also resistant to oxidation because of their wax-like texture. They are also used in greases.

689. The element that shows greater ability to form pπ - pπ multiple

(a) Ge
(b) Si
(c) Sn
(d) C

(JEE Main 2019, 12 Jan Shift-II)

Ans. (d): Carbon (C) atom has 2p orbital's able to form strongest pπ– pπ bonds due to its size. The pπ- pπ bond is formed when the collision occurs sideways and not head on.

690. The element that does not show catenation is

(a) Ge
(b) Sn
(c) Si
(d) Pb

(JEE Main 2019, 12 Jan Shift-II)

Ans. (d): Catenation is not shown by Pb. Down the group metallic character increases and Pb is a metal and catenation is the property of non-metal.

691. Which of the following exists as covalent crystals in the solid state?

(a) Iodine
(b) Silicon
(c) Sulphur
(d) Phosphorus

(JEE Main 2013)

@apna_pdf

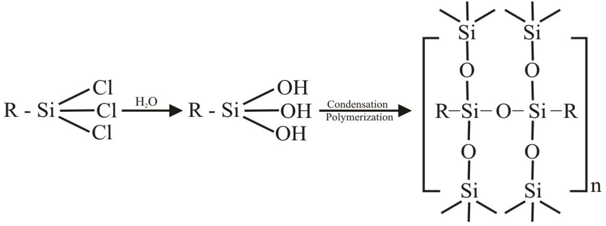
Ans. (b) Silicon (Si) : Covalent solid.
Sulphur (S_8) : Molecular solid
Phosphorous (P_4): Molecular solid
Iodine (I_2): Molecular solid.
Hence, option (b) is correct.

692. Among the following substituted silanes the one which will give rise to cross linked silicone polymer on hydrolysis is

(a) R_4Si (b) $R\,SiCl_3$
(c) R_2SiCl_2 (d) R_3SiCl

(AIEEE 2007)

Ans. (b) : On hydrolysis of $RSiCl_3$ will give $RSi(OH)_3$ which will polymerise to cross-linked silicon polymer



693. The stability of dihalides of Si, Ge, Sn and Pb increases steadily in the sequence

(a) $GeX_2 < SiX_2 < SnX_2 < PbX_2$
(b) $SiX_2 < GeX_2 < PbX_2 < SnX_2$
(c) $SiX_2 < GeX_2 < SnX_2 < PbX_2$
(d) $PbX_2 < SnX_2 < GeX_2 < SiX_2$

(AIEEE 2007)

Ans. (c) : $SiX_2 < GeX_2 < SnX_2 < PbX_2$.
On moving down the group (IV) the +2 oxidation state is more stable due to inert pair effect.

694. Which of the following oxides is amphoteric in character?

(a) SnO_2 (b) SiO_2
(c) CO_2 (d) CaO

(AIEEE 2005)

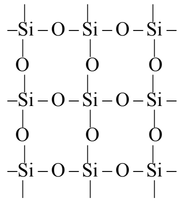
Ans. (a): SnO_2 reacts both acid and base hence it is an amphoteric oxide.

695. In silicon dioxide

(a) Three are double bonds between silicon and oxygen atoms
(b) Silicon atom is bonded to two oxygen atoms
(c) Each silicon atom is surrounded by two oxygen atoms and each oxygen atom is bonded to two silicon atoms
(d) Each silicon atom is surrounded by four oxygen atoms and each oxygen atom is bonded to two silicon atoms

(AIEEE 2005)

Ans. (d): In silicon dioxide (SiO_2) each silicon atom is surrounded by four oxygen atoms and each oxygen atom is bonded to two silicon atoms.



696. The soldiers of Napolean army while at Alps during freezing winter suffered a serious problem as regards to the tin buttons of their uniforms. White metallic tin buttons got converted to grey powder. This transformation is related to

(a) A change in the crystalline structure of tin
(b) An interaction with nitrogen of the air at very low temperature
(c) A change in the partial pressure of oxygen in the air
(d) An interaction with water vapour contained in the humid air

(AIEEE 2004)

Ans. (a): Grey tin is very brittle and easily crumbles down to a powder in very cold climates.

Grey tin $\rightleftharpoons$ White tin
(Cubic) (Tetragonal).

The change of white tin to grey tin is accompanied by an increase in the volume. This is called a tin disease or tin plague.. As temperature, decreases, white tin (β form) changes to grey tin (α form)

$\beta\text{-Sn} \longrightarrow \alpha\text{–Sn}$ at 132ºC.

α–Sn has much less density than β-Sn. It changes the crystalline structure.

697. Glass is a

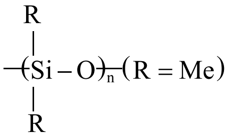
(a) Microcrystalline solid
(b) Super cooled liquid
(c) Gel
(d) Polymeric mixture

(AIEEE 2003)

Ans. (b) : Glass is a super cooled liquid because it has an amorphous structure. Amorphous solid have tendency to flow so called a super coolled liquid.

698. The basic structural unit of feldspar, zeolites, mica and asbestos is

(a) $(SiO_3)^{2-}$ (b) SiO_2
(c) $(SiO_4)^{4-}$ (d)



$-(\overset{R}{\underset{R}{Si}}-O)_n-(R = Me)$

(JEE Main 2019, 12 April Shift-I)

Ans. (c) : Basic unit of zeolite, mica, asbestos and feldspar is $(SiO_4)^{4-}$

699. The amorphous form of silica is

(a) Tridymite (b) Kieselguhr
(c) Cristobalite (d) Quartz

(JEE Main 2019, 9 April Shift-II)

Ans. (b) : Quartz, tridymite and cristobalite are all crystalline form of silica however kiesalguhr is an amorphous (crypto-crystalline) form of silica.

700. The correct order of catenation is

(a) $C > Sn > Si \approx Ge$ (b) $Si > Sn > C > Ge$
(c) $C > Si > Ge \approx Sn$ (d) $Ge > Sn > Si > C$

(JEE Main 2019, 10 April Shift-I)

@apna_pdf

Ans. (c) : C > Si > Ge ≈ Sn
Catenation properties of non-metal decreases on moving down the group.

701. Which of the following is used for making optical instruments?

(a) SiO_2 (b) Si
(c) SIH_4 (d) SiC

AP EAMCET- 2006

Ans. (a): SiO_2 is used for making optical instrument.

- Use of silicon element to the making the semiconductor devices.
- SiH_4 is used in the production of amorphous silicon.
- Silicon carbide (SiC) elements are used today in the melting of glass and non-ferrous metal etc.

702. An oxide of an element is a gas and dissolves in water to give an acidic solution. The element belongs to

(a) II group (b) IV group
(c) VIII group (d) zero group

AP EAMCET- 2007

Ans. (b) : An oxide of an element is a gas and dissolved in water to give an acidic solution. The element belong to IV group.

$$\underset{\text{element}}{C} + O_2 \rightarrow \underset{\text{oxide}}{CO_2} \xrightarrow{H_2O} \underset{\text{acidic solution}}{H_2CO_3}$$

703. Identify B in the following reaction

$$H_4SiO_4 \xrightarrow[-H_2O]{1000^0C} A \xrightarrow[A]{\text{Carbon}} B + CO$$

(a) corundum (b) quartz
(c) silica (d) carborundum

AP EAMCET-2008

Ans. (d) : Orthosilicic acid (H_4SiO_4), on heating at high temperature, loses two water molecules and gives silica (SiO_2) which on reduction with carbon gives carborundum (SiC) and CO.

$$H_4SiO_4 \xrightarrow[-2H_2O]{1000°C} SiO_2 \xrightarrow[\Delta]{C} \underset{\substack{\text{Carborundum} \\ \text{'B'}}}{SiC} + CO$$

704. Which of the following substances consists of only one element

(a) Marble (b) Sand
(c) Diamond (d) Glass

MPPET- 2009

Ans. (c) : Diamond is an allotrope of carbon.
Diamond is a substance consists of only one element.
It is a hard, beautiful crystalline substance.

- Glass is mainly composed of silica and sodium carbonate.
- Marble is mainly composed of calcium carbonate.
- Sand is composed of silica dioxide.

705. Which of the following statements is correct ?

(a) Silicon doped with boron is an n-type semiconductor
(b) Silicon doped with arsenic is a p-type semiconductor
(c) Metals are good conductors of electricity
(d) Electrical conductivity of semiconductors decreases with increasing temperature

AP EAMCET Engg. -2007

Ans. (c): Metals are good conductor of electricity due to the presence of free electrons. Silicon doped with boron is an p-type semi conductor.

- Silicon doped with arsenic is a n-type semi conductor.
- Electrical conductivity of semi conductors increases with increase in temperature.

706. Carbon and germanium belong to the 14th group. The maximum co-ordination number of carbon is less than germanium, because of _____

(a) Larger size of germanium
(b) Electronegativity difference
(c) Availability of low-lying d-orbitals in germanium
(d) Electrical conductivity

AP EAPCET 23-08-2021 Shift-I

Ans. (c) : Carbon (C) and Germanium (Ge) belong to the 14th group. Carbon is in 2nd period and no d-orbital include. Germanium (Ge) is in 4th period and will have d-orbital. So, the maximum coordination number of carbon is less than germanium because of availability of low-lying d-orbitals in germanium.

707. An inorganic compound (A) made of two most occurring elements in the earth's crust and used in building construction when made to react with carbon, forms a poisonous gas(B) which is most stable diatomic molecule. Compound (A) and (B) are

(a) SiO_2 , CO_2 (b) SiO_2 , CO
(c) SiO_2 , N_2 (d) CaO , CO_2

AP-EAMCET-25-08-2021 Shift-I

Ans. (b) : When silica react with carbon forms the poisoneous gas CO. The reaction is as given below-

$$\underset{\text{'A'}}{SiO_2} + 2C \rightarrow Si + \underset{\substack{\text{'B'} \\ \text{(poisoneous gas} \\ \text{most stable)}}}{2CO}$$

708. Among the following options the element with the highest density and lowest boiling point is

(a) C (b) Sn
(c) Pb (d) Ge

TS-EAMCET (Engg.), 07.08.2021 Shift-II

Ans. (c) :

Element	Density(g/*l*)	Boiling point(°C)
C	2.26	4827
Sn	7.31	2602
Pb	11.35	1749
Ge	5.323	2833

Hence, lead (Pb) has highest value of density and lowest value of boiling point.

@apna_pdf

5. Allotropes of Carbon

709. Choose the correct statement:

(a) Both diamond and graphite are used as dry libricants

(b) Diamond and graphite have two dimensional network

(c) Diamond is covalent and graphite is ionic

(d) Diamond is sp^3 hybridised and graphite is sp^2 hybridized.

NEET-17.07.2022

Ans. (d) : The allotrope of carbon is diamond and graphite. In diamond each carbon is bonded with four other carbon atom. So, hybridisation of carbon atom is sp^3. In graphite each carbon is bonded with three other carbon atom. So, hybridisation of carbon atom is sp^2.

710. Which one of the following compounds of Group-14 elements is not known?

(a) $[GeCl_6]^{2-}$ (b) $[Sn(OH)_6]^{2-}$

(c) $[SiCl_6]^{2-}$ (d) $[SiF_6]^{2-}$

(JEE Main 2021, 25 July Shift-I)

Ans. (c) Due to inter-electron repulsions between chlorine atoms the compound $(SiCl_6)^{2-}$ is not known.

711. The incorrect statement regarding the structure of C_{60} is

(a) The six-membered rings are fused to both six and five-membered rings

(b) Each carbon atom forms three sigma bonds

(c) The five-membered rings are fused only to six-membered rings

(d) It contains 12 six-membered rings and 24 five-membered rings

(JEE Main 2021, 16 March Shift-II)

Ans. (d) : It contains 12 six-membered rings and 24 five-membered rings.

The C_{60} actually contains 12 five-membered rings and 20 six membered rings.

712. Water does not produce CO on reacting with

(a) CH_4 (b) C

(c) CO_2 (d) C_3H_8

(JEE Main 2021, 25 Feb Shift-II)

Ans. (c) : $CO_2 + H_2O \rightarrow H_2CO_3$

$C + H_2O(\text{Steam}) \rightarrow CO + H_2$

$CH_4 + H_2O \rightarrow CO + 3H_2$

$C_3H_8 + H_2O \rightarrow 3CO + H_2$

Thus, CO_2 does not produce CO, but it produces carbonic acid.

713. 'X' melts at low temperature and is a bad conductor of electricity in both liquid and solid state. X is

(a) carbon tetrachloride (b) silicon carbide

(c) mercury (d) zinc sulphide

(JEE Main 2020, 9 Jan Shift-II)

Ans. (a) : The melting point of carbon tetrachloride is –22.92°C

The dipole moment of carbon is zero hence it is a non-polar compounds. As there is no charge separation in the molecule, therefore this compound is a very bad conductor of electricity in solid as well as in liquid state.

Carbon tetrachloride, a colourless, dense, highly toxic, volatile, nonflammable liquid possessing a characteristic odour and belonging to the family of organic halogen compound, used principally in the manufacture of dichlorodifluromethane (a refrigerant and propellant).

714. Which one of the following statements about diamond and graphite is not correct?

(a) Diamond has a tetrahedral structure, whereas graphite has a hexagonal planar structure.

(b) Both physical and chemical properties of diamond and graphite are different.

(c) Graphite is soft but diamond is hard.

(d) Graphite is a good conductor of electricity while diamond is not.

NDA (II)-2019

Ans : (b) Since they both made of carbon their chemical properties are similar. But the most physical properties like hardness, conductivity of heat/electricity etc. are different. Graphite has a layered structure while diamond has a crystalline structure.

715. The hydride that is not electron deficient is

(a) AlH_3 (b) B_2H_6

(c) SiH_4 (d) GaH_3

(JEE Main 2019, 11 Jan Shift-II)

Ans. (c) : To know about electron deficient we have to determine the octet or duplet of each atom in the molecule. If the octet and duplet of each of the atoms in the molecule is complete them it is not electron deficient.

Silicon has 4 electrons in its valence shells and requires 4 electrons to complete its octet and here it forms a bond with 4 hydrogen SiH_4 is an electron precise molecule not electron deficient.

716. The difference in activity

$Me_3CCH_2COOH > Me_3SiCH_2COOH$

Can be attributed to the fact that

(a) Silicon is more electropositive than carbon and therefore has an electron donating inductive effect

(b) Silicon is a non-metal

(c) carbon is more electropositive than silicon and has an electron donating inductive effect

(d) carbon is a non-metal.

J & K CET-(2001)

Ans. (a) : Silicon is more electropositive than carbon and therefore has an electron donating inductive effect Me_3CCH_2COOH is more acidic than Me_3SiCH_2COOH.

717. The electronic configuration of chalcogens is

(a) $ns^2\ np^2$ (b) $ns^2\ np^3$

(c) $ns^2\ np^4$ (d) $ns^2\ np^1$

J & K CET-(2000)

Ans. (c) : The chalcogens are the elements that belongs to group 16 of the modern periodic table (or the oxygen family). The chalcogens consists of 5 elements-oxygen, sulphur, selenium, tellurium and polonium. The general electronic configuration of the chalcogens can be written as '$ns^2\ np^4$', when 'n' denotes the value of the principal quantum number corresponding to the valence shell of the element.

@apna_pdf

718. Which of the following is used for making optical instruments?

(a) SiO_2 (b) Si
(c) SiH_4 (d) SiC

JCECE - 2009

Ans. (a):
Silica is an important ingredient which is widely used for making optical instruments. A clear, strong glass is produced when pure silica is fused at a high temperature. Thus, amorphous silicon dioxide (SiO_2) is used in making optical instruments.

719. Among the following substituted silanes the one which will give rise to cross linked silicone polymer on hydrolysis is

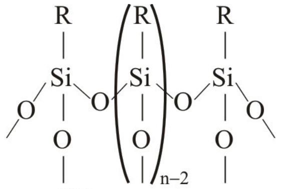
(a) R_3SiCl (b) R_3SiCl_2
(c) R_4Si (d) $RSiCl_3$

JCECE - 2017

Ans. (d): Preparation of silicone takes place as

$$RSiCl_3 + 3H_2O \longrightarrow RSi(OH)_3 + 3HCl$$

$$nRSi(OH)_3 \xrightarrow{(n-1)H_2O}$$



Silicone

720. The catenation tendency of C, Si and Ge is in the order Ge < Si < C. The bond energies [in kJ mol^{-1}]of C–C, Si–Si and Ge–Ge bonds, respectively are

(a) 348, 167, 180 (b) 348, 180, 167
(c) 167, 180, 348 (d) 180, 167, 348

JIPMER-2015

Ans. (b) : 348, 180, 167
The catenation tendency is depends on bonds energies, more will be the catenation tendency more will be the bond energy. Carbon has highest bond energy hence highest catenation tendency.

$$C-C > Si-Si > Ge-Ge$$
$$348 > 180 > 167 \text{ kJ/mol}$$

721. Which of the following sets has Lewis acid behaviour for all the components?

(a) BF_3 (b) BF_3, SiF_4, PF_5
(c) SiF_4, PF_5 (d) BF_3, PF_5
(e) (a) and (b)

Kerala-CEE-2019

Ans. (e) : BF_3, SiF_4, PF_5 sets has Lewis acid behavior for all the components. In Lewis concept many acids do not have proton. These species are electron deficient that readity react with base by accepting its Ione-pair of electron.

$$\underset{\substack{\text{Lewis acid}\\\text{(electron accepter)}}}{A^+} + \underset{\substack{\text{Lewis acid}\\\text{(electron donor)}}}{B^-} \longrightarrow \underset{\substack{\text{Co-ordinate}\\\text{covalent bond}}}{A-B}$$

722. The energy gap is much more in silicon than in germanium because

(a) It has less number of electrons
(b) It has high atomic mass number
(c) Its crystal has much stronger bonds called ionic bonds
(d) It valence electrons are more tightly bound to their parent nuclii
(e) Its valence electrons are more loosely bound to their parent nuclii

Kerala-CEE-2019

Ans. (d) : Its valence electrons are more tightly bound to their parent the electrons in the silicon atoms are more tightly bound to the nucleus than the electrons of the germanium atom due to its small size. Hence, the bond gap of silicon is more than that of germanium.

723. Which one of the following element is represented as Eka-Silicion in Mendeleev's periodic table?

(a) Gallium (b) Germanium
(c) Aluminium (d) Tin
(e) Arsenic

Kerala-CEE-2020

Ans. (b) : The element Eka-Silicon in Mendeleev's periodic table is known as Germanium.
Germanium (Ge) is a chemical element places between silicon and tin in Group of the periodic table.

- Germanium has a diamond-like structure and its properties are very similar to the physical and chemical properties of silicon.

724. The number of six membered and five membered rings in Buckminster Fullerene respectively is

(a) 20, 12 (b) 12, 20
(c) 14, 18 (d) 14, 11

Kerala-CEE-29.08.2021
Karnataka CET-2021

Ans. (a) : Buckminster fullerene is an allotrope of carbon. It has a shape of soccer ball. It is made up of twenty hexagons and twelve pentagons and has an age like fuse with six ring structure of C_{60}.

725. More than four bonds are made by how many elements in carbon family?

(a) 1 (b) 2
(c) 3 (d) 4
(e) 5

Kerala-CEE-2018

Ans. (e) In carbon family except carbon all other forms more than four bonds due to presence of d-orbitals. Si, Ge, Sn, Pb, Fl.
C- does not form more than four bonds due to absence of d-orbitals.

726. A molecule of stachyose contains how many carbon atoms?

(a) 6 (b) 12
(c) 18 (d) 24

MHT CET-2017

Ans. (d) : Stachyose has 24 carbon atoms having chemical formula $C_{24}H_{42}O_{21}$.

727. What is the chief constituent of pyrex glass?

(a) B_2O_3 (b) SiO_2
(c) Al_2O_3 (d) Na_2O

MHT CET-2017

@apna_pdf

Ans. (b) Pyrex glass is obtained by fusing together 60 to 80% SiO_2, 10 to 25% B_2O_3 and remaining Al_2O_3.
Pyrex is a very important material for a many number of applications that require heat and chemical resistance.
SiO_2 is the chief constituent of Pyrex glass.

728. What is the hybridisation of carbon atoms in fullerene?

(a) sp^3 (b) sp
(c) sp^2 (d) dsp^3

JIPMER-2018, MHT CET-2017

Ans. (c) : sp^2 - hybridisation
In fullerene, Carbon atom is sp^2-hybridised like to graphite.

729. The common basic structural unit in silicates and silica is

(a) $Si_2O_6^{4-}$ (b) SiO_3^{2-}
(c) SiO_4^{4-} (d) $Si_2O_7^{6-}$

MHT CET-2011

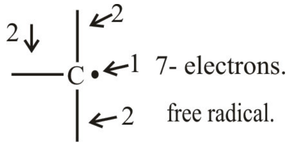
Ans. (c) : The common basic structural unit in silicates and silica is SiO_4^{4-}.
Silica (SiO_2) and silicates contain a common structural unit $(SiO_4)^{4-}$ in which each Si is surrounded tetrahedrally by four oxygen atoms.

730. The central carbon atom of a free radical contains

(a) 6 electrons (b) 7 electrons
(c) 8 electrons (d) 10 electrons

MHT CET-2011

Ans. (b) : Free radicals are obtained by homalytic bond fission hence central carbon atom of free radical contains 7 electrons.



731. Which of the following does not contain silicon?

(a) Kaoline (b) Agate
(c) Ruby (d) Quartz

MHT CET-2007

Ans. (c) :

Kaoline	$Al_2Si_2O_5(OH)_4$
Agate	SiO_2
Ruby	Al_2O_3
Quartz	SiO_2

732. Monosilane on coming in contact with air burns with a luminous flame producing vortex rings. These rings are of

(a) SiO_2 (b) SiO
(c) Si (d) H_2SiO_3

MHT CET-2007

Ans. (a) Monosilane (eg. SiH_4) on coming in contact with air burns with luminous flame producing vortex ring. These rings are of silica.

$$\underset{\text{Monosilone}}{SiH_4} + 3O_2 \rightarrow \underset{\text{Vortex ring.}}{SiO_2} + 2H_2O$$

733. Identify the correct statements from the following:

(A) $CO_{2(g)}$ is used as refrigerant for ice-cream and frozen food.

(B) The structure of C_{60} contains twelve six carbon rings and twenty five carbon rings.

(C) ZSM-5, a type of zeolite, is used to convert alcohols into gasoline

(D) CO is colourless and odourless gas

(a) (A), (B) and (C) only (b) (A) and (C) only
(c) (B) and (C) only (d) (C) and (D) only

NEET-2020

Ans. (d)
(a) $CO_2(g)$ used as refrigerant for ice-cream and frozen food because of its sublimation properties. (Wrong).
(b) The structure of C_{60} contains twelve five-carbon rings and twenty six carbon rings. (Wrong)
(c) ZSM-5 a type of Zeolite, is use to convert alcohol in to gasoline. (Correct)
(d) CO is a colorless and odorless gas. (Correct).
∴ hence statements (c) and (d) are correct.

734. Which of the following compounds is used in cosmetic surgery?

(a) Silica (b) Silicates
(c) Silicones (d) Zeolites

Odisha NEET-2019

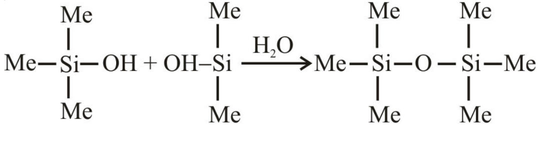
Ans. (c) : Silicones are used in cosmetic surgery to increase water resistance.
Silicones persist indefinitely as substitutes for bone, cartilage and soft tissue of all shapes and sizes.

735. Which of these is not a monomer for a high molecular mass silicone polymer?

(a) Me_3SiCl (b) $PhSiCl_3$
(c) $MeSiCl_3$ (d) Me_2SiCl_2

NEET-2013

Ans. (a) : Me_3SiCl is not a monomer for a high molecular mass. Silicon polymer because it generate Me_3SiOH when subjected to hydrolysis which contains only one reaction site



$$Me_3Si{-}OH + OH{-}SiMe_3 \xrightarrow{H_2O} Me_3Si{-}O{-}SiMe_3$$

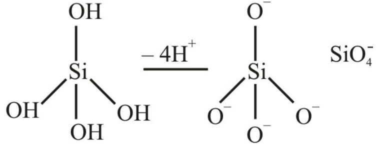
Final product

736. The basic structural unit of silicates is

(a) SiO_3^{2-} (b) SiO_4^{2-}
(c) SiO^- (d) SiO_4^{4-}

NEET-2013

Ans. (d) : In a silicate is any member of a family of anions consisting of silicon and oxygen usually with the general formula (SiO^{4-}_4). It is a tetrahedral unit, Si atom is Sp^3-hybridized and forms four covalent bonds with oxygen atoms.



@apna_pdf

737. Which statement is wrong?

(a) Beryl is an example of cyclic silicate.

(b) Mg_2SiO_4 is orthosilicate

(c) Basic structural unit in silicates is the SiO_4 tetrahedron

(d) Feldspars are not aluminosilicates

NEET-Karnataka-2013

Ans. (d) : Magnesium orthos silicate is a chemical compound with the formula Mg_2SiO_4. It is the ortho silicate salt of magnesium. It exists a forsterite in nature.

- Silicate mineral structures is the silicon oxygen tetrahedron (SiO^{4-}_4). It consist of a central silicon atom surrounded by four oxygen atoms in the shape of a tetrahedron.
- Feldspars is a common tectosilicate aluminosilicate mineral made of potassim, sodium and calcium cations surrounded by a negatively charged network of silicon, aluminium and oxygen atoms.

738. Carbon cannot reduce Fe_2O_3 to Fe at a temperature below 983 K because

(a) free energy change for the formation of CO is more negative than that of Fe_2O_3

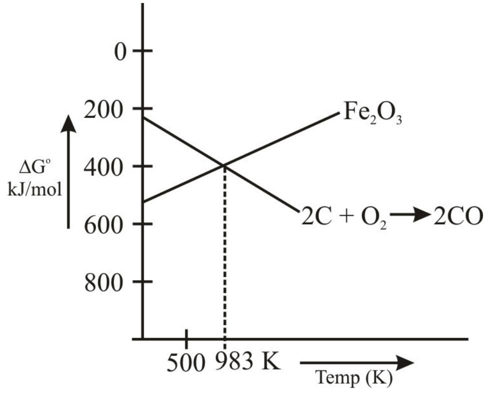
(b) CO is thermodynamically more stable than Fe_2O_3

(c) carbon has higher affinity towards oxygen than iron

(d) iron has higher affinity towards oxygen than carbon

Karnataka-CET-2011

Ans. (d) : carbon connot reduce Fe_2O_3 to Fe at a temperature below 983K because iron has higher affinity towards oxygen than carbon.



Below 983 K, conversion of iron to ferric oxide is more favourable.

739. The Straight chain polymer is formed by

(a) hydrolysis of CH_3SiCl_3 followed by condensation polymerisation

(b) hydrolysis of $(CH_3)_4Si$ by addition polymerisation

(c) hydrolysis of $(CH_3)_2SiCl_2$ followed by condensation polymerisation

(d) hydrolysis of $(CH_3)_3SiCl$ followed by condensation polymerisation

NEET-2009

Ans. (c) : hydrolysis of $(CH_3)_2SiCl_2$ followed by condensation polymerization.

The condensation polymerision of dimethyl dihydroxy silane leads to straight chain polymerisarion.

$(CH_3)_2SiCl_2 \xrightarrow{H_2O} (CH_3)_2Si(OH)_2 \rightarrow [(CH_3)_2SiO]_n$

740. Which of the following anions is present in the chain structure of silicates?

(a) $(Si_2O_5^{2-})_n$ (b) $(SiO_3^{2-})_n$

(c) SiO_4^{4-} (d) $Si_2O_7^{6-}$

NEET-2007

Ans. (b) : Silicate minerals containing chains are termed inosilicates. They consist of single chains $(SiO^{2-}_3)_n$ in which the silicon to oxygen atom ratio is 1:3, and double chains $(Si_4O^{6-}_{11})_n$ in which the silicon to oxygen atom ratio is 4:11.

$[SiO_3^{2-}]_n$ and $[Si_4O_{11}]^{6-}$ have chain structure of silicates.

741. Which one of the following statements about the zeolite is false?

(a) They are used as cation exchanges

(b) They have open structure which enables them to take up small molecules

(c) Zeolites are aluminosilicates having three dimensional network.

(d) Some of the SiO_4^{4-} units are replaced by AlO_4^{5-} and AlO_6^{9-} ions in zeolites

NEET-2004

Ans. (d) :

(a) Zeolites are natural ion exchanger as in permutit water softeners hence it is correct.

(b) Zeolites are like molecular sieves. They trap small molecules such as water. ammonia and CO_2 in their interstices. It is true.

(c) Zeolites are aluminosilicates having three dimensional network. they are termed aluminisilicates because some of the Si^{4+} ions may be replaced by Al^{3+} ions it is ture.

(d) In zeolites some of the Si^{4+} ions may be replaced by Al^{3+}. This results in unbalance anionic charge to main-tain electrical neutrality positive ions must be introduced.

Thus, statement (d) is false.

742. Hydrogen gas is not liberated when the following metal is added to dil HCl

(a) Ag (b) Zn

(c) Mg (d) Sn

Karnataka-CET, 2008

Ans. (a) : Silver (Ag) do not liberates hydrogen from HCl as the silver is less reactive than

Among the given metals only Ag is present below hydrogen in electrochemical series, so it does not evolve hydrogen with dil HCl.

$$Ag + dil\,HCl \longrightarrow No\,reaction$$

743. Which of the following is incorrect statement?

(a) SnF_4 is ionic in nature

(b) PbF_4 is covalent in nature

(c) $SiCl_4$ is easily hydrolysed

(d) GeX_4 (X = F, Cl, Br, I) is more stable than GeX_2.

NEET-2019

@apna_pdf

Ans. (b) : PbF_4 is covalent in nature.
PbF_4 is not covalent as Pb is large in size and F is very small in size hence by Fajan's rule PbF_4 is not covalent.

744. Name the type of the structure of silicate in which one oxygen atom of $[SiO_4]^{4-}$ is shared?
(a) Sheet silicate
(b) Pyrosilicate
(c) Three dimensional silicate
(d) Linear chain silicate.

JIPMER-2014, NEET-2011

Ans. (b) : Silicates are inorganic chain compounds formed by tetrahedral units $[SiO_4]^{4-}$.
In pyrosillicates, linear chain silicates and three dimensional silicates 1, 2 and 4 oxygen of SiO_4^{4-} shared respectively.

745. It is because of inability of ns^2 electrons of the valence shell to participate in bonding that
(a) Sn^{2+} is oxidising while Pb^{4+} is reducing
(b) Sn^{2+} and Pb^{4+} are both oxidising and reducing
(c) Sn^{4+} is reducing while Pb^{4+} is oxidising
(d) Sn^{2+} is reducing while Pb^{4+} is oxidising

NEET-2017

Ans. (d) : Sn^{2+} is reducing while Pb^{4+} is oxidising. Sn^{4+} is more stable than Sn^{2+} while Pb^{2+} is more stable than Pb^{4+} due to inert pair effect hence Sn^{2+} oxidizes to Sn^{4+} acts as reducing agent and Pb^{4+} reduces to Pb^{2+} and acts as oxidising agent.

746. A nuclide of an alkaline earth metal undergoes radioactive decay by emission of three α particles in succession. The group of the resulting daughter element would belong to
(a) Group 14 (b) Group 16
(c) Group 4 (d) Group 6

JIPMER-2007

Ans. (a) Suppose,
Nuclide is $_{12}Mg^{24}$ (∵ Alkaline earth metal)
It undergoes 3 α-particles emission

$$\therefore \quad {}_{12}Mg^{24} \xrightarrow{3\,{}_2He^4} {}_6X^{12}$$

$${}_6X^{12} = {}_6C^{12}$$

∴ It belongs to group 14.

747. Carbon and silicon belong to (IV) group. The maximum coordination number of carbon in commonly occurring compounds is 4, whereas that of silicon is 6. This is due to
(a) availability of low lying d-orbital's in silicon
(b) large size of silicon
(c) more electropositive nature of silicon
(d) both (b) and (c)

NEET-1994

Ans. (a) : Availability of low lying d-orbital's in silicon. Corbon atom has no d-orbits hence does not show coordination number more than 4 while silicon has 6 (six) because it has vacant d–orbital in its valence shell so it can expand its valency using these available vacant d–orbital and form 6 coordination number.

748. The element Z = 114 has been discovered recently. It will belong to which of the following family/group and electronic configuration?
(a) Carbon family, $[Rn]\ 5f^{14}\ 6d^{10}\ 7s^2\ 7p^2$
(b) Oxygen family, $[Rn]\ 5f^{14}\ 6d^{10}\ 7s^2\ 7p^4$
(c) Nitrogen family, $[Rn]\ 5f^{14}\ 6d^{10}\ 7s^2\ 7p^6$
(d) Halogen family, $[Rn]\ 5f^{14}\ 6d^{10}\ 7s^2\ 7p^5$

NEET-2017

Ans. (a) : Carbon family : $[Rn]\ 5f^{14}, 6d^{10}, 7s^2, 7p^2$
Atomic number of Rn = 86
∴ Hence, the element belongs to carbon family and electronic configuration is $[Rn], 5f^{14}, 6d^{10}, 7s^2, 7p^2$ shows correct atomic number (Z) is 114.

749. Which of the following compounds is the hardest material?
(a) Be_2C (b) SiC
(c) B_4C (d) Graphite

Tripura JEE-2022

Ans. (c) : Boron carbide (B_4C) is the hardest material after diamond and cubic boron nitride.

750. Carbon atom consists of electrons, protons and neutrons. If the mass attributed to neutron were halved and that attributed to the electron were doubled, the atomic mass of $_6C^{12}$ would be approximately
(a) same (b) doubled
(c) halved (d) reduced by 25%

UP CPMT-2013

Ans. (d) : (i) There is no change by doubling mass on electrons, because there are only 6-electrons in carbon atom which have negligible mass (6/1837 of the mass of a proton).
(ii) However, by reducing mass of neutron half, total atomic mass becomes 6 (protons) +3 (neutrons) instead 6 (protons) +6 (neutrons).
Thus, the new atomic mass of $_6C^{12}$ would be

$$\frac{3}{12} \times 100 = 25\%$$

Thus, the atomic mass of $_6C^{12}$ is reduced by 25%.

751. Ge (II) compounds are powerful reducing agents where as Pb (IV) compounds are strong oxidants. It can be due to
(a) Pb is more electropositive than Ge
(b) ionisation potential of lead is less than of Ge
(c) ionic radii of Pb^{2-} and Pb^{++} are larger than those of Ge^{2+} and Ge^{4+}
(d) more pronounced inert pair effect in lead than Ge

UP CPMT-2011

Ans. (d) : Inert pair effect is more pronounced in heavier members like Pb. Hence, Pb (IV) compounds act as strong oxidising agents and are reduced to more stable Pb(II) compounds.

752. Darking of surfaces painted with white lead is due to
(a) H_2S (b) CO_2
(c) Cu (d) O_2

UP CPMT-2009

Ans. (a): White lead reacts with H_2S of the atmosphere and forms lead sulphide (PbS) which is black in colour. Due to this reason, the surface painted with white lead becomes dark after sometime.

@apna_pdf

753. Ordinary glass is formed by mixing of

(a) $Na_2CO_3 + CaCO_3$

(b) $Na_2CO_3 + CaCO_3 + \text{silica}$

(c) silica + Na_2CO_3

(d) silica + borax

UP CPMT-2009

Ans. (b): On the heating of sodium carbonate (Na_2CO_3), calcium carbonate ($CaCO_3$) and silica (SiO_2) at the 1700K forms ordinary glass or soda glass.

Reaction given below:

$$Na_2CO_3 + SiO_2 + CaCO_3 \xrightarrow{1700\,K} \underset{\text{ordinary glass}}{Na_2SiO_3CaSiO_34SiO_2} + CO_2$$

754. SiO_2 is reacted with sodium carbonate. What is the gas liberated?

(a) CO (b) O_2

(c) CO_2 (d) O_3

UP CPMT-2008

Ans. (c): When silica is heated with metal carbonate, it form silicates.

$SiO_2 + Na_2CO_3 \xrightarrow{\Delta} Na_2SiO_3 + CO_2 \uparrow$

755. White lead is

(a) Pb_3O_4

(b) PbO

(c) $2PbCO_3Pb(OH)_2$

(d) $Pb(CH_3COO)_2\,Pb(OH)_2$

UPTU/UPSEE-2008

UP CPMT-2007

Ans. (c) : White lead is $2PbCO_3Pb(OH)_2$. It is also known as basic lead carbonate.

Note:– White lead is useful for the manufacturing of white paints.

756. The oxidation number of carbon in CH_2O is

(a) -2 (b) +2

(c) 0 (d) +4

UP CPMT-2004

Ans. (c) : The sum of oxidation states of all atoms in a molecule is zero.

Let the oxidation number of carbon be 'x'.

CH_2O

or $x + (2 \times 1) + (-2) = 0$

or $x + 2 - 2 = 0$

$\therefore$ $x = 0$

757. The purest form of coal is

(a) Peat (b) Anthracite

(c) Bituminous (d) Lignite

UP CPMT-2003

Ans. (b) : Anthracite is the purest form of coal because it has highest percentage of carbon in it. Anthracite contains in between 92.1 to 98% in a coal.

758. Sindoor is represented by

(a) $Pb(NO_3)_2$ (b) $PbCO_3 \cdot Pb(OH)_2$

(c) $Pb(OH)_2 \cdot 4PbCO_3$ (d) Pb_3O_4

UP CPMT-2002

Ans. (d) : $Pb(NO_3)_2$ – Lead Nitrate

$PbCO_3.Pb(OH)_2$ – Basic lead carbonate

Pb_3O_4 – Sindoor (poisonous)

Sindoor is a red powder. Chemically red lead is lead tetroxide. Pb_3O_4 or $2PbO.PbO_2$.

759. Reducing power of Ge^{+2}, Sn^{+2} and Pb^{2+} decrease in the order

(a) $Ge^{+2} > Sn^{+2} > Pb^{+2}$ (b) $Sn^{+2} > Ge^{+2} > Pb^{+2}$

(c) $Pb^{+2} > Sn^{+2} > Ge^{+2}$ (d) $Sn^{+2} > Pb^{+2} > Ge^{+2}$

UP CPMT-2001

Ans. (a) : If the oxidation state of the elements is same, then the reducing power of elements decreases with increase in stability of cation.

The stability of +2 oxidation state of elements of group 14 increase down the group due to inert pair effect.

$\therefore$ $Pb^{2+} > Sn^{2+} > Ge^{2+}$

(reducing order of stability)

$\therefore$ $Ge^{2+} > Sn^{2+} > Pb^{2+}$

(decreasing order of reducing character)

760. When an iron object is plated with tin, tin does not act as sacrificial anode in protecting against corrosion, because

(a) tin is more reactive than iron

(b) tin is less reactive than iron

(c) reactivity of tin and iron is same

(d) tin is oxidizing agent while iron is not so

JIPMER-2016

Ans. (b) : Tin is less reactive than iron.

As we know, tin is less reactive than iron so when we placed iron object with tin, it does not act as sacrificial anode in protecting against corrosion.

761. Pb reacts with dilute HNO_3 produces:

(a) NO (b) NH_4NO_3

(c) N_2O_5 (d) NO_2

UPTU/UPSEE-2006

Ans. (a) : Pb reacts with dilute HNO_3 produces NO gas.

$Pb + (\text{dil})\ HNO_3 \rightarrow Pb(NO_3)_2 + NO + H_2O$

762. The elements commonly used for making transistors are:

(a) C and Si (b) Ga and In

(c) P and As (d) Si and Ge

UPTU/UPSEE-2006

Ans. (d) : Transistors are semiconductor devices hence Si and Ge are used for making them.

763. Red lead is

(a) PbO (b) Pb_3O_4

(c) PbO_2 (d) Pb_4O_3

UPTU/UPSEE-2015

Ans. (b) : Red lead pigment prepared by heating PbO in revolving furnace with excess of air about 450°C

$$6PbO + O_2 \xrightarrow{450\,^{\circ}C} 2Pb_3O_4\ (\text{Red lead})$$

764. Silicon doped with gallium forms

(a) n-type semiconductor

(b) both n and p-type semiconductor

(c) an intrinsic semiconductor

(d) p-type semiconductor

Karnataka-CET-2020

@apna_pdf

Ans. (d) : p-type semiconductor semi-trivalent impurity makes the conductor p-type and pentavalent impurity makes the semi-conductor n-type, since Ga is trivalent hence makes Si p-type semiconductor when doped in Si-crystal.

765. Which of the following statements is not correct?
(a) Silicon is extensively used as a semiconductor
(b) Carborundum is SiC
(c) Silicon occurs in free state in nature
(d) Mica contains the element silicon

WB-JEE-2009

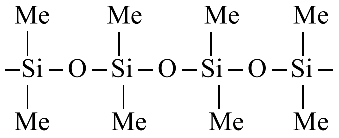
Ans. (c) : Silicon does not occurs in free state in nature. Silicons occurs in nature either form of silica or silicates. So, Option (c) is not correct.

766. Silicon oil is obtained from the hydrolysis and polymerisation of
(a) trimethylchlorosilane and dimethyldichlorosilane
(b) trimethylchlorosilane and methyldichlorsilane
(c) methyltrichlorosilane and dimethyldichlorosilane
(d) triethylchlorosilane and dimethyldichlorosilane

WB-JEE-2013

Ans. (a) : Trimethylchlorosilane and dimethyldichlorosilane.
Silicon oil is a polymer of trimethylchlorosilane and dimethylchlorisilane. It is used as broad-spectrum antifoaming agents.

$Si(Me_3)Cl + Si(Me)_2\,Cl_2 \xrightarrow{H2O, polymerisation}$



$$-\underset{Me}{\overset{Me}{Si}}-O-\underset{Me}{\overset{Me}{Si}}-O-\underset{Me}{\overset{Me}{Si}}-O-\underset{Me}{\overset{Me}{Si}}-$$

767. The main reason that $SiCl_4$ is easily hydrolysed as compared to CCl_4 is that
(a) Si–Cl bond is weaker than C – Cl bond
(b) $SiCl_4$ can form hydrogen bonds
(c) $SiCl_4$ is covalent
(d) Si can extend its coordination number beyond four

WB-JEE-2018

Ans. (d) : Si can extend it coordination number beyond four and $SiCl_4$ is easily hydrolyzed.
Due to presence of d-orbitals Si can extend where as carbon has no d-orbitals hence do not hydrolysed.

768. Which of the following statements is not correct?
(a) In CO_2 molecule, carbon hybridisation is sp
(b) Fullerenes are made by heating graphite in an electric arc in the presence of argon gas
(c) Both $[SiF_6]^{2-}$ and $[SiCl_6]^{2-}$ ions are known
(d) In CO molecule, there are one 'sigma' (σ) and tow "pi" (π) bonds.

AP EAMCET-2017

Ans. (c) : SiF_6^{2-} is known, as F has small size and thus, the ion is quite stable unlike $SiCl_6^{2-}$ in which size of Cl atom is large which is stabilize it

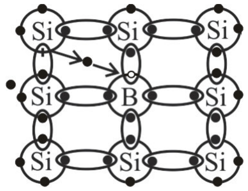
769. Which one of the following elements, when present as an impurity in silicon makes it a p-type semiconductor?
(a) As (b) P
(c) In (d) Sb

AP EAMCET (Engg.) - 2012

Ans. (c) : When a trivalent impurity is added to an intrinsic or pure semiconductor, Then it is said to be an p–semiconductor

13 Group Elements

⇒ Indium (In) has 3 valency, and when it is used in doping in silicon crystal then there is hole formation and p-type of semiconductor is formed.



770. The INCORRECT statement regarding the structure of C_{60} is:
(a) It contains 12 six-membered rings and 24 five-membered rings.
(b) The six-membered rings are fused to both six and five-membered rings.
(c) The five-membered rings are fused only to six-membered rings.
(d) Each carbon atom forms three sigma bonds.

JEE Main 16.03.2021, Shift-II

Ans. (a) : The structure of C_{60} contains the 20 hexagons and 12 pentagons, Both rings attached to each other and making the three sigma bond, Buckminster fullerene is a type of fullerene with the formula C_{60}.

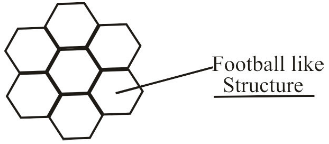
771. Fullerene with formula C_{60} has a structure where every carbon atom is
(a) sp-hybridized (b) sp^2-hybridized
(c) sp^3-hybridized (d) not hybridized.

COMEDK-2014

Ans. (b) : In fullerene with formula C_{60}, all the carbon atoms are equal and they undergo sp^2 hybridization.

Fullerene –

(1) Allotrope of carbon
(2) Its structure similar to graphite
(3) Good conductor of electricity
(4) Partial closed mesh structure
(5) C_{60} , C_{70}
(6) sp^2 hybridization



772. Which statement is wrong?
(a) Beryl is an example of cyclic silicate.
(b) Mg_2SiO_4 is orthosilicat.

@apna_pdf

(c) Basic structural unit in silicates is the SiO_4 tetrahedron.
(d) Feldspars are not aluminosilicates.

Karnataka NEET 2013

Ans. (d) : Feldspars, any of a group of aluminosilicate minerals that contains calcium, sodium or potassium feldspars make up more than half of earth is crust and professional literature about them constitutes a large percentage of the literature of mineralogy.

773. Assertion: Diamond is a bad conductor.
Reason: Graphite is a good conductor.
(a) If both Assertion and Reason are correct and Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

(AIIMS-2002)

Ans. (b) : (1) Diamond is a bad conductor of electricity but good conductor of heat, electricity is conducted in a crystal by electrons that are relatively free but in diamond each carbon atom is covalently bonded with four other carbon atoms and there are no free electrons.

(2) Due to the free electrons in graphite framework, graphite can perform electricity. Therefore graphite is said to be a good conductor electricity.

774. Thermodynamically, the most stable form of carbon is

(a) Diamond	(b) Graphite
(c) Fullerenes	(d) Coal

(AIIMS-2009)

Ans. (b): The most stable form of carbon is graphite.
Graphite contains one delocalized electron per carbon these cause greater attraction between carbon atom hence giving stronger bonds, more stability to the structure.

775. In diamond crystal, each carbon atom is linked with carbon atoms. The number of carbon atoms linked is:

(a) 2	(b) 4
(c) 3	(d) 1

(AIIMS-2001)

Ans. (b): In the diamond crystal, each atom is bounded with four other carbon atoms by strong covalent bond. The central carbon atoms are at the four vertices of a regular tetrahedron. The other carbon atoms are in turn tetrahedrally bonded to four atom each. Each carbon atoms is an sp^3–hybridised state so each is linked with four other carbons by σ-bond.

776. Buckminster fullerene contains
(a) 12 six membered rings and 6 five membered rings
(b) 20 six membered rings and 12 five membered rings
(c) 12 six membered rings and 20 five membered rings
(d) 5 six membered rings and 12 five membered rings

Assam CEE-2019

Ans. (c) : A Buckminister fullerene C_{60} contains 20 five member rings and 12 six member rings is a six-member ring is fused with six or five member rings whereas a five member ring can only fuse with six member rings.

(1) It is third form of carbon known as fullerence was discovered by H.W. Kroto e smelly and R.F. curl in 1985

(2) C_{60} molecule has shape like a soccer ball and is called Buckminister fullerence

This ball shaped molecule has 60 vertices and each one is occupied by one carbon atom.

777. Buckminster- fullerene is a variety of

(a) boron	(b) carbon
(c) ammonia	(d) fluorine

CG PET -2009

Ans. (b) : Buckminister fullerence is an allotropic form of carbon with formula C_{60}. It is a spherical molecule. It has a shape of soccer ball. There are sixty equidistant spaces on the sphere that are occupied by C-atoms. Each C-atom of fullerene is sp^2- hybridised.

778. Which one of the following is a good conductor of electricity?

(a) Diamond	(b) Graphite
(c) Silicon	(d) amorphous carbon

CG PET -2006

Ans. (b) : Good conductor are material that allow an electric current to pass through them example- metals like copper, silver etc are good conductors. Graphite is also a good conductor of electricity they are used for making conducting wires

⇒ Poor conductors are minerals that do not allow an electric current to pass through them

Example – wood, diamond, plastic, pure water etc.

779. Which is the most thermodynamically stable form of carbon?

(a) Carbon black	(b) Graphene
(c) Graphite	(d) Diamond

CG PET -2017

Ans. (c) : Graphite is thermodynamically the most stable form of carbon. Graphite has delocalized π–electrons over the entire sheet. This delocalization lowers the energy of the system, leading to greater thermodynamic stability.

780. Which of the following order of acidic strength is correct?
(a) $HClO > HClO_2 > HClO_3 > HClO_4$
(b) $HClO_4 > HClO_2 > HClO_3 > HClO$
(c) $HClO_2 > HClO > HClO_4 > HClO_3$
(d) $HClO_4 > HClO_3 > HClO_2 > HClO$

GUJCET-2019

Ans. (d) : As electronegativity of the halogen groups decreases, the order of acidic strength also decreases,
Thus the acidic strength follows the order-
$HClO_4 > HClO_3 > HClO_2 > HClO$

@apna_pdf

781. **The C–C bond length is maximum in**

(a) graphite (b) C_{70}
(c) C_{60} (d) diamond

(JEE Main-2019, 12 April Shift-II)

Ans. (d) : Carbon – carbon bond length is maximum in diamond having value 154 pm, because the diamond has a purely single bond. Here each carbon atoms undergoes sp^3 hybridisation.

Carbon allotrope	**C-C bond length**
Diamond	154 pm
Graphite	141.5 pm
C_{60}	138.3 pm and 143.5 pm
C_{70}	Eight type of bond lengths from 0.137 pm to 0.146 pm

782. **The number of pentagons in C_{60} and trigons (triangles) in white phosphorus, respectively, are**

(a) 20 and 3 (b) 12 and 4
(c) 20 and 4 (d) 12 and 3

(JEE Main-2019, 10 April Shift-II)

Ans. (b) : C_{60} is a molecule that consists of 60 carbon atom, arranged as 12 pentagons and 20 hexagons. The shape is the same as that of a soccer ball.

Total no. of pentagons in C_{60} =12

Total no. of trigons (Triangles) in white Phosphorous (P_4) = 4

783. **C_{60} an allotrope of carbon contains**

(a) 16 hexagons and 16 pentagons
(b) 20 hexagons and 12 pentagons
(c) 12 hexagons and 20 pentagons
(d) 18 hexagons and 14 pentagons

(JEE Main-2019, 9 April Shift-I)

Ans. (b) : C_{60} particle has gloriously symmetrical structure. It is an intertwined ring of aromatic framework containing 20 hexagons and 12 pentagons of sp^2 hybridized C atoms.

- It is a fullerene having a shape look soccer ball and called Buckminster fullerene.

784. **The hardest substance is**

(a) Iron (b) Steel
(c) Diamond (d) Graphite

JIPMER-2005

Ans. (c) : Diamond is the hardest substance

- It is a crystalline carbon and usually nearly colourless
- Diamonds are also chemically resistant and have the highest thermal conductivity of any natural material.

785. **Graphite is soft while diamond is hard because**

(a) graphite is in powder form
(b) diamond has sp^2 hybridisation but graphite has sp^3 hybridisation
(c) graphite is in planar form while diamond is in tetrahedral form
(d) graphite is covalent and diamond is ionic

JIPMER-2005

Ans. (c) : Diamond and graphite both are the allotrope of carbon.

Diamond	**Graphite**
1. Diamond has a crystalline structure	1. Graphite has layered structure
2. Diamond is formed by tetrahedral units in which each carbon atom is sp^3 hybridised	2. Graphite has a planner geometry in which each carbon atom is sp^2 hybridised by forming three sigma σ and one pi π bond
3. Diamond is the hardest naturally occurring substance	3. The graphite is soft and has a greasy touch

786. **Which of the following statement is correct for isotope of carbon?**

(a) graphite is conductor of electricity
(b) diamond have all sp^3 carbon
(c) graphite is more stable thermodynamically than diamond
(d) All are correct

JIPMER-2019

Ans. (d) : (1) Graphite is anisotropic and owing to its in plane metallic bonding it behaves as behaves as brilliant thermal and electrical conductor.

(2) The carbon atoms, here are sp^3 hybridized, and the bond lengths of the carbon-carbon atom are equal.

(3) Graphite is more stable thermodynamically than diamond

All given statement about Diamond and graphite are correct.

787. **Which of the following is not allotrope of carbon?**

(a) Diamond (b) Fullerene
(c) Soot (d) Graphite

JIPMER-2019

Ans. (c) : Diamond, Graphite and fullerene (substances that include nanotubes and buck balls, such buckminster fullerene) are three allotropes of pure carbon.

788. **Hybridised states of carbon in graphite and diamond are respectively**

(a) sp^3, sp^3 (b) sp^3, sp^2
(c) sp^2, sp^2 (d) sp^2, sp^3

Karnataka-CET-2013

Ans. (d) :

(1) The structure of graphite is planer and the carbon atoms are sp^2 hybridized

(2) In diamond, carbon atoms are arranged in a tetrahedral arrangement so, it has a sp^3 hybridization.

789. **Graphite is a soft solid lubricant extremely difficult to melt. The reason for this anomalous behavior in the graphite.**

(a) is an allotropic form of carbon
(b) is a non–crystalline substance
(c) has carbon atoms arranged in large plates of rings of strongly bond carbon atoms with weak interplate bonds
(d) has molecules of variable molecular masses like polymers

Karnataka-CET-2007
UPTU/UPSEE-2007, AIEEE–2003

@apna_pdf

Ans. (c) : Graphite is a two-dimensional sheet like structure and each carbon have sp^2 hybridized. It is a soft solid lubricant extremely difficult to melt. The reason for this anomalous behavior is that graphite has carbon atoms arranged in large plates of rings of strongly bound carbon atoms with weak interplate bonds.

790. The number of six membered and five membered rings in Buckminster Fullerene respectively is

(a) 20, 12	(b) 12, 20
(c) 14, 18	(d) 14, 11

Kerala-CEE-29.08.2021
Karnataka-CET-2021

Ans. (a) : Buckminster fullerene is an allotrope of carbon. It has a shape of soccer ball. It is made up of twenty hexagons and twelve pentagons and has a cage like fused ring structure.

791. Thermodynamically, in which form of carbon is the most stable?

(a) Coal	(b) Fullerenes
(c) Diamond	(d) Graphite

Manipal-2016

Ans. (d) : Thermodynamically, graphite is the most stable form of carbon.
Graphite contains one delocalized electron per carbon these cause greater attraction between carbon atom hence giving stronger bonds, more stability to the structure.

792. Which statement is not correct about fullerene C_{60}?

(a) It contains 20 six membered rings and 12 five membered rings
(b) All carbon atoms undergo sp^2 hybridisation
(c) A six membered ring is fused with six membered rings only
(d) A five membered ring is fused with six membered ring only

MHT CET-2014

Ans. (c) : C_{60} (fullerene) looks like a soccer ball and contains 20 six membered rings and 12 five membered rings of carbon atoms.
⇒ Six membered rings are fused with both six membered as well as five membered rings while five membered rings attached only with six membered rings.

793. Which of the following does not show electrical conduction?

(a) Diamond	(b) Graphite
(c) Potassium	(d) Sodium

NEET-1999

Ans. (a) : Sodium, potassium and graphite all three are electric conductor except diamond which is an insulator of electric current due to the absence of free electron.

794. Percentage of lead in lead pencil is

(a) 80	(b) 20
(c) zero	(d) 70

NEET-1999

Ans. (c) : There is no percentage of lead in lead pencils, or we can say zero percentage of lead. Pencils are nowadays made up of graphite which is an allotrope of carbon.

795. In graphite, electrons are

(a) localised on each C-atom
(b) localised on every third C-atom
(c) spread out between the structure
(d) present in antibonding orbital

NEET-1997, 1993

Ans. (c) : In graphite, each carbon is sp^2 hybridized and the single occupied unhybridized p – orbital's of C – atoms overlap side wise to give π - electron cloud which is delocalized and thus the electrons are spread out between the structure.

796. Which of the following types of forces bind together the carbon atoms in diamond?

(a) Ionic	(b) Covalent
(c) Dipolar	(d) van der Walls

NEET-1992

Ans. (b) : Carbon atoms in diamond are liked each other by covalent bond. In diamond, each carbon atom undergoes sp^3 hybridization and is covalently bounded to four other carbon atoms by single bonds.

797. Which of the following is an insulator?

(a) Graphite	(b) Aluminium
(c) Diamond	(d) Silicon

NEET-1992

Ans. (c) : Diamond is an insulator of electric current due to the absence of free electron. In 4th group elements as we move down the group, Si acts as semiconductor.

798. Graphite is a good conductor of electricity. Its electrical conductivity is due to the fact that

(a) It is an allotrope of carbon
(b) It has C atoms arranged in large plates of rings of strongly bound C atoms
(c) In it C atoms are sp^2 hybridized
(d) It is a non-crystalline substance

UP CPMT-2010

Ans. (c) : In graphite, each carbon atom is sp^2 hybridised. The remaining fourth electron of each carbon atom is free to move. These free electrons make the graphite, good conductor of electricity.

799. Inorganic graphite is

(a) BN	(b) BF_3
(c) B_2H_6	(d) None of these

UP CPMT-2005

Ans. (a) : BN is borazon or boron nitride. It exists two crystallographic modifications. The hexagonal form has a simple layer structure similar to graphite. So, it is called inorganic graphite. The other form is cubic which is very hard and acts as insulator like diamond.

800. Buckminster fullerene is:

(a) pure graphite	(b) C-60
(c) diamond	(d) C-90

UPTU/UPSEE-2006

Ans. (b) : Buck minister fullerene (C_{60}) is a spherical carbon allotrope where 60 atoms are assembled in pentagons and hexagons, in a geometry similar to a soccer ball all the carbon atom are connected by single and double bonds, these are often called Buck balls.

@apna_pdf

6. Nitrogen Family

801. Consider the following reactions:

$PCl_3 + H_2O \rightarrow A + HCl\ ,\ A + H_2O \rightarrow B + HCl$

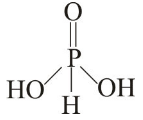
The number of ionisable protons present in the product B is

JEE Main-25.06.2022, Shift-II

Ans. (2) : $PCl_3 + \underset{\text{(Partial Hydrolysis)}}{H_2O} \longrightarrow \underset{A}{P(OH)_2Cl} + HCl$

$P(OH)_2Cl \xrightarrow[\text{Hydrolysic}]{H_2O} \underset{B}{H_3PO_3}$

Phosphorous acid



No of ionizable proton is "2"

802. The number of bridged oxygen atoms present in compound B formed from the following reactions is

$Pb(NO_3)_2 \xrightarrow{673K} A + PbO + O_2\ ,$

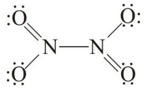
$A \xrightarrow{\text{Dimerise}} B$

(a) 0 (b) 1
(c) 2 (d) 3

JEE Main-25.06.2022, Shift-II

Ans. (a) : $Pb(NO_3)_2 \xrightarrow{673K} \underset{A}{4NO_2} + 2PbO + O_2$

$2NO_2 \xrightarrow{\text{Dimerisation}} \underset{B}{N_2O_4}$



No Bridge Oxygen in N_2O_4
Correction option is (a).

803. $(NH_4)_2Cr_2O_7$ **on heating liberates a gas. The same gas will be obtained by**

(a) Treating H_2O_2 with $NaNO_2$
(b) Treating Mg_3N_2 with H_2O
(c) Heating NH_4NO_3
(d) Heating NH_4NO_2

Karnataka CET-17.06.2022, Shift-II

Ans. (d) : Heating of ammonium dichromate $(NH_4)_2Cr_2O_7$ liberates nitrogen gas (N_2).

$$(NH_4)_2Cr_2O_7 \longrightarrow N_2(g) + Cr_2O_3 + 4H_2O$$

Heating of Ammonium Nitrite (NH_4NO_2) liberates Nitrogen gas (N_2).

$$NH_4NO_2 \longrightarrow N_2(g) + 2H_2O$$

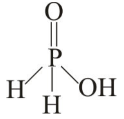
So, Correct option is d "Heating NH_4NO_2"

804. The strong reducing property of hypophosphorus acid is due to

(a) Two P-H bonds
(b) Presence of phosphorus in its highest oxidation state
(c) Its concentration
(d) The positive valency of phosphorus

Karnataka CET-17.06.2022, Shift-II

Ans. (a) : Hypophosphorus acid



H_3PO_2 having strong reducing behaviour. This reducing behaviour is due to the two P-H Bond.
All oxy acid of phosphorus having P-H bond act as strong reducing agent.
So, Correct option is 'a'

805. PCl_5 is well known, but NCl_5 in not. Because,

(a) Nitrogen is less reactive than phosphorous
(b) Nitrogen doesn't have d-orbitals in its valence shell.
(c) Catenation tendency is weaker in nitrogen than phosphorous.
(d) Size of phosphorous is larger than nitrogen

JEE Main-24.06.2022, Shift-II

Ans. (b) : NCl_5 is not known because nitrogen does not have d-orbitals is valence shell and PCl_5 is well known because phosphorous has vacant d-orbital in its valence shell which enable it to expand its octet.

806. Consider the following reaction:

A + alkali → B (Major Product)

If B is an oxoacid of phosphorus with no P-H bond, then A is:

(a) White P_4 (b) Red P_4
(c) P_2O_3 (d) H_3PO_3

JEE Main-26.06.2022, Shift-I

Ans. (b) : $P_4(\text{white}) + \text{Alkali} \longrightarrow H_3PO_4$

807. The highest industrial consumption of molecular hydrogen is to produce compound element:

(a) Carbon (b) Nitrogen
(c) Oxygen (d) Chlorine

JEE Main-24.06.2022, Shift-I

Ans. (b) : Industrial method of preparation of NH_3 is hydrogen combines with nitrogen to produce ammonia in Habers process.

$$N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$$

808. The most stable trihalide of nitrogen is:

(a) NF_3 (b) NCl_3
(c) NBr_3 (d) NI_3

JEE Main-24.06.2022, Shift-I

Ans. (a) : Stability of covalent compound is directly proportional to its bond strength. Stability of covalent compound α bond strength order of stability are -

$NF_3 > NCl_3 > NBr_3 + NI_3$

The stability of trihalides decreases as we move down the group due to weaking of N–X bond strength.

809. Heating white phosphorus with conc. NaOH solution gives mainly:

(a) Na_3P and H_2O
(b) H_3PO and NaH

@apna_pdf

(c) $P(OH)_3$ and NaH_2PO_4
(d) PH_3 and NaH_2PO_2

JEE Main-27.06.2022, Shift-I

Ans. (d) : $P_4(white) + NaOH \rightarrow PH_3 + NaH_2PO_2 + H_2O$
In above reaction on heating white phosphorus with concentrated sodium hydroxide (NaOH) gives phosphine (PH_3) and sodium hypophosphite (NaH_2PO_2)

810. The oxoacid of phosphorus that is easily obtained from a reaction of alkali and white phosphorus and has two P-H bonds, is:
(a) Phosponic acid
(b) Phosphinic acid
(c) Pyrophosphorus acid
(d) Hypophosphoric acid

JEE Main-29.06.2022, Shift-I

Ans. (b) : When alkali react with white phosphorous then phosphinic acid is formed.
White phosphorous + Alkali → H_3PO_2
(Phosphinic acid)

811. Which statement is correct for dinitrogen pentoxide
(a) In the gas phase it decomposes into NO_2, NO and O_2
(b) Solid N_2O_5 is ionic
(c) Covalent in solution and gas phase
(d) Coloured deligueseent solid

CG PET-22.05.2022

Ans. (b) : Solid N_2O_5 is ionic because x-ray diffraction shows that solid N_2O_5 exist as NO_2^+, NO_3^- (nitronium nitrate). The bond between a metal and non-metal are usually ionic.

812. Which one of the following is not used as fertilizer?
(a) Ammonium nitrate
(b) Ammonium sulphide
(c) Ammonium phosphate
(d) Ammonium sulphate

NDA (II)-2018

Ans. (b) : Ammonium sulphide is not used in fertilizer. This is because a fertilizer is used to increase the concentration of Nitrogen, Phosphorus and Potassium.

813. Which one of the following reactions will give NO (nitric oxide) gas as one of the products?
(a) $3Cu + 8HNO_3\ (dilute) \rightarrow$
(b) $Cu + 4HNO_3\ (conc.) \rightarrow$
(c) $4Zn + 10HNO_3\ (dilute) \rightarrow$
(d) $Zn + 4HNO_3\ (conc.) \rightarrow$

NDA (II)-2018

Ans. (a) : In the reaction ,

$$3Cu + 8HNO_3 \rightarrow 3Cu(NO_3)_2 + 2NO\uparrow + 4H_2O$$

Hence, on reaction of $3Cu + 8HNO_3$ will give NO(nitric oxide) while other will give NO_2 (nitrogen dioxide.)

814. Which one of the following is a tribasic acid?
(a) Hydrochloric acid (b) Nitric acid
(c) Sulphuric acid (d) Phosphoric acid

NDA (II)-2018

Ans. (d) Phosphoric acid is a tribasic acid. Phosphoric acid is a colorless solid, it is commonly encountered as on 85% aqueous solution, which is a colorless, odourless solution and non-volatile syrup liquid.

815. The reaction takes place in two steps as

(i) $NO_2Cl(g) \xrightarrow{k_1} NO_2(g) + Cl(g)$

(ii) $NO_2Cl(g) + Cl(g) \xrightarrow{k_2} NO_2(g) + Cl(g)$

Identify the reaction intermediate.
(a) $NO_2Cl(g)$ (b) $NO_2(g)$
(c) $Cl_2(g)$ (d) $Cl(g)$

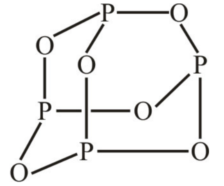
MHT CET-2016

Ans. (d) : The given reaction follows the two step kinetic. Cl(g) is regenerated in the first step and consumed in the second step. Here, Cl(g) is the intermediate in the given reactions.

816. The number of oxygen atoms bonded to one phosphorus atom in P_4O_6 is
(a) 4 (b) 3
(c) 6 (d) 5

AP EAMCET- 2004

Ans. (b) : The structure of P_4O_6 is-



Hence, the three oxygen atom bonded to one phosphorus atom in P_4O_6.

817. Which of the following does not exhibit allotropy?
(a) P (b) Bi
(c) Sb (d) As

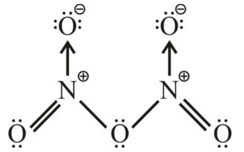
AP-EAMCET (Med.)-1999

Ans. (b) : Bismuth does not exhibit allotropy.
- Phosphorous has exist number of allotrope (i) red, (ii) white, (iii) scarlet phosphorous etc.
- Arsenic exists in three allotropic forms such as grey, yellow and black.
- Similarly, antimony exists in three allotropic form as α-antimony, β-antimony and metallic form.

818. The total number of N-O bonds present in N_2O_5 molecule are:
(a) 4 (b) 5
(c) 6 (d) 7

SCRA 2012

Ans. (c) : The structure of nitrogen pentoxide is:



Hence, the total number of N-O bonds are 6.

819. In Haber's process for the manufacturing of ammonia best yields are obtained under which one of the following conditions?
(a) 250°C to 380°C and 1 atm using a catalyst
(b) 380°C to 450°C and 100 atm using a catalyst
(c) 380°C to 450°C and 200 atm using a catalyst
(d) 200°C to 250°C and 100 atm using a catalyst

SCRA 2012

@apna_pdf

Ans. (c) : On a large scale, ammonia is manufactured by Haber's process. The optimum conditions for the production of ammonia are a pressure of 200 atm and a temperature of 380°C to 450°C and use of a catalyst such as iron oxide.

$$N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$$

820. NH_3 on passing through which one of the following is most significantly absorbed?

(a) P_2O_5	(b) CaO
(c) Na_2O	(d) TiO_2

SCRA 2012

Ans. (a) : P_2O_5 can absorb ammonia but CaO can not absorb ammonia. CaO absorbs only moisture.

$$P_2O_5 + 6NH_3 + 3H_2O \longrightarrow 2(NH_4)_3PO_4$$

821. In the manufacture of ammonia by Haber process high pressure is maintained because

(a) all reactants and product are gases
(b) reaction is exothermic
(c) the moles of the product are less than the moles of reactants
(d) reactions is a reversible reaction

SCRA-2015

Ans. (c): Haber process is used in the manufacturing of ammonia from nitrogen and hydrogen. Ammonia by Haber process high pressure is maintained because the moles of the products are less than that moles of reactants.

$$N_2 + 3H_2 \underset{200\,atm}{\overset{400-450\,^{o}C}{\rightleftharpoons}} 2NH_3$$
$$\text{Fe, catalyst}$$

822. Consider the following statements:
Statement I : Phosphorus - 32 decays to sulphur-32 with emission of a β particle
Statement II : The neutron to proton ratio is less than 1.0 for all light stable nuclides.
Which one of the following is correct in respect of the above statements?

(a) Both the statements are true and statement II is the correct explanation of statement I
(b) Both the statements are true but statement II is not the correct explanation of statement I
(c) Statement I is true, but statement II is false
(d) Statement I is false, but statement II is true

SCRA-2015

Ans. (b): Phosphorous -32 decays to sulphur-32 with emission of a β-particles and the ratio of neutron to proton is nearly 1.5 and whereas for the lighter nuclei is nearly 1.0 .

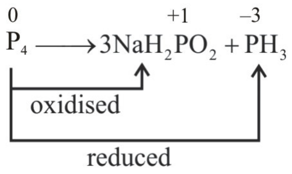
$$^{32}_{15}P \longrightarrow {}^{32}_{16}S + O_{-1}\beta$$

823. Consider the following reaction:
$P_4 + 3NaOH + 3H_2O \rightarrow 3NaH_2PO_2 + PH_3$
In the above reaction,
1. Phosphorus is oxidized.
2. Phosphorus is reduced.
Which of the above is/are correct?

(a) 1 only	(b) 2 only
(c) Both 1 and 2	(d) Neither 1 nor 2

SCRA-2015

Ans. (c): Given the reaction
$P_4 + 3NaOH + 3H_2O \rightarrow 3NaH_2PO_2 + PH_3$
In P_4 oxidation state of P = 0
In NaH_2PO_2 oxidation state of P = 1 + 2 + x – 4 = 0
x = +1
In PH_3 oxidation state of P = x + 3 (+1) = 0
x = –3



824. The boiling point of NH_3 is much higher than that of PH_3 because

(a) NH_3 undergoes umbrella inversion
(b) NH_3 has larger molecular weight
(c) NH_3 forms inter-molecular hydrogen bonds
(d) NH_3 contains ionic bonds whereas PH_3 contains covalent bonds

SCRA-2015

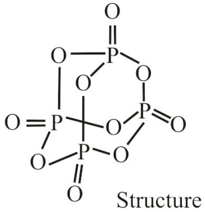
Ans. (c): The boiling point of NH_3 is higher than that of PH_3 because NH_3 has strong intermolecular H bonding between themselves.
whereas in PH_3 there is no hydrogen bonding.

825. Number of sigma bonds in P_4O_{10} is-

(a) 6	(b) 7
(c) 17	(d) 16

BCECE-2018

Ans. (d) : The number of sigma bonds (σ bonds) in P_4O_{10} is 16.



Structure of P_4O_{10}

826. Which of the following oxides of nitrogen is anhydride of HNO_3?

(a) N_2O_3	(b) N_2O_4
(c) N_2O_5	(d) N_2O

AP EAMCET- 1991

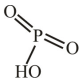
Ans. (c) : $N_2O_5 + H_2O \rightarrow 2HNO_3$
∴ Conc. HNO_3 on distillation with P_2O_5 gives N_2O_5.
Hence, N_2O_5 is the anhydride of nitric acid.

827. Meta- phosphoric acid is represented by

(a) H_3PO_3	(b) H_2PO_3
(c) HPO_3	(d) $H_4P_2O_7$

AP EAMCET- 1994

Ans. (c) : Metaphosphoric acid is HPO_3.



1 + x + 3(–2) = 0
x – 5 = 0
x = +5
Hence, the oxidation state P is +5

@apna_pdf

828. While phosphorus form PCl_5, nitrogen does not form NCl_5 because

(a) Nitrogen is more electronegative than phosphorus
(b) Nitrogen atom is smaller than phosphorus
(c) The ionization energy of nitrogen is greater than that of phosphorus
(d) Unlike Phosphorus, nitrogen has no 'd' orbital in its valence shell

AP EAMCET- 1995

Ans. (d) : The electronic configuration of N and P is –

$_7N = 1s^2, 2s^2, 2p^3$

$_{15}P = 1s^2, 2s^2, 2p^6, 3s^2, 3p^3, 3d^0$

∴ Nitrogen due to absence of d-orbitals does not form NCl_5.

829. Catalyst used in the manufacture of HNO_3 in Ostwald process

(a) Platinum gauze (b) V_2O_5
(c) Fe/Mo (d) MnO_2

JEE Main 07.04.2018

Ans. (a) : Nitric acid is manufactured by the Ostwald process, the catalyst is platinum gauze.

$$4NH = 3 + 5O_2 \xrightarrow[500K,9bar]{Pt/Rh\ gauge.} 4NO + 6H_2O$$

$$2NO + O_2 \rightleftharpoons 2NO_2$$

$$3NO_3(g) + H_2O(l) \xrightarrow[gauze]{Platinum} 2HNO_3(g) + NOC(g)$$

830. Which of the following is correct with respect to the V^{th} group elements?

(a) All the elements exhibit allotropy
(b) Except nitrogen all elements exhibit allotropy
(c) All elements except nitrogen and bismuth exhibit allotropy
(d) All elements except nitrogen and arsenic exhibit allotropy

AP EAMCET- 1995

Ans. (b) : The V^{th} group elements contains the following elements– N, P, As, Sb and Bi. Except nitrogen all elements exhibit allotropy.

831. The oxy acid of phosphorus in which phosphorus has the lowest oxidation state is

(a) Hypophosphorus acid
(b) Orthophosphoric acid
(c) Pyrophosphoric acid
(d) Metaphosphoric acid

AP EAMCET- 1995

Ans. (a) : Hypophosphorus acid has the lowest oxidation state i.e. +1. The chemical formula of the oxyacid is H_3PO_2.

Similarly,

O.S. of orthophosphoric acid (H_3PO_4) = +5
O.S. of pyrophosphoric acid ($H_4P_2O_7$) = +5
O.S. of metaphosphoric acid (HPO_3) = +5

832. Which of the following nitrogen halides is most stable?

(a) NI_3 (b) NBr_3
(c) NCl_3 (d) NF_3

AP EAMCET- 1995

Ans. (d) : NF_3 is stable and highly inert gas at room temperature. It is because fluorine and nitrogen have comparable sizes and electronegativity.

833. The industrial preparation of nitric acid by Ostwald's process involves

(a) Reduction of NH_3 (b) Oxidation of NH_3
(c) Hydrogenation of NH_3 (d) Hydrolysis of NH_3

AP EAMCET- 1999

Ans. (b) : The industrial preparation of nitric acid by Ostwald's process involve is-

$$4NH_3 + 5O_2 \rightarrow 4NO + 6H_2O$$

$$2NO + O_2 \rightarrow 2NO_2$$

$$2NO_2 + H_2O + [O] \rightarrow 2HNO_3$$

Hence, the oxidation of NH_3 take place.

834. What are the products formed when ammonia reacts with excess chlorine?

(a) N_2 and NCl_3 (b) NCl_3 and HCl
(c) N_2 and NH_4Cl (d) N_2 and HCl

AP EAMCET- 2002

Ans. (b) : When ammonia reacts with excess amount of chlorine then nitrogen trichloride is formed.

$$\underset{\text{Ammonia}}{NH_3} + \underset{\text{(excess)}}{3Cl_2} \rightarrow NCl_3 + 3HCl$$

Ammonia reacts with chlorine to create nitrogen gas and hydrogen chloride vapour.

835. PCl_3 on hydrolysis gives:

(a) $HCl + PH_3$ (b) $HCl + H_3PO_4$
(c) $HCl + H_3PO_3$ (d) $HCl + POCl_3$

AP EAMCET (Medical) -1998

Ans. (c): PCl_3 on hydrolysis gives phosphorous acid and hydrochloric acid. The reaction is as follows–

$$PCl_3 + 3H_2O \rightarrow \underset{\substack{\text{Phosphorous}\\ \text{acid}}}{H_3PO_3} + 3HCl$$

836. Which one of the following statements is correct with respect to basic character?

(a) $PH_3 > P(CH_3)_3$ (b) $PH_3 = NH_3$
(c) $PH_3 > NH_3$ (d) $P(CH_3)_3 > PH_3$

AP EAMCET- 2002

Ans. (d) : NH_3 is more basic than PH_3 due to the electronegativity of N atom. Presence of three CH_3 group on P atom increase the election density and make the loss of electron easier i.e. $P(CH_3)_3 > PH_3$

837. One mole of N_2H_4 loses 10 moles of electrons to form a new compound Z. Assuming that all the nitrogens appear in the new compound, what is the oxidation state of nitrogen in Z? (There is no change in the oxidation state of hydrogen).

(a) –1 (b) –3
(c) +3 (d) +5

AP EAMCET (Engg.) - 2012

Ans. (c) $N_2H_4 \rightarrow (Z) + 10e$

∵ Z contains all n-atoms.

$$N_2^{2-} \longrightarrow {}_2N^{a+} + 10e^-$$

∴ $2a - [2\times(-2)] = 10$

∴ $a = +3$

@apna_pdf

838. Which one of the following cannot form an amphoteric oxide?

(a) Al (b) Sn

(c) Sb (d) P

AP EAMCET (Engg.) - 2012

Ans. (d) : P does not form the amphoteric oxide P form the covalent oxide covalent oxides are acidic in nature. Ampboteric oxides are formed by elements like Al, Sn and Sb. Since phosphorus is non-metal it forms acidic oxides.

839. Which of the element of nitrogen family produce maximum number of oxy-acids

(a) N (b) P

(c) As (d) Sb

MPPET-2008

Ans. (b) : Phosphorous (P) element of nitrogen family produce maximum number of oxy- acids.

840. Consider the following statements :

In the Haber method of synthesis of ammonia

1. increase of pressure favours the formation of NH_3

2. decreases of pressure produces more NH_3

3. increase of temperature dissociates NH_3

4. addition of inert gas favours the formation of NH_3

Which of the statements given above are correct ?

(a) 1 and 3 (b) 2 and 4

(c) 1 and 4 (d) 2 and 3

SCRA - 2009

Ans. (a) : Consider, the reaction of nitrogen gas (N_2) with hydrogen gas (H_2) to form ammonia (NH_3).

$$N_{2(g)} + 3H_{2(g)} \rightleftharpoons 2NH_{3(g)} + 92\,kJ\,mol^{-1} \left(\Delta H = -92 kJ\,mol^{-1}\right)$$

It is an exothermic reaction. So low temperature is required to perform this reaction.

If, we increase pressure then volume decreases, the equilibrium will shift to the right, counteracting the pressure increase by shifting to the side with fewer moles of gas that exert less pressure. So, high pressure will be required for formation of NH_3.

An inert gas will not react with either the reactants or the products, so, it will have no effect on the product or reactant ratio, and therefore, it will have no effect on equilibrium.

841. Which reactions (s) among the following produce Dinitrogen ?

(a) $NH_4Cl(aq) + NaNO_2(aq) \longrightarrow$

(b) $NH_2CONH_2 + 2H_2O \longrightarrow$

(c) $Ba(N_3)_2 \longrightarrow$

(d) $NH_4Cl + Ca(OH)_2 \longrightarrow$

AP EAPCET 24.08.2021 Shift-II

Ans. (a, c):

(i) $NH_4Cl(aq) + NaNO_2(aq) \longrightarrow N_2 + NaCl + 2H_2O$

(ii) $NH_2CONH_2 + 2H_2O \longrightarrow CO_2 + 2NH_3$

(iii) $Ba(N_3)_2 \xrightarrow{\Delta} Ba + 3N_2$

(iv) $NH_4Cl + Ca(OH)_2 \longrightarrow COCl_2 + NH_3 + H_2O$

So, the option (a) and (c) produce dinitrogen.

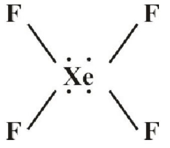
842. Shape of XeF_4 molecule is ____

(a) Pyramidal (b) Square planar

(c) Triangular planar (d) Linear

AP EAPCET 24.08.2021 Shift-II

Ans. (b): XeF_4 molecule has



So, the shape of is XeF_4 square planar.

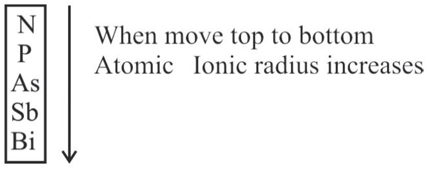
843. Ionic radius (in Å) for As^{3+}, Sb^{3+} and Bi^{3+} follow the order

(a) $As^{3+} > Sb^{3+} > Bi^{3+}$ (b) $Sb^{3+} > Bi^{3+} > As^{3+}$

(c) $Bi^{3+} > As^{3+} > Sb^{3+}$ (d) $Bi^{3+} > Sb^{3+} > As^{3+}$

AP EAMCET (Engg.) 2001

Ans. (d) : Ionic radius is directly proportional to molar mass in a group.



So, $Bi^{3+} > Sb^{3+} > As^{3+}$

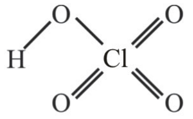
844. Which of the following is not a peroxy acid?

(a) Perphosphoric acid (b) Pernitric acid

(c) Perdisulphuric acid (d) Perchloric acid

AP EAMCET- 2007

Ans. (d) : Perchloric acid ($HClO_4$) is not a peroxy acid.



(Perchloric acid)

- Perphosphoric acid is the oxy acid of nitrogen family element i.e. P. The molecular formula of perphosphoric acid is H_3PO_5.
- Pernitric acid (HNO_4) is the oxy acid of nitrogen after peroxynitrous acid.
- Peroxydisulfuric acid is an inorganic compound with a chemical formula $H_2S_2O_8$. This is the oxy acid of sulphur.

845. The oxoacid of sulphur which contains two sulphur atoms in different oxidation states is

(a) pyrosulphurous acid

(b) hyposulphurous acid

(c) pyrosulphuric acid

(d) persulphuric acid

AP EAMCET (Engg.) 2012

Ans. (a) : Disulphurous acid or pyrosolphurous acid is an oxoacid of sulpur with the formula $H_2S_2O_5$.

@apna_pdf

(i) 
Pyrosulphuric acid

(ii) 
Hyposulphurous acid

(iii) 
Pyrosulphuric acid

(iv) 
Peroxodisulphuric acid

Since the oxidation state of two S-atom in Pyrosulphuric acid is different.

846. Which one of the following is used in the preparation of cellulose nitrate ?

(a) KNO_3 (b) HNO_3

(c) KNO_2 (d) HNO_2

AP EAMCET (Engg.) 2012

Ans. (b) : Cellulose nitrate is generally prepared by the nitration of cellulose with nitric acid or a mixture of nitric and some other acid.

$$3HNO_3 + C_6H_{10}O_5 \longrightarrow C_6H_7(NO_2)_3O_5 + 3H_2O$$

847. The product(s) formed when H_2O_2 reacts with disodium hydrogen phosphate is

(a) $P_2O_5 \cdot Na_3PO_4$ (b) $Na_2HPO_4 \cdot H_2O_2$

(c) $NaH_2\ PO_{4,}H_2O$ (d) $Na_2H\ PO_4 \cdot H_2O$

AP EAMCET (Engg.) 2012

Ans. (b) : $H_2O_2 + Na_2HPO_4 \longrightarrow \underset{\text{addition product}}{Na_2HPO_4.H_2O_2}$

H_2O_2 forms addition product with disodium hydrogen phosphate (Na_2HPO_4).

848. Nitrogen shows maximum covalency of 4 whereas other heavier elements of the group show higher covalency because,

(a) it has higher electronegativity

(b) it has smaller size

(c) it has only 4 orbitals available in the valence shell.

(d) it prefers to form multiple bonds with atoms.

COMEDK-2014

Ans. (c) : The maximum covalency of nitrogen is 4 because due to absence of d-orbital. Only four orbital i.e. one 2s and three 2p orbitals are available in the valence shell.

849. Solid A reacts with strong $NaOH_{(aq)}$ liberating a foul smelling gas B which spontaneously burn in air giving smoky rings. A and B are respectively

(a) P_{red} and PH_3 (b) P_{white} and PH_3

(c) S and H_2S (d) P_{white} and H_2S

COMEDK 2014

Ans. (b) : Solid white phosphorus (P_4) reacts with strong NaOH(aq) librating a foul smelling gas phosphine (PH_3) which spontaneously burn in air give smoky rings.

$$\underset{\text{White phosphorus}}{P_4} + 3NaOH + 3H_2O \longrightarrow \underset{\text{Phosphine}}{PH_3} + \underset{\text{Sodiumhypophosphite}}{3NaH_2PO_2}$$

850. N_2 does not show property of catenation because

(a) it has no 'd' orbitals in the valence shell

(b) interelectronic repulsion between non bonding electrons is greater

(c) $N \equiv N$ has high bond enthalpy

(d) nitrogen has very high ionization enthalpy.

COMEDK 2015

Ans. (b) : In the N-N bond, more electrons are present on N due to which inter electronic repulsions generated and reduced the property of catenation.

851. Which of the following reactions does not produce PH_3?

(a) White phosphorus with water

(b) White phosphorus with conc. NaOH

(c) Metal phosphide with dil. HCl

(d) Metal phosphides with water

COMEDK-2015

Ans. (a) :

(a) $\underset{\text{White phosphorus}}{P_4} + H_2O \longrightarrow \text{No reaction occure}$

(b) $P_4 + 3NaOH + 3H_2O \longrightarrow \underset{\text{Phosphine}}{PH_3} + 3NaH_2PO_2$

(c) $Ca_3P_2 + 6HCl \rightarrow 3CaCl_2 + 2PH_3$

(d) $Ca_3P_2 + 6H_2O \rightarrow 3Ca(OH)_2 + 2PH_3$

852. PCl_3 on hydrolysis gives

(a) H_3PO_3 (b) HPO_3

(c) H_3PO_4 (d) $POCl_3$

COMEDK-2019

Ans. (a) : PCl_3 is a colourless oily liquid and hydrolysis in the presence of moisture to give the orthophosphorus acid.

$$\underset{\text{Phosphorustrichloride}}{PCl_3} + 3H_2O \longrightarrow \underset{\text{orthophosphorus acid}}{H_3PO_3} + 3HCl$$

853. $Pb_3O_4 + 4HNO_3 \longrightarrow 2Pb(NO_3)_2 + PbO_2 + 2H_2O$

Which is true about the lead ions in Pb_3O_4?

(a) Pb^{2+} reacts with HNO_3 to give lead nitrate.

(b) Pb^{4+} reacts with HNO_3 to give lead mitrate.

(c) Pb^{2+} reacts with HNO_3 to give PbO_2

(d) Pb^{4+} reacts with HNO_3 to give PbO_2.

COMEDK-2015

Ans. (a) : Pb_3O_4 is actually a stoichiometric mixture of PbO_2+PbO and only PbO i.e., Pb^{2+} reacts with HNO_3 to form $Pb(NO_3)_2$.

@apna_pdf

854. Which of the following chemicals does not liberate hydrogen gas on reaction with aluminium metal?

(a) Dil. sulphuric acid
(b) Aqueous sodium hydroxide
(c) Dil. hydrochloric acid
(d) Conc. nitric acid

COMEDK-2015

Ans. (d) : Dilute and concentrated HNO_3 has no effect on Al. Aluminium is rendered passive by nitric acid due to the formation of a thin film of oxide (Al_2O_3) on its surface.

$$2Al_{(s)} + 6HCl_{(aq.)} \rightarrow 2Al^{3+}_{(aq.)} + 6Cl^{-}_{(aq.)} + 3H_{2(g)}$$

Aluminium dissolves in dil. HCl and liberates dihydrogen.

Aluminium also reacts with aqueous alkali and liberates dihydrogen.

$$2Al_{(s)} + 2NaOH_{(aq.)} + 6H_2O_{(l)} \longrightarrow 2Na[Al(OH)_4]_{(aq.)} + 3H_{2(g)}$$

$$2Al + 6HNO_3(\text{conc.}) \longrightarrow Al_2O_3 + 6NO_2 + 3H_2O$$

$$2Al + 6H_2SO_4 \longrightarrow Al_2(SO_4)_3 + 3SO_2 + 6H_2O$$

855. Concentrated nitric acid with aluminium gives

(a) nitric oxide
(b) nitrogen peroxide
(c) hydrogen
(d) passive metal.

COMEDK-2018

Ans. (d) : Whe aluminium reacts with nitric acid, nitrogen dioxide gas is evolved.

$Al + 6HNO_3 \rightarrow Al(NO_3)_3 + 3NO_2 + 3H_2O$

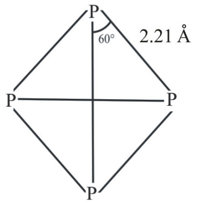
So, concentrated nitric acid with Al becomes passive due to the formation of a thin protective layer of its oxide on the surface of metal which prevents further reaction.

856. The atomicity of phosphorus is X and the PPP bond angle in the molecule is Y. What are X and Y?

(a) X = 4, Y = 90°
(b) X = 4, Y = 60°
(c) X = 3, Y = 120°
(d) X = 2, Y = 180°

AP-EAMCET (Medical), 2003

Ans. (b) : The molecular formula of white phosphorus is P_4. The four atoms of phosphorus present in the molecule are arranged at the corners of a tetrahedral. So, the PPP bond angle is 60°.



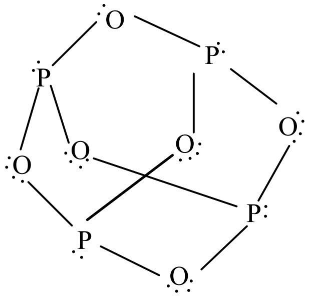
Hence, X and Y are 4 and 60° respectively.

857. The number of P—O bonds and lone pair of electrons present in P_4O_6 molecule are, respectively

(a) 12, 16
(b) 12, 12
(c) 8, 8
(d) 12, 4

AP-EAMCET (Medical), 2008

Ans. (a) : The structure of P_4O_6 is given as-



The number of bonds and lone pairs are 12 and 16 respectively.

858. Which one of the following is an oxy acid?

(a) $Ba(OH)_2$
(b) $Mg(OH)_3$
(c) H_3PO_3
(d) HCl

AP-EAMCET (Medical), 2001

Ans. (c) :

(a) $Ba(OH)_2$	– base
(b) $Mg(OH)_3$	– base
(c) H_3PO_3	– oxy acid
(d) HCl	– non oxy acid

859. Which one of the following is used in the industrial preparation of nitric acid by Ostwald's process?

(a) N_2
(b) NH_4NO_3
(c) N_2O_5
(d) NH_3

AP-EAMCET (Medical), 2001

Ans. (d) : By Haber's process, the ammonia obtained is mixed with 10 volumes of air and passed over a platinum at 750–900°C when NH_3 is oxidised to HNO_3.

$$4NH_3 + 5O_2 \xrightarrow{Pt} 4NO + 6H_2O$$

$$2NO + O_2 \longrightarrow 2NO_2$$

$$4NO_2 + 2H_2O + O_2 \longrightarrow 4HNO_3$$

860. Aqueous sodium hydroxide reacts with white phosphorus to form phosphine and:

(a) NaH_2PO_2
(b) P_2O_5
(c) Na_3PO_3
(d) P_2O_3

AP-EAMCET (Medical), 2001

Ans. (a) : Sodium hydroxide P_4 to form PH_3 and sodium hypophosphite (NaH_2PO_2).

$$\underset{\text{White phosphorus}}{P_4} + 3NaOH + 3H_2O \rightarrow \underset{\text{Phosphine}}{PH_3} + \underset{\text{Sodium hypo phosphite}}{3NaH_2PO_2}$$

861. Which one of the following statements is correct?

(a) 2s orbital is spherical with two nodal planes
(b) The de-Broglie wavelength (λ) of a particle of mass 'm' and velocity 'v' is equal to mv/h
(c) The principal quantum number (n) indicates the shape of the orbital
(d) The electronic configuration of phosphorous is given by [Ne] $3s^2 3p_x^1 3p_y^1 3p_z^1$

AP-EAMCET (Medical), 2002

@apna_pdf

Ans. (d) : The atomic number of phosphorus is 15. Electronic configuration of $_{15}P$ is $1s^2, 2s^2, 2p^6, 3s^2, 3p^3$ or [Ne] $3s^2, 3p_x^1, 3p_y^1, 3p_z^1$. Hence, the statement is true.

- As we know, 2s orbital is spherical but it has one nodal plane i.e. $n–l–1 = 2 – 0 – 1 = 1$. Hence, statement is false.
- According to the electron duality of de-Broglie equation –

$$\lambda = \frac{h}{mv}$$

Hence, statement is false.

- The principal quantum number (n) indicates the size of the orbital whereas azimuthal quantum no. indicates the shape of the orbital.

862. Two grams of sulphur is completely burnt in oxygen to form SO_2. In this reaction, what is the volume (in litres) of oxygen consumed at STP?
(Atomic weight of sulphur and oxygen are 32 and 16 respectively).

(a) $\frac{16}{22.4}$ (b) $\frac{22.4}{16}$
(c) $\frac{22.4}{32}$ (d) $\frac{32}{22.4}$

AP-EAMCET (Medical), 2002

Ans. (b) : The following reaction occur which is given below –

$$S + O_2 \rightarrow SO_2$$

Molecular weight of SO_2 = $32 + 2 \times 16 = 64g$
Volume of oxygen (1 mole), at STP = 22.4L
At STP,
$\because$ 32g of sulphur requires O_2 = 22.4 L
$\therefore$ 2g of sulphur requires $O_2 = \frac{22.4 \times 2}{32} = \frac{22.4}{16}$ L

863. Which one of the following elements does not form the compound, M_4O_{10} (M = elements)?

(a) P (b) Sb
(c) As (d) Bi

AP-EAMCET (Medical), 2002

Ans. (d) : The stability of higher oxidation states decreases down the group due to inert pair effect.
Hence Bi hardly forms +5 oxidation state due to inert pair effect.

864. Which of the following has the highest proton affinity ?

(a) Stibine (SbH_3) (b) Arsine (AsH_3)
(c) Phosphine (PH_3) (d) Ammonia (NH_3)

GUJCET-2007

Ans. (d) : The hydrides of group 15 elements shows low basicity. When we move down the group, NH_3 is more basic so it has highest affinity for hydrogen.
Ammonia has the highest proton affinity

$$NH_3 + H^+ \rightarrow NH_4^+$$

Decreases in the order

$$NH_3 > PH_3 > AsH_3 > SbH_3$$

865. The correct option from below is

(a) Both α – and β – forms of black phosphorus can be made from red phosphorus
(b) White phosphorus is more reactive due to angular strain in the P_4- molecule
(c) Red phosphorus can be prepared from white phosphorus under open air condition
(d) Red phosphorus is poisonous and soluble in carbon disulphide

TS-EAMCET 09.08.2021, Shift-I

Ans. (b) : White phosphorus is more reactive due to angular strain in the P_4 molecule. It is less stable. Therefore more reactive.

- Red phosphorus is obtained by heating the white phosphorus at a high temperature around 573K.

866. The correct order of reducing ability of the following hydrides is

(a) $BiH_3 > SbH_3 > PH_3 > NH_3$
(b) $NH_3 > PH_3 > SbH_3 > BiH_3$
(c) $SbH_3 > BiH_3 > PH_3 > NH_3$
(d) $PH_3 > BiH_3 > SbH_3 > NH_3$

TS EAMCET 05.08.2021, Shift-I

Ans. (a) : The reducing ability depends on the stability of the hydride and due to decrease in their bond dissociation enthalpy. Hence, the reducing ability order

$$BiH_3 > SbH_3 > AsH_3 > PH_3 > NH_3$$

867. Match List- I with List -II:

List-I	**List-II**
Name of oxo acid	**Oxidation state of 'P'**
(a) Hypophosphorous acid	(i) +5
(b) Orthophosphoric acid	(ii) +4
(c) Hypophosphoric acid	(iii) + 3
(d) Orthophosphorous acid	(iv) +2
	(v) +1

Choose the correct answer from the options given below:

(a) (a)-(v), (b)-(iv), (c)-(ii), (d)-(iii)
(b) (a)-(iv), (b)-(i), (c)-(ii), (d)-(iii)
(c) (a)-(iv), (b)-(v), (c)-(ii), (d)-(iii)
(d) (a)-(v), (b)-(i), (c)-(ii), (d)-(iii)

JEE Main 16.03.2021, Shift-I

Ans. (d) : (a) Hypophosphorous acid (H_3PO_2) –

$$+3 + x - 4 = 0 \Rightarrow x = +1$$

(b) Orthophosphoric acid (H_3PO_4)–

$$+3 + x - 8 = 0 \Rightarrow x = +5$$

(c) Hypophosphoric acid ($H_4P_2O_6$)–

$$+4 + 2x - 12 = 0 \Rightarrow x = +4$$

(d) Orthophosphorous acid (H_3PO_3)–

$$+3 + x - 6 = 0 \Rightarrow x = +3$$

Hence, (d) is the correct option.

868. Which of the following has highest ratio of reducing hydrogen/OH:

(a) Orthophosphoric acid
(b) Hypophosphorus acid
(c) Phosphorus acid
(d) Pyrophosphoric acid

AIIMS 25 May 2019 (Evening)

@apna_pdf

Ans. (b): Reducing hydrogen :- Hydrogen attached directly to central metal.

(1) Orthphosphoric acid (H_3PO_4) ratio

$$\frac{\text{Reducing hydrogen}}{\text{OH group}} = \frac{0}{3} = 0$$

(2) Hypophosphorus acid (H_3PO_2) ratio

$$\frac{\text{Reducing hydrogen}}{\text{OH group}} = \frac{2}{1} = 2$$

(3) Phosphorus acid (H_3PO_3) ratio

$$\frac{\text{Reducing hydrogen}}{\text{OH group}} = \frac{1}{2}$$

(3) Pyrophosphoric acid ($H_4P_2O_7$) ratio =

$$\frac{\text{Reducing hydrogen}}{\text{OH group}} = \frac{0}{4} = 0$$

869. The following are some statements related to VA group hydrides,

I. Reducing property increases from NH_3 to BiH_3.

II. Tendency to donate lone pair decreases from NH_3 to BiH_3.

III. Thermal stability of hydrides decreases from NH_3 to BiH_3.

IV. Bond angle of hydrides decreases from NH_3 to BiH_3

The correct statements are

(a) I, II, III and IV (b) I, III, and IV

(c) I, II and IV (d) I and IV

AP EAMCET- 2007

Ans. (a) : (i) Reducing property increases from NH_3 to BiH_3 i.e. $NH_3 < PH_3 < AsH_3 < SbH_3 < BiH_3$ as the stability of hydride decreases down the group. It's reducing power increases.

(ii) Tendency to donate lone pair decreases from NH_3 to BiH_3 i.e. $NH_3 > PH_3 > AsH_3 > SbH_3 > BiH_3$ because the electron density of central atom decreases.

(iii) Thermal stability of hydrides decrease from NH_3 to BiH_3 i.e. $NH_3 > PH_3 > AsH_3 > SbH_3 > BiH_3$ because thermal stability increases with decrease in the size of central atom.

(iv) Bond angle of hydrides decreases from NH_3 to BiH_3 i.e. $NH_3 > PH_3 > AsH_3 > SbH_3 > BiH_3$.

870. Which metals upon heating in presence of air followed by hydrolysis gives ammonia?

(a) Li, K (b) Rb, Mg

(c) Li, Mg (d) Ca, K

AIIMS 25 May 2019 (Morning)

Ans. (c):

$$6Li + N_2 \rightarrow 2Li_3N$$

$$Li_3N + 3H_2O \rightarrow 3\,LiOH + NH_3$$

$$3\,Mg + N_2 \rightarrow Mg_3N_2$$

$$Mg_3N_2 + 6H_2O \rightarrow 3Mg(OH)_2 + 2NH_3$$

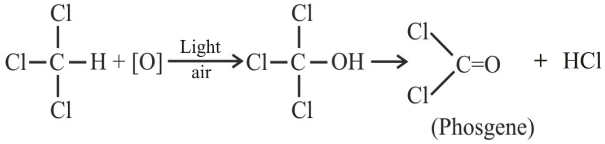
871. When chloroform is exposed to air and sunlight, it gives

(a) mustard gas (b) phosgene

(c) carbon tetrachloride (d) lewisite

AIIMS-1994

Ans. (b): When chloroform is exposed to air and sunlight it gives phosgene.



872. The correct order of reducing abilities of hydrides of V group elements is

(a) $NH_3 < PH_3 < AsH_3 < SbH_3 < BiH_3$

(b) $NH_3 > PH_3 > AsH_3 > SbH_3 > BiH_3$

(c) $NH_3 < PH_3 > AsH_3 > SbH_3 > BiH_3$

(d) $SbH_3 > BiH_3 > AsH_3 > NH_3 > PH_3$

AP EAMCET-2008

Ans. (a) : The reducing character of hydrides of group - 15 elements increases from top to bottom because of E-H strength.

$NH_3 < PH_3 < AsH_3 < SbH_3 < BiH_3$.

873. In the following reaction, the products are

$P_4 + 3NaOH + 3H_2O \rightarrow ?$

(a) $PH_3 + 3NaH_2PO_2$ (b) $PH_3 + 3NaHPO_2$

(c) $PH_3 + 3Na_2HPO_2$ (d) $PH_3 + 3NaH_2PO_3$

Jharkhand – 2019

Ans. (a) : The given reaction,

$$P_4 + 3NaOH + 3H_2O \rightarrow PH_3 + 3NaH_2PO_2$$

Oxidation state of P in $P_4 = 0$

Oxidation state of P in $PH_3 = -3$

Oxidation state of P in $NaH_2PO_2 = +1$

P undergoes both oxidation and reduction. So this is an example of disproportionation reaction.

874. Hypophosphorus acid is a good reducing agent because

(a) it contains two P – OH bonds

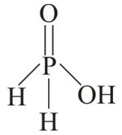
(b) it contains two P – H bonds

(c) it contains two P = O bonds

(d) it contains one P – H bond and one P – OH bond

Jharkhand – 2019

Ans. (b) : Hypophosphorous acid as well as its salts are strong reducing agents. It is only one ionisable hydrogen atom. Hypophosphorous acid (H_3PO_2) is a good reducing agent because it contains two P – H bonds.



875. 3 moles of ethanol react with one mole of phosphorus tribromide to form 3 moles of bromoethane and one mole of X. Which of the following is X?

(a) H_3PO_4 (b) H_3PO_2

(c) HPO_3 (d) H_3PO_3

AP-EAMCET-2001

@apna_pdf

Ans. (d) : 3 moles of ethanol react with one mole of phosphorus tribromide to form 3 moles of bromoethane and one mole of orthophosphorous acid (H_3PO_3).

$$\underset{\text{ethanol}}{3CH_3CH_2OH} + PBr_3 \rightarrow \underset{\text{Bromoethane}}{3CH_3CH_2Br} + \underset{(X)}{H_3PO_3}$$

876. Assertion: H_3PO_4 and H_3PO_3 both are present in fertilizers.

Reason: H_3PO_4 increases the solubility of fertilizers.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

[AIIMS-26 May, 2018(M)]

Ans. (c): H_3PO_4 and H_3PO_3 are the acid of phosphorus they are used for fertilizer due to its strong reducing property. So, Assertion is true but reason is false.

877. Assertion: Although PF_5, PCl_5 and PBr_5 are known, the pentahalides of nitrogen have not been observed.

Reason: Phosphorus has lower electronegativity than nitrogen.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

[AIIMS-2010]

Ans. (b): Nitrogen does not form pentahalides because it does not have d– orbitals. The electro negativity of N is greater than that of phosphorus.

878. False statement about white phosphorus is

(a) It is highly soluble in carbon disulphide
(b) The angle ∠PPP is P_4 molecule is 60°
(c) White P_4 molecules contains four P-P covalent bonds
(d) White phosphorus is the most reactive allotrope of phosphorus

TS-EAMCET (Engg.), 07.08.2021 Shift-II

Ans. (c) : White phosphorus insoluble in H_2O and soluble in C_6H_6, C_2H_5OH, $CHCl_3$ and Carbon disulphide (CS_2).

- 
∠PPP=60°
Six covalent Bond (P–P)
- White phosphorus is most reactive form of phosphorus.
- Translucent in appearance like white waxy solid.
- When mixed with carbon disulphide, it dissolves.

879. Which of the following statements is incorrect?

(a) Red P is toxic
(b) White 'P' is thermodynamically most stable
(c) Black 'P' is thermodynamically most stable
(d) White 'P' is soluble in NaOH and evolves PH_3

[AIIMS-26 May, 2018(M)]

Ans. (a): Red P is not considered as toxic in its pure form.

Red P is non-poisonous and white P is poisonous.

Black phosphorus is the thermodynamically stable from of phosphorus at room temperature and pressure. It is obtained by heating white phosphorus under high pressures (12000 atmosphere).

880. Observe the following statements,

1. The solubility of group V hydrides in water decreases from NH_3 to BiH_3.
2. Phosphorus does not exhibit allotropy.
3. The stability of group V hydrides decreases from NH_3 to BiH_3.

The correct statement(s) are

(a) 1 and 3 (b) 2
(c) 1 and 2 (d) 1, 2 and 3

AP EAMCET (Medical) - 2013

Ans. (a)

1. The solubility of group 15 hydrides in water decreases from NH_3 to BiH_3 because NH_3 forms H-bonding with H_2O but other hydrides are less soluble. Hence, statement is true.
2. All the 15 group elements shows allotropy except bismuth. Phosphorus exists in a number of allotropic forms such as white, red and black. Hence, statement is false.
3. The stability of hydrides decreases from NH_3 to BiH_3 which can be observed from their bond dissociation enthalpy. So, we can say that bond dissociation energy increases from NH_3 to BiH_3. Hence, statement is true.

881. P_4O_{10} is not used to dry NH_3 gas because

(a) P_4O_{10} reacts with moisture in NH_3
(b) P_4O_{10} is not a drying agent
(c) P_4O_{10} is acidic and NH_3 is basic
(d) P_4O_{10} is basic and NH_3 is acidic

[AIIMS-2012]

Ans. (c) : NH_3 is basic and P_4O_{10} is acidic, when they react they form salt.

$$\text{Acid} + \text{base} \longrightarrow \text{salt}$$

P_4O_{10} is not used to dry NH_3 gas.

882. H_2S gas is not evolved when SO_3^{2-} ion reacts with following reagents.

(a) Zn + dil. H_2SO_4 (b) Al + Conc.NaOH
(c) Al + dil.HCl (d) None of these

[AIIMS-2009]

Ans. (b):

$$SO_3^{2-} + 2Al + 2OH^- + 3H_2O \rightarrow S^{2-} + \left[Al(OH)_4\right]^-$$

H_2S gas is not evolved because liberated H_2s is neutralized by NaOH and Na_2S is formed.

@apna_pdf

883. In the nitrogen family the H - M - H bond angle in the hydrides MH_3 gradually becomes closer to 90° on going from N to Sb. This shows that gradually-

(a) The basic strength of hydrides increases.
(b) Almost pure p-orbitals are used for M - H bonding.
(c) The bond energies of M - H bond increases.
(d) The bond pairs of electrons becomes nearer to the central atom.

[AIIMS-2009]

Ans. (b): In nitrogen family the H-M-H bond anlge in hydrides gradually closer to 90° on going from N to Sb because almost pure p-orbitals are used for M-H bonding.

884. Which of the following oxides is most acidic?

(a) Ag_2O (b) V_2O_5
(c) CO (d) N_2O_5

[AIIMS-2009]

Ans. (d): The difference of electronegativities between nitrogen and oxygen is least compared of that of in the other oxides. On moving down the group acidic strength decreases.

885. An element (X) forms compounds of the formula XCl_3, X_2O_5 and Ca_3X_2, but does not form XCl_5. Which of the following is the element.

(a) B (b) Al
(c) N (d) P

[AIIMS-2009]

Ans. (c): Nitrogen form NCl_3, N_2O_5 but it does not form NCl_5 because of absence of d-orbital. It can not extend its covalency by more than three.

886. Choose the correct statement :

(a) White or yellow phosphorus is stored under water.
(b) Ignition temperature of red phosphorus is low
(c) Black phosphorus is non crystalline in nature.
(d) Phosphorus does not form hydrides.

[AIIMS-2009]

Ans. (a): White phosphorus reacts very fast with atmospheric oxygen and catches fire. So it is dipped in water to prevent form oxygen gas supply and it is insoluble in water.

887. The compound, found in nature in gas phase but ionic in solid state is:

(a) PCl_5 (b) CCl_4
(c) PCl_3 (d) $POCl_3$

[AIIMS-2006]

Ans. (a): In gaseous and molten state Pcl_5 in Neutral molecule with trigonal bipyramidal symmetry

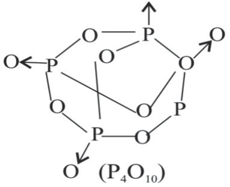
In solid state it remains as PCl_4^+ ,PCl_6^- .

888. The number of P–O–P bridges in the structure of phosphorus pentoxide and phosphorus trioxide are respectively :

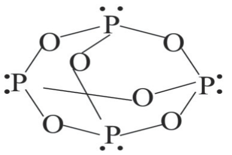
(a) 6,6 (b) 6,5
(c) 5,6 (d) 6,5

[AIIMS-2005]

Ans. (a):



(P_4O_{10})



(P_4O_6)

⇒ Both phosphorus pentoxide and phosphorus trioxide have 6 P–O–P bridges in their structure.

889. The element which forms oxides in all oxidation states varying from +1 to +5 is

(a) N (b) P
(c) As (d) Sb

[AIIMS-2004]

Ans. (a): N_2 has wide spectrum of oxidation state, from +1 to +5. It forms oxides in all oxidation state, $N_2O(+1)$, $NO(+2)$, $N_2O_3(+3)$, $NO_2(+4)$ $N_2O_5(+5)$.

890. The statement true for N_3^- is :

(a) it has non-linear structure
(b) it is called paeudohalogen
(c) the formal oxidation state of nitrogen in this anion is –1
(d) it is isoelectronic with NO_2

[AIIMS-2004]

Ans. (c): g

- The azide ion (N_3^-) has 16 valence electrons and is isoelectronic with CO_2
- The azide ion (N_3^-) is linear (N–N–N) like CO_2 molecule.
- The formal oxidation state of nitrogen in this anion is –1, because the net charge on the ion is –1.

891. The true statement for the acids of phosphorus. H_3PO_2, H_3PO_3 and H_3PO_4 is :

(a) the order of their acidity is $H_3PO_4 < H_3PO_4 < H_3PO_2$
(b) all of them are reducing in nature
(c) all of them are tribasic acids
(d) the geometry of phosphorus is tetrahedral in all the three

[AIIMS-2003]

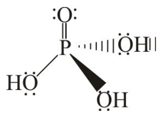
Ans. (d): H_3PO_4, H_3PO_4, H_3PO_2 as sp^3 hybridised all are tetrahedral.
the order of their acidity is $H_3PO_4 < H_3PO_4 < H_3PO_2$

892. Which of the following compound is a tribasic acid ?

(a) H_3PO_2 (b) H_3PO_4
(c) H_3PO_3 (d) $H_4P_2O_7$

[AIIMS-2001, 2002]

Ans. (b):



H_3PO_4 is a tribasic acid as it has three acidic protons. Its salts are called phosphates.

893. The correct decreasing order of basic strength is :

(a) $AsH_3 > SbH_3 > PH_3 > NH_3$
(b) $SbH_3 > AsH_3 > PH_3 > NH_3$

@apna_pdf

(c) $NH_3 > PH_3 > AsH_3 > SbH_3$
(d) $PH_3 > AsH_3 > SbH_3 > NH_3$

[AIIMS-1999]

Ans. (c): As size of central atom increase the lone pair of electrons occupies a larger volume. In other words electron density on the central atom decreases and consequently its tendency to donate a pair of electron decreases along with basic character from NH_3 to SbH_3

$$NH_3 > PH_3 > AsH_3 > SbH_3$$

894. The laughing gas is :

(a) NO
(b) N_2O
(c) N_2O_4
(d) N_2O_5

[AIIMS-1998]

Ans. (b): Nitrous oxide is commonly known as laughing gas. It is colorless, non-flammable gas. It is oxide of nitrogen and its chemical formula is N_2O.

895. Phosphine is generally prepared in the laboratory :

(a) By heating phosphorus in a current of hydrogen
(b) By heating white phosphorus with an aqueous solution of caustic potash
(c) By decomposition of P_2H_2 at 110°C
(d) By heating red phosphorus with an aqueous solution of caustic soda

JEE Main 14.01.2020

Ans. (b) : Phosphine is generally prepared in the laboratory by heating white phosphorous with an aqueous solution of caustic potash.

$$\underset{\text{White}}{P_4} + 3NaOH + 3H_2O \rightarrow \underset{\text{Phosphine}}{PH_3} + 3NaH_2PO_2$$

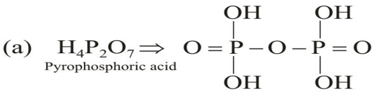
The concentration of phosphine varies in the atmosphere. It plays a vital role in the phosphorous biochemical cycle.

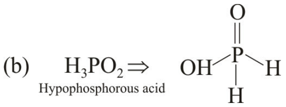
896. Which of the following oxy-acids has the maximum number of hydrogens directly attached to phosphorus?

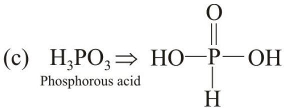
(a) $H_4P_2O_7$
(b) H_3PO_2
(c) H_3PO_3
(d) H_3PO_4

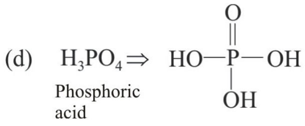
AIPMT- 1999

Ans. (b) :









By referring the structures we see that, H_3PO_2 has maximum number of hydrogen attached to phosphorus.

897. Group 15 elements have more electron gain enthalpy than group 16-elements. The correct reason for this is

(a) Half-filled stability of gp. 15 elements.
(b) Poor shielding in gp. 15
(c) Poor shielding in gp. 16
(d) Half-filled stability of gp. 16 elements

VITEEE-2016

Ans. (a) : The atoms having half-filled and fully filled orbitals are comparatively more stable, hence energy is required to remove the electron from such atoms. Therefore group 15 element have more electron gain enthalpy than group 16 elements.

898. With excess of water, both P_2O_5 and PCl_5 give

(a) H_3PO_3
(b) H_3PO_2
(c) H_3PO_4
(d) $H_4P_2O_7$

VITEEE-2015

Ans. (c) : With excess of water, both P_2O_5 and PCl_5 give H_3PO_4

$$P_2O_5 + 3H_2O \rightarrow 2H_3PO_4$$
(Ortho phosphoric acid)

$$PCl_5 + 4H_2O \rightarrow H_3PO_4 + 5HCl$$
(Colourless solid)

899. When copper is treated with a certain concentration of nitric acid, nitric oxide and nitrogen dioxide are liberated in equal volumes according to the equation,

$$xCu + yHNO_3 \rightarrow Cu(NO_3)_2 + NO + NO_2 + H_2O$$

The coefficients of x and y are respectively

(a) 2 and 3
(b) 2 and 6
(c) 1 and 3
(d) 3 and 8

VITEEE-2015

Ans. (b) : Balanced equation are

$$3Cu + 8HNO_3 \longrightarrow 3Cu(NO_3)_2 + \underset{\substack{\text{nitric}\\\text{oxide}}}{2NO} + H_2O \quad ....(i)$$

$$Cu + 4HNO_3 \longrightarrow Cu(NO_3)_2 + \underset{\substack{\text{nitrogen}\\\text{dioxide}}}{2NO_2} + 2H_2O \quad ....(ii)$$

Addition equation (i) and (ii) we get,

$$4Cu+12HNO_3 \rightarrow 4Cu(HNO_3)_2 + 2NO_2+2NO + 6H_2O$$
$$2Cu+6HNO_3 \rightarrow 2Cu(HNO_3)_2 + NO_2+NO + 3H_2O$$

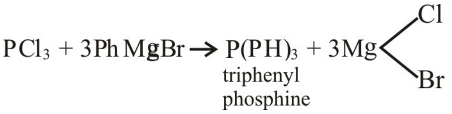
Thus coefficients x and y of Cu and HNO_3 are 2 and 6.

900. Reaction of PCl_3 and PhMgBr would give

(a) bromobenzene
(b) chlorobenzene
(c) triphenylphosphine
(d) dichlorobenzene

VITEEE- 2008

Ans. (c) : When phosphorus trichloride reacts with phenyl magnesium bromide (Grignard's reagent), all the three chlorine atoms of PCl_3 are replaced by phenyl group of phenyl magnesium bromide and triphenyl phosphine is obtained.



$$PCl_3 + 3PhMgBr \rightarrow \underset{\substack{\text{triphenyl}\\\text{phosphine}}}{P(PH)_3} + 3Mg\begin{cases}Cl\\Br\end{cases}$$

901. NH_3 group in a coordination compound is named as

(a) ammonium
(b) ammine
(c) amine
(d) ammonia

VITEEE- 2006

@apna_pdf

Ans. (b) : NH_3 (Ammine) is a neutral ligand with zero charge and named 'ammine'. However, two very important exceptions to this rule are H_2O (Aqua) NH_3 Ammine.

902. The total number of σ and π-bonds in pyrophosphoric acid are respectively

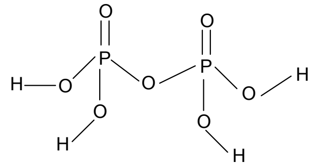
(a) 8, 2 (b) 10, 2

(c) 12, 2 (d) 8, 4

AP-EAMCET- (Engg.)-2011

Ans. (c) :

The structure of pyrophosphoric acid ($H_4P_2O_7$)



Pyrophosphoric acid $\left(H_4P_2O_7\right)$

Thus, it contains 12σ and 2π bonds.

903. Calgon is

(a) Na_2HPO_4 (b) Na_3PO_4

(c) $Na_6P_6O_{18}$ (d) NaH_2PO_4

AP-EAMCET – 2016

Ans. (c) : Calgon is a sodium hexametaphosphate $Na_6P_6O_{18}$. It is used for softening hard water. Calgon is a trade name of a complex salt.

- Disodium phosphate is the inorganic compound with the formula Na_2HPO_4. It is water soluble white powders. It is used in conjuction with trisodium phosphate in foods and water softening treatment.
- Chemical name of Na_3PO_4 is sodium phosphate. It is trisodium salt of phosphoric acid H_3PO_4.
- Sodium dihydrogen phosphate compound with the chemical formula NaH_2PO_4.

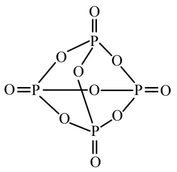
904. The number of oxygen atoms bonded to each phosphorus atom in P_4O_{10} is :

(a) 3 (b) 4

(c) 5 (d) 2

AP-EAMCET (Engg.)-2004

Ans. (b) : The structure of P_4O_{10} is given as :



Hence, there are four oxygen atom bonded to each phosphorus atom.

905. The oxide of nitrogen formed by thermal decomposition of NH_4NO_3 is

(a) NO (b) N_2O

(c) N_2O_5 (d) NO_2

AP-EAMCET- (Engg.) - 2010

Ans. (b) : The thermal decomposition of NH_4NO_3 is nitrous oxide.

$$NH_4NO_3 \xrightarrow[\text{at}\,250^\circ C]{\Delta} N_2O + 2H_2O$$

Hence, N_2O is nitrous oxide. It is also known as laughing gas.

906. Solvay process is used in the manufacture of

(a) K_2CO_3 (b) $KHCO_3$

(c) Na_2CO_3 (d) $CaCl_2$

AP-EAMCET- (Engg.) - 2010

Ans. (c) : The solvay process or ammonia-soda process is the industrial process for the production of sodium carbonate (Na_2CO_3).

$$\underset{\text{Sodiumbicarbonate}}{2NaHCO_3} \xrightarrow{\Delta} \underset{\text{Sodiumcarbonate}}{Na_2CO_3} + H_2O + CO_2.$$

This process can not be used in manufacture of potassium carbonate as potassium bicarbonate is soluble in the solution of NH_4Cl and KCl.

907. Which one of the following is not correct?

(a) Pyrophosphoric acid is a tetrabasic acid

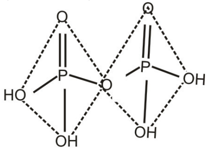
(b) Pyrophosphoric acid contains P—O—P linkage

(c) Pyrophosphoric acid contains two P—H bonds

(d) Orthophosphoric acid can be prepared by dissolving P_4O_{10} in water

AP-EAMCET (Engg.) 2013

Ans. (c) : The structure of Pyrophosphoric acid ($H_4P_2O_7$) is —



$\left(H_4P_2O_7\right)$

In pyrophosphoric acid four P–OH bonds,

two P – O bonds and one P– O – P linkage.

So, option (c) is not correct.

908. Which is in the decreasing order of boiling points of V group hydrides ?

(a) $NH_3 > PH_3 > AsH_3 > SbH_3$

(b) $SbH_3 > AsH_3 > PH_3 > NH_3$

(c) $PH_3 > NH_3 > AsH_3 > SbH_3$

(d) $SbH_3 > NH_3 > AsH_3 > PH_3$

AP - EAMCET (Medical) - 2007

Ans. (d) : The boiling point of hydrides of group 15 elements are given as :

	SbH_3 >	NH_3 >	AsH_3 >	PH_3
Boiling point–	254.6	238.5	210.6	185.5

909. Which of the following is not correct?

(a) Hydrolysis of NCl_3 gives NH_3 and HOCl

(b) NH_3 is less stable than PH_3

(c) NH_3 is a weak reducing reagent compared to PH_3

(d) Nitric oxide in solid state exhibits diamagnetic property

AP-EAMCET (Engg.)-2005

@apna_pdf

Ans. (b) : (a) Nitrogen trichloride undergo hydrolysis in presence of hot water to give ammonia and hypochlorous acid.

$$NCl_3 + 3H_2O \rightarrow NH_3 + 3HOCl$$

Hence, the statement is true.

(b) Ammonia (NH_3) is the most stable hydride in 15th group. So, order of bond strength of hydride is $NH_3 > PH_3 > AsH_3 > SbH_3$. So, order of stability of hydride of elements of 15th group is $NH_3 > PH_3 > AsH_3 > SbH_3$. Hence, the statement is false.

(c) The reducing power of hydrides increases from NH_3 to BiH_3 which can be observed from their bond dissociation enthalpy. Thus, statement is true.

(d) Nitric oxide in solid state exhibits diamagnetic character because unpaired electrons gets paired up in dimer form of solid. Thus, the statement is true.

Hence, only statement (b) is not correct.

910. Which of the following is more stable?

(a) N_2 (b) O_2

(c) Li_2 (d) All of these

SRMJEEE – 2011

Ans. (a) : Element–	N_2	O_2	Li_2
Bond order–	3	2	1

911. Which among the following has the garlic taste?

(a) P_2O_3 (b) H_3PO_4

(c) PCl_3 (d) H_3PO_3

SRMJEEE – 2009

Ans. (d) :

H_3PO_3 has the garlic taste.

P_2O_3 is garlic odour.

H_3PO_4 is Pleasant taste

PCl_3 : is sour taste.

912. P – O – P bond is present in

(a) pyrophosphoric acid

(b) orthophosphoric acid

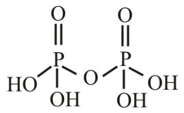
(c) phosphorous acid

(d) hypophosphorous acid.

SRMJEEE – 2013

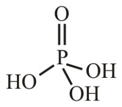
Ans. (a) : P – O – P bond are present in pyrophosphoric acid.

(i)



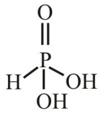
Pyrophosphoric acid

(ii)



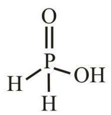
Orthophosphoric acid

(iii)



Phosphorous acid

(iv)



Hypophosphorous acid

Hence, the option (a) is correct.

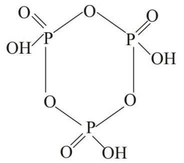
913. The number of P–O–P bonds in trimetaphosphoric acid is

(a) 0 (b) 2

(c) 3 (d) 6

AMU-2019

Ans. (c) : The number of P–O–P bond in cyclic metaphosphoric acid is three.



Hence, there are 3 P–O–P bonds.

914. The best reducing agent among the following is

(a) NH_3 (b) SbH_3

(c) PH_3 (d) AsH_3

AMU-2018

Ans. (b) : The reducing character of hydrides of group 15 elements increases down the group

$NH_3 < PH_3 < AsH_3 < SbH_3$

Number of shells is highest in 'Sb' which means the outermost electron is most loosely held in Sb. Therefore, SbH_3 is the strongest reducing agent.

915. Which of the following have same number of electrons in the outermost orbit?

(a) Pb, Sb (b) N, O

(c) As, Bi (d) P, Ca

BITSAT 2010

Ans. (c) : The outermost orbit has the same number of electron in As, Bi

Arsenic (As) and Birmuth (Bi) are in the same group

So, they have the same valence electron configuration

$As = 3d^{10}, 4s^2, 4p^3$

$Bi = 4f^{14}, 5d^{10}, 6s^2, 6p^3$

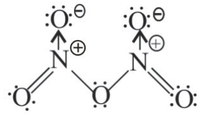
916. What is the number of nitrogen-nitrogen bonds in N_2O_5?

(a) 1 (b) 0

(c) 1.5 (d) None

AMU-2017

Ans. (b) : The structure of



The number of nitrogen -nitrogen bonds in N_2O_5 is zero.

917. Which of the following oxides of nitrogen is blue in nature?

(a) NO (b) N_2O_3

(c) N_2O_5 (d) NO_2

AMU-2017

Ans. (b) : Dinitrogen trioxide N_2O_3 is blue colours in liquid and solid state but in gaseous state it is brown in colour.

918. The number of P–O–P bonds in cyclic meta phosphoric acid is

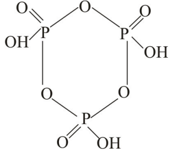
(a) zero (b) two

(c) three (d) four

AMU-2016

@apna_pdf

Ans. (c) : The chemical formula of cyclic metaphosphoric acid is ($P_3O_9H_3$).



The number of P–O–P bond in cyclic metaphosphosphoric acid is three.

919. Which of the following statements is wrong about the oxides of nitrogen?

(a) N_2O_5 is an anhydride of HNO_3
(b) NO is an acidic oxide
(c) N_2O_3 is an anhydride of HNO_2
(d) NO is not anhydride of an acid.

AMU-2016

Ans. (b) :

$\left.\begin{matrix} N_2O \\ NO \end{matrix}\right\}$ Neutral

$\left.\begin{matrix} NO_2 \\ N_2O_3 \\ N_2O_5 \end{matrix}\right\}$ Acidic

Oxides of nitrogen acts as a oxidizing as well as a reducing agent.

920. The molecule which is linear is

(a) N_2O
(b) NO_2
(c) SO_2
(d) H_2O

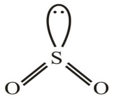
AMU-2016

Ans. (a) : N_2O is linear molecule.

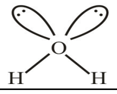
$N_2O \Rightarrow N \equiv N \rightarrow O$

$NO_2 \Rightarrow$

$SO_2 \Rightarrow$



$H_2O \Rightarrow$



921. P_4O_{10} dissolves in water to give

(a) phosphorous acid
(b) orthophosphoric acid
(c) hypophosphorous acid
(d) pyrophosphoric acid

AMU-2011

Ans. (b) : P_4H_{10} has a great affinity for water. The final product is orthophosphoric acid.

$$P_4H_{10} \xrightarrow[\text{Hydrolysis}]{H_2O} \underset{\text{orthophosphoric acid}}{H_3PO_4}$$

922. Phosphine can be prepared by the reaction of water with

(a) calcium phosphide
(b) calcium hydride
(c) calcium dihydrogen phosphate
(d) calcium phosphate

AMU – 2010

Ans. (a) : $Ca_3P_2 + 6H_2O \rightarrow 3Ca(OH)_2 + 2PH_3$

923. Which of the following will dissolve in excess of ammonia?

(a) AgI
(b) AgBr
(c) AgCl
(d) None of these

AMU – 2010

Ans. (c) : (a) AgI does not dissolve in NH_4OH solution.
(b) AgBr is sparingly soluble in NH_4OH solution.

$AgBr + 2NH_4OH \rightarrow \underset{\text{Sparingly soluble}}{[Ag(NH_3)_2]Br} + 2H_2O$

(c) AgCl dissolves in NH_4OH by forming a complex salt.

$AgCl + 2NH_4Cl \rightarrow \underset{\text{Soluble complex}}{[Ag(NH_3)_2]Cl} + 2H_2O$

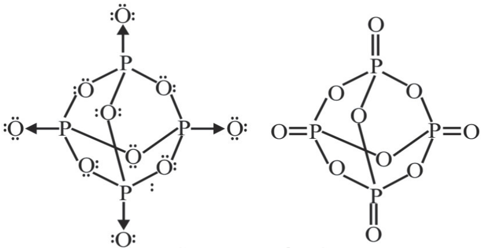
Hence, option (c) is correct.

924. In the structure of P_4O_{10} molecule the number of σ(sigma) and π(pi) bonds are

(a) 12 sigma and 4 pi
(b) 16 sigma and 4 pi
(c) 10 sigma and 4 pi
(d) 8 sigma and 4 pi

AMU – 2008

Ans. (b) : The structure of P_4O_{10} is similar to P_4O_6 with a difference that each phosphorous atom is linked with an additional oxygen atom with the help of a co-ordinate linkage involving a pair of electrons on each phosphorous atom . It has 16σ and 4π bonds.



Structure of P_4O_{10}

925. Carius method is used for the quantitative estimation of

(a) carbon
(b) halogens
(c) nitrogen
(d) sulphur

AMU–2006

Ans. (b) : The quantitative estimation of the halogens (Cl, Br or I) in organic compounds is done by Carius method.

926. Which of the following compounds will give phosphoric acid on reaction with water?

(a) PCl_5
(b) P_4O_6
(c) P_4O_{10}
(d) Ca_2P_2

AMU–2006

Ans. (b) : P_4O_6 reacts with water to give phosphoric acid.

$$P_4O_6 + 6H_2O \rightarrow 4H_3PO_3$$

Phosphoric acid

927. Which of the following metals will react with N_2 to from nitride ?

(a) Li
(b) Na
(c) K
(d) Rb

AMU-2004

Ans. (a) : On heating, Li readily combines with nitrogen to form the nitride (Li_3N).

$Li(s) + N_2(g) \rightarrow 2Li_3N(s)$

@apna_pdf

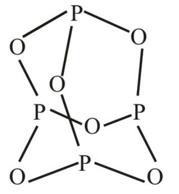
928. In P_4O_6, the number of oxygen atoms bonded to each phosphorus atom is

(a) 4 (b) 3

(c) 2 (d) 1.5

AMU–2001

Ans. (b) : In P_4O_6, the P atoms lie the corners of a tetrahedron and the six oxygen atoms are present along the edges in between the P atoms. Each P atom is covalently bonded to three oxygen atoms each of which is bonded to 2 P atoms.



Structure of P_4O_6

929. Anomalous behaviour of nitrogen is due to

(a) Small size and high electronegativity

(b) non-availability of d-orbitals in valency shells

(c) ease of multiple bond formation

(d) all of the above

Assam CEE-2018

Ans. (d) : Nitrogen differs from the rest of his family elements. Because its properties we know that on moving top to bottom (down the group) size of an atom decreases. In the group 15 nitrogen is smaller in size. Nitrogen has very high ionization energy because of its stable half-filled configuration. Nitrogen has electronic configuration is $1s^2, 2s^2, 2p^3$.

Here p-orbital is half- filled. Nitrogen has high electronegativity

930. The oxidation state of phosphorous in H_3PO_3, $H_4P_2O_6$ and $H_4P_2O_7$, respectively are

(a) +, 1+3, +4 (b) +3, +4, +5

(c) +3, +4, +4 (d) +3, +5, +4

Assam CEE-2021

Ans. (b) : The oxidation state of phosphorous-

$H_3PO_3 = 3 + x - 6 = 0, \quad x = 3$

$H_4P_2O_6 = 4 + 2x - 12 = 0, \quad x = 4$

$H_4P_2O_7 = 4 + 2x - 14 = 0, \quad x = 5$

931. The sides of safety matches contains

(a) red phosphorus + sand powder

(b) P_4S_3

(c) $Ca_3(PO)_4$ + glass pieces

(d) $KClO_3$, KNO_3, sulphur + antimony

BCECE-2007

Ans. (a) : The sides a safety matches contain red phosphorus and sand powder. The striking surface or sides of the safety matchbox contain red phosphorus, powder glass and glue. When the rubbing of safety matches on the striking surface the friction generates enough heat to converted a trace of the red phosphorus into white phosphorus. While the head of match stick contain P_4S_3

932. Zinc and cold dil. HNO_3 reacts to produce

(a) NO (b) NO_2

(c) NH_4NO_3 (d) $ZnNO_3$

BCECE-2007

Ans. (c) : $4Zn + 10HNO_3 \rightarrow 4Zn(NO_3)_2 + NH_4NO_3 + 3H_2O$

Zinc react with cold and very dilute nitric acid yields zinc carbonate and ammonium -nitrate.

933. Which of the following is kept in water?

(a) White phosphorus (b) Sodium

(c) Potassium (d) Calcium

BCECE-2005

Ans. (a) : White phosphorus is very reactive isotope of phosphorus. Phosphorus is kept in water due to in burn at 30°C. It is soluble in organic solvents.

934. The most favourable condition for the manufacture of NH_3 is :

(a) high temperature and high pressure

(b) low temperature and low pressure

(c) high temperature and low pressure

(d) low temperature and high pressure

BCECE-2004

Ans. (d) : The manufacture of NH_3 takes place by the Haber's process as below:

$$N_2(g) + 3H_2(g) \rightarrow 2NH_3(g) + 22.4 \text{ kcal.}$$

Low temperature and high pressure are favourable conditions for formation of NH_3

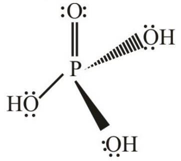
935. Which is tribasic acid ?

(a) H_3PO_2 (b) H_3PO_4

(c) $H_4P_2O_7$ (d) H_3PO_3

BCECE-2008

Ans. (b) : H_3PO_4 or phosphoric acid is a tribasic acid. It can be written as $PO(OH)_3$



936. Three reactions involving $H_2PO_4^-$ are given below–

I. $H_3PO_4 + H_2O \longrightarrow H_3O^+ + H_2PO_4^-$

II. $H_2PO_4^- + H_2O \longrightarrow HPO_4^{2-} + H_3O^+$

III. $H_2PO_4^- + OH^- \longrightarrow H_3PO_4 + O^{2-}$

In which of the above does $H_2PO_4^-$ act as an acid?

(a) II only (b) I and II

(c) III only (d) I only

BCECE-2014

Ans. (a) : $H_2PO_4^- + H_2O \rightarrow HPO_4^{2-} + H_3O^+$

in second reaction $H_2PO_4^-$ acts as on acid because acid gives H^+ in aqueous medium

$H_2PO_4^-{}_{(aq)} + H_2O_{(l)} \rightarrow H_3O^+ + HPO_4^{2-}{}_{(aq)}$

937. The product (s) formed when H_2O_2 reacts with disodium hydrogen phosphate is–

(a) P_2O_5. Na_3PO_4 (b) Na_2HPO_4. H_2O_2

(c) $NaH_2PO_4.H_2O$ (d) Na_2HPO_4. H_2O

BCECE-2014

@apna_pdf

Ans. (b) : Disodium hydrogen phosphate (Na_2HPO_4) react with hydrogen peroxide (H_2O_2) forms $Na_2HPO_4 \cdot H_2O_2$

$$Na_2HPO_4 + H_2O_2 \rightarrow Na_2HPO_4.H_2O_2$$

938. Hydrolysis of PCl_3 produces

(a) $H_3PO_3 + HCl$ (b) $H_3PO_3 + H_2O$

(c) $H_3PO_4 + HCl$ (d) $PH_3 + HClO$

BCECE-2016

Ans. (a) : $PCl_3+3H_2O \rightarrow H_3PO_3+3HCl$

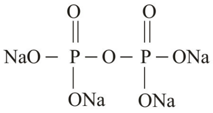
939. Sodium pyrophosphate is

(a) $Na_2P_2O_7$ (b) $Na_4P_2O_7$

(c) $NaPO_4$ (d) Na_2PO_4

[BITSAT-2008]

Ans. (b) : Sodium pyrophosphate is a salt of pyrophosphoric acid ($H_4P_2O_7$) and its chemical formula is $Na_4P_2O_7$



$$NaO-\overset{\overset{O}{\parallel}}{\underset{\underset{ONa}{|}}{P}}-O-\overset{\overset{O}{\parallel}}{\underset{\underset{ONa}{|}}{P}}-ONa$$

940. Phosphine is not obtained by the reaction

(a) White P is heated with NaOH

(b) Red P is heated with NaOH

(c) Ca_3P_2 reacts with water

(d) Phosphourus trioxide is boiled with water

[BITSAT-2011]

Ans. (b) : When red phosphorus react with NaOH, $H_4P_2O_6$ is obtained

$$P_4(Red) + NaOH \rightarrow H_4P_2O_6$$

Hence, phosphine (PH_3) is not obtained.

So, option (b) is not correct.

941. Which liberates ammonia when treated with water?

(a) Li_3N (b) Mg_3N_2

(c) $CaCN_2$ (d) All

[BITSAT-2010]

Ans. (d) : All Nitrates release NH_3 on reacting with H_2O

$Li_3N+H_2O \rightarrow LiO+NH_3$

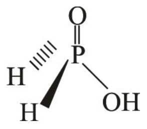
$Mg_3N_2+H_2O \rightarrow MgO+NH_3$

$CaN_2+H_2O \rightarrow CaCO_3+NH_3$

942. Formula of hypophosphorus acid is :

(a) 
(b) 
(c) 
(d) 
BCECE-2005

Ans. (a) :



Formula of hypophosphorus acid is H_3PO_2.

It is also known as monobasic acid.

943. Which of the following shows nitrogen with its increasing order of oxidation number?

(a) $NO < N_2O < NO_2 < NO_3^- < NH_4^+$

(b) $NH_4^+ < N_2O < NO_2 < NO_3^- < NO$

(c) $NH_4^+ < N_2O < NO < NO_2 < NO_3^-$

(d) $NH_4^+ < NO < N_2O < NO_2 < NO_3^-$

[BITSAT-2017]

Ans. (c) :

Compound	**O.S of N**
N_2O	+1
NO	+2
NO_2	+4
NO_3^-	+5
NH_4^+	–3

Therefore increasing order of oxidation state of N is

$$NH_4^+ < N_2O < NO < NO_2 < NO_3^-$$

944. Which of these doesn't exist?

(a) PH_3 (b) PH_5

(c) LuH_3 (d) PF_5

[BITSAT-2017]

Ans. (b) : PH_3 exists but PH_5 does not exist due to the absence of d-orbital contraction.

945. Which of the following is a strong base?

(a) PH_3 (b) AsH_3

(c) NH_3 (d) SbH_3

[BITSAT-2015]

Ans. (c) : NH_3 is a strong base the decreasing order of the basic character is $NH_3 > PH_3 > AsH_3 > SbH_3$

Basic character decreases down the group from N to Bi due to increase in atomic size.

$NH_3 > PH_3 > AsH_3 > SbH_3$

946. Phosphine is not obtained by which of the following reaction?

(a) White P is heated with NaOH.

(b) Red P is heated with NaOH.

(c) Ca_3P_2 reacts with water.

(d) None of these

[BITSAT-2021]

Ans. (b) : Phosphine is also obtained when calcium phosphide is heated with water.

$$Ca_3P_2 + 6H_2O \rightarrow 2PH_3 + 3Ca(OH)_2$$

When red phosphorus reacts with NaOH $H_4P_2O_6$ is obtained.

$P_4(Red) + NaOH \rightarrow H_4P_2O_6$

947. Hydrolysis of NCl_3 gives NH_3 and X. Which of the following is X?

(a) $HClO_4$ (b) $HClO_3$

(c) HOCl (d) $HClO_2$

[BITSAT-2021]

Ans. (c) : Hydrolysis is the process of using water to break down a molecule into two parts. If we see the word hydrolysis we can automatically think of term 'reaction with water'

@apna_pdf

The general formula of a hydrolysis reaction

$AB + H_2O \rightarrow AH + BOH$

So,

Reaction will be as follows

$NCl_3 + 3H_2O \rightarrow NH_3 + 3HOCl$

948. Which of the following has the highest pπ–pπ bonding tendency? [BITSAT-2021]

(a) N (b) P

(c) As (d) Sb

[BITSAT-2021]

Ans. (a) : Due to small size and higher electro negativity carbon has the highest tendency to form multiple bonds either with itself or with the other atoms of similar size such as oxygen and nitrogen.

949. Nitrogen is obtained by the thermal decomposition of:

(a) NH_4NO_2 (b) NH_4NO_3

(c) $AgNO_3$ (d) $Pb(NO_3)_2$

[BITSAT-2021]

Ans. (a) :

(a) $NH_4NO_2 \rightarrow N_2 + 2H_2O$

(b) $NH_4NO_3 \rightarrow N_2O + 2H_2O$

(c) $AgNO_3 \rightarrow Ag + NO_2 + \frac{1}{2}O_2$

So, nitrogen is obtained from NH_4NO_2

950. P_4O_{10} on reacting with water does not form

(a) tetrametaphosphoric acid

(b) Phosphorus acid

(c) orthophosphoric acid

(d) pyrophosphoric acid

CG PET- 2011

Ans. (b) : Phosphorus pentoxide, P_4O_{10} has great affinity for water and gives orthophosphoric acid as final product.

$$P_4O_{10} + 2H_2O\,(Cold) \rightarrow \underset{\text{Metaphosphoric acid}}{4HPO_3}$$

$$P_4O_{10} + 6H_2O(Hot) \rightarrow \underset{\text{Phosphoric acid}}{4H_3PO_4}$$

951. The bond present in N_2O_5 are

(a) only ionic

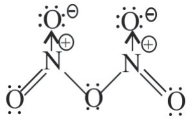
(b) covalent and coordinate

(c) only covalent

(d) covalent and ionic

CG PET- 2013

Ans. (b) : In N_2O_5, the combining atoms are nitrogen and oxygen. As both of them are non-metals. Hence, they share electrons when both of them chemically combine.



There are both covalent and coordinate bonds.

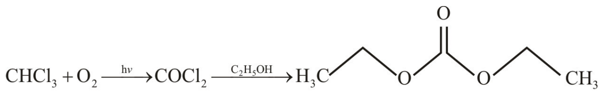
952. The compound added to prevent chloroform to form phosgene gas (poisonous gas) is

(a) CH_3COOH (b) CH_3OH

(c) CH_3COCH_3 (d) C_2H_5OH

CG PET -2007

Ans. (d) : Chloroform in presence of atmospheric oxygen, gets converted to poisonous gas phosgene ($COCl_2$). In order to prevent this oxidation, alcohol is added which converts phosgene to alkyl carbonate.



953. The element which liberates oxygen gas from water is

(a) P (b) Na

(c) F (d) I

CG PET -2007

Ans. (c) : Fluorine liberates oxygen gas from water.

$2F_2 + 2H_2O \rightarrow 4HF + O_2$.

954. Very dilute nitric acid reacts with zinc to form zinc nitrate and

(a) ammonium nitrate (b) NO_2

(c) NO (d) N_2O

CG PET -2007

Ans. (a) : Zinc, reacts with very dilute nitric acid gives zinc nitrate and ammonium nitrate.

$[Zn + 2HNO_3 \longrightarrow Zn(NO_3)_2 + 2H] \times 4$

$HNO_3 + 8H \rightarrow NH_3 + 3H_2O$

$NH_3 + HNO_3 \rightarrow NH_4NO_3$

$4Zn + 10HNO_3 \rightarrow 4Zn(NO_3)_2 + NH_4NO_3 + 3H_2O$

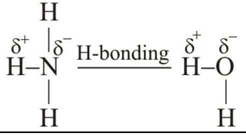
955. Which of the following exhibits highest solubility in water?

(a) NH_3 (b) PH_3

(c) AsH_3 (d) SbH_3

CG PET -2007

Ans. (a) : Compounds which forms inter molecular hydrogen bond with water is supposed to be soluble in water. NH_3 forms inter molecular hydrogen bond with water, so it is exhibits highest solubility in water.



956. $NaOH + P_4 + H_2O \longrightarrow ?$

(a) $PH_3 + NaH_2PO_2$ (b) $PH_3 + Na_2PO_4$

(c) $PH_3 + Na_2HPO_2$ (d) $H_3PO_4 + NaO$

BCECE-2004

Ans. (a) : : $NaOH + P_4 + H_2O \rightarrow PH_3 + NaH_2PO_2$

957. The passivity of iron in concentrated nitric acid is due to

(a) ferric nitrate coating on the metal

(b) ammonium nitrate coating on the metal

(c) a thin oxide layer coating on the metal

(d) a hydride coating on the metal

CG PET -2004

Ans. (c) : When iron reacts with concentrated HNO_3, a thin oxide layer is formed on the metal surface. So, iron become passive.

@apna_pdf

958. When heated NH_3 is passed over CuO gas evolved is :

(a) N_2 (b) N_2O
(c) HNO_3 (d) NO_2

BCECE-2005

Ans. (a) : When ammonia is heated and passed over solid copper (II) oxide at high temperatures nitrogen gas is forms. This N_2 is not pure as it would be in the heating of NaN_3 like compounds.

$$2NH_3(g)+3CuO(s) \rightarrow N_2(g)+3Cu(s)+3H_2O(g)$$

959. In the following reaction

$$P_4+3NaOH+3H_2O \rightarrow PH_3+3NaH_2PO_2$$

(a) phosphorus is oxidised
(b) phosphorus is oxidised and reduced
(c) phosphorus is reduced
(d) sodium is oxidised

CG PET -2004

Ans. (b) :

$$\overset{(0)}{P_4}+3NaOH+3H_2O \rightarrow \overset{(-3)}{PH_3}+3NaH_2\overset{(+1)}{P}O_2$$

Rcduction

oxidation

960. The formula of phosphate of a metal, M is MPO_4. The formula of its nitrate will be

(a) MNO_3 (b) $M(NO_3)_2$
(c) $M(NO_3)_3$ (d) $M_2(NO_3)_3$

CG PET -2006, 2004

Ans. (c) : In MPO_4 the oxidation state of M is +3. So, the formula of nitrate is $M(NO_3)_3$.

961. In the mixture of conc. H_2SO_4 and HNO_3 the nitration species is

(a) N_2O_4 (b) NO_2^+
(c) NO_2 (d) NO_2^-

CG PET -2005

Ans. (b) : $H_2SO_4+HNO_3 \rightarrow H_2NO_3^++H_5O_4^-$

$$H_2NO_3^+ \rightarrow H_2O+NO_2^+$$

The electrophile in nitration of benzene is nitronium ion (NO_2^+).

962. A deep brown gas is formed by mixing two colourless gases which are

(a) NO_2 and O_2 (b) N_2O and NO
(c) NO and O_2 (d) NH_3 and HCl

CG PET -2005

Ans. (c) : The chemical name of the deep coloured brown gas is nitrogen dioxide (NO_2).
NO_2 is acidic in nature and gives anhydrides of nitric and nitrous oxide which are brown in colour.

$$\underset{\text{Nitric oxide}}{2NO}+\underset{\text{oxygen gas}}{O_2} \longrightarrow \underset{\text{Nitrogen di-oxide}}{2NO_2}\text{ (Brown gas)}$$

Colourless gases : – NO and O_2

963. Which of the following, on heating with ammonia gives urotropin?

(a) Formaldehyde (b) Acetaldehyde
(c) Acetone (d) Benzaldehyde

CG PET -2006

Ans. (a) : When formaldehyde reacts with ammonia, a well known urinary antiseptic urotropine (also called hexamethylenentetramine) is obtained.

$$6HCHO+4NH_3 \rightarrow (CH_2)_6N_4+4H_2O$$

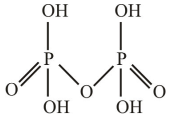
Hence, Urotropine is formed by the action of Ammonia on Formaldehyde.

964. Which is the correct options for bonds and their number in pyrophosphoric acid ?

(a) Two P–OH, Four P = O, One P–O–P
(b) Four P–OH, One P = O, One P–O–P
(c) Two P–OH, Four P = O, Two P–O–P
(d) Four P–OH, Two P = O, One P–O–P

GUJCET-2022

Ans. (d): Pyrophosphoric Acid–Pyrophosphate is the conjugate base of Pyrophosphoric acid and is corrosive as well as toxic in nature. Pyrophosphoric acid is a medium-strong inorganic hygroscopic by nature and is a colourless as well as odourless chemical.



P–OH = 4
P=O = 2
P–O–P =1

965. Concentrated HNO_3 oxidize white phosphorus into which substance?

(a) H_3PO_2 (b) $H_4P_2O_7$
(c) H_3PO_4 (d) H_3PO_3

GUJCET-2020

Ans. (c) : Concentrated nitric acid oxidises phosphorus to phosphoric acid according to the following equation–

$$P+5HNO_3 \rightarrow H_3PO_4+5NO_2+H_2O$$

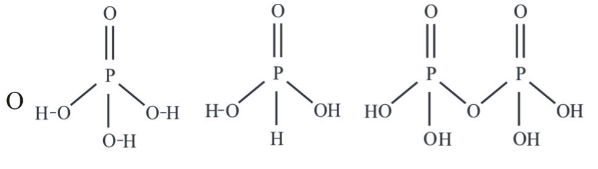
966. In which of the following acid, the maximum number of hydrogen atoms are joined directly with phosphorous?

(a) Phosphoric acid (b) Phosphorous acid
(c) Pyrophsphoric acid (d) Phosphonic acid

GUJCET-2017

Ans. (b) : Phosphoric acid; H_3PO_4
Phosphorus acid; H_3PO_3
Pyrophosphoric acid; $H_4P_2O_7$

So, in H_3PO_3, one Hydrogen atom is attached to phosphorus directly.



H_3PO_4 H_3PO_3 $H_4P_2O_7$

967. Which of the following hydride is the most stable?

(a) PH_3 (b) SbH_3
(c) NH_3 (d) AsH_3

GUJCET-2019

@apna_pdf

Ans. (c) : The stability of hydride decreases from N to Bi. SO, NH_3 most stable

NH_3 is the most stable hydride among the hydrides of group 15 elements, because the strength of E–H (Here E = N, P, As, Sb or Br) bond decreases down the group due to increase in the size of the central atom.

968. Which product will be obtained in the following reaction?

Reaction : $P_4(g) + 3NaOH(aq) + 2H_2O(l) \rightarrow$

(a) $PH_3(g) + 3Na_2HPO_2(aq)$

(b) $PH_3(g) + 3NaH_2PO_2(aq)$

(c) $2PH_3(g) + 3Na_2HPO_2(aq)$

(d) $2PH_3(g) + 3NaH_2PO_2(aq)$

GUJCET-2016
GUJCET-2015

Ans. (b) :

$$P_4(g) + 3NaOH(aq) + 2H_2O(l) \rightarrow PH_3(g) + \underset{\text{(Sodium hypophosphite)}}{3NaH_2PO_2(aq)}$$

In above reaction:–

- Phosphorus is oxidized
- Phosphorus is reduced

This reaction is used for the preparation of phosphine gas in the laboratory.

969. For the hydrides of nitrogen family, in going down the group :

(a) Stability decreases
(b) Reducing activity decreases
(c) Bond angle HEH increases
(d) Boiling point increases

HP CET-2018

Ans. (a) : (increases / decreases)

$$[NH_3 >> PH_3 > AsH_3 > SbH_3 >> BiH_3]$$

Moving down the group

→Increases size of atom

→ Metallic character increases

Acid → H^+	(N) ——— H
Basic → OH^-	(P) ——— H
	(As) ——— H
Basic character↑	Basic character↓

970. PCl_3 and PCl_5 both exist; NCl_3 exists but NCl_5 does not exist. It is due to

(a) lower electronegativity of P than N
(b) lower tendency of N to form covalent bond
(c) availability of vacant d-orbital in P but not in N
(d) statement is itself incorrect

(AIEEE 2002)

Ans. (c) : PCl_3 and PCl_5 both exist and NCl_3 exist but NCl_5 does not exist. It is due to in Nitrogen, vacant d-orbitals are not available.

But in case of phosphorous vacant 3d–orbitals are available.

971. In which of the following arrangements, the sequence is not strictly according to the property written against it?

(a) $CO_2 < SiO_2 < SnO_2 < PbO_2$: increasing oxidising power
(b) HF < HCl < HBr < HI : increasing acid strength
(c) $NH_3 < PH_3 < AsH_3 < SbH_3$: increasing basic strength
(d) B < C < O < N : increasing first ionisation enthalpy

(AIEEE 2009)

Ans. (c) : The correct increasing basic strength

$SbH_3 < AsH_3 < PH_3 < NH_3$

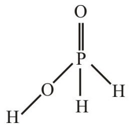
NH_3 is most basic because of its small size, the electron density of electron pair is concentrated over small region.

972. Good reducing nature of H_3PO_2 is attributed to the presence of

(a) two P–H bonds
(b) one P–H bond
(c) two P–OH bonds
(d) one P–OH bond

(JEE Main 2019, 9 Jan Shift-II)

Ans. (a) : The structure of H_3PO_2 (hypophosphorous) acid is,



H_3PO_2 is good reducing agent due to presence of two P–H bonds.

973. The metal that forms nitride by reacting directly with N_2 of air, is

(a) Rb
(b) K
(c) Cs
(d) Li

(JEE Main 2019, 9 Jan Shift-II)

Ans. (d) : Only Li react directly with N_2 out of alkali metals

$4Li + O_2 \rightarrow 2Li_2O$

$6Li + N_2 \rightarrow 2Li_3N$

974. The pair that contains two P–H bonds in each of the oxoacids is

(a) $H_4P_2O_5$ and $H_4P_2O_6$
(b) H_3PO_3 and H_3PO_2
(c) $H_4P_2O_5$ and H_3PO_3
(d) H_3PO_2 and $H_4P_2O_5$

(JEE Main 2019, 10 Jan Shift-II)

Ans. (d) : Before solving this question, we should know what oxoacids are, as the name suggest, oxoacids are the acids that contain oxygen. All the oxoacids of phosphorus have one P–OH bond and one P=O bond. They have different oxidation states. It these cases the oxidation state of phosphorus is less than +5.

975. The compound that does not produce nitrogen gas by the thermal decomposition is

(a) $Ba(N_3)_2$
(b) $(NH_4)_2Cr_2O_7$
(c) NH_4NO_2
(d) $(NH_4)_2SO_4$

(JEE main 2018)

Ans. (d) : $(NH_4)_2Cr_2O_7 \xrightarrow{\Delta} N_2 + 4H_2O + Cr_2O_3$

$NH_4NO_2 \xrightarrow{\Delta} N_2 + 2H_2O$

$(NH_4)_2SO_4 \xrightarrow{\Delta} 2NH_3 + H_2SO_4$

@apna_pdf

$$Ba(N_3)_2 \xrightarrow{\Delta} Ba + 3N_2$$

Among all the given compounds, only $(NH_4)_2SO_4$ does not form dinitrogen on heating, it produces ammonia gas.

976. The species in which the N-atom is in a state of sp hybridisation is

(a) NO_2^- (b) NO_3^-

(c) NO_2 (d) NO_2^+

(JEE main 2016)

Ans. (d) : The hybridization of NO_2^+ is sp hybridisation. It is a linear molecule. NO_2^-, NO_3^- and NO_2 does not have sp hybridization.

$$NO_2^- \rightarrow n = \frac{1}{2}(5+0+1)$$
$$= \frac{1}{2}\times 6 = 3$$
$$= sp^2$$
$$NO_3^- \rightarrow n = \frac{1}{2}(5+0+1)$$
$$= sp^2$$
$$NO_2^+ \rightarrow n = \frac{1}{2}(5+0-1)$$
$$= sp$$
$$[:\ddot{O}=N=\ddot{O}:]^+$$

Therefore, the correct option is (d).

977. The pair in which phosphorus atoms have a formal oxidation state of +3 is

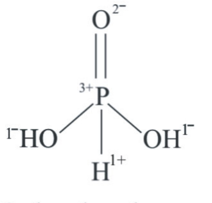
(a) pyrophosphorus and hypophosphoric acids
(b) orthophosphorus and hypophosphoric acids
(c) phrophosphorus and pyrophosphoric acids
(d) orthophosphorus and pyrophosphorous acids

(JEE Main 2016)

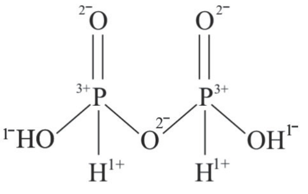
Ans. (d) : Orthophosphorus and pyrophosphorous acids have a formal oxidation state of +3 for phosphorous atoms.

In $H_3PO_3 \Rightarrow 3\times1 + x + (-2\times3)$
$\Rightarrow 3 + x - 6 = 0$
$\Rightarrow x = 6 - 3$
$\Rightarrow x = 3$

In $H_4P_2O_5 \Rightarrow 4\times1 + x\times2 + (-2\times5) = 0$
$\Rightarrow 4 + 2x - 10 = 0$
$\Rightarrow 2x = 6$
$\Rightarrow x = 3$



Ortho phosphorus acid



Pyrophosphorus acid

Hence, the correct option is (d).

978. Which one of the following properties is not shown by NO?

(a) It is diamagnetic in gaseous state
(b) It is a neutral oxide
(c) It combines with oxygen to form nitrogen dioxide
(d) Its bond order is 2.5

(JEE main 2014)

Ans. (a) : NO is nitric oxide . NO reacts with O_2 to form NO_2. This reaction is used to prepare NO2 and give as,

$$2NO + O_2 \rightarrow 2NO_2$$

- An anti bonding orbital of NO has one unpaired electron and so, it is paramagnetic in nature.
- The bond order of NO is calculated as $\frac{8-3}{2} = \frac{5}{2} = 2.5$

So, option (a) is wrong.

979. Which of the following statements is wrong?

(a) The stability of hydrides increases from NH_3 to BiH_3 in group 15 of the periodic table
(b) Nitrogen can't form dπ-pπ bond
(c) Single N–N bond is weaker than the single P–P bond
(d) N_2O_4 has two resonance structure

(AIEEE 2011)

Ans. (a) : Thermal stability of the hydrides decrease as we go down the group in the periodic table for group 15 (N–family)

$BiH_3 < SbH_3 < AsH_3 < PH_3 < NH_3$

Least stable Most stable

(b) Due to absence of d–orbital, nitrogen can't form dπ–pπ; thus it is correct.

(c) The N–N bond (B.E 160 KJ mol^{-1}) is weaker than P–P bond (BE 209 KJ mol^{-1}). Thus, it is correct.

(d) N_2O_4 can form two resonance structure thus it is also correct.

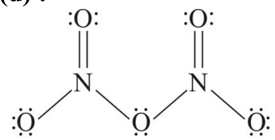
980. The oxide without nitrogen-nitrogen bond is

(a) N_2O (b) N_2O_4

(c) N_2O_3 (d) N_2O_5

(JEE Main 2021, 1 Sep Shift-II)

Ans. (d) :



N_2O_5 does not contain any N – N bonds

981. Which one of the following is formed (mainly) when red phosphorus is heated in a sealed tube at 803 K?

(a) White phosphorus
(b) Yellow phosphorus
(c) β- black phosphorus
(d) α- black phosphorus

(JEE Main 2021, 27 Aug Shift-II)

Ans. (d) : When red phosphorus is heated in a sealed tube at 803K, α- black phosphorus is formed.

@apna_pdf

$$\text{Red phosphorous}\ \xrightarrow[\text{high p.}]{473K} \beta-\underset{\text{(Rhombohedral)}}{\text{black phosphorous}}$$

$$\text{Red phosphorous}\ \xrightarrow[\text{sealed tube}]{803K} \alpha-\underset{\text{(monoclinic)}}{\text{black phosphorous}}$$

982. The oxidation states of 'P' in $H_4P_2O_7$, $H_4P_2O_5$ and $H_4P_2O_6$ respectively are

(a) 7, 5 and 6 (b) 5, 4 and 3
(c) 5, 3 and 4 (d) 6, 4 and 5

(JEE Main 2021, 27 July Shift-I)

Ans. (c) : Oxidation states of 'P' in $H_4P_2O_7$, $H_4P_2O_5$ and $H_4P_2O_6$ is 5, 3 & 4 respectively

$H_4P_2O_7$
$2x + 4(+1) +7(-2) = 0$
$x = +5$
$H_4P_2O_5$
$2x + 4(+1) +5(-2) = 0$
$x = +3$
$H_4P_2O_6$
$2 x + 4(+1) +6(-2) = 0$
$x = +4$

983. Which one of the following group-15 hydride is the strongest reducing agent?

(a) AsH_3 (b) BiH_3
(c) PH_3 (d) SbH_3

(JEE Main 2021, 22 July Shift-II)

Ans. (b) : Among 15th group hydrides, BiH_3 is strongest reducing agent because Bi–H bond dissociation energy is very less.

984. Chemical nature of the nitrogen oxide compound obtained from a reaction of concentrated nitric acid and P_4O_{10} (in 4:1 ratio) is

(a) acidic (b) basic
(c) amphoteric (d) neutral

(JEE Main 2021, 20 July Shift-I)

Ans. (a) : $4HNO_3 + 1P_4O_{10} \longrightarrow 2N_2O_5 + (HPO_3)_4$
Nitric acid
N_2O_5 — Dinitrogen pentoxide
(acidic in nature)

985. Regular use of which of the following fertilizers increases the acidity of soil?

(a) Potassium nitrate
(b) Urea
(c) Superphosphate of lime
(d) Ammonium sulphate

(AIEEE 2007)

Ans. (d) : Regular use of ammonium sulphate increases the acidity of soil.

$(NH_4)_2\ SO_4$ is a salt of strong acid and weak base on hydrolysis it will produce H^+ ion.

$$NH_4^+ + H_2O \rightleftharpoons NH_4OH + H^+$$

$(NH_4)_2\ SO_4 \rightarrow 2NH_3 + H_2SO_4$

To prevent acidity, slaked lime is added to neutralize the acid.

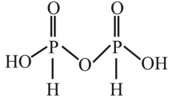
986. The number of ionisable hydrogens present in the product obtained from a reaction of phosphorus trichloride and phosphonic acid is

(a) 3 (b) 0
(c) 2 (d) 1

(JEE Main 2021, 18 March SHift-I)

Ans. (c) : $PCl_3 + H_3PO_3 + H_2O \rightarrow H_4P_2O_5 + HCl$

Pyrophosphrous acid



The structure of pyrophosphrous acid shows that it has two acidic or ionisable hydrogen.

987. The set that represents the pair of neutral oxides of nitrogen is

(a) NO and N_2O (b) N_2O and N_2O_3
(c) N_2O and NO_2 (d) NO and NO_2

(JEE Main 2021, 17 March Shift-II)

Ans. (a) : NO and N_2O are neutral oxides while N_2O_3, NO_2 and N_2O_5 are acidic oxides. Neutral oxides are those oxides which show neither basic nor acidic properties when they react with water.

988. Which of the following compound cannot act as Lewis base?

(a) NF_3 (b) PCl_5
(c) SF_4 (d) CIF_3

(JEE Main 2021, 17 March Shift-I)

Ans. (b) : Lewis base– Chemical species which has capability to donate electron pair. In NF_3, SF_4, ClF_3 having lone pair therefore act as Lewis base.

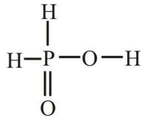
NF_3 has no vacant orbital neither in nitrogen nor in fluorine so it cannot accept the electron and hence, cannot act as Lewis acid but for PCl_5 has no L.P. Hence, it cannot acts as a base but ClF_3 (3B.P +2C.P) & SF_4(4 B.P +1 L.P).

989. The number hydrogen atom(s) attached to phosphorus atom in hypophosphorous acid is

(a) Three (b) one
(c) two (d) zero

(AIEEE 2005)

Ans. (c) : Molecular formula of Hypophosphorous acid is H_3PO_2.



Hypophosphorus acid (H_3PO_2) is monobasic acid and has only one ionisable H, two H-atoms are directly attached to phosphorus.

990. A group 15 element, which is a metal and forms a hydride with strongest reducing power among group 15 hydrides. The element is

(a) Sb (b) P
(c) As (d) Bi

(JEE Main 2021, 16 March Shift-I)

Ans. (d) : $\left.\begin{matrix}N\\P\end{matrix}\right]$ —— Non metal

$\left.\begin{matrix}As\\Sb\end{matrix}\right]$ —— Metalloid

$\left.Bi\right]$ —— Metal

@apna_pdf

Hydrides of group 15 elements are NH_3, PH_3, AsH_3, SbH_3, BiH_3 in NH_3, hydrogen atom gets partial positive charge due to less electronegativity.
But in BiH_3, hydrogen atom gets partial negative charge because hydrogen is more electronegative than bismuth. i.e. BiH_3 is a strong reducing agent than others because we know that H^- is a strong reducing agent.

991. Find A, B and C in the following reactions:
$NH_3 + A + CO_2 \rightarrow (NH_4)_2CO_3$
$(NH_4)_2CO_3 + H_2O + B \rightarrow NH_4HCO_3$
$NH_4HCO_3 + NaCl \rightarrow NH_4Cl + C$
(a) A–O_2, B–CO_2, C–Na_2CO_3
(b) A–H_2O, B–O_2, C–Na_2CO_3
(c) A– H_2O, B–O_2, C–$NaHCO_3$
(d) A– H_2O, B–CO_2, C–$NaHCO_3$

(JEE Main 2021, 26 Feb Shift-I)

Ans. (d) : $2NH_3 + \underset{(A)}{H_2O} + CO_2 \rightarrow (NH_4)_2CO_3$

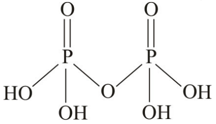
$(NH_4)_2 CO_3 + H_2O + \underset{(B)}{CO_2} \rightarrow 2NH_4 HCO_3$

$NH_4HCO_3 + NaCl \rightarrow \underset{(C)}{NaHCO_3} + NH_4Cl$

992. In a molecule of pyrophosphoric acid, the number of P–OH, P = O and P–O–P bonds/moiety(ies) respectively are
(a) 2, 4 and 1 (b) 3, 3, and 3
(c) 4, 2, and 0 (d) 4, 2, and 1

(JEE Main 2020, 3 Sep Shift-I)

Ans. (d) H_4P_2O (pyrophosphoric acid)



P – OH bonds = 4
P = O bonds = 2
P – O – P linkage = 1

So, option (d) is correct.

993. Reaction of ammonia with excess Cl_2 gives
(a) NH_4Cl and N_2 (b) NH_4Cl and HCl
(c) NCl_3 and NH_4Cl (d) NCl_3 and HCl

(JEE Main 2020, 5 Sep Shift-II)

Ans. (d) : Pure chlorine gas may react vigorously with ammonia gas. An excessive mix of the two gases in air can produce hazardous compounds such as nitrogen trichloride.
The following reaction takes place.
$NH_3 + 3Cl_2 \rightarrow NCl_3 + 3HCl$
Ammonia reacts with excess of chlorine to form NCl_3 and HCl.

994. The correct statement with respect to dinitrogen is
(a) N_2 is paramagnetic in nature.
(b) it can combine with dioxygen at 25^0C.
(c) liquid dinitrogen is not used in cryosurgery
(d) it can be used as an inert diluent for reactive chemicals.

(JEE Main 2020, 6 Sep Shift-I)

Ans. (d) : (a) $N_2=14e^-$.
It has unpaired e^- in its bonding and antibonding molecule then it is paramagnetic.
(b) $N_2+O_2 \rightarrow 2NO$
(c) Cryosurgery – Extreme cold to destroy abnormal liq. N_2 used to freeze cancer cell. So, used in cryosurgery.
(d) In iron and chemical industry inert diluents for reactive chemicals.

995. The reaction of NO with N_2O_4 at 250 K gives
(a) N_2O (b) NO_2
(c) N_2O_3 (d) N_2O_5

(JEE Main 2020, 6 Sep Shift-II)

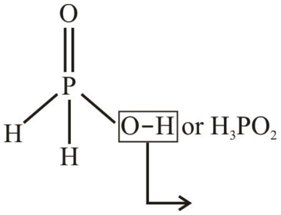
Ans. (c) : $2NO + N_2O_4 \xrightarrow{250K} 2N_2O_3$ (blue solid)

996. White phosphorus on reaction with concentrated HaOH solution in an inert atmosphere of CO_2 gives phosphine and compound (X). (X) on acidification with HCl gives compound (Y). The basicity of compound (Y). The basicity of compound (Y) is
(a) 4 (b) 3
(c) 2 (d) 1

(JEE Main 2020, 8 Jan Shift-II)

Ans. (d) : The basicity of compound Y is 1.

$$\begin{tikzcd} P_4+NaOH+H_2O \arrow[r] & PH_3+NaH_2PO_2 \arrow[d, "HCl"] \\ & H_3PO_2 \end{tikzcd}$$



Only one ionisable H ions are there in it.

$\boxed{\text{Basicity} = 1}$

997. Ammonia forms the complex ion $[Cu(NH_3)_4]^{2+}$ with copper ions in the alkaline solutions but not in acidic solutions. What is the reason for it?
(a) In acidic solutions, hydration protects copper ions
(b) In acidic solutions, protons coordinate with ammonia molecules forming NH_4^+ ions and N its molecules are not available
(c) In alkaline solutions, insoluble $(Cu(OH)_2$ is precipitated which is soluble in excess of any alkali
(d) Copper hydroxide is an amphoteric substance

(AIEEE 2003)

Ans. (b) : In acidic solutions protons coordinate with ammonia molecules forming NH_4^+ ions and NH_3 molecules are not available.
In acidic solution, N atoms of NH_3 donates forming NH_4^+ ions.
Therefore, lone pair electrons of NH_3 are not available for forming the complex with copper ions.

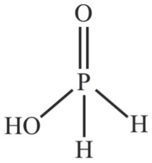
@apna_pdf

998. The oxyacid of phosphorous which is reducing nature, among the following is

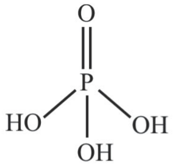
(a) Orthophosphoric acid
(b) Mtetaphosphoric acid
(c) Pyrophosphoric acid
(d) Phosphinic acid.

J & K CET-(2016)

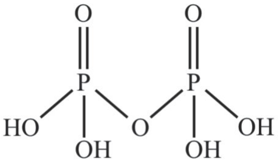
Ans. (d) :



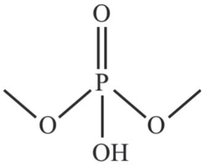
Phosphoric acid(H_3PO_2)



Orthophosphoric acid(H_3PO_4)



Pyrophosphoric acid($H_4P_2O_7$)



Metaphosphoric acid$(HPO_3)_n$

999. Who has synthesised the organic compound 'urea' for the first time?

(a) Friedrich Wohler
(b) Berzelius
(c) Kolbe
(d) Berthelot

J & K CET-(2014)

Ans. (a) : German chemist Friedrich Wholer prepared urea in a laboratory in 1828 form ammonium cyanate.

$$NH_4CNO \rightarrow (H_2N)2CO$$

This was the first time an organic compound was artificially synthesized from inorganic starting materials, without the involvement of living organisms.

1000. Phosphorus pentoxide (P_2O_5) is the starting material for phosphate esters used as surfactants and extraction agents. P_2O_5 is extensively used as.

(a) reducing agent
(b) preservative
(c) oxidizing agent
(d) dehydrating agent

J & K CET-(2017)

Ans. (d) : P_2O_5 is powerful dehydrating agent.

$$4HNO_3 + P_4O_{10} \rightarrow 2N_2O_5 + 4HPO_3$$
$$2H_2SO_4 + P_4O_{10} \rightarrow 2SO_3 + 4HPO_3$$
$$4HClO_4 + P_4O_{10} \rightarrow 2Cl_2O_7 + 4HPO_3$$

1001. What will be the resultant products formed when the phosphorus halide PBr_5 splits up?

(a) $[PBr_4]^+$ and Br^-
(b) $[PBr_6]^-$ and $[PBr_4]^+$
(c) $[PBr_4]^+$
(d) $[PBr_6]^-$

J & K CET-(2018)

Ans. (a) : $PBr_5 \rightleftharpoons [PBr_4]^+ [Br^-]$

1002. An organic compound A is oxidised with Na_2O_2 followed by boiling with HNO_3. The resultant solution is then treated with ammonium molybdate to yield a yellow precipitate.
Based on above observation, the element present in the given compound is

(a) nitrogen
(b) phosphorus
(c) fluorine
(d) sulphur

(JEE Main 2019, 12 April Shift-I)

Ans. (b) : Phosphorus is detected in the form of yellow ppt (precipitate) of ammonium phosphate molybdate on reaction with ammonium molybdate.
The solution is boiled with nitric acid and then treated with ammonium molybdate to produced conary yellow precipitate.

$Na_3+PO_4+3HNO_3 \rightarrow H_3PO_4 + 3Na\,NO_3$

$H_3PO_4+ 12\,(NH_4)_2\,MoO_4+ 21\,HNO_3 \rightarrow (NH_4)_3$

$\downarrow$ $PO_4.12MoO_3\downarrow+21NH_4NO_3+12H_2O$

(Ammonium
molybdate)

1003. Which of the following statements about liquid nitrogen is true?

(a) It is unreactive.
(b) it is used in cryosurgery.
(c) It does not decompose organic compounds.
(d) It is very stable.

J & K CET-(2010)

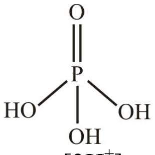
Ans. (b) : It is used in cryosurgery removal of cancer and skin lesions. It is used as a part of the medical gas mixture for lung function test.

1004. Which of the following is a tribasic acid?

(a) H_3PO_4
(b) $H_4P_2O_7$
(c) $H_4P_2O_7$
(d) $H_4P_2O_6$

J & K CET-(2005)

Ans. (a) : Basicity of an Acid– No. of replacable H^+ ion Orthophosphoric acid or phosphoric acid H_3PO_4 is tribasic acid.



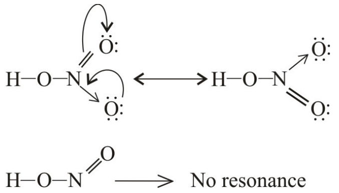
$[3H^+]$

1005. Which of the following statements is true?

(a) H_3PO_3 is a stronger acid than H_2SO_3
(b) In aqueous medium, HF is a stronger acid than HCl
(c) $HClO_4$ is weaker acid than $HClO_3$
(d) HNO_3 is a stronger acid than HNO_2

(AIEEE 2006)

Ans. (d) : Resonance stabilization is done in conjugate base of HNO_3 and not in HNO_2. Hence, HNO_3 is stronger acid than HNO_2



@apna_pdf

1006. Which of the following pentafluorides can't be formed?

(a) PF_5 (b) AsF_5

(c) SbF_5 (d) BiF_5

J & K CET-(2003)

Ans. (d) : Bismuth due to inert pair effect exists with only +3 oxidation state. +5 oxidation state is uncommon for Bi. So, bismuth does not form pentahalide.

1007. Which of the following is metaphosphoric acid?

(a) $H_3P_3O_9$ (b) $H_5P_3O_{10}$

(c) $H_9P_2O_7$ (d) H_3PO_4

J & K CET-(2002)

Ans. (a) : $3HPO_3 \Rightarrow (HPO_3)_3 \Rightarrow$ Trimetaphosphoric acid $\Rightarrow H_3P_3O_9$

1008. Which of the following non-metal possesses the atomicity double than that of phosphorus?

(a) oxygen (b) sulphur

(c) nitrogen (d) arsenic

J & K CET-(2001)

Ans. (b) : Atomicity is defined as the total number of atoms present in a molecule.

Sulphur – S_8 – 8

$\therefore$ S > P > N = O

1009. Anomalous behavior of nitrogen is due to

(a) small size and high electronegativity

(b) non-availability of d-orbitals in the valency shell

(c) ease of multiple bond formation

(d) all of the above

J & K CET-(2000)

Ans. (d) : Nitrogen differs from other members of the group due to its smaller size, high electronegativity, high IE and non availability of d-orbitals. Nitrogen has unique ability to form $P\pi–P\pi$ multiple bonds with itself and with other elements having small size and high electronegativity. Generally, electronegativity decreases down the group with increase in atomic size.

1010. Which of the following oxides of nitrogen is the anhydride of nitrous acid?

(a) NO (b) N_2O_3

(c) N_2O_4 (d) N_2O_5

J & K CET-(1999)

Ans. (b) : Two oxides of nitrogen are acid anhydrides, that is, they react with water to form nitrogen-

$N_2O_3 \rightarrow 2HNO_2$

Containing oxyacids, Dinitrogen trioxide (N_2O_3) is the anhydride of nitrous acid, HNO_2, and dinitrogen pentoxide (N_2O_5) is the anhydride of nitric acid HNO_3.

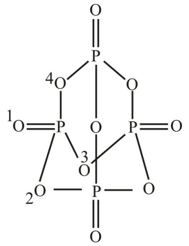
1011. In P_4O_{10} the number of oxygen atoms bonded to each phosphorus atom is

(a) 2.5 (b) 3

(c) 4 (d) 5

J & K CET-(1998)

Ans. (b) :



1012. Ammonia can be dried by

(a) conc. H_2SO_4 (b) P_2O_5

(c) anhydrous $CaCl_2$ (d) none of the above

J & K CET-(1998)

Ans. (d) : Both sulphuric acid and phosphorous pentoxide react with ammonia, since they are acidic. Anhydrous copper sulphate is not a drying agent.

1013. Oxidation state of phosphorus in pyrophosphoric acid is :

(a) +5 (b) +3

(c) +4 (d) +1

JCECE - 2006

Ans. (a) : Pyrophosphoric acid $H_4P_2O_7$

Let oxidation state of phosphorus is x

$[4 \times 1 + (-2) \times 7 + 2x] = 0$

$2x = 10$

$x = +5$

1014. Kjedahl's method can be used for estimation of nitrogen in

(a) $C_6H_5NO_2$ (b) pyridine

(c) $C_6H_5—N{=}N—C_6H_5$ (d) $C_6H_5NH_2$

JCECE - 2011

Ans. (d) : In nitro or azo compounds or cyclic compounds (in which nitrogen is a part of ring), nitrogen is not completely converted into $(NH_4)_2SO_4$ during digestion. Thus, Kjeldahl's method does not work on such compounds.

1015. Ammonia will not form complex with

(a) Ag^{2+} (b) Pb^{2+}

(c) Cu^{2+} (d) Cd^{2+}

JCECE - 2012

Ans. (b) : Generally d-block elements form complex and lead is a p-block element.

1016. The maximum covalency of nitrogen is

(a) 3 (b) 4

(c) 5 (d) 6

JCECE - 2013

Ans. (b) : Nitrogen does not possess d-orbitals in its valence shell (n = 2). It can have 8 electrons maximum. Therefore, nitrogen cannot extend its covalency beyond 4.

1017. The number of σ-bons in P_4O_{10} is

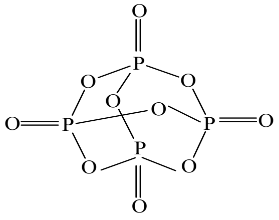
(a) 6 (b) 16

(c) 20 (d) 7

JCECE - 2014

@apna_pdf

Ans. (b) : The number of σ-bonds in P_4O_{10} is 16. There are also 4 π-bonds present in P_4O_{10} molecule.



P_4O_{10} molecule

1018. In Ostwald's process ……………. is used as catalyst.

(a) Ni (b) Pt

(c) Fe (d) V_2O_5

JCECE – 2018, BCECE-2005

Ans. (b) : In Ostwald's process, Pt (platinum) is used as catalyst. This process is used to manufacture nitric acid (HNO_3). Platinum is used to oxidise ammonia by heating with oxygen to form nitric oxide. This reaction is highly exothermic.

$$4NH_3(g) + 5O_2(g) \xrightarrow{Pt} 4NO(g) + 6H_2O(g)$$

1019. $4HNO_3 + P_4O_{10} \rightarrow 4HPO_3 + X$, X is

(a) N_2O_3 (b) N_2O_4

(c) N_2O (d) N_2O_5

JCECE - 2018

Ans. (d) : The X in the reaction is N_2O_5 complete equation is as follows:

$$4HNO_3 + P_4O_{10} \longrightarrow 4HPO_3 + 2N_2O_5$$

This reaction is used to prepare HPO_3, which is formed by the dehydration of HNO_3 with P_4O_{10}.

1020. Which of the following oxide is most acidic?

(a) As_2O_3 (b) P_2O_5

(c) Sb_2O_3 (d) Bi_2O_3

JIPMER-2017

Ans. (b) : More the positive oxidation state of a non – metallic oxide more is its acidic nature. It is very clear that P_2O_5 is the only compound with 5 oxygen atoms, P is going to be in the highest oxidation state.

1021. Which of the following fluorides does not exist?

(a) NF_5 (b) PF_5

(c) AgF_5 (d) SbF_5

JIPMER-2011

Ans. (a) : NF_5 does not exist because N does not form pentahalides due to the absence of d– orbital in its valence shell.

While P, As and sb form pentahalides of the general formula MX_5 (where, M = P, As and Sb) due to the presence of vacant d–orbitals in their respective valence shell.

1022. Yellow phosphorus is kept in

(a) water (b) kerosene

(c) ether (d) alcohol

JIPMER-2004

Ans. (a) : White phosphorus reacts very fast with atmospheric oxygen and catches fire yellow phosphorus was being used in the manufacture of Lucifer matches. So, phosphorus (white or yellow) is kept preserved in water.

1023. Which of the following acids is monobasic?

(a) H_3PO_3 (b) H_3PO_2

(c) H_2SO_3 (d) H_3PO_4

JIPMER-2004

Ans. (b) : The basicity depends on the number of the ionisable hydrogen atom H_3PO_3 contains 2 ionisable hydrogen atom. H_3PO_2(hypophosphorus acid) is a monobasic acid. It gives only one type of salt e.g.NaH_2PO_2

1024. In which of the following, oxidation state of phosphorous is + 3?

(a) Orthophosphoric acid

(b) Pyrophosphoric acid

(c) Orthophosphorous acid

(d) Meta phosphoric acid

JIPMER-2019

Ans. (c) : Orthophosphoric acid H_3PO_4

Pyrophosphoric acid $H_4P_2O_7$

Orthophosphorus acid H_3PO_3

Metaphosphoric acid HPO_3

Thus, Orthophosphoric acid has + 3 oxidation state.

1025. Which of the following pair behaves as strong and weak base hydride respectively NH_3, PH_3, AsH_3, SbH_3, BiH_3

(a) NH_3, PH_3 (b) NH_3, BiH_3

(c) PH_3, BiH_3 (d) BiH_3, AsH_3

JIPMER-2018

Ans. (b) : Strong base has an capability to remove a proton from a very weak acid.

Weak base does not fully dissociate in water.

Basic nature of hydride decreases

$NH_3 > PH_3 > AsH_3 > SbH_3 > BiH_3$

1026. Duma's method involves the determination of nitrogen content in the organs compound in the form of

(a) NH_3 (b) N_2

(c) NaCN (d) $(NH_4)_2SO_4$

JIPMER-2016

Ans. (b) : Dumas' method involves the determination of nitrogen content in the organic compound in form of N_2

$$N_2O + Cu \rightarrow N_2 + CuO$$

$$\%N = \frac{28}{22400} \times \frac{\text{Volume of } N_2 \text{ at N.T.P}}{\text{weight of Compound} \times 100}$$

1027. Phosphorus pentachloride

(a) On hydrolysis gives an oxo-acid of phosphorus which is tribasic

(b) On hydrolysis gives an oxo-acid of phosphorus which is a good reducing agent

(c) Has all the five equivalent bonds

(d) Exists as an ionic solid in which cation has octahedral structure and anion has tetrahedral structure

Karnataka-CET-2020

Ans. (a) : • PCl_5 has trigonal bipyramidal structure.

• $PCl_5 \rightarrow$ Solid exists as – $[PCl_4]^+$ and $[PCl_6^-]$

It has tetrahedral and octahedral structures

• On hydrolysis PCl_5 gives H_3PO_4 – Tribasic.

@apna_pdf

$PCl_5 + H_2O \rightarrow POCl_3 + 2HCl$

$POCl_3 + 3H_2O \rightarrow H_3PO_4 + 3HCl$

(Phosphoric acid)

Tri basic

Hence, option (a) is true.

1028. In the reaction of gold with aquaregia, oxidation state of nitrogen changes from

(a) + 4 to +2
(b) + 6 to +4
(c) + 5 to +2
(d) + 3 to +1

Karnataka-CET-2019

Ans. (c) : In the reaction of gold with aquaregia, oxidation state of nitrogen changes from + 5 to +2.

$$\underbrace{Au + 4H^+ + \overset{+5}{N}O_3^- + 4Cl^-}_{aqua-regia} \rightarrow AuCl_4^- + \overset{+2}{N}O + 2H_2O$$

1029. When PbO_2 reacts with concentrated HNO_3, the gas evolved is

(a) NO_2
(b) O_2
(c) N_2
(d) N_2O

Karnataka-CET-2018

Ans. (b) : When PbO_2 (strong oxidizing agent) treated with conc. HNO_3. Lead dioxide accepts electrons from nitric acid and thus oxidizing it to form lead nitrate. In this reaction when PbO_2 reacts with conc. HNO_3, the oxygen gas evolved.

$2PbO_2 + 4\,HNO_3 \rightarrow 2Pb\,(NO_3)_2 + 2H_2O + O_2$

1030. Which of the following property is true for the given sequence?
$NH_3 > PH_3 > AsH_3 > SbH_3 > BiH_3$?

(a) Reducing property
(b) Thermal stability
(c) Bond angle
(d) Acidic character

Karnataka-CET-2021

Ans. (b) : Thermal stability of the hydrides of nitrogen family decreases down the group is -

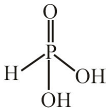
$NH_3 > PH_3 > AsH_3 > SbH_3 > BiH_3$

1031. Among the oxyacids of phosphorus, the dibasic

(a) $H_4P_2O_7$
(b) H_3PO_2
(c) HPO_3
(d) H_3PO_4
(e) H_3PO_3

Kerala-CEE-2010

Ans. (e) : H_3PO_3 shows a dibasic acid property and it contains two P-OH bonds.



1032. The least stable hydride of 15th group elements is

(a) NH_3
(b) PH_3
(c) AsH_3
(d) SbH_3
(e) BiH_3

Kerala-CEE-2011

Ans. (e) : As we move from NH_3 to BiH_3, size of the central atom increases and its tendency to form covalent bond with comparatively small H-atom decreases.

Hence, stability decreases down the group.

the decreasing order is -

$NH_3 > PH_3 > AsH_3 > BiH_3$

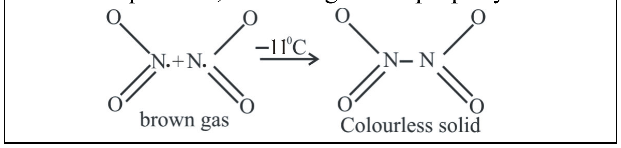
1033. Which one of the following oxides nitrogen dimerises into colourless is solid/liquid on cooling?

(a) N_2O
(b) NO
(c) N_2O_3
(d) NO_2
(e) N_2O_5

Kerala-CEE-2011

Ans. (d) : Nitrogen oxide is a colorless and non-flammable gas, also known as laughing gas.

At low temperature, it shows gaseous property.

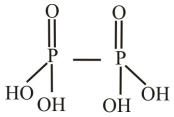


1034. Which one of the following has the maximum number of P—OH bonds?

(a) H_3PO_2
(b) H_3PO_4
(c) H_3PO_3
(d) $H_4P_2O_5$
(e) $H_4P_2O_6$

Kerala-CEE-2015

Ans. (e) : $H_4P_2O_6$ has four P – OH bonds



1035. Consider the following compounds:

(1) $(NH_4)_2Cr_2O_7$
(2) NH_4NO_2
(3) NH_4VO_3
(4) NH_4NO_3

Which compounds(s) yield nitrogen gas upon heating?

(a) 1 and 2
(b) 2 and 3
(c) 3 and 4
(d) 1 and 4
(e) All

Kerala-CEE-2018

Ans. (a) : When Ammonium dichromate heated, then it involves with the decomposition reaction and forms chromium oxide and nitrogen gas.

$$(i)\,(NH_4)_2\,Cr_2O_7 \overset{\Delta}{\rightarrow} Cr_2O_3 + 4H_2O + N_2\Delta\Delta$$

$$(ii)\,NH_4NO_2 \xrightarrow[\Delta]{\text{Thermal decomposition}} 2H_2O + N_2$$

Hence, option (a) is the correct answer.

1036. PCl_3 is stored in a well stoppered bottle since

(a) It decomposes in the presence of moisture
(b) It is decomposed by light
(c) It is highly volatile
(d) It reacts with air to form $POCl_3$
(e) (A) and (C)

Kerala-CEE-2019

Ans. (a) : The phosphorous acid is corrosive and volatile so it gets oxidized.

$PCl_3 + 3H_2O \rightarrow H_3PO_3 + 3HCl$

1037. Acetic acid in liquid ammonia behaves as

(a) Weaker acid than that in water
(b) Stronger acid than that in water
(c) Basic acid
(d) Neutral acid
(e) (C) and (D)

Kerala-CEE-2019

@apna_pdf

Ans. (b) :

$$\underset{\text{weak acid}}{CH_3COOH} + \underset{\text{strong base}}{NH_3} \rightleftharpoons \underset{\text{acid}}{NH_3^{\oplus}} + \underset{\text{base}}{CH_3COO^-}$$

CH_3COOH act as an acid. NH_3 accept H^+ ion easily then H_2O So, NH_3 more strong acid.

1038. The compound(s) that does (do) not exist is (are)

(a) BiF_5 (b) PF_5

(c) AsF_5 (d) SbF_5

(e) All the compounds exist

Kerala-CEE-2019

Ans. (a) : Bismuth is a element of 15 group. BiF_5 does not exist because the size of the halogen atom 'F' is very small in comparison with Bi. So, $BiCl_5$ does not exist.

1039. The oxyacid of phosphorus that contains one P-OH, two P-H and one P=O bonds is

(a) Phosphinic acid

(b) Phosphoric acid

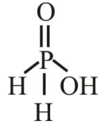
(c) Pyrophosphoric acid

(d) Hypophosphoric acid

(e) Pyrophosphorous acid

Kerala-CEE-2020

Ans. (a) : The formula of Phosphinic acid is H_3PO_2.
Phosphinic acid is a monoprotic acid



It has one P – OH, one P = 0 and two P – H bonds.

1040. Which of the following property is/are true for the given sequence $NH_3 > PH_3 > AsH_3 > SbH_3 > BiH_3$?

(a) Reducing property (b) Thermal stability

(c) Bond angle (d) Acidic character

Kerala-CEE-29.08.2021

Ans. (b&c) Thermal stability and bond angle decreases down the group due to increase in bond length.

1041. Which statement is false for white phosphorus (P_4) ?

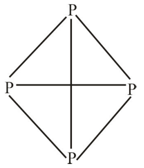
(a) It has six P–P single bonds

(b) It has four P–P single bonds

(c) It has four lone pair of electrons

(d) It has PPP angle 60º **Manipal-2020**

Ans. (b) :



• it has 6 – P – P bond
It has 4 lone pair electron
Bond angle = 60°

1042. In the reaction,

$P_2O_5 + 3CaO \rightarrow Ca_3(PO_4)_2$, P_2O_5 acts as :

(a) acidic flux (b) Basic flux

(c) basic impurity (d) acidic impurity

Manipal-2019

Ans. (a) : P_2O_5 is an acidic oxide, acting as an acidic flux.

1043. Which hydride among the following is strongest reducing agent?

(a) AsH_3 (b) BiH_3

(c) PH_3 (d) SbH_3

MHT CET-02.05.2019, SHIFT-III

Ans. (b) : BiH_3 is the strongest reducing agent among the given compound.
$PH_3 < AsH_3 < SbH_3 < BiH_3$

1044. Which of following is not a property of red phosphorus?

(a) Insoluble in carbon disulphide

(b) It does not show chemiluminescence by action of air

(c) It forms phosphine when treated with hot sodium hydroxide solution

(d) It is non-poisonous

MHT CET-02.05.2019, SHIFT-III

Ans. (c) : Red phosphorus has an iron-grey sheen to it. As with carbon disulphide, it has no odour, is non-poisonous, and is insoluble in water. It does not exhibit chemalumiscence due to air action. It has a melting point of 860 K. It is odorless and is solid at standard temperature and pressure.

1045. Which among the following group 15 elements does not exhibit allotropy?

(a) N (b) As

(c) Sb (d) Bi

MHT CET-02.05.2019, SHIFT-III

Ans. (d) : All the elements of group 15 except Bi shows allotropy. Bismuth alone does not exist with allotropy. Bismuth due to its inert pair effect does not exist with variable oxidation state.

1046. In which among the following compounds, oxidation number of nitrogen is +5?

(a) N_2O (b) N_2O_3

(c) NO_2 (d) HNO_3

MHT CET-03.05.2019, SHIFT-I

Ans. (d) : Oxidation number of nitrogen is + 5 in HNO_3.

$1 + x + 3(-2) = 0$

$x - 5 = 0$

$x = +5$

Where x is the oxidation number.

1047. Oxidation state of nitrogen in nitric oxide is

(a) +2 (b) +3

(c) +4 (d) –2

MHT CET-03.05.2019, SHIFT-I

Ans. (a) : Oxidation number of an atoms is defined as the charge that an atom appears to have on forming ionic bonds with other heteroatoms. An atom having higher electronegativity is given a negative oxidation state.
Oxidation state of nitrogen in nitric oxide (NO) is + 2.
Molecular formula of nitric oxide = NO

$x - 2 = 0$

$x = +2$

@apna_pdf

1048. The element which does not belong to group 15 is

(a) As (b) P

(c) Bi (d) Se

MHT CET-03.05.2019, SHIFT-I

Ans. (d) : Element Se belong to group 16 and 4th period with atomic number = 34

Electronic configuration of Se is $4s^2$, $4p^4$.

1049. In which oxidation state, group 15 elements act as Lewis base?

(a) +5 (b) +4

(c) –3 (d) +3

MHT CET-02.05.2019, SHIFT-II

Ans. (c) : The number of electrons in the outermost shell of the group 15 members is 5. In order to make it an octet configuration, it requires 3 more electrons.

Therefore, the more common oxidation for these elements is the –3 oxidation which means adding 3 more electrons.

1050. Which of the following is also called as nitrogen sesquioxide ?

(a) NO_2 (b) N_2O_3

(c) N_2O_4 (d) N_2O_5

MHT CET-02.05.2019, SHIFT-II & III

Ans. (b) : Nitrogen sesquloxide is an oxide containing three atoms of oxygen with two atoms of nitrogen element. It's chemical formula is N_2O_3

$N_2\ O_3$ is formed when the nitrogen dioxide reacts with the nitric oxide and it is a bluish colour liquid having unpleasant odour and has tendency to get dissociated back into the nitrogen dioxide and nitric oxide and it has very low boiling point.

Thus, the oxide of nitrogen which is called as nitrogen sesquioxide is N_2O_3 i.e. dinitrogen trioxide.

1051. Which among the group-15 elements does not exists as tetra atomic molecule?

(a) Nitrogen (b) Phosphorus

(c) Arsenic (d) Antimony

MHT CET-2018

Ans. (a) : Nitrogen due to smaller size, high ionization energy high electronegativity and the absence of d–orbital does not exist as a tetra atomic molecule. It exist in diatomic molecule.

1052. In which substance does nitrogen exhibit the lowest oxidation state?

(a) Nitrogen gas (b) Ammonia

(c) Nitrogen gas (d) Nitric oxide

MHT CET-2018

Ans. (b) : Oxidation state of nitrogen gas (N_2) is zero as both the nitrogen atom possess same electro negativity as well as same number of electrons. The oxidation states of ammonia.

Nitrous oxide and nitric oxide are given below-

Ammonia (NH_3)

$x = 3(1) = 0$

$x = -3$

Nitrous oxide (N_2O)

$2(x) + 1(-2) = 0$

$2x = 2$

$x = +1$

Nitric oxide (NO)

$x + (-2) = 0$

$x = +2$

Thus, nitrogen exhibits lowest oxidation state.

1053. Which among the following oxoacids of phosphorus shows a tendency of disproportionation ?

(a) Phosphinic acid (H_3PO_2)

(b) Orthophosphoric acid (H_3PO_4)

(c) Phosphonic acid (H_3PO_3)

(d) Pyrophosphoric acid ($H_4P_2O_7$)

MHT CET-2018

Ans. (c) : Phosphoric acid (H_3PO_3), Oxoacid of phosphorus shows a tendency of disproportionation. On heating H_3PO_3 disproportionates to give orthophosphoric acid and phosphine gas.

$$4H_3PO_3 \xrightarrow{\Delta} 3H_3PO_4 + PH_3$$

1054. Identify the compound, in which phosphorus exists in the oxidation state of +1.

(a) Phosphonic acid (H_3PO_3)

(b) Phosphinic acid (H_3PO_2)

(c) Pyrophosphorus acid ($H_4P_2O_5$)

(d) Orthophosphoric acid (H_3PO_4)

MHT CET-2017

Ans. (b) : Phosphinic acid (H_3PO_2) is the compound in which phosphorus exists in the oxidation state of + 1.

The oxidation state of P atom in phosphinic acid H_3PO_2 is

$3 + x - 4 = 0$

$x = +1$

1055. Which among the following group 15 element forms most stable pentavalent compount?

(a) Phosphorus (b) Antimony

(c) Bismuth (d) Arsenic

MHT CET-2015

Ans. (a) : In group 15 element, phosphorus having property to form most stable compound like PCl_5, $P_2O_{5.]}$ Because available of d-electrons also on moving down the group, the stability of the +5 oxidation state decreases.

Thus, phosphorus form the most stable pentavalent compounds.

1056. Oxidation number of nitrogen in which among the oxides of nitrogen is the lowest?

(a) Nitric oxide (b) Nitrous oxide

(c) Nitrogen dioxide (d) Nitrogen trioxide

MHT CET-2014

Ans. (b) : (a) Nitric oxide, NO $x - 2 = 0$

$\Rightarrow x = +2$

(b) Nitrous oxide, N_2O_2 $x - 2 = 0$

$\Rightarrow x = +1$

(c) Nitrogen dioxide, NO_2

$x + 2(-2) = 0 \Rightarrow x = +4$

(d) Nitrogen trioxide NO_3

$x + 2x(-3) = 0$

$\Rightarrow x = +6$

Thus , in nitrous oxide, oxidation number of nitrogen is lowest.

@apna_pdf

1057. Haber process is used for the production of which of the following?

(a) NH_3 (b) HNO_3

(c) H_2SO_4 (d) O_3

MHT CET-2012

Ans. (a) : Haber process is used for the production of ammonia (NH_3) gas.

$N_2\ (g) + 3H_2\ (g) \rightleftharpoons 2NH_3(g)$

1058. The laughing gas is

(a) N_2O_4 (b) NO

(c) N_2O (d) N_2O_5

[BITSAT-2016], MHT CET-2012

Ans. (c) : Nitrous oxide is knows as laughing gas

Nitrous oxide is used in medical and dental procedures as a sedative. The oxidation number of nitrogen in laughing gas is +1

It is colorless and non-flammable gas and has a slightly scent and taste.

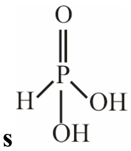
1059. Which of the following phosphorus oxyacids can act as a reducing agent?

(a) H_3PO_3 (b) H_3PO_4

(c) $H_2P_2O_6$ (d) $H_4P_2O_7$

MHT CET-2011

Ans. (a) : The P–H bond accounts for its reducing behavior while two –OH groups accounts for its basicity.



s .

1060. Nitrogen dioxide and sulphur dioxide have some properties in common. Which property is shown by one of these compounds, but not by the other?

(a) Is soluble in water

(b) Is used as a food preservative

(c) Forms 'Acid-rain'

(d) Is a reducing agent

(NEET-2015, Cancelled)

Ans. (b) : Nitrogen and sulphar both atoms in their oxides have high oxidation states. So, it cannot get further oxidized to higher oxidation states. Acid rain occurs when some gases in the atmosphere react with moisture to form inorganic acids.

1061. Which of the following phosphorus is the most reactive?

(a) Scarlet phosphorus (b) White phosphorus

(c) Red phosphorus (d) Violet phosphorus

(NEET-1999)

Ans. (b) : White phosphorus is insoluble in water and soluble in carbon sulphide and the most reactive, most toxic. It has galic smell and it is most reactive.

1062. Each of the following is true for white and red phosphorus except that they

(a) are both soluble in CS_2

(b) can be oxidized by heating in air

(c) consist of the same kind of atoms

(d) can be converted into one another

(NEET-1989)

Ans. (a) : White and red phosphorus, one the main allotropes of phosphorus. White phosphorus is soluble in carbon disulphide whereas red phosphorus is insoluble in carbon disulphide.

1063. A compound 'X' upon reaction with H_2O produces a colourless gas 'Y' with rotten fish smell Gas 'Y' is absorbed in a solution of $CuSO_4$ to give Cu_3P_2 as one of the products. Predict the compound 'X'.

(a) Ca_3P_2 (b) NH_4Cl

(c) As_2O_3 (d) $Ca(PO_4)$

(Odisha NEET 2019)

Ans. (a) : $\underset{(X)}{Ca_3P_2} + 6H_2O \rightarrow 3Ca(OH)_2 + \underset{\substack{(Y)\\(\text{Rotten fish smell})}}{2PH_3}$

$3CuSO_4 + \underset{(Y)}{2PH_3} \rightarrow \underset{\substack{(\text{Copper}\\\text{Phosphide})}}{Cu_3P_2} + 3H_2SO_4$

Hence, X is Ca_3P_2 (calcium phosphide)

1064. PH_4I + NaOH forms

(a) PH_3 (b) NH_3

(c) P_4O_6 (d) P_4O_{10}

(NEET-1991)

Ans. (a) : When PH_4I and Na OH react, Phosphine gas is obtained

$PH_4I + NaOH \rightarrow PH_3 + NaI + H_2O$

1065. Identify the incorrect statement related to PCl_5 from the following :

(a) PCl_5 molecule is non-reactive

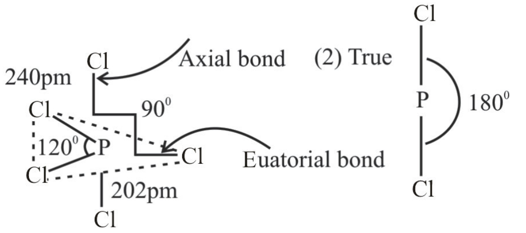
(b) Three equatorial P – Cl bonds make an angle of 120º with each other.

(c) Two axial P – Cl bonds make an angle of 180º with each other

(d) Axial P – Cl bonds are longer than equatorial P – Cl bonds

(NEET 2019)

Ans. (a) : Due to longer and hence weaker axial bonds, PCl_5 is a reactive molecule.



1066. PCl_3 reacts with water to form

(a) PH_3 (b) $H_3\ PO_3$, CHl

(c) $POCl_3$ (d) H_3PO_4

(NEET-1991)

Ans. (b) : PCl_3 reacts with water to form phosphorous acid and hydrochloric acid.

$POCl_3 + 3H_2O \rightarrow H_3PO_3 + 3HCl$

1067. Which of the following oxoacids of phosphorus has strongest reducing property?

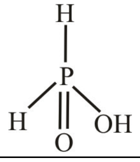
(a) $H_4P_2O_7$ (b) H_3PO_3

(c) H_3PO_2 (d) H_3PO_4

(Odisha NEET 2019)

@apna_pdf

Ans. (c) : Reducing property ∝ no. of P – H bond H_3PO_2 contains maximum P – H bond H_3PO_3 contains one P – H bond and hence, act as reducing agent whereas, rest do not have P – H bond.

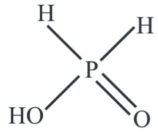


1068. Which is the correct statement for the given acids?

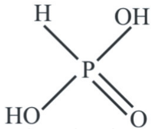
(a) Phosphinic acid is a monoprotic acid while Phosphonic acid is a diprotic acid
(b) Phosphinic acid is a diprotic acid while Phosphonic acid is a monoprotic acid
(c) Both are diprotic acids
(d) Both are triprotic acids

(NEET-I 2012)

Ans. (a) : Phosphinic acid contain one P–OH bond that means one replaceable H ion. So, it is monoprotic acid. Phosphonic acid contain two P–OH bonds that means two replaceable H ion. So, it is diprotic acid



Phosphinic acid
is monoprotic as it
contain one– OH group



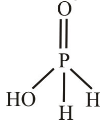
Phosphonic acid
is diprotic as it contains
two – OH group

1069. Strong reducing behaviour of H_3 PO_2 is due to

(a) high electron gain enthalpy of phosphorus
(b) high oxidation state of phosphorus
(c) presence of two-OH groups and one P–H bond
(d) presence of one–OH group and two P–H bonds

(NEET-2015)

Ans. (d) : Strong reducing behavior of H_3PO_2 is due to presence of one – OH group and two P–H bonds.
Hence, it acts as a strong reducing agent.

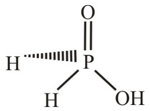


1070. Which of the following statements is not valid for oxoacids of phosphorus?

(a) Orthophosphoric acid is used in the manufacture of triple superphosphate
(b) Hypophosphorous acid is a diprotic acid
(c) All oxoacids contain tetrahedral four coordinated phosphorus
(d) All oxoacids contain alteast one P = O unit and one P – OH group

(NEET-2012)

Ans. (b) : Hypophosphorus acid is a monoprotic acid, as it contains only one P– OH group.



1071. Oxidation state of P in $H_4P_2O_5$, $H_4P_2O_4$, $H_4P_2O_7$ are respectively

(a) +3, +5, +4
(b) +5, +3, +4
(c) +5, +4, +3
(d) +3, +4, +5

(NEET-2010)

Ans. (d) : The oxidation number of P in

$$H_4P_2O_5$$
$$4+2x-10=0$$
$$2x=6$$
$$x=+3$$

The oxidation number of P in

$$H_4P_2O_6$$
$$4+2x-12=0$$
$$2x=8$$
$$x=+4$$

The oxidation number of P in

$$H_4P_2O_7$$
$$4+2x-14=0$$
$$2x=10$$
$$x=+5$$

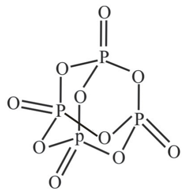
Where x is the oxidation states

1072. How many bridging oxygen atoms are present in P_4O_{10}?

(a) 6
(b) 4
(c) 2
(d) 5

(NEET-Mains 2010)

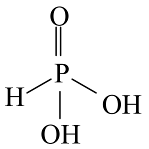
Ans. (a) : 6 bridging oxygen atoms are present in P_4O_{10}.



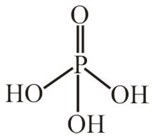
In P_4O_{10} there are 4 phosphorus atoms and 10 oxygen atom. There are P-O-P bond present and each are sp^3 hybridised.
There are six bridging oxygen combine to form tetrahedron.

1073. The structural formula of hypophosphrous acid is

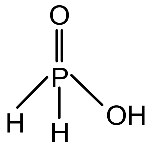
(a)



(b)



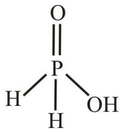
(c)



(d) none of these

(NEET-1997)

Ans. (c) : Hypophosphorous acid (H_3PO_2) is monobasic acid, so, its structure is



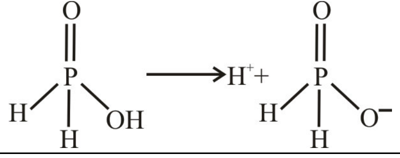
@apna_pdf

1074. H_3PO_2 is the molecular formula of an acid of phosphorus. Its name and basicity respectively are

(a) phosphorous acid and two
(b) hypophosphorous acid and two
(c) hypophosphorous acid and one
(d) hypophosphoric acid and two

(NEET-1992)

Ans. (c) : The name of H_3PO_2 is hypophosphorous acid when dissolve in water as it contains only one P–OH bond, it give one H ion. So, its basicity is one.



1075. Which one of the following substance is used in the laboratory for fast drying of neutral gases?

(a) Phosphorus pentoxide
(b) Active charcoal
(c) Anhydrous calcium chloride
(d) Na_3PO_4

(NEET-1992)

Ans.(c): Anhydrous $CaCl_2$ is used in the laboratory for fast drying of neutral gases. Phosphorus pentoxide absorbs moisture much readily than anhydrous $CaCl_2$ Active charcoal removes colour impurities.

1076. P_2O_5 is heated with water to give

(a) hypophosphorous acid
(b) phosphorous pentoxide
(c) Active charcoal
(d) Orthophosphoric acid

(NEET-1991)

Ans. (d) : When P_2O_5 or (P_4O_{10}) is heated with water, it form orthophosphoric acid (H_3PO_4)

$P_4O_{10} + 6H_2O \rightarrow 4H_3PO_4$

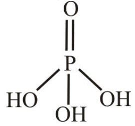
1077. Basicity of orthophsphoric acid is

(a) 2
(b) 3
(c) 4
(d) 5

(NEET-1991)

Ans. (b) : Basicity is the number of acidic hydrogen atoms in the molecule. For hydrogen to be acidic, it must be attached to a strongly electronegative atom.

For orthophosphoric (H_3PO_4)



It is clear from the structure that it contains three replaceable hydrogen atoms.

1078. When orthophosphoric acid is heated to 600 ºC, the product formed is

(a) PH_3
(b) P_2O_5
(c) H_3PO_3
(d) HPO_3

(NEET-1989)

Ans. (d) : When orthophosphoric acid (H_3PO_4) is heated 600ºC, then dehydration takes place and the product formed is metaphosphoric acid (HPO_3)

$$H_3PO_4 \xrightarrow{\Delta} HPO_3 + H_2O$$

1079. In which of the following compounds, nitrogen exhibits highest oxidation state?

(a) N_2H_4
(b) NH_3
(c) N_3H
(d) NH_2OH

(NEET-2012)

Ans. (c) : Oxidation number of nitrogen in N_3H = $-\frac{1}{3}$

$NH_2OH = -1$

$N_2H_4 = -2$

$NH_3 = -3$

1080. Nitrogen forms N_2, but phosphorus does not form P_2, however, it converts P_4, reason is

(a) triple bond present between phosphorus atom
(b) pπ–pπ bonding is weak
(c) pπ–pπ bonding is strong
(d) multiple bonds form easily

(NEET-2001)

Ans. (b) : It case of phosphorous (P) pπ – pπ bonding is weak because of its large atomic size. So, in P_4 each P atom is linked with 3 other P atoms by 3 sigma bonds.

Phosphorous form P_4 because in P_2 pπ – pπ bond is weaker.

1081. Which of the following oxides is most acidic?

(a) As_2O_5
(b) P_2O_5
(c) N_2O_5
(d) Sb_2O_5

(NEET-1999)

Ans. (c) : Covalent oxide – Acidic
Ionic oxide – Basic
Group –15 – N ↓
P
As
Sb

Fajan's Rule:– Smaller the size of cation, bigger the size of anion more the covalent character

Cation	anion
N_2	O_5
P_2	O_5
As_2	O_5
Sb_2	O_5

N_2O_5 is most acidic.

1082. Which of the following has the highest dipole moment?

(a) SbH_3
(b) AsH_3
(c) NH_3
(d) PH_3

(NEET-1997)

Ans. (c) : In the given molecules nitrogen has greater electro negativity. So, it has greater dipole moment and correct order of dipole moment is

$NH_3 > PH_3 > AsH_3 > SbH_3$

1083. The basic character of hydrides of the V group elements decreases in the order

(a) $NH_3 > PH_3 > AsH_3 > SbH_3$
(b) $SbH_3 > AsH_3 > PH_3 > NH_3$
(c) $SbH_3 > PH_3 > AsH_3 > NH_3$
(d) $NH_3 > SbH_3 > PH_3 > AsH_3$

(NEET-1996)

@apna_pdf

Ans. (a) : Basic character of hydrides of group 15 elements decreases down the group. The basic character is in the order.
$NH_3 > PH_3 > AsH_3 > SbH_3$

1084. Among the following oxides, the lowest acidic is
(a) As_4O_6 (b) As_4O_{10}
(c) P_4O_6 (d) P_4O_{10}
(NEET-1996)

Ans. (a) : As the oxidation state of central atom increases
The acidic character increase so the correct order of acidic character is –
$$\overset{+5}{P_4O_{10}} > \overset{+3}{P_4O_6} > \overset{+5}{As_4O_{10}} > \overset{+3}{As_4O_6}$$

1085. Which of the following fluorides does not exist?
(a) NF_5 (b) PF_5
(c) AsF_5 (d) SbF_5
(NEET-1993)

Ans. (a) : Due to unavailability of vacant d-orbital, nitrogen does not form pentafluoride. P, As and Sb from pentafluorides due to the presence of vacant d-orbitals.

1086. Which one has the lowest boiling point?
(a) NH_3 (b) PH_3
(c) AsH_3 (d) SbH_3
(NEET-1989)

Ans. (b) : In the hydrides of group number five the boiling points changes as
$$\underset{238.5k}{NH_3} < \underset{185.5k}{PH_3} < \underset{254.6k}{AsH_3} < \underset{254.6k}{SbH_3}$$
Generally mass increases then boiling point increases. The higher boiling point of NH_3 is due to excessive hydrogen bonding. So, PH_3 have lowest point among hydrides of group number i.e. nitrogen family.

1087. Number of electrons shared in the formation of nitrogen molecule is
(a) 6 (b) 10
(c) 2 (d) 8
(NEET-1992)

Ans. (a) : Six electrons are shared in the formation of nitrogen molecule. Nitrogen molecule is diatomic containing a triple bond between two N atoms.

1088. Nitrogen is relatively inactive element because
(a) its atom has a stable electronic configuration
(b) it has low atomic radius
(c) its electronegativity is fairly high
(d) dissociation energy of its molecule is fairly high
(NEET-1992)

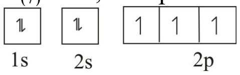
Ans. (d) : N_2 molecule contains triple bond between N atoms having very high dissociation energy (946 kJ mol^{-1}) due to which it is relatively inactive.

1089. Pure nitrogen is prepared in the laboratory by heating a mixture of
(a) $NH_4OH + NaCl$ (b) $NH_4NO_3 + NaCl$
(c) $NH_4Cl + NaOH$ (d) $NH_4Cl + NaNO_2$
(NEET-1991)

Ans. (d) : Pure nitrogen is prepared in the laboratory by heating a mixture of ammonium chloride and sodium nitrite.
$$\underset{\text{ammonium chloride}}{NH_4Cl(aq)} + \underset{\text{Sodium nitrite}}{NaNO_2(aq)} \xrightarrow{\text{Heat}} N_2(g) + 2H_2O(l) + NaCl$$

1090. Which of the following statement is not correct for nitrogen?
(a) Its electronegativity is very high
(b) d-orbitals are available for bonding
(c) It is a typical non-metal
(d) Its molecular size is small
(NEET-1990)

Ans. (b) : Nitrogen does not have vacant d-orbital in its outermost shell.
$N_{(7)} = 1s^2, 2s^2 2p^3$



1091. Urea reacts with water to form A which will decompose to form B. B when passed through $Cu^{2+}(aq)$ deep blue colour solution C is formed. What is the formula of C from the following?
(a) $CuSO_4$ (b) $[Cu(NH_3)_4]^{2+}$
(c) $Cu(OH)_2$ (d) $CuCO_3.Cu(OH)_2$
(NEET 2020)

Ans.(b) :
$$NH_2CONH_2 + H_2O \rightarrow \underset{(A)}{(NH_4)_2CO_3} \rightleftharpoons \underset{(B)}{2NH_3} + H_2O + CO_2$$
$$4NH_3 + Cu(aq) \rightarrow \underset{\substack{\text{(deep blue)} \\ \text{(C)}}}{\left[Cu(NH_3)_4\right]^{2+}}(aq)$$

1092. Aqueous solution of ammonia consists of
(a) H^+ (b) OH^-
(c) NH_4^+ (d) NH_4^+ and OH^-
(NEET-1991)

Ans. (d) : When ammonia dissolve in water, it form ammonium hydroxide.
$$H_2O + NH_3 \rightleftharpoons NH_4^+ + OH^-$$

1093. Which of the following oxides of nitrogen is paramagnetic?
(a) NO_2 (b) N_2O_3
(c) N_2O (d) N_2O_5
(NEET-1994)

Ans. (a) : In NO_2 there are free electron. So, it is paramagnetic in nature. It is an odd electron system containing 23 electrons.

1094. Which of the following is a nitric acid anhydride?
(a) NO (b) NO_2
(c) N_2O_5 (d) N_2O_5
(NEET-1988)

Ans. (c) : Dinitrogen pentoxide (N_2O_5) is a nitric acid anhydride. Acid anhydrides are the molecules that are capable of forming acidic solution in water.
Hydration of dinitrogen pentoxide –
$$N_2O_5 + H_2O \rightarrow \underset{\text{nitric acid}}{2HNO_3}$$

@apna_pdf

1095. When copper is heated with conc. HNO_3 if produces

(a) $Cu(NO_3)_2$, NO and N_2O
(b) $Cu(NO_3)_2$, and N_2O
(c) $Cu(NO_3)_2$, NO and NO_2
(d) $Cu(NO_3)_2$, NO

(NEET-I 2016)

Ans. (c) : When copper is heated with conc. HNO_3 produces cupric nitrate $Cu(NO_3)_2$ and nitrogen dioxide NO_2.

$Cu+4HNO_3 \rightarrow Cu(NO_3)_2+2NO_2+2H_2O$

1096. The electronic configuration of an element is $1s^2$ $2s^2$ $2p^6$ $3s^2$ $3p^3$. What is the atomic number of the element, which is just below the above element in the periodic table?

(a) 36 (b) 49
(c) 33 (d) 34

NEET-1995

Ans. (c) : The element which present just below this element will have outermost electronic configuration is $1s^2$, $2s^2$ $2p^6$, $3s^2$ $3p^6$, $4s^2$, $3d^{10}$, $4p^3$, and hence , its atomic number is 33.

1097. If the atomic number of an element is 33, it will be placed in the periodic table in the

(a) first group (b) third group
(c) fifteenth group (d) seventh group

NEET-1993

Ans. (c) : Electronic configuration of element

Z (33) = $1s^2$, $2s^2$, $2p^6$, $3s^2$, $3p^6$, $3d^{10}$, $4s^2$, $4p^3$

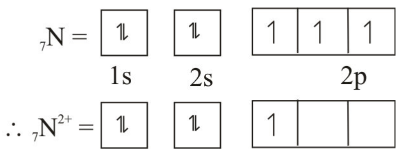
The element has its valence electrons in p orbitals. So, it is p-block elements. It's p-orbital also contains 3 electrons like nitrogen due to this it is placed in fifteenth group

1098. Number of unpaired electrons in N^{2+} is/are

(a) 2 (b) 0
(c) 1 (d) 3

NEET-1989

Ans. (c) : The electronic configuration of N^{2+}



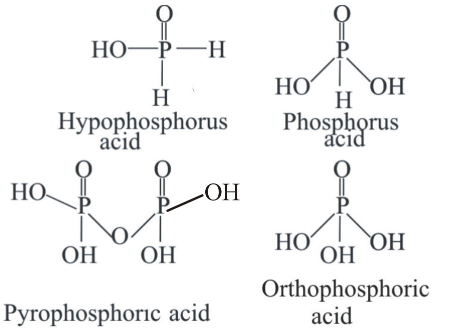
Hence, the number of unpaired electron in N^{2+} is 1.

1099. Which of the following acids contains P – O – P bond?

(a) Hypophosphorous acid
(b) Phosphorous acid
(c) Pyrophosphoric acid
(d) Orthophosphoric acid

Tripura JEE-2022

Ans. (c): The structures of the given acids are –



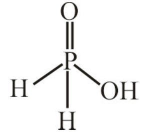
Thus, P–O–P bond is present in pyrophophoric acid.

1100. Find the basicity of the following acids: Hypophosphorous acid, metaphosphoric acid, phosphorous acid, orthophosphoric acid, pyrophosphoric acid.

(a) 1,1,2,3,3 (b) 1,2,2,3,4
(c) 1,1,2,3,4 (d) 1,2,3,3,2

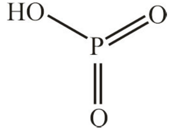
Tripura JEE-2021

Ans. (c) : Hypophosphorous acid



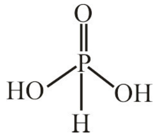
Basicity of acid =1

Metaphosphoric acid



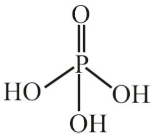
Basicity of acid =1

Phosphorous acid



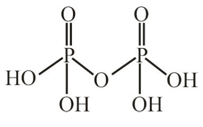
Basicity of acid =2

Orthophosphoric acid



Basicity of acid = 3

Pyrophosphoric acid



Basicity of acid = 4

So, the correct order is – 1,1,2,3,4

1101. A hydride of nitrogen which is acidic is

(a) NH_3 (b) N_3H
(c) N_2H_2 (d) N_2H_4

UP CPMT-2011

@apna_pdf

Ans. (b) : N_3H is a hydride of nitrogen which is acidic as it can easily release H^+ ion.

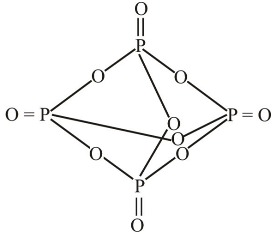
1102. The number of P – O bonds in P_4O_{10} is

(a) 16 (b) 12

(c) 8 (d) 4

UP CPMT-2010

Ans. (a): The structure of P_4O_{10} is



Number of P – O single bonds = 12

Number of P = O bonds = 4

Total number of P – O bonds = 16.

1103. Which of the following is not correct?

(a) Hydrolysis of NCl_3 gives NH_3 and HOCl

(b) NH_3 is less stable than PH_3

(c) NH_3 is a weak reducing reagent compared to PH_3

(d) Nitric oxide in solid state exhibits diamagnetic property

UP CPMT-2008

Ans. (b): Among V A group hydrides, the stability decreases in going down the group i.e, $NH_3 > PH_3 > AsH_3 > SbH_3 > BiH_3$

It is due to the increasing bond length down the group.

1104. On hydrolysis PCl_3 gives

(a) H_3PO_3 (b) PH_3

(c) H_3PO_4 (d) $POCl_3$

UP CPMT-2007

Ans. (a) : Hydrolysis of **PCl_3**: On hydrolysis of PCl_3, it gives phosphorous acid and HCl.

$$PCl_3+3H_2O \rightarrow H_3PO_3+3HCl$$

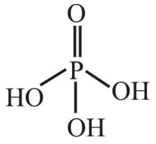
1105. Which is tribasic acid?

(a) H_3PO_2 (b) H_3PO_4

(c) $H_4P_2O_7$ (d) H_3PO_3

UP CPMT-2007

Ans. (b) : H_3PO_4 is tribasic acid



It is ionizes in three steps because three -OH group are present.

1106. Which of the following oxide of nitrogen is most thermally stable?

(a) N_2O_5 (b) N_2O

(c) NO (d) N_2O_3

UP CPMT-2006

Ans. (c) : Nitric oxide (NO) is decomposed at 900°C. So, it is the most thermally stable oxide of nitrogen.

$$2NO \xrightarrow{900^\circ C} N_2 + O_2$$

1107. Which of the following gas is used in artificial respiration ?

(a) O_2 (b) CO_2

(c) Helium (d) All of these

UP CPMT-2006

Ans. (d) : Oxygen mixed with CO_2 or helium is used for artificial respiration ($O_2 + CO_2$) or (O_2 + He).

Helium is used as it is less soluble in blood.

1108. PCl_5 is possible but NCl_5 does not exist

(a) in N, d–sub-shell is absent

(b) ionization energy of N is very high

(c) it does not like Cl

(d) None of the above

UP CPMT-2006

Ans. (a) : Nitrogen cannot form pentahalides because it cannot expand its octet due to non-availability of d-orbitals.

1109. Which phosphorus reacts with KOH solution to produce phosphene gas?

(a) Whit ephosphorus (b) Red Phosphorus

(c) Both (a) and (b) (d) None of the above

UP CPMT-2003

Ans. (a) : White phosphorus is most reactive form of phosphorus. Its molecular formula is P_4. Out of three forms of phosphorus–white, red and black, only white phosphorus react with aqueous alkali to form phosphine (PH_3).

$$\underset{\text{White phosphorus}}{P_4} + 3KOH + 3H_2O \longrightarrow \underset{\text{Potassium hypophosphite}}{3KH_2PO_2} + \underset{\text{Phosphine}}{PH_3}$$

1110. PCl_3 and cold water reacts to produce which of the following?

(a) H_3PO_3 (b) H_3PO_2

(c) $H_4P_2O_7$ (d) H_3PO_4

UP CPMT-2003

Ans. (a) : $$PCl_3 + 3H_2O \longrightarrow \underset{\substack{\text{phosphorus}\\\text{acid}\\\text{or}\\\text{ortho phosphorus}\\\text{acid}}}{H_3PO_3} + 3HCl$$

∴ PCl_3 gives ortho phosphorus acid on reaction with H_2O.

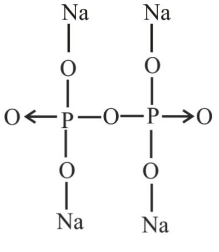
1111. Sodium pyrophosphate is represented by which of the following formula?

(a) $Na_2P_2O_4$ (b) $Na_2P_2O_5$

(c) $Na_4P_2O_7$ (d) $Na_2P_2O_5$

UP CPMT-2003

Ans. (c) : Sodium pyrophosphate is chemically $Na_4P_2O_7$ It is sodium salt of pyrophospheric acid ($H_4P_2O_7$).



Sodium pyrophosphate

@apna_pdf

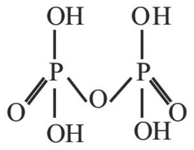
1112. In pyrophosphoric acid, the number of hydroxyl groups are

(a) 2 (b) 3

(c) 4 (d) 5

UP CPMT-2001

Ans. (c) :



$H_4P_2O_7$
Pyrophosphoric acid

∴ Pyrophosphoric acid has 4, –OH groups.

1113. NH_3 gas is dried over:

(a) CaO (b) HNO_3

(c) P_2O_5 (d) $CuSO_4$

UPTU/UPSEE-2005

Ans. (a) : Base + Acid → Salt +H_2O

NH_3 gas dried over CaO, because both are basic in nature and they do not react each other.

Note - CaO is used as a reactant and drying agent in the production of ammonia.

1114. Which of the following is the correct decreasing order of oxidation state of nitrogen?

(a) $HNO_3 > NO > NH_4Cl > N_2$

(b) $HNO_3 > NO > N_2 > NH_4Cl$

(c) $HNO_3 > NH_4Cl > NO > N_2$

(d) $NO > HNO_3 > NH_4Cl > N_2$

UPTU/UPSEE-2015

Ans. (b) : $HNO_3 \Rightarrow +1+x+3(-2)=0$

$\Rightarrow 1+x-6=0$

$\Rightarrow x=+5$

$NH_4Cl \Rightarrow x+4(+1)+(-1)=0$

$\Rightarrow x+4-1=0$

$\Rightarrow x=-3$

$NO \Rightarrow x+(-2)=0$

$\Rightarrow x=+2$

$N_2 \Rightarrow x=0$

$HNO_3 > NO > N_2 > NH_4Cl$

1115.

Iodide	**PI_3**	**AsI_3**	**SbI_3**
Bond angle	**102^o**	**$100^o2'$**	**99^o**

The bond angle is maximum in PI_3, which is

(a) due to small size of P

(b) due to more bp–bp repulsion in PI_3

(c) due to less electronegativity of P

(d) None of the above

UPTU/UPSEE-2014

Ans. (b) : Among P, As and Sb, P is the most electronegative element due to this there is more bp – bp repulsion.

1116. In the following Haber synthesis of NH_3, the equilibrium constant for NH_3 formation, on increase in temperature, is

$N_2(g)+3H_2(g) \rightleftharpoons 2NH_3(g)$+ heat energy

(a) decreased

(b) increased

(c) first decreased and then increased

(d) not altered

UPTU/UPSEE-2011

Ans. (a) : $N_2(g)+3H_2(g) \rightleftharpoons 2NH_3(g)$+ heat energy.

The given reaction is exothermic and equilibrium constant for an exothermic reaction decreases with rise in temperature.

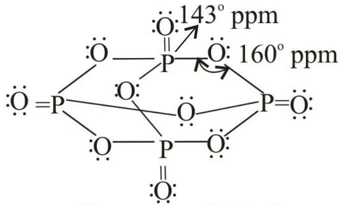
1117. Which one of the following represents the correct number of types of P–O bonds in P_4O_{10}?

(a) 1 (b) 2

(c) 3 (d) 4

UPTU/UPSEE-2011

Ans. (b) : In P_4O_{10} there of two type of bonding one is P – O and second is P = O.



[Structure of P_4O_{10}]

1118. The conjugated base of hydrazoic acid is

(a) HN_3^- (b) N_2^-

(c) N_3^- (d) N^{-3}

UPTU/UPSEE-2010

Ans. (c) : N_3H is also known as hydrazoic acid. It will release are H^+ and forms the conjugate base N_3^- the reaction is

$$\underset{\text{Acid}}{HN_3} \rightarrow H^+ + \underset{\text{Conjugate base}}{N_3^-}$$

The conjugate base of hydrazoic acid is N_3^- .

1119. Which is the strongest Lewis base?

(a) SbH_3 (b) AsH_3

(c) PH_3 (d) NH_3

UPTU/UPSEE-2010

Ans. (d) : NH_3 is the strongest Lewis base due to smallest size and high charge density on nitrogen atom. It can give up its lone pair of electron most easily.

1120. Among NH_3, HNO_3, NaN_3 and Mg_3N_2 the number of molecules having nitrogen in negative oxidation state is

(a) 1 (b) 2

(c) 3 (d) 4

UPTU/UPSEE-2008

Ans. (c) : Calculating the oxidation state of nitrogen in given molecules, oxidation state of N in NH_3 is

$x + 3 \times (+1) = 0$ or $x = -3$

oxidation state on N in HNO_3 is

$1 + x + 3 \times (-2) = 0$ or $x = +5$

oxidation state of N in NaN_3 is

@apna_pdf

$+1+3x = 0$ or $x = -\frac{1}{3}$

Oxidation state of N in Mg_3N_2 is

$3\times2+2x=0$ or $x = -3$

This 3 molecules NH_3, NaH_3 and Mg_3N_2 have nitrogen in negative oxidation states.

1121. During the preparation of NH_3 in Haber's process, the promoter (s) used is/are-

(a) PtO_2 (b) Mo

(c) Mix of Al_2O_3 and K_2O (d) Fe and Mn

WB-JEE-30.04.2022

Ans. (b) : In Haber process of ammonia production the element used as catalytic promoter to increase the activity of iron catalyst is Mo

$$N_2+3H_2 \rightleftharpoons 2NH_3+24\text{ Kcal}$$

1122. Atoms in a P_4 molecule of white phosphorus are arranged regularly in the following way

(a) at the corners of a cube

(b) at the corners of an octahedron

(c) at the corners of a tetrahedron

(d) at the centre and corners of a tetrahedron

WB-JEE-2009

Ans. (c) : The easiest way to solve this question is by calculating the hybridization of the compound given above we generally consider the hybridization of the central element, but in this case, all the atoms will act the same i.e. hybridization of all four phosphorus will be the same.

1123. Of the following compounds the most acidic is

(a) As_2O_3 (b) P_2O_5

(c) Sb_2O_5 (d) Bi_2O_3

WB-JEE-2009

Ans. (b) : Generally, acidic nature of oxides increases along a period from left to right and decreases along a group from up to down.

Since As, P, Sb, and Bi all belong to V group and arranged in the fallowing manner.

P, As, Sb, Bi

$\therefore$ P_2O_5 it is the most acidic and Bi_2O_3 is the least acidic.

1124. P_4O_{10} is the anhydride of

(a) H_3PO_2 (b) H_3PO_3

(c) H_3PO_4 (d) $H_4P_2O_7$

WB-JEE-2010

Ans. (c) : H_3PO_4 is the anhydride of P_4O_{10}.

$$4H_3PO_4 \xrightarrow{\Delta} P_4O_{10} + 6H_2O$$

1125. NO_2 is not obtained on heating

(a) $AgNO_3$ (b) KNO_3

(c) $Cu(NO_3)_2$ (d) $Pb(NO_3)_2$

WB-JEE-2011, WB-JEE-2016

Ans. (b) : $2AgNO_3 \xrightarrow{\Delta} 2Ag + 2NO_2 + O_2$

$$2KNO_3 \xrightarrow{\Delta} 2KNO_2 + O_2$$

$$2Cu(NO_3)_2 \xrightarrow{\Delta} 2CuO + 4NO_2 + O_2$$

$$2Pb(NO_3)_2 \xrightarrow{\Delta} 2PbO + 4NO_2 + O_2$$

NO_2 is not obtained on heating KNO_3.

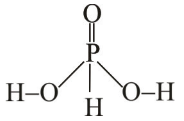
1126. The number of acidic protons in H_3PO_3 are

(a) 0 (b) 1

(c) 2 (d) 3

WB-JEE-2012

Ans. (c) : H_3PO_3 is dibasic acid i.e. two hydrogen atoms are ion sable. The structure of H_3PO_3



OH → acid proton

1127. Nitric acid can be obtained from ammonia via the formations of the intermediate compounds

(a) nitric oxide and nitrogen dioxide

(b) nitrogen and nitric oxide

(c) nitric oxide and dinitrogen pentoxide

(d) nitrogen and nitrous oxide

WB-JEE-2013

Ans. (a) : Nitric acid can be obtained from following steps -

$$\underset{\text{Ammonia}}{4NH_3} + 5O_2 \xrightarrow[700-800^\circ C]{\text{Pt gauge}} \underset{\text{Nitric oxide}}{4NO} + 6H_2O$$

$$2NO + O_2 \xrightarrow{50^\circ C} \underset{\text{Nitrogen dioxide}}{2NO_2}$$

$$4NO_2 + 2H_2O + O_2 \rightarrow \underset{\text{Nitric acid}}{4HNO_3}$$

1128. The hydrides of the first elements in groups 15-17, namely NH_3, H_2O and HF respectively show abnormally high values for melting and boiling points. This is due to

(a) small size of N, O and F

(b) the ability to form extensive intramolecular H-bonding

(c) the ability to form extensive intramolecular H-bonding

(d) effective van der Waals' interaction

WB-JEE-2014

Ans. (b) :

Atom	Electronegativity in Pauling scale
F	4.0
O	3.5
N	3.0

Hydrides of N, O and F because of the small size and high electronegativity of elements, have ability to form extensive intermolecular hydrogen bonding. Thus a large amount of energy is revered to break these bonds i.e. the melting and boiling points of hydrides of these elements are abnormally high.

1129. Sulphuryl chloride (SO_2Cl_2) reacts with white phosphorus (P_4) to give

(a) PCl_5, SO_2 (b) $OPCl_3$, $SOCl_2$

(c) PCl_5, SO_2, S_2Cl_2 (d) $OPCl_3$, SO_2, S_2Cl_2

WB-JEE-2015

Ans. (a) : When Sulphuryl chloride (SO_2Cl_2) reacts with white phosphorus (P_4), it forms phosphorous pentachloride (PCl_5) and sulphur dioxide (SO_2)

$$10SO_2Cl_2+P_4 \rightarrow 4PCl_5 +10SO_2$$

@apna_pdf

1130. An element X belongs to fourth period and fifteenth group of the periodic table. Which of the following statememt is true?

(a) It has completely filled s-orbital and a partially filled *d*-orbital
(b) It has completely filled s-and *p*-orbitals and a partially filled *d* -orbital
(c) It has completely filled s-and *p*-orbitals and a half filled *d*-orbital
(d) It has a half filled *p*-orbital and completely filled s-and *d* - orbitals

WB-JEE-2016

Ans. (d)

Period	**Group 15**
1	Nil
2	N(7)
3	P(15)
4	As (33)

Let us configure As (33), Now.

As(33) $\rightarrow 1s^2\ 2s^2\ 2p^6\ 3s^2\ 3p^6\ 3d^{10}\ 4s^2\ 4p^3$

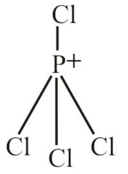
So, s and d-orbital are fully filled and p-orbital and half filled.

1131. In the solid state, PCl_5 exists as

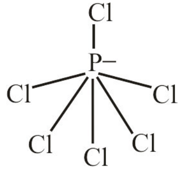
(a) $[PCl_4]^-$and $[PCl_6]^+$ ions
(b) covalent PCl_5 molecules only
(c) $[PCl_4]^+$and $[PCl_6]^-$ ions
(d) covalent P_2Cl_{10} molecules only

WB-JEE-2016

Ans. (c) : In the solid state, PCl_5 prefers to exist as oppositely charged ion like $[PCl_4]^+$ and$[PCl_6]^-$ as ionic. PCl_5 exist as solid in $[PCl_4]^+$and $[PCl_6]^-$ ions.



$[PCl_4]^+$
sp^3
Tetrahedral Shape



$[PCl_6]^-$
sp^3d^2
Octahedral Shape

1132. Very pure N_2 can be obtained by

(a) thermal decomposition of ammonium dichromate
(b) treating aqueous solution of NH_4Cl and $NaNO_2$
(c) liquefaction and fractional distillation of liquid air
(d) thermal decomposition of sodium azide

Karnataka-CET-2018

Ans. (d) : When sodium azide (NaN_3) undergoes thermal decomposition i.e. breakdown in the presence of heat, pure N_2 is obtained. Pure nitrogen is obtained by heating sodium are barium azide in vacuum.

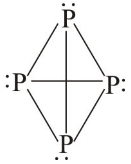
$$\underset{\text{Sodium azide}}{2NaN_3} \xrightarrow{\Delta} 2Na(s) + \underset{\text{pure nitrogen gas}}{3N_2(g)}$$

1133. White phosphorous P_4 has the following characteristics

(a) 6P– P single bonds
(b) 4P– P single bonds
(c) 4 lone pair of electrons
(d) P–P–P angle of 60^0

WB-JEE-2018

Ans. (a,c,d) : P_4 (white phosphorus) has large in size. It has less electro negativity. It forms only single bond. P_4 has 6, P-P single bond. Angle between P-P-P is 60^o.



1134. The $H-N-H$ angle in ammonia is 107.6^o, while the H–P–H angle in phosphine is 93.5^o. Relative to phosphine, the p-character of the lone-pair on ammonia is expected to be

(a) Less
(b) More
(c) Same
(d) Cannot be predicted

WB-JEE-2019

Ans. (a) : Relative to phosphine, the p-character of the lone-pair on ammonia is expected to be less because bond angle is decrease.

1135. Which is true regarding nitrogen?

(a) Less electronegative
(b) Has low ionisation enthalpy
(c) d-orbitals are available
(d) Ability to form pπ- pπ bonds with itself

Karnataka-CET-2016

Ans. (d) : Nitrogen having 1s electron in its inner core and they do not show repulsion between non paired electron and inner core because of this overlapping pi(π) bond is formed.

Nitrogen has ability to form pπ-pπ bonds itself due to their small size and high electronegativity.

1136. The statement that is not correct is

(a) Hypophosphorous acid reduces silver nitrate to silver
(b) In solid state PCl_6 exists as $[PCl_4]^+[PCl_6]^-$
(c) Pure phoshine in non-inflammable
(d) Phosphorous acid on heating disproportionates to give metaphosphoric acid and phosphine

Karnataka-CET-2014

Ans. (c) : Pure phosphine gas is stable in air and not inflammable at normal temperature but on heating up to 150^oC, it catches fire and produces phosphorus pentaoxide.

$$2PH_3 + 4O_2 \rightarrow P_2O_5 + 3H_2O$$

1137. Conjugate base of $H_2PO_4^-$ is

(a) HPO_4^-
(b) HPO_4^{2-}
(c) H_3PO_4
(d) PO_4^{3-}

Karnataka-CET-2013

Ans. (b) : When acids are acceptor of a proton then it leads to the formation of conjugate acid and when an acid loses a proton, the left over substance is known as conjugate base.

So,

$$H_2PO_4^- \rightarrow HPO_4^{-2} + H^+$$

@apna_pdf

7. Oxygen Family

1138. Given below are two statements:

Statement I:

The boiling points of the following hydrides of group 16 elements increases in the order-

$H_2O < H_2S < H_2Se < H_2Te$

Statement II:

The boiling points of these hydrides increase with increase in molar mass

In the light of the above statements, choose the most appropriate answer from the options given below:

(a) Both Statement I and Statement II are incorrect
(b) Statement I is correct but Statement II is incorrect
(c) Statement I is incorrect but Statement II is correct
(d) Both Statement I and Statement II are correct

NEET-17.07.2022

Ans. (a): $H_2O > H_2Te > H_2Se > H_2S$

Among hydrides of group 16 elements, with the increase in molecular weight, Van der wall forces in crease so boiling point also increase.

However H_2O unexpectedly has highest boiling point due to presence of H- bonding.

1139. The correct order of melting points of hydrides of group 16 elements is:

(a) $H_2S < H_2Se < H_2Te < H_2O$
(b) $H_2 < H_2S < H_2Se < H_2Te$
(c) $H_2S < H_2Te < H_2Se < H_2O$
(d) $H_2Se < H_2Se < H_2Te < H_2O$

JEE Main-26.06.2022, Shift-I

Ans. (a) : Melting point of H_2O is higher than other hydrides due to intermolecular hydrogen bonding and melting point increases as we move down the group due to increasing Vander wall force

Hydride	Melting Point
H_2O	273 K
H_2S	188 K
H_2Se	208 K
H_2Te	222 K

So, the correct order is

$H_2S < H_2Se < H_2Te < H_2O$.

1140. Match List I with List II

List-I		**List-II**	
A.	CO_3^{2-}	**I.**	**Colourless gas which turns lead acetate paper black**
B.	S^{2-}	**II.**	**Colourless gas which turns acidified potassium dichromate solution green**
C.	SO_3^{2-}	**III.**	**Brown fumes which turns acidified KI solution containing starch blue.**
D.	NO_2^-	**IV.**	**Colourless gas evolved with brisk effervescence, which turns lime water milky.**

Choose the correct answer from the options given below:

(a) A-III, B-I, C-II, D-IV
(b) A-II, B-I, C-IV, D-III
(c) A-IV, B-I, C-III, D-II
(d) A-IV, B-I, C-II, D-III

JEE Main-27.06.2022, Shift-II

Ans. (d) : (a) CO_3^{2-} on action of dil. sulphuric acid, CO_2 gas is released which turns lime water milky.

(b) S^{2-}: Colourless gas which turns lead acetate paper black

(c) SO_3^{2-} colourless gas which turns acidified potassium dichromate solution green.

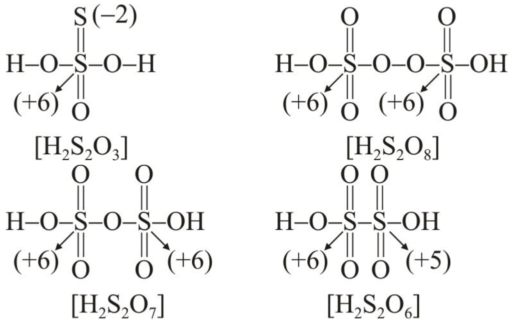
(d) NO_2^- on action of dil. H_2SO_4, NO_2 gas is evolved which turns KI solution blue.

1141. Which of the following oxoacids of sulphur contains "S" in two different oxidation states ?

(a) $H_2S_2O_3$ (b) $H_2S_2O_6$
(c) $H_2S_2O_7$ (d) $H_2S_2O_8$

JEE Main-28.06.2022, Shift-II

Ans. (a) :



1142. Which one of the following gases is placed second in respect of abundance in the Earth's atmosphere?

(a) Oxygen (b) Hydrogen
(c) Nitrogen (d) Carbon dioxide

NDA (II)-2017

Ans. (a) : Earth's atmosphere is composed of about 78% nitrogen, 21% oxygen, 0.9 % argon, and 0.1 other gases.

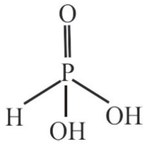
Oxygen with 21% is placed second in respect of abundance in the earth's atmospheres.

1143. The basicities of H_3PO_3 and $H_4P_2O_7$, respectively, are

(a) 1 and 4 (b) 2 and 4
(c) 3 and 4 (d) 2 and 3

AMU-2019

Ans. (b) :

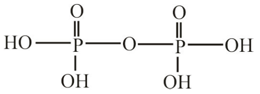


@apna_pdf

H_3PO_3 is dibasic acid. It has two P–OH bonds and one P–H bond.

Hence, its basicity is 2.

Note- To Calculate basicity, we count H atom directly attached to O atom.



As it is clearly shown in the figure, the acid $H_4P_2O_7$ contains 4 replaceable H-atoms.

Hence its basicity is = 4

1144. Which of the following form of sulphur can be prepared by pouring liquid sulphur into cold water?

(a) Monoclinic (b) Rhombic
(c) Plastic (d) Colloidal

AP-EAMCET (Med.)-1999

Ans. (c) : Plastic sulphur is obtained by pouring boiling sulphur in cold water when rubber like mass is obtained.

1145. Consider the following statements in respect of oxides of sulphur

1. In gas phase SO_2 molecules are V-shaped

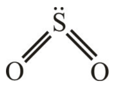
2. In gas phase SO_3 molecule has a planer structure.

3. γ-SO_3 is cyclic trimer and solid at 0°C. Which of the above statements are correct?

(a) 1 and 2 only (b) 2 and 3 only
(c) 1 and 3 only (d) 1, 2 and 3

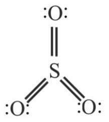
SCRA 2012

Ans. (d) :



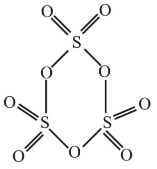
sp^2 hybrided
V-shape, Bent

SO_3



Trigonal planer

γ-SO_3



Cyclic trimer

Thus, all the three statements are correct

1146. Among the following the most reactive is:

(a) S_2O (b) SO_3
(c) SO_2 (d) SO_3

SCRA 2012

Ans. (d) : SO_3 is a highly reactive substance and strong oxidizing agent and it also acts as a fire hazard.

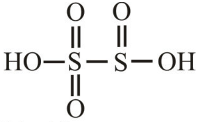
1147. Which oxy-acid of sulphur does not contain S S bond?

(a) $H_2S_2O_5$ (b) $H_2S_2O_4$
(c) $H_2S_2O_7$ (d) $H_2S_2O_6$

SCRA-2015

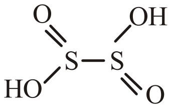
Ans. (c): Structure of oxy-acid of sulphur are –

(i) $H_2S_2O_5$



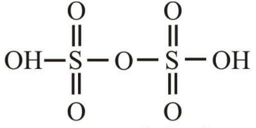
Disulfurous acid

(ii) $H_2S_2O_4$



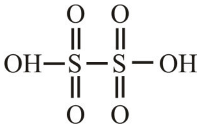
Dithionous acid

(iii) $H_2S_2O_7$



pyrosulphuric acid (oleum)

(iv) $H_2S_2O_6$



Dithionic acid

1148. The catalyst used in the manufacture of sulphuric acid by contact process is

(a) Al_2O_3 (b) Cr_2O_3
(c) V_2O_5 (d) MnO_2

J&K CET-2007, JCECE-2003
AP EAMCET- 1993

Ans. (c) : In Contact process V_2O_5 (Vanadium pentaoxide) catalyst is used in the manufacture of H_2SO_4.

$$2SO_2 + O_2 \xrightleftharpoons{V_2O_5} 2SO_3$$

1149. The crystalline form of sulphur that is stable at room temperature is

(a) Engel's sulphur (b) Rhombic sulphur
(c) Monoclinic sulphur (d) Plastic sulphur

AP EAMCET- 1994

Ans. (b) : Rhombic sulphur is present in prismatic crystalline form an is stable upto 95.5°C.

1150. With respect to both oxygen and ozone, which one of the following statements is not correct?

(a) Both have similar reactivity with water
(b) Oxygen is colorless and ozone is colored
(c) Oxygen valency is 2 in both
(d) Oxygen has 2 bonds and ozone has 3 bonds

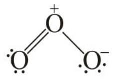
AP EAMCET- 1996

Ans. (c) : (a) Ozone and oxygen both have equal reactivity with water. Hence, statement is true.

(b) As we know oxygen is colorless whereas ozone is a pale blue gas and consists of three oxygen atoms.

(c) Oxygen gas and ozone have different valency which is given below–

$O_2 \equiv$:Ö = Ö: and $O_3 \equiv$
Valency = 2



Valency = 3,2,1

Hence, statement is false.

(d) It is clear that from the structure of oxygen and ozone, oxygen and ozone have 2 and 3 bonds respectively.

1151. Which of the following is the weakest acid in its aqueous solution?

(a) H_2Te (b) H_2Se
(c) H_2S (d) H_2Po

AP EAMCET- 1999

@apna_pdf

Ans. (c) : In VI group, on moving down a group the size of atom increase and thermal stability decrease and acidic nature increases. Hence, among the given hydrides H_2S is least acidic.

1152. Which one of the VI group elements has the highest catenation power?

(a) O (b) Se

(c) S (d) Te

AP EAMCET- 2000

Ans. (c) : On moving down the group catenating power of element decreases but oxygen has less catenation power because of high electronegative force. Therefore, the sulphur has the highest catenation power among VI group element.

1153. Mustard gas among the following is

(a) CCl_3NO_2

(b) $ClCH_2CH_2SCH_2CH_2Cl$

(c) CH_3SH

(d) H_2S

TS-EAMCET (Engg.), 05.08.2021 Shift-II

Ans. (b) : $ClCH_2CH_2SCH_2CH_2Cl$ or $C_4H_8Cl_2S$ is known as Mustard gas.

Mustard gas is colored oily liquid with a faint odor of garlic. Mustard gas is also known as dichlorodiethyl sulfide. This gas used in Second World War because it is toxic acid and it can be absorbed easily through skin.

1154. SF_6 is a kinetically inert substance because

(a) Fluorine is highly electronegative

(b) It is sterically protected

(c) Greater difference in electronegativities of S and F

(d) Larger size of S-atom

AP EAMCET (Engg.) 17.09.2020, Shift-II

Ans. (b) : In SF_6, sulphur is sp^3d^2 hybridised. Both geometry and shape of the molecule is octahedral. SF_6 is also a non-polar molecule (dipole moment, μ = 0), because S atom sterically protected six F atoms and not allowed to water molecule to attack at the S atom. So, SF_6 is also kinetically inert.

1155. Which of the following is used as a rocket fuel?

(a) Nitrolim+ O_3 (b) Water gas + O_3

(c) Cyanogen +O_2 (d) Cyanogen +O_3

AP EAMCET (Medical) -1998

Ans. (d): Combination of cyanogens and O_3 is utilized as a rocket fuel. Cyanogen is the chemical compound with formula CN_2 and colorless gas and also highly toxic.

1156. Which of the element of Oxygen family is most poisonous to human race?

(a) O (b) S

(c) Se (d) None

MPPET-2008

Ans. (c) : Selenium (se) element of oxygen family is most poisonous to human race.

The long term intake of excessive selenium may involve either organic or inorganic forms in food or water.

1157. The type of bonds present in sulphuric anhydride are

(a) 3σ and three $p\pi$ - $d\pi$

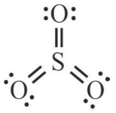
(b) 3σ, one $p\pi$-$d\pi$ and two $p\pi$ - $d\pi$

(c) 3σ and three $p\pi$ - $d\pi$

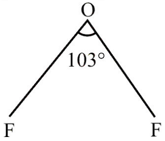
(d) 3σ and two $p\pi$ - $d\pi$

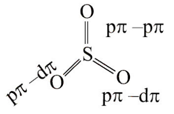
AP EAMCET (Engg.)-2009

Ans. (b): Sulphuric anhydride is SO_3 and structure is –



$\Rightarrow$ 3σ-bond deciding the shape of the molecule, $1p\pi$-$p\pi$ and $2p\pi$-$d\pi$ bonds are present.





1158. When some helium gas is added, at constant pressure, to an equilibrium mixture of $2SO_{2(g)} + O_{2(g)} \rightleftharpoons 2SO_{3(g)}$. Which of the following conditions will occur?

(a) The concentration of all three gases remain unchanged

(b) Concentration of Sulphur trioxide increases

(c) Concentration of Sulphur dioxide increases

(d) The number of moles of oxygen will decrease

AP EAPCET-6 Sep. 2021, Shift-II

Ans. (c): When on inert gas is added to the system in equilibrium at constant pressure, then the total volume will increase. Hence, the number of moles percent volume of various reactants and products will decrease. Therefore, the equilibrium shifts toward the direction in which there is increase in number of moles of gases.

1159. Which of the following is not given by SO_2 ?

(a) It converts acidified iodates to iodine

(b) It decolorize acidified $KMnO_4$ solution

(c) It decolorizes acidified potassium dichromate to form green colored solution

(d) It reacts with green colored ferrous sulphate to form yellowish brown ferric sulphate

AP EAPCET 24.08.2021, Shift-I

Ans. (d) : The first statement in option is true because sulphur dioxide acts as a reducing agent and it reduces the iodates.

$5SO_2+2KMNO_4+2H_2O\rightarrow 2H_2SO_3 + 2MNSO_4 + K_2SO_4$

SO_2 is also decolourises the $KMnO_4$ solution. So, the second statement is also true. Sulfur dioxide gas turns acidified potassium dichromate solution form orange to green and reduced chromium +4 to +3.

The fourth statement is not true because SO_2 reacts with ferrous sulphate to form the ferric oxide (Fe_2O_3).

1160. Sulphuric acid has high viscosity because of

(a) The presence of hydrogen bonds

(b) Its high boiling point

(c) Its high acid strength

(d) The presence of double bond.

COMEDK 2011

@apna_pdf

Ans. (a) : The Sulfuric acid has high viscosity because of presence of hydrogen bond. These hydrogen bonds helps sulphuric acid to form cluster.

1161. Which of the following is NOT TRUE for concentrated H_2SO_4?

(a) Sulphonating agent
(b) Oxidizing agent
(c) Dehydrating agent
(d) Deliquescent in nature

COMEDK-2012

Ans. (d) : The Conc. H_2SO_4 does not deliquescent in nature because its nature is hygroscopic and it absorbs moisture from nature without changing physical state.

1162. An element belonging to chalcogen group is

(a) carbon (b) phosphorus
(c) chlorine (d) sulphur

COMEDK-2015

Ans. (d) : Group 16 of the periodic table is sometimes known as group of chalcogens. Oxygen, sulphur, selenium, tellurium, polonium, and livermorium constitute group-16 of the periodic table.

1163. What is X in the following reaction?
$KHSO_4 + F_2 \rightarrow HF + X$

(a) K_2SO_4 (b) $K_2S_2O_4$
(c) $K_2S_2O_2$ (d) $K_2S_2O_8$

AP-EAMCET (Medical), 2006

Ans. (d) : For the reaction–

$$\underset{\substack{\text{Potassium}\\\text{hydrogen}\\\text{sulphate}}}{2KHSO_4} + F_2 \rightarrow 2HF + \underset{\substack{\text{Potassium}\\\text{persulphate}}}{K_2S_2O_8}$$

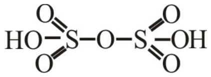
In this reaction- F_2 oxidized the potassium hydrogen sulphate in to potassium per sulphate.

1164. Which of the following oxy-acid of sulphur does not contain S-S bond?

(a) Pyrosulphuric acid (b) Dithionic acid
(c) Dithionous acid (d) Pyrosulphurous acid

AP-EAMCET (Medical), 2006

Ans. (a) : The molecular formula of pyrosulphuric acid is $H_2S_2O_7$. The structure of pyrosulphuric acid is given as:



Thus, structure is not attaining the S-S bond.

1165. For the preparation of sodium thiosulphate by Springs reaction the reactants used are:

(a) $Na_2S + Na_2SO_3 + Cl_2$ (b) $Na_2S + SO_2$
(c) $Na_2SO_3 + S$ (d) $Na_2S + Na_2SO_3 + I_2$

AP-EAMCET (Medical), 2003

Ans. (d) : Springs reaction for the preparation of sodium thiosulphate is given below:

$$\underset{\substack{\text{Sodium}\\\text{sulphide}}}{Na_2S} + \underset{\substack{\text{Sodium}\\\text{sulphite}}}{Na_2SO_3} + I_2 \longrightarrow \underset{\substack{\text{Sodium}\\\text{thiosulphate}}}{Na_2S_2O_3} + 2NaI$$

1166. In a balanced equation:

$$H_2SO_4 + xHI \longrightarrow H_2S + yI_2 + zH_2O$$

The values of x, y, z are

(a) x = 3, y = 5, z = 2 (b) x = 4, y = 8, z = 5
(c) x = 8, y = 4, z = 4 (d) x = 5, y = 3, z = 4

AP-EAMCET (Medical), 2003

Ans. (c) : The given equation is:

$$H_2SO_4 + xHI \longrightarrow H_2S + yI_2 + zH_2O$$

By the oxidation number method, we calculate the change in oxidation number of sulphur and then balance I_2 and H_2O.

$$\underset{\uparrow 8e^-}{\overset{+1\ \ +6}{H_2SO_4}} + \underset{1e^- \times 8}{\overset{+1\,-1}{HI}} \longrightarrow \overset{+1\ \ -2}{H_2\,S} + \overset{0}{I_2} + H_2O$$

$$\therefore H_2SO_4 + 8HI \longrightarrow H_2S + 4I_2 + 4H_2O$$

So, the value of x , y and z will be 8, 4 and 4 respectively.

1167. O_2^{2-} is the symbol of…… ion.

(a) Oxide (b) Super oxide
(c) Peroxide (d) Monoxide

AP-EAMCET (Medical), 2003

Ans. (c) : Oxide ion is the dianion of oxygen, O^{2-} ion. Superoxide ion is the ion with chemical formula O_2^-.

- The peroxide ion is the ion with the chemical formula O_2^{2-} and it has a single oxygen-oxygen covalent bond and oxidation state of –1.

$$:\ddot{\underset{..}{O}}-\ddot{\underset{..}{O}}:$$

- A monoxide is any oxide containing only one atom of oxygen for example, a well-known monoxide is carbon monoxide, CO.

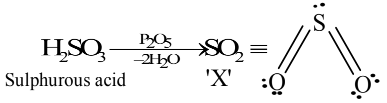
O_2^{2-} — $:\ddot{O}-\ddot{O}:$ Peroxide

1168. X, Y are anhydrides of sulphurous acid and sulphuric acid, respectively. The hybridisation state and the shape of X and Y are

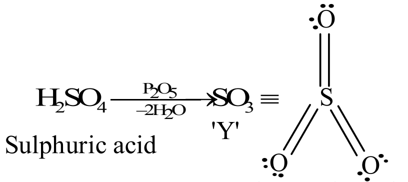
	X	Y
(a)	sp^2 ,angular	sp^3, tetrahedral
(b)	sp^2, angular	sp^2, angular
(c)	sp^2, angular	sp^2, planar triangular
(d)	sp^3, planar	sp^3, planar

AP-EAMCET (Medical), 2008

Ans. (c) : The anhydride of sulphurous acid is sulphur dioxide, which can understand by following reaction-



(angular shape)
Hybridisation = lonepair + bondpair
= 1 + 2 = 3 (sp^2)



(planer trigonal)
Hybridisation = 0 + 3 = (sp^2)

Hence, both X (SO_2) and Y (SO_3) have sp^2 hybridisation.

@apna_pdf

1169. What is the product formed when ozone reacts with mercury?

(a) HgO (b) Hg_2O_2

(c) Hg_2O (d) HgO_2

AP-EAMCET (Medical), 2001

Ans. (c) : When Mercury (Hg) is oxidized by O_3

$2Hg + O_3 \rightarrow Hg_2O + O_2$

Thus, Hg_2O is formed.

The phenomenon of mercury sticking to glass is called tailing mercury.

1170. Which one of the following compounds undergoes hydrolysis during distillation to yield hydrogen peroxide?

(a) $H_2S_2O_8$ (b) $H_2S_2O_6$

(c) HNO_3 (d) $H_4P_2O_7$

AP-EAMCET (Medical), 2002

Ans. (a) : Peroxydisulfuric acid is the inorganic compound with the chemical formula $H_2S_2O_8$ also called Marshalls acid. Peroxydisulfuric acid ($H_2S_2O_8$) reacts with water during distillation to form hydrogen peroxide.

Molar mass – 194.14 g /mol

Solubility in water = soluble

Melting point – 65°C

$$H_2S_2O_8 + 2H_2O \longrightarrow 2H_2SO_4 + H_2O_2$$

1171. Fluorine oxidises HSO_4^- to :

(a) $S_2O_3^{2-}$ (b) $S_2O_8^{2-}$

(c) $S_4O_6^{2-}$ (d) SO_2

AP-EAMCET (Medical), 2002

Ans. (b) : As we know that F_2 is the strongest oxidizing agent. Fluorine oxidises HSO_4^- to –

$$2H\overset{+6}{S}O_4^- + F_2 \longrightarrow 2HF + S_2O_8^{2-}$$

1172. Which element is not considered as 'Chalcogens'?

(a) Polonium (b) Sulphur

(c) Oxygen (d) Selenium

GUJCET-2008

Ans. (a) : Oxygen, Sulphur, Selenium, Tellurium, constitute group 16 of the periodic table. This is sometimes known as group of Chalcogens. Polonium is a radioactive element and forms a less number of compounds and therefore it is not considered as Chalcogens.

1173. Match the following

Column - 1 **Type of sulphur**	**Column - 2** **Property**
(A) α – Sulphur	**(I) Soluble in CS_2**
(B) S_2	**(II) Soluble in H_2O**
(C) β – Sulphur	**(III) Puckered ring**
	(IV) Paramagnetic
	(V) Chair form

The correct match is

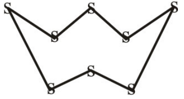
	A	B	C
(a)	I, III	IV	I,III
(b)	I, II, III	IV	I, II
(c)	II, III	II	II,V
(d)	I, IV,V	II	I, IV,V

TS-EAMCET 09.08.2021, Shift-I

Ans. (a) : α- Sulphur- It is S_8 puckered ring structure.

-It is readily soluble in Carbon Disulphide (CS_2).

-It is also called a crown shape.



(Puckered ring structure)

β-sulphur– β suphur is less dense than α- sulphur.

- it also contain puckered S_8 ring.

- it is also soluble in CS_2.

- Below 95.3°c it converts is to α sulphur.

S_2 (Disulphide)– it is paramagnetic in nature.

1174. Commercial name of Peroxydisulphuric acid is

(a) Marshall's acid

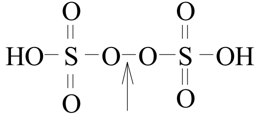
(b) Caro's acid

(c) Oleum

(d) Fuming sulphuric acid

TS EAMCET 06.08.2021

Ans. (a): The structure of peroxydisulphuric acid is–



$$HO-\overset{\overset{O}{\|}}{\underset{\underset{O}{\|}}{S}}-O-O-\overset{\overset{O}{\|}}{\underset{\underset{O}{\|}}{S}}-OH$$

(one peroxide bond)

Peroxysulphuric Acid ($H_2S_2O_8$)

Peroxydisulphuric acid ($H_2S_2O_8$) is an inorganic compound. It is also known as Marshall's Acid, after its inventor Professor Hugh Marshall. It is a sulphur oxoacid.

1175. Assertion (A) : SF_6 is highly stable

Reason (R) : SF_6 is a gas

The correct option among the following is

(a) (A) is true, (R) is true and (R) is the correct explanation for (A)

(b) (A) is true, (R) is true but (R) is not the correct explanation for (A)

(c) (A) is true but (R) is false

(d) (A) is false but (R) is true

TS EAMCET 04.08.2021, Shift-I

Ans. (b) : SF_6 is a gas and It is highly stable and extremely stable and chemically inert for steric resons. In SF_6, the six F atom protected the sulphur atom from attack by reagents to such an extent that even thermodynamically most favorable reaction.

1176. The reaction of sulphur in alkaline medium is given below:

$$S_{8(s)} + aOH^-_{(aq)} \rightarrow bS^{2-}_{(aq)} + cS_2O^{2-}_{3(aq)} + dH_2O_{(f)}$$

The values of 'a' is ________. (Integer answer)

JEE Main 24.02.2021, Shift-I

@apna_pdf

Ans. : Write the half reaction–

$$16e^- + S_8 \longrightarrow 8S^{2-}$$

$$\underline{S_8 + 12H_2O \longrightarrow 4S_2O_3{}^{2-} + 24H^+ + 16e^-}$$

$$2S_8 + 12H_2O \longrightarrow 8S^{2-} + 4S_2O_3^{2-} + 24H^+$$

Now, balancing in basic medium add an equal number of OH^- that of H^+ –

$$2S_8 + 12H_2O + 24OH^- \longrightarrow 8S^{2-} + 4S_2O_8^{2-} + 24H_2O$$

$$2S_8 + 24OH^- \longrightarrow 8S^{2-} + 4S_2O_8^{2-} + 12H_2O$$

$$S_8 + 12OH^- \longrightarrow 4S^{2-} + 2S_2O_8^{2-} + 6H_2O$$

So, a = 12.

1177. Assertion: SO_2 is more covalent than SeO_2
Reason: Covalent radius of Se is more than S

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

[AIIMS-27 May, 2018 (E)]

Ans. (b): SO_2 is more covalent than SeO_2 because in SO_2, S has +6 oxidation state while in SeO_2, Se has +4 oxidation state.

Covalent radius of Se is more than S.

Therefore, both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.

1178. Assertion: O_3 has higher boiling point than O_2.
Reason: O_3 is allotrope of oxygen

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

[AIIMS-26 May, 2018(M)]

Ans. (b): O_3 has high molar mass than O_2 so, it has higher boiling point than that of O_2.

Both A and R are true but R is not correct expiation of A.

1179. Assertion : Both rhombic and monoclinic sulphur exist as S_8 but oxygen exists as O_2.
Reason : Oxygen forms $p\pi - p\pi$ multiple bond due to small size and small bond length but $p\pi - p\pi$ bonding is not possible in sulphur.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

[AIIMS-2017]

Ans. (a): Assertion and Reason are correct and Reason is the right explanation for assertion.

Both rhombic and monoclinic sulphur exist as S_8 but oxygen exists as O_2. The formation of $P\pi - P\pi$ bond is the main reason for the existence of oxygen in O_2 structure, but formation of $P\pi - P\pi$ bond is not possible in sulphur. Sizes of oxygen and sulphur determine the formation of $P\pi - P\pi$ bond. Oxygen is in small size it can be able to forms multiple bond of $P\pi - P\pi$ and the size of sulphur is bigger than the oxygen. So, it can not be able to form the $P\pi - P\pi$ bond.

1180. Assertion: SF_6 cannot be hydrolysed but SF_6 can be.
Reason: Six F atoms in SF_6 prevent the attack of H_2O on sulphur atom of SF_6.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

[AIIMS-2016]

Ans. (a): Both assertion and reason are correct and reason is the correct explanation for assertion.

SF_6 cannot be hydrolysed because it is sterically protected by the six F atoms. So it is difficult were OH^- atom to attack central atoms. However in SF_4, due to lesser surrounding F-atom, it's comparatively easy to attack central atom and hence SF_4 get hydrolysed but not SF_6.

1181. Assertion: Sulphuric acid is more viscous than water.
Reason: Concentrated sulphuric acid has a great affinity for water.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

[AIIMS-2009]

Ans. (b): Assertion and reason are true but reason is not the correct explanation of assertion.

Concentrated sulphuric acid is more viscous than water because of the presence of extensive intermolecular hydrogen bonding in sulphuric acid.

1182. Assertion: The S – S – S bond angle in S_8 molecule is 105°.
Reason: S_8 has a V-shape.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.

@apna_pdf

(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

[AIIMS-2008, 2009]

Ans. (c): Atoms in S_8 molecule undergoes SP^3 hybridisation and consists of two lone pairs of electrons on each and exists as staggered 8 atom rings.

S_8 has puckered ring structure.

1183. Assertion: Reaction of SO_2 and H_2S in the presence of Fe_2O_3 catalyst gives elemental sulphur.

Reason: SO_2 is a reducing agent.

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

[AIIMS-2005]

Ans. (c) : Reaction of SO_2 and H_2S in the presence of Fe_2O_3 is as follows :

$$2H_2S + SO_2 \rightarrow 2H_2O + 3S\downarrow$$

In the reaction SO_2 is oxidising agent and H_2S is reducing agent. So, assertion is true but the reason is false.

1184. Assertion: Dinegative anion of oxygen (O^{2-}) is quite common but dinegative anion of sulphur (S^{2-}) is less common.

Reason: Covalency of oxygen is two.

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

[AIIMS-2002]

Ans. (b): Fluorine is the most electronegative element on the earth. The second most electronegative element is oxygen by which it can easily gain electrons to form dinegative anion (O^{2-}),while sulphur is not so electronegative element as oxygen.

The covalency of an atom is the number of electrons it shares with other atoms when forming chemical bonds. So covalency of oxygen is two as it forms a double bonds (as H_2O).

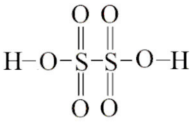
1185. Which of the following are peroxyacids of sulphur?

(a) H_2SO_5 and $H_2S_2O_8$ (b) H_2SO_5 and $H_2S_2O_7$
(c) $H_2S_2O_7$ and $H_2S_2O_8$ (d) $H_2S_2O_6$ and $H_2S_2O_7$

[AIIMS-2017]

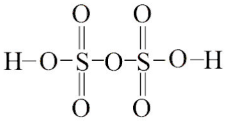
Ans. (a): Peroxyacids have peroxy linkage which means there should be a bond between oxygen and oxygen (O – O) in a compound.

H_2SO_5, $H_2S_2O_8$ have peroxy linkage and thus are peroxy acids.



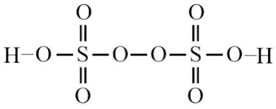
$$H-O-\overset{O}{\underset{O}{\overset{\|}{\underset{\|}{S}}}}-\overset{O}{\underset{O}{\overset{\|}{\underset{\|}{S}}}}-O-H$$

dithionic acid
($H_2S_2O_6$)



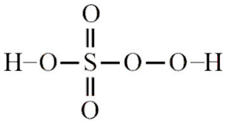
$$H-O-\overset{O}{\underset{O}{\overset{\|}{\underset{\|}{S}}}}-O-\overset{O}{\underset{O}{\overset{\|}{\underset{\|}{S}}}}-O-H$$

Oleum
pyrosulphuric acid
($H_2S_2O_7$)



$$H-O-\overset{O}{\underset{O}{\overset{\|}{\underset{\|}{S}}}}-O-O-\overset{O}{\underset{O}{\overset{\|}{\underset{\|}{S}}}}-O-H$$

Peroxodisulphuric acid ($H_2S_2O_8$)



$$H-O-\overset{O}{\underset{O}{\overset{\|}{\underset{\|}{S}}}}-O-O-H$$

Peroxomonosulphuric acid (H_2SO_5)

1186. Oxygen is more electronegative than sulphur, yet H_2S is acidic while H_2O is neutral. This is because

(a) Water is a highly associated.
(b) H–S bond is weaker than H–O bond.
(c) H_2S is a gas while H_2O is a liquid.
(d) The molecular weight of H_2S is more than that of H_2O.

[AIIMS-2012]

Ans. (b): H–S bond is weaker than H–O bond due to large size of S (Sulphur). Moreover, due to high electronegativity of oxygen it forms hydrogen bond in H_2O.

1187. Which one of the following is the correct decreasing order of boiling point?

(a) $H_2Te > H_2O > H_2Se > H_2S$
(b) $H_2O > H_2S > H_2Se > H_2Te$
(c) $H_2Te > H_2Se > H_2S > H_2O$
(d) $H_2O > H_2Te > H_2Se > H_2S$

[AIIMS-2010]

Ans. (d): Van der waal's forces increases due to increase in molecular weight of hydrides of group 16 elements. So, boiling point also increases. But H_2O unexpectedly has highest boiling point due to presence of hydrogen bonding.

So, correct decreasing order of boiling point is

$H_2O > H_2Te > H_2Se > H_2S$

1188. S^{2-} and SO_3^{2-} can be distinguished by using

(a) $(CH_3COO)_2$ Pb (b) $Na_2[Fe(CN)_5NO]$
(c) both (a) and (b) (d) None of these

[AIIMS-2008]

Ans. (c): Both the reagents can be used to distinguish between S^{2-} and SO_3^{2-}

@apna_pdf

Test with $(CH_3COO)_2Pb$:

$$S^{2-} + (CH_3COO)_2Pb \rightarrow \underset{\text{(black ppt)}}{PbS\downarrow} + 2CH_3COO^-$$

$$SO_3^{2-} + (CH_3COO)_2Pb \rightarrow \underset{\text{(white ppt)}}{PbSO_4\downarrow} + 2CH_3COO^-$$

Test with $Na_2[Fe(CN)_5NO]$:

$$S^{2-} + Na_2[Fe(CN)_5NO] \rightarrow \underset{\text{(Violet)}}{Na_4[Fe(CN)_5NOS]}$$

$$SO_3^{2-} + Na_2[Fe(CN)_5NO] \rightarrow \underset{\text{(Purple)}}{Na_4[Fe(CN)_5NO.SO_3]}$$

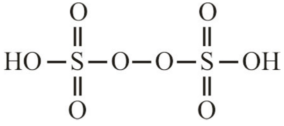
1189. Peroxydisulphuric acid has the following bond:

(a) $O \leftarrow O = O$ (b) $\leftarrow O = O \rightarrow$

(c) $> O \rightarrow O <$ (d) $-O-O-$

[AIIMS-2008]

Ans. (d): The structure of Peroxydisulphuric acid ($H_2S_2O_8$) is



$$HO-\overset{\overset{O}{\|}}{\underset{\underset{O}{\|}}{S}}-O-O-\overset{\overset{O}{\|}}{\underset{\underset{O}{\|}}{S}}-OH$$

Peroxide linkage

Thus, Peroxydisulphuric acid contains peroxide i.e. –O–O– bond.

1190. The element which is the most abundant in the earth crust is

(a) O (b) S

(c) Al (d) H

[AIIMS-2007]

Ans. (a) : The most abundant element in the earth's crust is oxygen (46.1 % by weight) followed by silica and aluminium.

1191. The incorrect statement among the following is:

(a) C_{60} is an allotropic form of carbon.

(b) O_3 is an allotropic form of oxygen.

(c) S_8 is the only allotropic form of sulphur.

(d) Red phosphorus is more stable in air than white phosphorus.

[AIIMS-2006]

Ans. (c):

- C_{60} is an allotropic form of carbon which is true.
- O_3 is an allotropic form of oxygen which is also true.
- But sulphur has different allotropes such as monoclinic sulphur, plastic sulphur, orthorhombic sulphur etc. Thus, S_8 is not the only allotrope of sulphur.
- And red phosphorus is more stable than white phosphorus in air, this is also true.

1192. Hypo on treatment with iodine produces :

(a) H_2S (b) Na_2SO_4

(c) Na_2SO_3 (d) $Na_2S_4O_6$

[AIIMS-2000]

Ans. (d): Sodium thiosulphate is an important inorganic salt with several medical uses. It also called sodium hyposulfite or 'hypo'.

Hypo ($Na_2S_2SO_3$) on treatment with iodine produces sodium tetrathionate such as;

$$\underset{\text{Sodiumthiosulphate}}{2Na_2S_2O_3} + I_2 \rightarrow \underset{\text{Sodiumtetrathionate.}}{Na_2S_4O_6} + 2NaI$$

1193. H_2S does produce metallic sulphide with :

(a) $CuCl_2$ (b) $COCl_2$

(c) $CdCl_2$ (d) $ZnCl_2$

[AIIMS-1997]

Ans. (b): H_2S is the group reagent for II and IV group of basic redicals (cations). So with $CoCl_2$ (no metal here), no metallic sulphide will be produced.

1194. Which gas cannot be collected over water ?

(a) O_2 (b) PH_3

(c) N_2 (d) SO_2

[AIIMS-1997]

Ans. (d): Insoluble gases don't dissolve in water and thus can be collected over it. For example, Nitrogen, Oxygen, carbon dioxide etc. Soluble gases dissolve easily in water and thus can't be separated from it.

Here, sulphur dioxide (SO_2) cannot be collected over water because it reacts with water forming H_2SO_3 as;

$SO_2 + H_2O \rightarrow H_2SO_3$

1195. The sodium extract of an organic compound on acidification with acetic acid and addition of lead acetate solution gives a black precipitate. The organic compound contains

(a) nitrogen (b) halogen

(c) sulphur (d) phosphorus

VITEEE-2014

Ans. (c) :

$$Na_2S + (CH_3COO)_2Pb \rightarrow \underset{\text{(Black ppt)}}{Pbs} + 2CH_3COONa$$

The organic compounds containing sulphur when react with sodium metal give Na_2S. The Na_2S when react with lead acetate forms black ppt of PbS.

1196. Out of $H_2S_2O_3$, $H_2S_2O_4$, H_2SO_5, and $H_2S_2O_8$ peroxy acids are

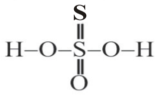
(a) $H_2S_2O_3$, $H_2S_2O_8$ (b) H_2SO_5, $H_2S_2O_8$

(c) $H_2S_2O_4$, H_2SO_5 (d) $H_2S_2O_3$, $H_2S_2O_4$

VITEEE-2013

Ans. (b) : Peroxy acids have peroxy linkage(–O–O–)

(i) $H_2S_2O_3$

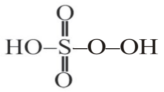


$$H-O-\overset{\overset{S}{\|}}{\underset{\underset{O}{\|}}{S}}-O-H$$

(ii) $H_2S_2O_4$

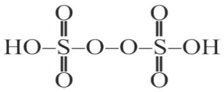
$$HO-\overset{\overset{O}{\|}}{S}-\overset{\overset{O}{\|}}{S}-OH$$

(iii) H_2SO_5



$$HO-\overset{\overset{O}{\|}}{\underset{\underset{O}{\|}}{S}}-O-OH$$

(iv) $H_2S_2O_8$



$$HO-\overset{\overset{O}{\|}}{\underset{\underset{O}{\|}}{S}}-O-O-\overset{\overset{O}{\|}}{\underset{\underset{O}{\|}}{S}}-OH$$

Here, in option (b) H_2SO_5 and $H_2S_2O_8$ have peroxy linkage. Thus, it is clear that H_2SO_5 and $H_2S_2O_8$ are peroxy acids.

1197. Which pair of oxyacids of phosphorus contains 'P–H' bonds?

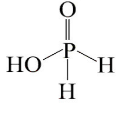
(a) H_3PO_4, H_3PO_3 (b) $H_3PO_5, H_4P_2O_7$

(c) H_3PO_3, H_3PO_2 (d) H_3PO_2, HPO_3

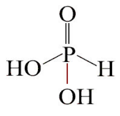
VITEEE- 2009

@apna_pdf

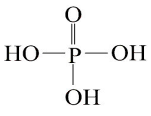
Ans. (b) :



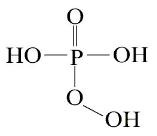
H_3PO_2



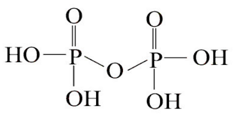
H_3PO_3



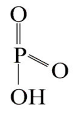
H_3PO_4



H_3PO_5



$H_4P_2O_7$



HPO_3

The structure of H_3PO_2, H_3PO_3, H_3PO_4, H_3PO_5, $H_4P_2O_7$ and HPO_3 is shown above.

From these structure we can conclude that H_3PO_2 and H_3PO_3 Contains P – H bonds.

H_3PO_2 contain two P – H bonds and H_3PO_3 contain one P–H bond.

1198. Which of the following statements regarding sulphur is not correct?

(a) At about 1000 K, it mainly consists of S_2 molecules

(b) The oxidation state of sulphur is never less than +4 in its compounds

(c) S_2 molecule is paramagnetic

(d) Rhombic sulphur is readily soluble in CS_2

AP-EAMCET – 2016

Ans. (b) : Sulphur crystal containing cyclic S_8 rings packed in a manner which leads to the formation of rhombic crystal. S_2 molecule is a paramagnetic. It is fairly soluble in CS_2, sparingly soluble in alcohol and ether. Whereas, totally insoluble in water. The oxidation state of sulphur in its compound is never less then +4 e.g. H_2SO_3, H_2SO_5, $H_2S_2O_8$, $H_2S_2O_6$ etc.

1199. Which of the following reactions does not involve liberation of oxygen?

(a) $XeF_4 + H_2O \rightarrow$ (b) $XeF_4 + O_2F_2 \rightarrow$

(c) $XeF_2 + H_2O \rightarrow$ (d) $XeF_6 + H_2O \rightarrow$

AP-EAMCET – 2016

Ans. (d) :

(i) $6XeF_4 + 12H_2O \rightarrow 4Xe + 2XeO_3 + 24HF + 3O_2$

(ii) $XeF_4 + O_2F_2 \rightarrow XeF_6 + O_2$

(iii) $2XeF_2 + 2H_2O \rightarrow 2Xe + 4HF + O_2$

(iv) $XeF_6 + 3H_2O \rightarrow XeO_3 + 6HF$

Hence, Xenonhexafluoride on reaction with water does not give the oxygen as a product.

1200. Which one of the following statements is not correct?

(a) O_3 is used as a germicide

(b) In O_3, $O-O$ bond length is identical with that of molecular oxygen

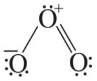
(c) O_3 is an oxidizing agent

(d) The shape of O_3 molecule is angular

AP-EAMCET – 2016
WB-JEE-2010, 2008

Ans. (b) : Ozone (O_3) is a polar molecule with a dipole moment of 0.53D. In O_3, O–O bond length is 1.278Å whereas O_2 bond length is 1.21Å. Thus, the bond length are not equal. Hence, given statement is false.

- Ozone is an unstable, colorless gas. It is powerful oxidizer and a potent germicide. Hence, statement is true.
- Ozone acts as a powerful oxidizing agent because it decomposes readily on heating to form a molecule of oxygen along with nascent oxygen. Nascent oxygen is a free radical which is very reactive in nature. Thus, it acts as a powerful oxidizing agent. Hence, statement is true.
- Ozone has sp^2 hybridisation with bent shaped.



Hence, statement is true.

1201. What is the formula of calgon ?

(a) $(NaPO_3)_6$ (b) $Mg_3(PO_4)_2$

(c) Na_3PO_4 (d) $MgSO_4$

AP-EAMCET (Engg.)-2004

Ans. (a) : The molecular formula of calgon is $(NaPO_3)_6$. It contains the sodium, phosphorus and oxygen elements. It's chemical name is sodium hexametaphosphate. It is used for removal of hardness of water.

1202. The oxidation numbers of sulphur in S_8, SO_2 and H_2S respectively are

(a) 0, +6, – 2 (b) 0, +4, – 2

(c) 0, +1, + 2 (d) 0, +1, – 2

AP- EAMCET(Medical) -2010

Ans. (b): The given species are S_8, SO_2 and H_2S. In the molecular form, the oxidation state is always zero. So, the S_8 has the 0 oxidation state.

For SO_2 —	For H_2S —
$+x + 2(-2) = 0$	$2(+1) + x = 0$
or $x = +4$	or $x = -2$

1203. Which one of the following is most acidic?

(a) H_2O (b) H_2S

(c) H_2Te (d) H_2Se

AP-EAMCET- (Engg.) - 2010

Ans. (c) : On going up to down in group, size of atom increase and bond length also increase. Thus the bond dissociation energy decreases. Since H_2Te gives a proton (H^+) more readily. Hence, it is most acidic among the given.

$$H_2Te + H_2O \longrightarrow H_3O^+ + HTe^-$$

1204. $Na_2S_2O_3$ reacts with moist Cl_2 to form Na_2SO_4, HCl and X. Which one of the following is X?

(a) H_2S (b) SO_2

(c) SO_3 (d) S

AP-EAMCET (Engg.) 2013

Ans. (d) :

$$Na_2S_2O_3 + Cl_2 + H_2O \longrightarrow Na_2SO_4 + 2HCl + S(X)$$

$Na_2S_2O_3$ (sodium thiosulphate) is oxidised by moist Cl_2 to form sulphur precipitates.

@apna_pdf

1205. The first four elements in group 16 are collectively known as

(a) halogens (b) chalcogens

(c) noble gases (d) carbon family.

SRMJEEE – 2010

Ans. (b) : The first four elements in group -16 are collectively known as chalcogens and elements are oxygen (O), Sulphur (S), Selenium (Se), and Tellurium (Te).

1206. The anhydride of H_2SO_4 is

(a) SO_2 (b) $H_2S_2O_7$

(c) H_2SO_3 (d) SO_3

SRMJEEE – 2011

Ans. (d) : The sulphuric acid (H_2SO_4) decomposes to give sulphur trioxide (SO_3) and H_2O. Thus SO_3 is regarded as anhydride of sulphuric acid.

$$H_2SO_4 \xrightarrow[-H_2O]{} SO_3 + H_2O$$

1207. The number of cations produced by Mohr's salt in solution is

(a) 1 (b) 2

(c) 3 (d) 4

SRMJEEE-2015

Ans. (c) : The formula of Mohr's salt is $Fe\ SO_4.(NH_4)_2SO_4.\ 6H_2O$

$FeSO_4.\ (NH_4)_2SO_4.\ 6H_2O \rightarrow Fe^{2+} + 2NH_4^+ + 2SO_4^{2-} + 6H_2O$

Therefore, three cation ($2NH_4^+$ and Fe^{2+}) are produced by Mohr's salt in the solution.

1208. Basicity of dithionic acid is

(a) two (b) one

(c) three (d) four.

AMU-2019

Ans. (a) : Dithionic acid with chemical formula $H_2S_2O_6$, is a chemical compound known only in solution. The basicity of dithionic acid is two.

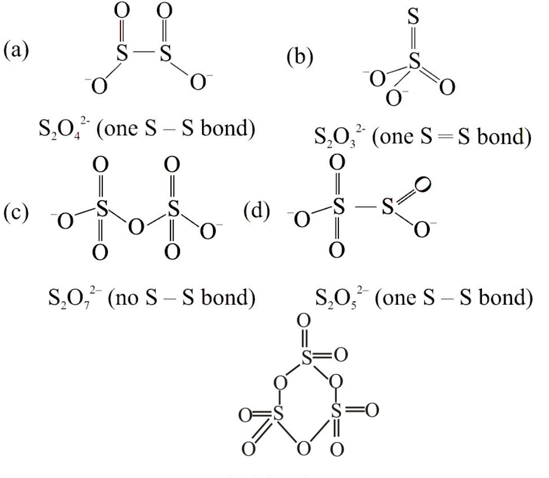
1209. The number of S–S bonds in sulphur trioxide trimer (S_3O_9) is

(a) 3 (b) 2

(c) 1 (d) 0

AMU-2019

Ans. (d) : Zero



(a)
$S_2O_4^{2-}$ (one S – S bond)
(b)
$S_2O_3^{2-}$ (one S = S bond)
(c)
$S_2O_7^{2-}$ (no S – S bond)
(d)
$S_2O_5^{2-}$ (one S – S bond)

(s-s) bond = zero

1210. Arrange H_2O, H_2S and H_2Se in order of increasing acidity.

(a) $H_2O < H_2S < H_2Se$ (b) $H_2S < H_2O < H_2Se$

(c) $H_2Se < H_2S < H_2O$ (d) $H_2O < H_2Se < H_2S$

AMU-2017

Ans. (a) : Because of decrease in bond dissociation enthalpy, acidity of hydrides increases down the group. Increasing order of acidity is ;

$H_2O < H_2S < H_2Se$

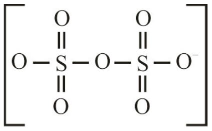
1211. The species having no S – S bond is

(a) $S_2O_4^{2-}$ (b) $S_2O_3^{2-}$

(c) $S_2O_7^{2-}$ (d) $S_2O_5^{2-}$

AMU-2015

Ans. (c) : $S_2O_7^{2-}$ species having no S–S bond



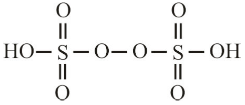
1212. Which of the following gas -O-O- linkage?

(a) $H_2S_2O_6$ (b) $H_2S_2O_8$

(c) $H_2S_2O_3$ (d) $H_2S_4O_6$

WB JEE-2016, AMU-2011

Ans. (b) : $H_2S_2O_8$ is a peroxy acid and has –O–O– linkage.



Peroxodisulphuric acid.

1213. Which of the following statement is incorrect?

(a) H_2S is less acidic than H_2Se

(b) H_2S is less acidic than H_2Te

(c) H_2Te is less acidic than H_2Se

(d) H_2Se is less acidic than H_2Te

AIIMS 2011

Ans. (c) : The acidity of the hydrides of the elements of the group increases with increasing size of the central atom. Hence, for the group 16 hydrides, the acidic character increases as $H_2O<H_2S<H_2Se<H_2Te$.

1214. The acidity of hydrides of O, S, Se and Te varies in the order

(a) $H_2O> H_2S> H_2Se> H_2Te$

(b) $H_2O< H_2S< H_2Se< H_2Te$

(c) $H_2S> H_2O> H_2Se> H_2Te$

(d) $H_2Se> H_2S> H_2O> H_2Te$

AMU-2005

Ans. (b) : The acidic nature increases from H_2O to H_2Te. The increase in acidic character of hydrides on moving down the group may be explained in terms of bond length of H–M bond. Larger is bond-length, lesser is bond energy and thus easier is ionisation of H–M bond or easier in proton donor nature.

$H_2O < H_2S < H_2Se < H_2Te$

1215. Hypo phosphorus acid, H_3PO_2 is :

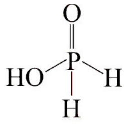
(a) a monobasic acid (b) a tribasic acid

(c) a dibasic acid (d) not acidic at all

BCECE-2006

@apna_pdf

Ans. (a) : Hypo phosphorus acid (H_3PO_2) gives basicity according to number of (–OH) group attached to phosphorous in its structure. Thus, H-atoms gives reducing character.



H_3PO_2

As only one (–OH) group is attached to phosphorous atom.

It is a monobasic acid.

1216. In presence of moisture, SO_2 can :

(a) act as oxidant (b) act as reductant

(c) gain electron (d) not act as reductant

BCECE-2006

Ans. (b) : In the presence of moisture, SO_2 act as a reducing agent by losing electrons . It reduces hydrogen peroxide into water.

$$SO_2 + 2H_2O \rightarrow H_2SO_4 + 2H$$

$$H_2O_2 + 2H \rightarrow 2H_2O$$

The bleaching action of SO_2 is due to its reducing property, presence of moisture and SO_2 given bleaching

$$SO_2 + 2H_2O \rightarrow H_2SO_4 + 2[H]$$

$$\text{Colouring matter} + 2H \xrightleftharpoons{\text{air}} \text{colourless compound.}$$

Note – sulphur dioxide acts as bleaching agent in presence of moisture, it is due to liberation of Nascent hydrongen.

1217. Fuming sulphuric acid is :

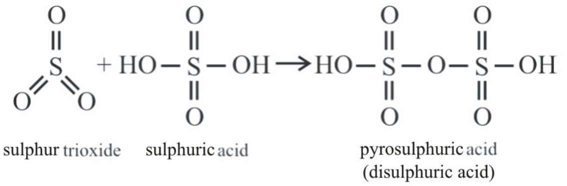
(a) $H_2SO_4 + SO_3$ (b) $H_2SO_4 + SO_2$

(c) H_2SO_4 (d) $H_2SO_4 + SO_4$

BCECE-2004

Ans. (a) : Fuming sulphuric acid is also called 'oleum', is produced by adding sulphur trioxide, SO_3 to sulfuric acid. It mostly contains disulphuric acid (also called pyrosulphuric acid).

$$H_2S_2O_7(H_2SO_4 + SO_3) \rightarrow \text{Fuming sulphuric acid}$$



1218. S – S bond is not present in :

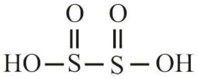
(a) $H_2S_2O_4$ (b) $H_2S_2O_6$

(c) $H_2S_2O_8$ (d) none of these

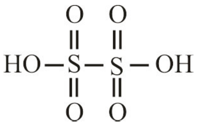
BCECE-2004

Ans. (c)

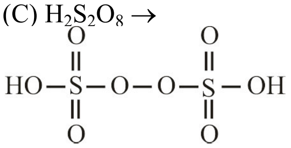
(A) $H_2S_2O_4 \rightarrow$



(B) $H_2S_2O_6 \rightarrow$



(C) $H_2S_2O_8 \rightarrow$



Thus, except $H_2S_2O_8$, all contains S–S bond.

1219. Ozone is used for purifying water because

(a) it dissociates and release oxygen

(b) do not leave any foul smell like chlorine

(c) kills bacteria, cyst, fungi and acts as a biocide

(d) All of the above

BCECE-2008

Ans. (d) : Ozone is used to purify water because ozone kills, bacteria, cysts, fungi, mold, parasites, viruses, contaminates etc.

O_3 → O_2 + [O] → Weak oxygen
↓ ↓
Ozone Oxygen

• We are getting oxygen to breath as a product, and it does not give any foul smell like chlorine.

• Weak oxygen is the strong oxidizing agent.

[O] + Carbon-compound→ kills bacteria by oxidization
↓
Like, bacteria, fungi, etc.

Hence, the option (d) is correct.

1220. An element is oxidized by fluorine and not by chlorine. Identify the element.

(a) Sodium (b) Aluminum

(c) Oxygen (d) Sulphur

BCECE-2013

Ans. (c) : Fluorine is more electronegative element than oxygen and oxygen is more electronegative than chlorine.

Hence, fluorine can oxidise oxygen whereas, chlorine reduced oxygen.

1221. The oxoacid of sulphur which contains two sulphur atoms in different oxidation states is –

(a) pyrosulphurous acid

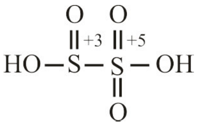
(b) hyposulphurous acid

(c) pyrosulphuric acid

(d) persulphuric acid

BCECE-2014

Ans. (a) : The oxidation states of two S atoms in pyrosulphurous acid or disulphurous acid ($H_2S_2O_5$) are different i.e. +3 and +5 state.



Pyrosulphurous acid

Note – The salts of disulphurous acid are called disulphites or metabisulphites.

1222. Sulphur (s) when react with HNO_3 (conc.) mainly gives

(a) H_2SO_4, NO_2 and H_2O (b) H_2S, N_2O_5 and SO_2

(c) H_2SO_3, NO_2 and SO_2 (d) SO_2, NO_2 and H_2O

BCECE-2017

@apna_pdf

Ans. (a) : When sulphur reacts with concentrated nitric acid (HNO_3), sulphuric acid (H_2SO_4), nitrogen dioxide (NO_2) and water are formed as the products.
The reaction is as follows:-

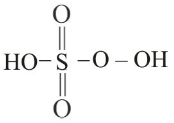
$$S + 6HNO_3 \rightarrow H_2SO_4 + 6NO_2 + 2H_2O$$

1223. Caro's acid is

(a) H_2SO_3	(b) $H_2S_2O_5$
(c) H_2SO_5	(d) $H_2S_2O_8$

[BITSAT-2005]

Ans. (c) : Caro's acid is peroxy monosulphurio acid (H_2SO_5).



$$HO-\overset{\overset{\large O}{\|}}{\underset{\underset{\large O}{\|}}{S}}-O-OH$$

Hybrid state of S = sp^3
Oxidation state of S = + 6

1224. Bleaching action of SO_2 is due to its

(a) oxidising property	(b) acidic property
(c) reducing property	(d) basic property

[BITSAT-2007]

Ans. (c) : Sulphur dioxide is a good reductant. In the presence of water, SO_2 is able to decolorise substances. Specifically it is a useful reduction bleach for papers and delicate materials such as clothes.

$$SO_2 + H_2O \rightleftharpoons H_2SO_3 \rightleftharpoons 2H^+ + SO_3^-$$
$$SO_3^- + O \rightarrow SO_4^{2-}$$
$$SO_4^{2-} + dye \rightarrow reduced\,dye$$

This bleaching effect normally does not last very long. Oxygen in the atmosphere reoxidises the reduced dyes, restoring the colour.

1225. Which of the following behaves as both oxidising and reducing agents?

(a) H_2SO_4	(b) SO_2
(c) H_2S	(d) HNO_3

[BITSAT-2006]

Ans. (b) : SO_2 has an O.N. of +4 which is neither highest (i.e. +6) nor lowest (i.e. t –2) therefore, it can act both as an oxidizing as well as a reducing agent.
Other H_2O_2, MnO_2 also act as both oxidizing and reducing agent.

1226. Which of the following is not a member of chalcogens?

(a) O	(b) S
(c) Se	(d) Po

[BITSAT-2018]

Ans. (d) : Group 16 of the periodic table is known as chalcogens. This group also called oxygen family.

- It consists of the elements oxygen (O), sulphur (S), selenium (Se), tellurium (Te), and the radioactive element polonium (Po).
- But polonium (Po) is a radioactive element and it is one of the rarest element in the group. It is also harmful due to its radioactivity. Thus we can say that polonium is not considered as a chalcogen.

Electronic configuration of chalcogen –

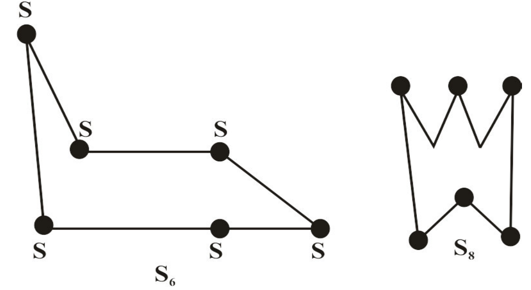
- Oxygen (O) – [He] $2s^2 2p^4$
- Sulphur (S) – [Ne] $3s^2 3p^4$
- Selenium (Se) – [Ar] $3d^{10} 4s^2 4p^4$
- Tellurium (Te) – [Kr] $4d^{10} 5s^2 5p^4$
- Polonium (Po) – [Xe] $4f^{14} 5d^{10} 6s^2 6p^4$

1227. Identify the incorrect statement:

(a) The S–S–S bond angles in the S_8 and S_6 rings are the same.
(b) Rhombic and monoclinic sulphur have S_8 molecules.
(c) S_2 is paramagnetic like oxygen
(d) S_8 ring has a crown shape.

[BITSAT-2021]

Ans. (a) : The S_6 molecule has a chair-form hexagon ring with the same bond length as that in S_8, but with somewhat smaller bond angles i.e. bond lengths are same but bond angles are different.



1228. Point out in which of the following properties oxygen differs from the rest of the members of its family (Group-VIA)?

(a) High value of ionisation energies
(b) Oxidation states (2,4,6)
(c) Polymorphism
(d) Formation of hydrides

CG PET -2007

Ans. (b) : Oxygen does not show + 4 and + 6 oxidation state.

Oxygen shows –2, –1, $-\frac{1}{2}$, 0, + 1 and + 2 oxidation state.

1229. In the formation of SO_3 according to following equilibrium $2SO_2 + O_2 \rightleftharpoons 2SO_3 + Heat$, which conditions favour the formation of SO_3?

(a) Low pressure
(b) Low concentration of oxygen
(c) Low temperature and used of catalyst
(d) High temperature without using catalyst

CG PET -2004

Ans. (c) : The given reaction is exothermic as heat is released during the reaction. For an exothermic reaction, on decreasing the temperature equilibrium will shift in forward direction. Hence, low temperature will be favoured for formation of SO_3.
According to the Le Chatelier's principle, on increasing pressure, equilibrium will shift in the direction where lesser number of gaseous moles are present. Hence, on increasing pressure equilibrium will shift in forward direction for the given system. Hence, high pressure is favourable for greater yield of SO_3.

@apna_pdf

1230. The formula of phosphate of a metal, M is MNH_4PO_4. The formula of its sulphate will be

(a) MSO_4 (b) $M(SO_4)_2$

(c) M_2SO_4 (d) $M_2(SO_4)_3$

CG PET -2004

Ans. (a) : The oxidation state of metal (M) in MNH_4PO_4 is +2 so the molecular formula of its sulphate will be MSO_4.

1231. Match List-I with List-II and select the correct answer using the codes give below

ListI (Oxyacid of sulphur)		List II (Oxidation state of sulphur)	
A.	H_2SO_3	1.	+1
B.	$H_2S_2O_6$	2.	+6
C.	$H_2S_2O_2$	3.	+4
D.	$H_2S_2O_8$	4.	+5

Codes

	A	B	C	D
(a)	4	3	2	1
(b)	2	1	3	4
(c)	4	3	2	1
(d)	3	4	1	2

CG PET -2017

Ans. (d) : The correct match for the given List I and II is as follows

Oxyacid	Structural representation	Oxidation state
H_2SO_3		+4
$H_2S_2O_6$		+5
$H_2S_2O_2$		+1
$H_2S_2O_8$		+6

1232. Which one of the following is used for water softening?

(a) $Ca_3 (PO_4)_2$ (b) Na_3PO_4

(c) $Na_2 [Na_4(PO_3)_6]$ (d) Na_2HPO_4

S. C. R. A - 2014

Ans. (c) : Sodium hexametaphosphate ($Na_2 [Na_4(PO_3)_6]$) commercially called 'calgon' is used for water softening.

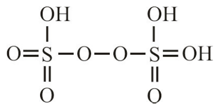
1233. In which of the following oxoacid of Sulphur, S-O-O-S bond is present?

(a) $H_2S_2O_7$ (b) $H_2S_2O_8$

(c) $H_2S_2O_4$ (d) $H_2S_2O_3$

GUJCET-2020

Ans. (b) :



$H_2S_2O_8$ (Marshall's acid/peroxy disulphuric acid)

1234. In manufacturing of sulphuric acid in presence of platinum catalyst, which metal impurity acts as catalytic poison?

(a) Fe (b) Cr

(c) Cu (d) V

GUJCET-2018

Ans. (b) : In the manufacturing of sulphuric acid in presence of platinum catalyst, arsenic metal impurity (in the form of As_2O_3) acts as a catalytic poison

Cr → behaves like negative catalyst poison.

1235. Which type of colloid is the dissolution of sulphur (S_8)?

(a) Macromolecular colloid

(b) Micelle

(c) Multimolecular colloid

(d) Associated colloid

GUJCET-2016

Ans. (c) : By dissolution, a large number of atoms or smaller molecules of a substance aggregate together to form species having a size in the colloidal range (1–1000nm). The species thus formed are called Multimolecular colloids.

1236. What is the catalyst used in the manufacture of sulphuric acid by contact process?

(a) Nickel powder (b) Platinised asbestos

(c) Anhydrous Al_2O_3 (d) Aluminium powder

AP EAMCET- 2000

Ans. (b) : Platinised asbestos is used in the manufacture of sulphuric acid. The contact process is a method to produce sulfuric acid in the high concentrations needed for industrial processes. Platinum is originally used as the catalyst for this reaction.

$$2SO_2 + O_2 \xrightleftharpoons[400-500^\circ C, 1-5atm]{\text{Platinised}} 2SO_3$$

1237. The correct order of electron gain enthalpy is

(a) S > Se > Te > O (b) Te > Se > S > O

(c) O > S > Se > Te (d) S > O > Se > Te

(JEE Main 2021, 26 Feb Shift-II)

Ans. (a) : Because of the small size leading to repulsion of the incoming electron second period elements (here oxygen) have low electron gain enthalpy than other element of the column. S has the highest enthalpy. Correct order of electron gain enthalpy is S > Se > Te > O

1238. Given below are two statement-

Statement-I α and β- forms of sulphur can change reversibly between themselves with slow heating or slow cooling.

Statement-II At room temperature, the stable crystalline form of sulphur is monoclinic sulphur.

In the light of the above statements, choose the correct answer from the options given below.

(a) Both statement I and II are true.

(b) Both statements I and II are false.

(c) Statement I is true but statement II is false

(d) Statement I is false but statement II is true.

(JEE Main 2021, 25 Feb Shift-II)

@apna_pdf

Ans. (c) : $\alpha-\text{sulphur} \underset{<369K}{\overset{>369K}{\rightleftharpoons}} \beta-\text{sulphur}$

At room temperature α-sulphur (Rhombic) is most stable form.

1239. Among the following allotropic forms of sulphur, the number of allotropic forms, which will show paramagnetism is..................

(a) α-sulphur
(b) β-sulphur
(c) S_2-form

(JEE Main 2021, 24 Feb Shift-II)

Ans. (a) : Only S_2 – From of sulphur is paramagnetic in nature, because S_2 is like O_2 i.e. paramagnetic as per molecular orbital theory. It contains unpaired electron.

α-sulphur and β-sulphur are diamagnetic as they do not have unpaired electron.

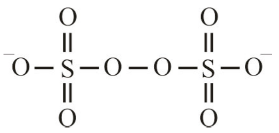
1240. The number of bonds between sulphur and oxygen atoms in $S_2O_8^{2-}$ and the sulphur atoms in rhombic sulphur, respectively, are rhombic sulphur, respectively, are

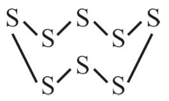
(a) 4 and 6
(b) 8 and 8
(c) 4 and 8
(d) 8 and 6

(JEE Main 2020, 8 Jan Shift-I)

Ans. (b) : We have to count S–O single bonds as well as S=O in $S_2O_8^{2-}$, as each double bond also has one sigma bond.

The structure of $S_2O_8^{2-}$ and S_8 is shown below,





1241. The acidic, basic and amphoteric oxides, respectively, are

(a) Cl_2O, CaO, P_4O_{10}
(b) N_2O_3, Li_2O, Al_2O_3
(c) Na_2O, SO_3, Al_2O_3
(d) MgO, Cl_2O, Al_2O_3

(JEE Main 2020, 9 Jan Shift-I)

Ans. (b) : Acidic oxides are mostly oxides of non-metals and they dissolve in water to form acids.

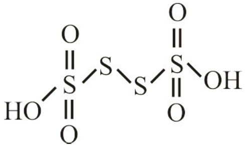
- Non-metal oxides are acidic in natures N_2O_3. Basic oxides are always oxides of metals.
- They combine with water to form bases which are usually called metal hydroxides.
- Alkali metal oxides are basic in nature- Li_2O an amphoteric oxide is an oxide that can act as either an acid or base in a reaction to produce a salt and water. Al_2O_3 is amphoteric oxide.

1242. The oxoacid of sulphur that does not contain bond between sulphur atoms is

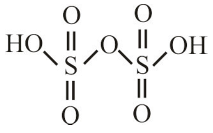
(a) $H_2S_2O_3$
(b) $H_2S_2O_4$
(c) $H_2S_2O_7$
(d) $H_2S_4O_6$

(JEE Main 2019, 10 April Shift-I)

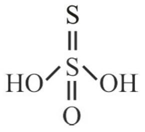
Ans. (c) : $H_2S_2O_7$ does not contain bond between sulphur atoms.



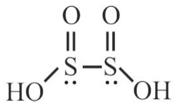
(I) $H_2S_4O_6$



(II) $H_2S_2O_7$



(III) $H_2S_2O_3$



(IV) $H_2S_2O_4$

1243. When the first electron gain enthalpy $(\Delta_{e_g}H)$ of oxygen is –141 kJ/mol, its second electron gain enthalpy is

(a) a positive value
(b) a more negative value than the first
(c) almost the same as that of the first
(d) negative, but less negative than the first

(JEE Main 2019, 9 Jan Shift-II)

Ans. (a) : As given, the first electron gain enthalpy of oxygen can be shown as,

$$O(g)+e^- \rightarrow O^-(g); \Delta e_g H_1 = -141 kJ/mol$$

The expression of second electron gain enthalpy of oxygen will be,

$$O^-(g)+e^- \rightarrow O^{2-}(g); \Delta e_g H_2 = +ve$$

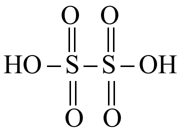
$\Delta e_g H_2$ of oxygen is positive, i.e. endothermic, because a strong electrostatic repulsion will be observed between highly negative O and the incoming electron (e^-). A very high amount energy will be consumed (endothermic) by the system to overcome the electrostatic repulsion.

1244. Which of the following has S-S bond?

(a) $H_2S_2O_6$
(b) $H_2S_2O_7$
(c) $H_2S_2O_8$
(d) Mustard gas

AP EAMCET- 2004

Ans. (a) : $H_2S_2O_6$ (Dithionic acid) contains S-S bond.



$$HO-\underset{\underset{O}{\|}}{\overset{\overset{O}{\|}}{S}}-\underset{\underset{O}{\|}}{\overset{\overset{O}{\|}}{S}}-OH$$

1245. Which of the following statements regarding sulphur is incorrect?

(a) S_2 molecule is paramagnetic
(b) The vapour at 200^0C consists mostly of S_8 rings
(c) At 600^0C, the gas mainly consists of S_2 molecules
(d) The oxidation state of sulphur is never less than +4 in its compounds

(AIEEE 2011)

Ans. (d) : Sulphur exhibit +2, +4, +6, oxidation states but +4 and +6 are more common.

@apna_pdf

1246. Which one of the following is an amphoteric oxide?

(a) ZnO (b) Na_2O

(c) SO_2 (d) B_2O_3

(AIEEE 2003)

Ans. (a) : Oxides made by metals which can act as a basic / acidic oxide.

ZnO – Amphoteric, Na_2O-basic, SO_2-acidic, B_2O_3-acidic

1247. Number of paramagnetic oxides among the following given oxides is Li_2O, Na_2O_2, KO_2, MgO and K_2O

(a) 1 (b) 2

(c) 3 (d) 0

(JEE Main 2021, 1 Sep Shift-II)

Ans. (a) : $Li_2O \rightarrow 2Li^+O^{2-}$

$MgO \rightarrow Mg^{2+}O^{2-}$

$K_2O \rightarrow 2K^+\,O^{2-}$,

$Na_2O_2 \rightarrow 2Na^+\,O_2^{2-}$

$KO_2 \rightarrow K^+\,O^{2-}$

O^{2-} = complete octet, diamagnetic

$O^{2-} \Rightarrow \sigma_{1s}^2\sigma_{1s}^{*2}\sigma_{2s}^2\sigma_{2s}^{*2}\sigma_{2px}^2\pi_{2py}^2 \simeq \pi_{2pz}^2\pi_{2py}^{*2} \simeq \pi_{2pz}^{*2}$ (dia)

$O_2^- \Rightarrow \sigma_{1s}^2\sigma_{1s}^{*2}\sigma_{2s}^2\sigma_{2s}^{*2}\sigma_{2px}^2\pi_{2py}^2 \simeq \pi_{2pz}^2\pi_{2py}^{*2} \simeq \pi_{2pz}^{*1}$ (para)

1248. Consider the sulphides HgS, PbS, CuS, Sb_2S_3, As_2S_3 and CdS.

Number of these sulphides soluble in 50% HNO_3 is

(JEE Main 2021, 31 Aug Shift-I)

Ans. (d) HgS → Aqua Regia

$PbS \rightarrow Pb(NO_3)_2 + H_2S$

$CuS \rightarrow Cu(NO_3)_2 + H_2S$

$Sb_2S_3 \rightarrow$ 50% HNO_3

$As_2S_3 \rightarrow As(NO_3)_3 + 3S + NO + H_2O$

$CdS \rightarrow Cd(NO_3)_2 + H_2S$

PbS, CuS, As_2S_3 and CdS are soluble in 50% HNO_3, HgS, Sb_2S_3 are insoluble in 50% HNO_3.

So the correct answer is option (d).

1249. In polythionic acid, $H_2S_xO_6$(X = 3 to 5) the oxidation state(s) of sulphur is/are

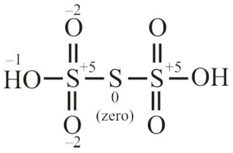
(a) only + 5 (b) only + 6

(c) +3 and +5 (d) 0 and +5

(JEE Main 2021, 27 Aug Shift-I)

Ans. (d) : When, x = 3

$H_2S_3O_6 \rightarrow$ 0 and +5



$HO-S(=O)_2-S-S(=O)_2-OH$

$\boxed{O.S.}\downarrow$

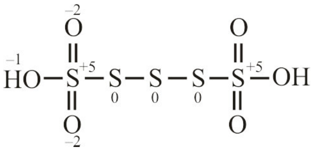
$H = +1$

$O = -2$

$-\overset{-2}{O}\overset{+1}{H} = -1$

When,

x = 5 $H_2S_5O_6 \rightarrow$ 0 and +5



$HO-S(=O)_2-S-S-S-S(=O)_2-OH$

1250. The product obtained from the electrolytic oxidation of acidified sulphate solutions, is

(a) HSO_4^- (b) HO_3SOOSO_3H

(c) HO_2SOSO_2H (d) HO_3SOSO_3H

(JEE Main 2021, 27 July Shift-I)

Ans. (b) : $2H_2SO_4 \rightarrow H_2S_2O_8 + 2H^+ + 2e^-$

$2H_2O \rightarrow O_2 + 4H^+ + 4e^-$

Cathode –

$e^- + H^+ \rightarrow \frac{1}{2}H_2$

Main product to electrolysis of conc. H_2SO_4 is HO_3SOOSO_3H or ($H_2S_2O_8$).

1251. Chalcogen group elements are

(a) Se, Tb and Pu (b) Se, Te and Po

(c) S, Te and Pm (d) 0, Ti and Po

(JEE Main 2021, 26 Aug Shift-II)

Ans. (b) : Group 16 of the periodic table is known as chalcogens. This group also called oxygen family.

- It consists of the elements oxygen (O), sulphur (S), selenium (Se), tellurium (Te), and the radioactive element polonium (Po).

1252. Which of the following oxyacids of sulphur has S-O-S linkage in its structure?

(a) Peroxodisulphuric acid

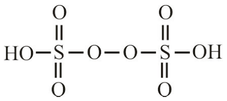
(b) Sulphuric acid

(c) Pyrosulphuric acid

(d) Sulphurous acid

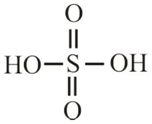
J & K CET-(2016)

Ans. (c) :



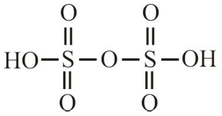
$HO-S(=O)_2-O-O-S(=O)_2-OH$

(a) Peroxodisulphuric acid ($H_2S_2O_8$)



$HO-S(=O)_2-OH$

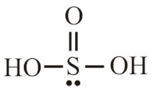
(b) Sulphuric acid (H_2SO_4)



$HO-S(=O)_2-O-S(=O)_2-OH$

(c) Pyrosulphuric acid ($H_2S_2O_7$)

(contains S–O–S linkage)



$HO-\ddot{S}(=O)-OH$

(d) Sulphurous acid (H_2SO_3)

1253. The catalyst for the oxidation of SO_2 to SO_3 and the manufacture of sulphuric acid by contact process is

(a) MoO_2 (b) V_2O_5

(c) CrO_3 (d) MnO_4

J & K CET-(2019)

@apna_pdf

Ans. (b) : $2SO_2 + O_2 \xrightleftharpoons{V_2O_5} 2SO_3$

SO_2 is oxidised by air in presence of V_2O_5 to SO_3.

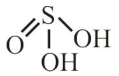
1254. The oxyacid of sulphur that contains a lone pair of electrons on sulphur is

(a) Sulphurous acid
(b) Sulphuric acid
(c) Peroxodisulphuric acid
(d) Pyrosulphuric acid

J & K CET-(2011)

Ans. (a) : Sulfurous acid H_2SO_3 is the oxyacid of sulphur that contains a lone pair of electrons in which 4 electrons are involved in bonding remaining 2 electrons are remained as a lone pair

∵ Sulphur has six valence electrons.



1255. Which one statement about sulphur dioxide gas is incorrect?

(a) It has an angular shape.
(b) It decolourises acidified potassium permanganate solution.
(c) Two S–O bonds are equal.
(d) It is a dehydrating agent

J & K CET-(2010)

Ans. (d) : Sulphur dioxide has angular shape because of the presence of one lone pair of electrons.

It reduces the acidified permanganate to Mn^{2+} thus, decolourises the acidified $KMnO_4$ solution.

$$5SO_2 + 2\underset{\text{coloured}}{MnO_4^-} + 2H_2O \rightarrow 5SO_4^{2-}$$

SO_2 is not a denydrating agent.

1256. Which one of the following is non-reducing?

(a) H_2S (b) H_2Te
(c) H_2Se (d) H_2O

J & K CET-(2009)

Ans. (d) : As the size of central metal atoms increases, H–X–H (Here, X = O, S, Se, Te) bond strength decreases and thus, the reducing power increases. The order of reducing power is $H_2O < H_2S < H_2Se < H_2Te$.

1257. The following is not an example of oxyacids of sulphur

(a) H_2SO_3 (b) $H_2S_2O_3$
(c) H_2SO_4 (d) SO_3

J & K CET-(2007)

Ans. (d) : Oxyacids are the compounds which contains hydrogen and oxygen along with main element.

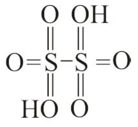
So, H_2SO_3, $H_2S_2O_3$, H_2SO_4 are the oxyacids of sulphur while SO_3 is the oxide of sulphur.

1258. The molecular formula of dithionic acid is

(a) $H_2S_2O_4$ (b) $H_2S_2O_6$
(c) $H_2S_2O_5$ (d) $H_2S_2O_7$

J & K CET-(2006)

Ans. (b) : The molecular formula of dithionic acid is



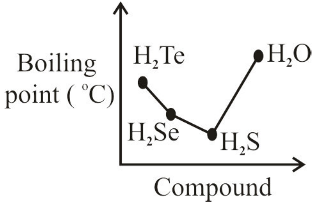
$(H_2S_2O_6)$

1259. Which of the following oxides of group 16 has the highest boiling point?

(a) H_2O (b) H_2S
(c) H_2Se (d) H_2Te

J & K CET-(2013)

Ans. (a) : Water has an abnormally high boiling point as it undergoes hydrogen bonding.



1260. The mass of carbon anode consumed (giving only carbondioxide) in the production of 270 kg of aluminium metal from bauxite by the Hall process is (Atomic mass Al = 27)

(a) 180 kg (b) 270 kg
(c) 540 kg (d) 90 kg

JCECE - 2012

Ans. (d) : In Hall and Heroult process

$$2Al_2O_3 \longrightarrow 4Al + 3O_2$$

$$4C + 3O_2 \longrightarrow 2CO_2 + 2CO\uparrow$$

Only for removal of CO_2, following equation is possible

$$2Al_2O_3 + \underset{3\times12=36}{3C} \longrightarrow \underset{4\times27=108}{4Al} + 3CO_2$$

∵ For 108 kg of Al, 36kg of C is required in above reaction

∴ For 270 kg of Al require amount of C

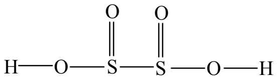
$$= \frac{36}{108} \times 270 = 90\text{kg}$$

1261. Sulphur in +3 oxidation state is present in

(a) Dithionous acid (b) Sulphurous acid
(c) Thionous acid (d) Phyrosulphuric acid

JCECE - 2015

Ans. (a) : Dithionous acid ($H_2S_2O_4$) has sulphur in +3 oxidation state.



Dithionous acid

Let oxidation state of sulphur is x.

$2 \times 1 + 4 \times (-2) + 2x = 0$

$2 - 8 + 2x = 0$

$2x = +6$

$x = +3$

1262. When a sulphur sol is evaporated, sulphur is obtained. On mixing with water, sulphur sol is not formed. The sol is

(a) Reversible (b) Hydrophobic
(c) Hydrophilic (d) Lyophilic

JCECE - 2017

Ans. (b): Sulphur solution being hydrophobic, is formed by the oxidation of H_2S gas as follows

$$2H_2S + O_2 \rightarrow 2H_2O + 2S$$

Direct addition of water does not form solution due to its hydrophobic nature.

@apna_pdf

1263. …………. is polyatomic molecule.

(a) Calcium (b) Oxygen
(c) Sulphur (d) Barium

JCECE - 2018

Ans. (c) : Polyatomic molecules are groups of three or more atoms held together by covalent bonds.

Sulphur is a polyatomic molecules as it exists in nature as S_6 and S_8.

1264. In which of the following compounds, sulphur show maximum oxidation number?

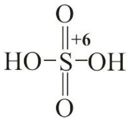
(a) H_2SO_4
(b) SO_3
(c) $H_2S_2O_7$
(d) All have same oxidation number for sulphur

JIPMER-2017

Ans. (d) : (i) Oxidation number of S in H_2SO_4 :

$x + 2 - 8 = 0$

$\therefore x = +6$

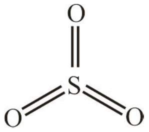


$$HO-\underset{\underset{O}{\|}}{\overset{\overset{O}{\|^{+6}}}{S}}-OH$$

(ii) Oxidation number of S in SO_3 :

$x - 6 = 0$

$\therefore x = +6$

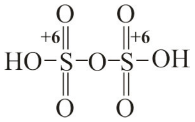


(iii) Oxidation number of S in $H_2S_2O_7$:

$= 2 + 2x - 14 = 0$

$2x = +12$

$\therefore x = +6$



$$HO-\underset{\underset{O}{\|}}{\overset{\overset{O}{{}^{+6}\|}}{S}}-O-\underset{\underset{O}{\|}}{\overset{\overset{O}{\|^{+6}}}{S}}-OH$$

[Where, x = Oxidation number of sulphur (S)]

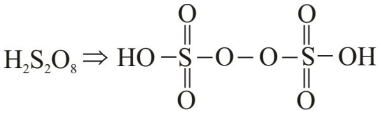
1265. Which of the following represents the correct order of decreasing number of S=O bonds?

(a) $H_2SO_4 > H_2SO_3 > H_2S_2O_8$
(b) $H_2S_2O_8 > H_2SO_3 > H_2SO_4$
(c) $H_2S_2O_8 > H_2SO_4 > H_2SO_3$
(d) $H_2SO_3 > H_2S_2O_8 > H_2SO_4$

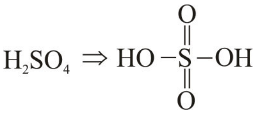
JIPMER-2015

Ans. (c) : Correct order of decreasing number of S = O bonds.

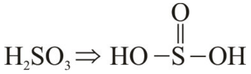
$H_2S_2O_8 > H_2SO_4 > H_2SO_3$



$$H_2S_2O_8 \Rightarrow HO-\underset{\underset{O}{\|}}{\overset{\overset{O}{\|}}{S}}-O-O-\underset{\underset{O}{\|}}{\overset{\overset{O}{\|}}{S}}-OH$$



$$H_2SO_4 \Rightarrow HO-\underset{\underset{O}{\|}}{\overset{\overset{O}{\|}}{S}}-OH$$



$$H_2SO_3 \Rightarrow HO-\overset{\overset{O}{\|}}{S}-OH$$

The number of S = O bond present in $H_2S_2O_8$, H_2SO_4 and H_2SO_3 are 4, 2 and 1 respectively.

1266. Oxidation state of oxygen in F_2O is

(a) + 1 (b) – 1
(c) + 2 (d) – 2

JIPMER-2009

Ans. (c) : In F_2O, as fluorine is more electronegative than oxygen, fluorine will have a negative charge and oxygen will have a positive charge. The oxidation state of fluorine is –1

Let the oxidation state of oxygen in F_2O is x.

$F_2O = 2(-1) + x = 0$

$-2 + x = 0$

$\boxed{x = +2}$

1267. Among the following, the correct formula of Marshall's acid is

(a) $H_2S_2O_6$ (b) $H_2S_2O_8$
(c) H_2SO_4 (d) H_2SO_5

JIPMER-2018

Ans. (b) : Peroxydisulfuric acid is the inorganic compound with the chemical formula $H_2S_2O_8$. Also called Marshall's acid.

1268. Sulphur sol contains

(a) Discrete S-atoms
(b) Discrete S molecules
(c) Large aggregates of S molecules
(d) Water dispersed in solid sulphur

Karnataka-CET-2016

Ans. (c) : A sulphur sol contains particles of various sizes composed of about a thousand molecules of sulphur.

Sulphur is a solution, contains large aggregates of sulphur molecules (S_8-molecules) so that they become in range of colloidal state.

1269. Excess of PCl_5 reacts with concentrated H_2SO_4 giving

(a) Chlorosulphonic acid (b) Sulphurous acid
(c) Sulphuryl chloride (d) Thionyl chloride

Karnataka-CET-2013

Ans.(c): $H_2SO_4 + 2PCl_5 \rightarrow SO_2Cl + 2POCl_3 + HCl$

Sulphuric acid sulphure echloride

PCl_5 reacts with cone H_2SO_4 to give sulphuryl chloride by replacing its hydroxyl groups with chlorine atoms.

1270. When sulphur dioxide is passed in an acidified $K_2Cr_2O_7$ solution, the oxidation state of sulphur is changed from

(a) +4 to 0 (b) +4 to +2
(c) +4 to +6 (d) +6 to +4

KARNATAKA-CET, 2008

Ans. (c) : When SO_2 is passed in an acidified $K_2Cr_2O_7$ solution,

$K_2Cr_2O_7 + H_2SO_4 + 3SO_2 \rightarrow K_2SO_4 + Cr_2(SO_4)_3 + H_2O$

Hence, oxidation state of sulphur changes from +4 to +6.

@apna_pdf

1271. Concentrated sulphuric acid can be reduced by

(a) NaCl (b) NaF
(c) NaOH (d) $NaNO_{3+}$
(e) NaBr

Kerala-CEE-2009

Ans. (e) : Concentrated sulphuric acid, being a strong acid, oxidises bromides and iodides but not chlorides and fluorides because fluoride and chloride are more electronegative. Hence, it can be reduced only by NaBr among the given options.

$$H_2\overset{+6}{S}O_4 + Na\overset{-1}{Br} \rightarrow NaH\overset{+6}{S}O_4 + H\overset{-1}{Br}$$

$$2H\overset{-1}{Br} + \underbrace{H_2\overset{+6}{S}O_4 \rightarrow 2H_2O + \overset{0}{Br_2} + \overset{+4}{S}O_2}_{\text{Reduction}}$$

1272. Which one of the following group 16, elements does not exist in -2 oxidation state?

(a) S (b) Se
(c) O (d) Po
(e) Te

Kerala-CEE-2016

Ans. (d) : In the group 16, most metallic elements does not show –2 oxidation state as its electronegativity is very low.

Hence, Po (Polonium) (Z = 84) does not show –2 oxidation state because on going down the group, electro positive nature increases.

1273. Which of the following does not exist?

(I) $HO_3S–S–SO_3H$ (II) HO–Te–OH
(III) $HS–S_2–SH$ (IV) HS–Po–OH
(a) Only II (b) Only III
(c) II and IV (d) I, III and IV

Manipal-2020

Ans. (c) : $H_2S_3O_6$ is an example of polythionic acid and it is an trithionic acid .H_2S_4 is an hydro sulfane

1274. Oxygen has an oxidation state of + 2 in :

(a) H_2O_2 (b) H_2O
(c) F_2O (d) SO_2

Manipal-2017

Ans. (c) : Oxidation state of oxygen is always -2 except in peroxides, superoxides and when it reacts with fluorine.

In F_2O, oxidation state of 'F' is –1, So oxidation state of oxygen is +2.

In SO_2 and H_2O, oxidation state of oxygen is –2

In H_2O_2 oxidation state of H is +1, So oxidation state of oxygen is –1.

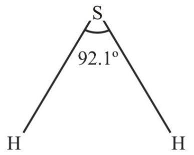
1275. What is the H—S—H bond angle in H_2S?

(a) 104.5° (b) 92.1°
(c) 91° (d) 90°

MHT CET-02.05.2019, SHIFT-III

Ans. (b) : As the electronegativity of the central atom decreases the lone pair of electrons lie further from it and therefore lp – lp repulsion decrease.

The H–S–H bond angle in H_2S is 92.1°. This is a smaller angle then tetrahedral angle. Because sulphur is less electronegative, it has less repulsion.



1276. The oxidation state of sulphur in $H_2S_2O_7$ is

(a) +4 (b) +6
(c) +5 (d) +7

MHT CET-02.05.2019, SHIFT-II

Ans. (b) : Let the oxidation number of sulphur be x. The oxidation number of H and O are +1 and – 2 respectively

$$\therefore\ 2(+1) + 2x + 7(-2) = 0$$
$$2 + 2x - 14 = 0$$
$$2x = +14 - 2$$
$$2x = +12$$
$$\boxed{x = +6}$$

The oxidation number of the sulphur atoms in $H_2S_2O_7$ is +6.

1277. In ozone molecule the formal charge on the central oxygen atom is

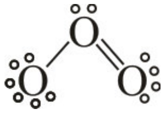
(a) –1 (b) +2
(c) 0 (d) +1

MHT CET-02.05.2019, SHIFT-II

Ans. (d) : The formal charge over an atom of a polyatomic molecule or ion is the difference between the valence electron of that atom in the elemental state and the number of electrons assigned to that atom in Lewis structure.

The formal charge on the central oxygen atom in O_3 molecule is +1

F.C = [Total no. of valence e^- in free state] – [Total no. of non-bonding pair e^- (lone pair)] $-\frac{1}{2}$[Total no. of bonding e–]



$$F.C = 6 - 2 - \frac{1}{2}(6)$$
$$F.C = 4 - 3$$
$$F.C = +1$$

1278. The oxidation number of sulphur in S_8 molecule is

(a) 6 (b) 0
(c) 2 (d) 3

MHT CET-02.05.2019, SHIFT-II

Ans. (b) : Oxidation number of sulphur is zero in S_8 ,as in any monotonic molecule. As oxidation number is defined by breaking a bond and giving the bond pair of electrons to the more electronegative element. Therefore, as S_8 as has a crown shape with each scan having bonds with two other 'S', if you break any bond elements on both sides are same i.e. sulphur having same electronegativity. So, electrons cannot be assigned to any of them.

Therefore, 'S' has zero oxidation number.

@apna_pdf

1279. In preparation of sulphuric acid from sulphur dioxide in lead chamber process. What substance is used as a catalyst?

(a) Manganese dioxide (b) Vanadium pentoxide
(c) Nitric oxide (d) Raney nickel

MHT CET-2017

Ans. (c) : In the preparation of sulphuric acid (H_2SO_4) by lead chamber process, mixture containing SO_2 and NO is treated with steam (H_2O). In this reaction nitric oxide (NO) acts as a catalyst.

$2SO_2 + O_2 + 2H_2O + NO \rightarrow 2H_2SO_4 + NO$

1280. Which is the most stable allotrope of sulphur?

(a) Octahedral sulphur (b) Monoclinic sulphur
(c) Plastic sulphur (d) Colloidal sulphur

MHT CET-2016

Ans. (a) : The two most commonly allotropes of sulphur are Rhombic and Monoclinic forms. Out of there rhombic allotrope (yellow in color) of sulphur is the most stable allotrope of sulphur.

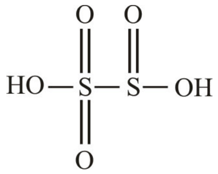
Rhombic sulphur is also called octahedral sulphur.

1281. Which oxoacid of sulphur contains S—S bond in its structure?

(a) Disulphurous acid
(b) Disulphuric acid
(c) Perdisulphuric acid
(d) Hydrosulphurous acid

MHT CET-2015

Ans. (a) : Disulphurous acid ($H_2S_2O_5$) contains S-S in its structure.



1282. Which oxyacid of sulphur contains S—S single bond?

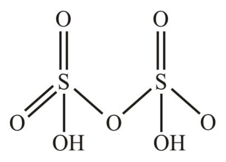
(a) Oleum (b) Marshall's acid
(c) Dithionic acid (d) Thiosulphuric acid

MHT CET-2014

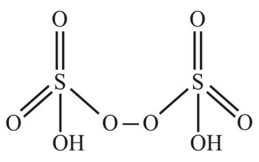
Ans. (c) : Oxyacid is a compound that contains oxygen, hydrogen and one other element. Here, we are provided with oxyacids of sulphur, these contain oxygen, hydrogen and sulphur atoms.

Thus, in dithinoic acid S–S single bond is present.

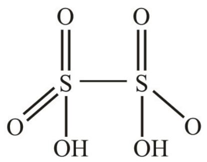
(a) Oleum ($H_2S_2O_7$)



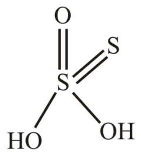
(b) Marshall's acid ($H_2S_2O_8$)



(c) Dithionic Acid ($H_2S_2O_6$)



(d) Thiosulphuric acid ($H_2S_2O_3$)



1283. Ozone is present as a chief constituent in which region of the atmosphere?

(a) Troposphere (b) Stratosphere
(c) Mesosphere (d) Thermosphere

MHT CET-2014

Ans. (b) : Ozone layer also called Ozonosphere, region of the upper atmosphere. Approximately 90% of the atmosphere's ozone occurs in the stratosphere, the region extending from 10 – 18 km to approximately 50 km above Earth's surface.

Ozone is a three oxygen molecule that are abundant in the stratosphere it absorbs energy from incoming ultraviolet radiation from the sun.

1284. Which among the following group 16 elements exists in more than two allotropic states?

(a) Polonium (b) Tellurium
(c) Selenium (d) Oxygen

MHT CET-2014

Ans. (c) : :

Sr. No	Element	Allotropes
(a)	Polonium	α and β- polonium
(b)	Tellurium	None
(c)	Selenium	Trigonal, rhombohedral, three deep red monodinic forms (α, β and λ amorphous red, black victrous selenium).
(d)	Oxygen	Dioxygen and Ozone

1285. Which of the statements given below is incorrect?

(a) O_3 molecule is bent
(b) ONF is isoelectronic with O_2N^-
(c) OF_2 is an oxide of fluorine
(d) Cl_2O_2 is an anhydride of perchloric acid

(NEET-2015)

Ans. (c) : FO is incorrect because it is a Fluoride of oxygen because electronegativity of fluorine is more than that of oxygen.

- The structure of O_3 is bent due to cone pair
- No. of electrons in ONF = 24
  No. of electrons in O_2N^- = 24

Both are isoelectronic.

- Cl_2O_7 is an anhydride of perchloric acid

$$2HClO_4 \xrightarrow[-H_2O]{\Delta} Cl_2O_7$$

1286. Sulphur trioxide can be obtained by which of the following reaction?

(a) $CaSO_4 + C \xrightarrow{\Delta}$ (b) $Fe_2(SO_4)_3 \xrightarrow{\Delta}$
(c) $S + H_2SO_4 \xrightarrow{\Delta}$ (d) $H_2SO_4 + PCl_4 \xrightarrow{\Delta}$

(NEET-2012)

Ans. (b) :

(a) $2CaSO_4 + C \xrightarrow{\Delta} 2CaO + 2SO_2 + CO_2$

(b) $Fe_2(SO_4)_3 \xrightarrow{\Delta} Fe_2O_3 + 3SO_3$

(c) $S + H_2SO_4 \xrightarrow{\Delta} SO_2 + H_2O$

(d) $H_2SO_4 + PCl_4 \xrightarrow{\Delta} POCl_3 + HSO_3Cl + HCl$

Sulphur trioxide is obtained by heating $Fe_2(SO_4)_3$

@apna_pdf

1287. Which one of the following pairs of reactants does not form oxygen, when they react with each other?

(a) F_2, NaOH solution (hot, conc.)
(b) F_2, H_2O
(c) Cl_2, NaOH solution (cold, dilute)
(d) $CaOCl_2$, H_2SO_4 (dilute, small amount)

AP EAMCET- 2005

Ans. (c) : Chlorine react with cold and dilute NaOH to give sodium hypochlorite.

$$Cl_2 + 2NaOH \rightarrow NaCl + NaClO + H_2O$$

• F_2 on reaction with under cold and dilute NaOH to give the following product–

$10F_2 + 20NaOH \rightarrow 20NaF + 10H_2O + 5O_2$

It is not form the oxygen.

• $2F_2(g) + 2H_2O(l) \rightarrow 4HF(aq) + O_2(g)$

• $2CaOCl_2 + H_2SO_4 \rightarrow CaCl_2 + CaSO_4 + 2HClO$
$HClO \rightarrow HCl + O$

1288. Identify the correct formula of Oleum from the following :

(a) $H_2S_2O_7$
(b) H_2SO_3
(c) H_2SO_4
(d) $H_2S_2O_8$

(Odisha NEET 2020)

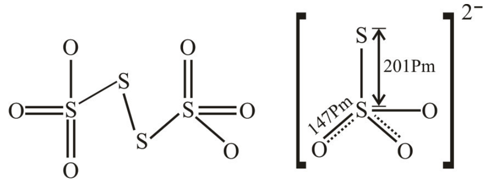
Ans. (a) : Formula of Oleum is $H_2S_2O_7$ is also called as Pyrosulfuric acid. Oleum or fuming sulfuric acid is a solution of various compositions of sulfur trioxide in sulfuric acid or sometimes more specifically to disulfuric acid.

1289. In which pair of ions both the species contain S–S bond?

(a) $S_4O_6^{2-}, S_2O_3^{2-}$
(b) $S_2O_7^{2-}, S_2O_8^{2-}$
(c) $S_4O_6^{2-}, S_2O_7^{2-}$
(d) $S_2O_3^{2-}, S_2O_3^{2-}$

(NEET 2017)

Ans. (a) : $S_4O_6^{2-}$ and $S_2O_3^{2-}$ both the species have S–S bond.

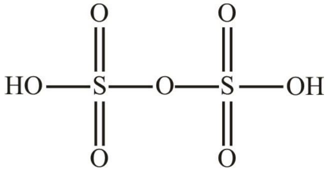


1290. Oleum is

(a) castor oil
(b) oil of vitriol
(c) fuming H_2SO_4
(d) none of these

(NEET-1991)

Ans. (c) : Oleum is a cloudy, gray, fuming, oil, corrosive liquid, with a sharp, penetrating odor. Its composition is that H_2SO_4 with dissolved SO_3.



1291. Match List I (substances) with List II (processes) employed in the manufacture of the substances and select the correct option.

	List I (Substances)		List II (Processes)
A.	Sulphuric Acid	I.	Haber's process
B.	Steel	II.	Bassemer's process
C.	Sodium hydroxide	III.	Leblanc process
D.	Ammonia	IV.	Contact process

(a) A - (i), B- (iv), C- (ii), D- (iii)
(b) A - (i), B- (ii), C- (iii), D- (iv)
(c) A - (iv), B- (iii), C- (ii), D- (i)
(d) A - (iv), B- (ii), C- (iii), D- (i)

(NEET-Mains 2010)

Ans. (d) :

(a) Sulphuric acid is manufactured by using the contact process.

(b) Steel is prepared by Bessemer's process.

(c) Sodium hydroxide is prepared by the Leblanc process.

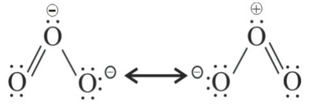
(d) Ammonia is manufactured by Haber's process

1292. The angular shape of ozone molecule (O_2) consists of

(a) 1σ and 1π bond
(b) 2σ and 1π bond
(c) 1σ and 1π bonds
(d) 2σ and 2π bond

(NEET-2008)

Ans. (b) : In case of double bond, there is one sigma and one π – bonds. Therefore, the angular shape of the ozone molecule (O_3) consists of 2 sigma and 1 pi bonds



1293. The gases respectively absorbed by alkaline pyrogallol and oil of cinnamon are

(a) O_3, CH_4
(b) O_2, O_3
(c) SO_2, CH_4
(d) N_2O, O_3

(NEET-1989)

Ans. (b) : Ozone, O_3 is absorbed by oil of cinnamon and oxygen. O_2 is absorbed by alkaline pyrogallol.

Oil of cinnamon contains unsaturation and so addition reaction is shown with O_3 therefore it absorbs O_3.

Pyragollol is also known pyrogallic acid, or 1, 2, 3-trihydroxybenzene an organic compound belonging to the phenol family which gets oxidized in presence of O_2 and therefore, it absorbs O_2.

1294. Which is the correct thermal stability order for H_2E (E = O, S, Se, Te and Po)?

(a) $H_2Se < H_2Te < H_2Po < H_2S$
(b) $H_2S < H_2O < H_2Se < H_2Te < H_2PO$
(c) $H_2O < H_2S < H_2Se < H_2Te < H_2PO$
(d) $H_2PO < H_2Te < H_2Se < H_2S < H_2O$

(NEET 2019)

Ans. (d) : The correct order of stability is as follows -

$H_2P_O < H_2T_e < H_2S_e < H_2S < H_2O$

On moving down the group thermal stability order for H_2E decreases because. H–E bond energy decreases.

1295. Acidity of diprotic acids in aqueous solutions increases in the order

(a) $H_2S < H_2Se < H_2Te$
(b) $H_2Se < H_2S < H_2Te$

@apna_pdf

(c) $H_2Te < H_2S < H_2Se$
(d) $H_2Se < H_2Te < H_2S$

(NEET-2014)

Ans. (a) : The strength of the bond between hydrogen and the central atom decreases and the acidic strength of hydrides increases as the size of the central atom increases which weakens the M-H bond. Order of increasing size is S < Se < Te and we also know that

$$\text{Acidic nature } \alpha \ \frac{1}{\text{Bond dissociation enthalpy}}$$

S to Te size increases, bond dissociation enthalpy decreases and acidic nature increases.

Therefore, the correct order would be-

$$H_2S < H_2S_e < H_2T_e$$

1296. Which of the following bonds has the highest energy?

(a) S–S
(b) O–O
(c) Se–Se
(d) Te–Te

(NEET-1996)

Ans. (a) : S–S contains the highest bond energy, which is due to lower size and less electron- electron repulsion.

1297. Which of the following does not give oxygen on heating?

(a) $K_2Cr_2O_7$
(b) $(NH_4)_2Cr_2O_7$
(c) $KClO_3$
(d) $Zn(ClO_3)_2$

(NEET 2013)

Ans. (b) :

- $\mathbf{(NH_4)_2Cr_2O_7} \xrightarrow{\Delta} N_2 + Cr_2O_3 + 4H_2O$
- $\mathbf{4K_2Cr_2O_7} \xrightarrow{\Delta} 4K_2CrO_4 + 2Cr_2O_3 + 3O_2$
- $\mathbf{2KClO_3} \xrightarrow{\Delta} 2KCl + 3O_2$
- $\mathbf{Zn(ClO_3)_2} \xrightarrow{\Delta} ZnCl_2 + 3O_2$

1298. Which would quickly absorb oxygen?

(a) Alkaline solution of pyrogallol
(b) Conc. H_2SO_4
(c) Lime water
(d) Alkaline solution of $CuSO_4$

(NEET-1991)

Ans. (a) : When pyrogallol is present in alkaline solution. It absorbs oxygen from the air and turns brown from colourless solution. It can be used to calculate the amount of oxygen in air.

The common name for Pyrogallol is 1, 2, 3–trihydroxybenzene.

1299. Oxygen will directly react with each of the following elements except

(a) P
(b) Cl
(c) Na
(d) S

(NEET-1989)

Ans. (b) : Out of 'P', Na, S and Cl, chlorine does not react directly but Na, P and S react with oxygen directly.

- $P_4 + 5O_2 \rightarrow P_4O_{10}$
- $S + O_2 \rightarrow SO_2$
- $4Na + O_2 \rightarrow 2Na_2O$

1300. It is possible to obtain oxygen from air by fractional distillation because

(a) oxygen is in a different group of the periodic table from nitrogen
(b) oxygen is more reactive than nitrogen
(c) oxygen has higher boiling point than nitrogen
(d) oxygen has a lower density than nitrogen

(NEET-1989)

Ans. (c) : It is possible to obtain oxygen from air by fractional distillation because oxygen has higher boiling point than Nitrogen. During this process, dinitrogen with less boiling point (78 K) distills as vapours while dioxygen with higher boiling point (90 k) remains in the liquid state and can be separated.

1301. Gas that cannot be collected over water is

(a) N_2
(b) SO_2
(c) O_2
(d) PH_3

UP CPMT-2013

Ans. (b) : The gas that will react with water cannot be collected over water.

Insoluble gases don't dissolve in water and thus can be collected over it for example N_2, O_2,CO_2 etc.

Reaction sulphur dioxide with water:-

$$SO_2 + H_2O \longrightarrow H_2SO_3$$

Therefore, sulphur dioxide cannot be collected over the water.

1302. The oxidation states of sulphur in the anions SO_3^{2-} , $S_2O_4^{2-}$ and $S_2O_6^{2-}$ follow the order

(a) $S_2O_4^{2-} < S_2O_6^{2-} < SO_3^{2-}$
(b) $S_2O_6^{2-} < S_2O_4^{2-} < SO_3^{2-}$
(c) $S_2O_4^{2-} < SO_3^{2-} < S_2O_6^{2-}$
(d) $SO_3^{2-} < S_2O_4^{2-} < S_2O_6^{2-}$

UP CPMT-2011

Ans. (c) : In SO_3^{2-}, $x + (-2 \times 3) = -2$

$$x - 6 = -2$$
$$x = -2 + 6$$
$$x = +4$$

In $S_2O_4^{2-}$, $2x + (-2 \times 4) = -2$

$$2x = +8 - 2$$
$$2x = +6 \rightarrow x = +3$$

In $S_2O_6^{2-}$, $2x + (-2 \times 6) = -2$

$$2x = +12 - 2$$
$$2x = +10$$
$$x = +5$$

Thus, increasing order of oxidation state of S is

$$S_2O_4^{2-} < SO_3^{2-} < S_2O_6^{2-}$$

1303. Peroxide bond is absent in

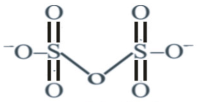
(a) $(S_2O_7)^{2-}$
(b) $(S_2O_8)^{2-}$
(c) CrO_5
(d) BaO_2

UP CPMT-2009

@apna_pdf

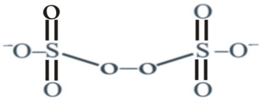
Ans. (a):

(a) $(S_2O_7)^{2-}$ ⇒



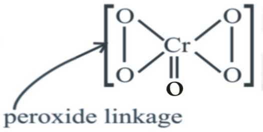
(no peroxide linkage)

(b) $(S_2O_8)^{2-}$ ⇒



(Peroxide linkage)

(c) CrO_5 ⇒



(d) $BaO_2 \Rightarrow [{}^-O-O^-]Ba^{2+}$

(Peroxide linkage)

1304. H_2S is not a/an
(a) reducing agent (b) acidic
(c) oxidising agent (d) None of these

UP CPMT-2007

Ans. (c) : (a) H_2S works as a reducing agent, because it can reduce PbO into PbS.

$$PbO + H_2S \rightarrow PbS + H_2O$$

(b) It is acidic in nature. In calcogens, the acidic nature of hydride increases from H_2O to H_2Te.
(c) It is not oxidising agent.

1305. Difference between S and S^{2-} as S^{2-} has
(a) larger radii and large size
(b) smaller radii and large size
(c) larger radii and small size
(d) smaller radii and small size

UP CPMT-2007

Ans. (a) : Size or radii of anion is always larger than its atom.
Difference between S and S^{2-} implies larger radii and larger size of S^{2-} because the radii of the anion are always larger than the atomic radii of its parent atom. In an anion as electron or electrons are added to the neutral atom the nuclear charge acts on more electrons so that each electron is held less tightly and there by the electron could expands.

1306. Ozone is used for purifying water because
(a) it dissociates and release oxygen
(b) do not leave any foul smell like chlorine
(c) kills bacteria, cyst, fungi and acts as a biocide
(d) All of the above

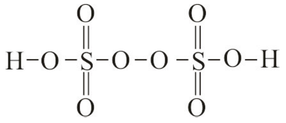
UP CPMT-2007

Ans. (c) : Ozone is a powerful oxidising agent and when it is dissolved in water, produces broad spectrum biocide that destroys all bacteria, viruses and cysts. It is one of the effective ways of eliminating microorganism in the water. Ozone is most effective oxidant (secondary to F_2). Ozone is very good biocide. Ozone also absorbs UV radiation.

1307. Oxidation number of sulphur in $H_2S_2O_8$ is
(a) +6 (b) +8
(c) +21 (d) +7

UP CPMT-2005
JCECE - 2003

Ans. (a) : The structure of $H_2S_2O_8$ –



$$H-O-\overset{\overset{O}{\|}}{\underset{\underset{O}{\|}}{S}}-O-O-\overset{\overset{O}{\|}}{\underset{\underset{O}{\|}}{S}}-O-H$$

∵ Sum of oxidation state of all elements is zero.
$+1 \times 2 + 2x + (-1 \times 2) + (-2 \times 6) = 0$
or $2 + 2x - 2 - 12 = 0$
or $2x = 12$
∴ $x = +6$

1308. Which of the following sulphides is yellow in colour?
(a) CuS (b) CdS
(c) ZnS (d) CoS

UP CPMT-2004

Ans. (b) : (a) CuS-black (b) CdS-Yellow
(c) ZnS-white (d) CoS-black

1309. Industrial name of $H_2S_2O_7$ is
(a) Caro's acid (b) Marshall's acid
(c) oleum (d) All of these

UP CPMT-2004

Ans. (c) : (i) Marshall's acid is $H_2S_2O_8$ (peroxydisulphuric acid)
(ii) Caro's acid is H_2SO_5 (peroxydisulphuric acid)
(iii) Oleum is $H_2S_2O_7$. On dilution, it gives sulphuric acid (H_2SO_4)

$$\underset{\text{Oleum}}{H_2S_2O_7} + H_2O \longrightarrow \underset{\text{sulphuric acid}}{2H_2SO_4}$$

1310. The oxidation number of sulphur in $Na_2S_2O_3$
(a) +1 (b) +2
(c) +3 (d) –3

UP CPMT-2002

Ans. (b) : $Na_2S_2O_3$
Let the oxidation state of S be x then
$2(+1) + 2x + 3(-2) = 0$
$2x - 4 = 0$
$x = +2$

1311. If a species has 16 protons, 18 electrons and 16 neutrons, the symbol (with charge) of species is
(a) S^- (b) Si^{2-}
(c) P^{3-} (d) S^{2-}

UPTU/UPSEE-2010

Ans. (d) : The species has 16 protons and 16 neutrons which means its mass number is 32. Hence, the element we are talking about is sulphur which is represented by the symbol 'S'. As we can see that the number of protons is less than electron. It means that the species will have a negative charge over it and also there are two excess electrons hence the magnitude of the negative charge would be 2.
The species will be shown by S^{-2}.

@apna_pdf

1312. On adding 1 g arsenic to 80 g benzene, the freezing point of benzene is lowered by 0.19^0 C. The formula of arsenic is

(a) As (b) As_2

(c) As_3 (d) As_4

UPTU/UPSEE-2008

Ans. (d) : Given–

$\Delta T_f = 0.19^oC$

$K_f = 5.08$ kg / mol

w = 1g

W = 80 g

$$\Delta T_f = \frac{1000\ K_f w}{mW}, \text{ where}$$

K_f = molar depression constant

M = Molality

W = Weight of benzene

w = Weight of arsenic

then, $$m = \frac{1000 \times K_f \times w}{\Delta T_f k \times W}$$

$$= \frac{1000 \times 5.08 \times 1}{0.19 \times 80} = 334.21$$

Atomic weight of As = 74.92

The number of Atoms = $\frac{334.21}{74.92} = 4.4608 \approx 4$

Hence, the formula of arsenic is As_4.

1313. Which one of the following is not true at room temperature and pressure?

(a) P_4O_{10} is a white solid.

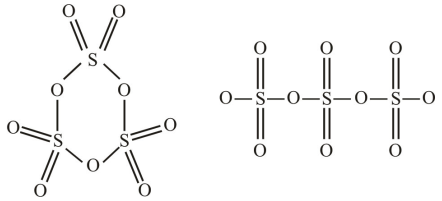
(b) SO_2 is a colourless gas.

(c) SO_3 is a colourless gas.

(d) NO_2 is a brown gas.

WB-JEE-2011

Ans. (c) : At room temperature SO_3 is a solid and exists as either α -SO_3, β - SO_3 or γ - SO_3 which contain similar chains cross linked into sheets



1314. 'Sulphan' is

(a) a mixture of SO_3 and H_2SO_5

(b) 100% conc. H_2SO_4

(c) a mixture of gypsum and conc. H_2SO_4

(d) 100% oleum (a mixture of 100% SO_3 in 100% H_2SO_4)

WB-JEE-2013

Ans. (d) : Sulphan is 100% oleum. In other words sulphan or oleum is a mixture of concentrated sulphuric acid that has been saturated with excess sulphur trioxide.

This is a corrosive dense liquid and is a strong dehydrating agent. When it is poured on glucose or sugar, it draws out practically all the water from the same.

1315. Electrolysis of X gives Y at anode. Vaccum distillation of Y gives H_2O_2. The number of peroxy (O-O) bonds present in X and Y respectively, are

(a) 1, 1 (b) 1, 2

(c) 0, 1 (d) 0, 0

AP EAMCET- 2006

Ans. (c) : Hydrogen peroxide can be obtained by the electrolysis of sulphuric acid followed by Vacuum distillation. The first product of electrolysis is perdisulphuric acid ($H_2S_2O_8$) which reacts with water during distillation to form H_2O_2.

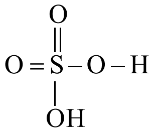
$$2H_2SO_4 \rightarrow 2H^+ + 2HSO_4^-$$

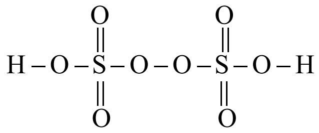
At anode–

$$2HSO_4^- \rightarrow \underset{Y}{H_2S_2O_8} + 2e^-$$

$$\underset{\text{'Y'}}{H_2S_2O_8} + 2H_2O \rightarrow \underset{\text{'X'}}{2H_2SO_4} + H_2O_2$$

X, Y are H_2SO_4 and $H_2S_2O_8$ respectively.





∴ No. of O–O bond = 0 ∴ No. of O–O bond = 1

Hence, correct option is (c).

1316. Which of the following is not correct?

(a) $3O_2 \underset{\text{discharge}}{\overset{\text{Silent electric}}{\rightleftharpoons}} 2O_3; \Delta H = -284.5kJ$

(b) Ozone undergoes addition reaction with unsaturated carbon compounds

(c) Sodium thiosulphate reacts with I_2 to form sodium tetrathionate and sodium iodide

(d) Ozone oxidises lead sulphide to lead sulphate

AP EAMCET- 2006

Ans. (a) : The formation of ozone from oxygen is an endothermic reaction, not exothermic reaction.

$$3O_2 \xrightarrow[\text{discharge}]{\text{Electric}} 2O_3 \quad \Delta H = -284.5kJ$$

So, statement,

$$3O_2 \underset{\text{discharge}}{\overset{\text{Silent electric}}{\rightleftharpoons}} 2O_3 \quad \Delta H = -284.5kJ$$

is not correct.

- Ozone undergoes addition reaction with unsaturated carbon compounds, this reaction is called the **ozonolysis** of alkene & alkyne.

$$CH_3CH = CH_2 \xrightarrow[\text{(ii)Zn-}H_2O]{\text{(i)}O_3} CH_3CHO + HCHO$$

Hence, statement is true.

- $\underset{\text{Sodiumthio sulphate}}{2Na_2S_2O_3} + I_2 \rightarrow 2NaI + \underset{\text{Sodiumtetra thionate}}{Na_2S_4O_6}$

Hence, statement is true.

- $\underset{\text{Lead sulphide}}{PbS(s)} + 4O_3(g) \rightarrow \underset{\text{Lead sulphate}}{PbSO_4(s)} + 4O_2(g)$

Hence, statement is true.

1317. Which of the following statements are correct for alkali metal compounds?

(i) Superoxides are paramagnetic in nature

(ii) The basic strengths of hydroxides increases down the group

@apna_pdf

(iii) The conductivity of chlorides in their aqueous solutions decreases down the group

(iv) The basic nature of carbonates in aqueous solutions is due to cationic hydrolysis

(a) (i), (ii) and (iii) only (b) (i) and (ii) only
(c) (ii), (iii) and (iv) only (d) (iii) and (iv) only

AP EAMCET- 2008

Ans. (b) :
(i) Alkalis are base which dissolves in water therefore, the alkali metal superoxides contain O_2^- ion, which has an unpaired electron. Hence, it show paramagnetic in nature.
(ii) The hydroxides are basic in nature. The basic strength of hydroxides increases down the group.
(iii) The conductivity of chlorides in their aqueous solution increase down the group.
(iv) The basic nature of carbonate in a aqueous solution is due to anionic hydrolysis.

1318. Which one of the following is not used as a catalyst in the reaction of SO_2 with O_2 (for the formation of SO_3)?

(a) V_2O_5 supported (b) Platonized asbestos
(c) Platinum gauze (d) Charcoal

S. C. R. A - 2014

Ans. (d) : Sulphurdioxide reacts with chlorine in the presence of charcoal to give sulphonyl chloride SO_2Cl_2.

$$SO_2(g) + Cl_2(g) \xrightarrow{\text{charcoal}} SO_2Cl_2$$

$$2SO_2(g) + O_2(g) \xrightarrow{V_2O_5} 2SO_3(g)$$

1319. Among the following allotropic forms of sulphur, which does not contain S_8 rings?

(a) Monoclinic sulphur
(b) Engel's sulphur
(c) Rhombic sulphur
(d) γ -monoclinic sulphur

S. C. R. A - 2014

Ans. (b) : Both rhombic and monoclinic sulphur have S_8 molecules as well as $\gamma -$monoclinic sulphur. Engel's sulphur contains S_6-ring. It is also called cyclo-S_6. Cyclo-S_6 is orange-red and forms rhombohedral crystals.

8. Halogen Family

1320. The property of halogens which is not correctly matched is

(a) $I > Br > Cl > F$ (density)
(b) $F > Cl > Br > I$ (electron gain enthalpy)
(c) $F > Cl > Br > I$ (ionization enthalpy)
(d) $F > Cl > Br > I$ (electronegativity)

Karnataka CET-17.06.2022, Shift-II

Ans. (b) : The electron gain enthalpy of Cl is maximum.
So, the trend is : Cl>F>Br>I.

1321. Polar stratospheric clouds facilitate the formation of:

(a) $ClONO_2$ (b) HOCl
(c) ClO (d) CH_4

JEE Main-26.06.2022, Shift-I

Ans. (b) : In summer season Nitrogen dioxide and methane react with chlorine monoxide and chlorine atom forming, chlorine sinks, preventing much ozone depletion, where as in winter season, special type of clouds are formed over antalica, these polar stratospheric cloud provide surface on which chlorine nitrate formed gels hydrated to form hypochloro acid.

$$ClO(g) + NO_2(g) \longrightarrow ClONO_2(g)$$

$$ClONO_2(g) + H_2O(g) \longrightarrow HOCl(g) + HNO_3(g)$$

Both reaction takes place in stratosphere.

1322. Given below are two statements: one is labelled as Assertion A and the other is labelled as Reason R.
Assertion A: Fluorine forms one oxoacid.
Reason R: Fluorine has smallest size amongst all halogens and is highly electronegative. In the light of the above statements, choose the most appropriate answer from the option given below.

(a) Both A and R are correct and R is the correct explanation of A.
(b) Both A and R are correct but R is NOT the correct explanation of A.
(c) A is correct but R is correct
(d) A is not correct but R is not correct.

JEE Main-27.06.2022, Shift-II

Ans. (a) : Fluorine forms only one oxoacid because of smaller size & high electronegativity.
Both the assertion and reason are correct and Reason is the correct explanation.

1323. HIO_3 On heating at 170°C give:

(a) I_2 (b) I_2O_5
(c) I_2O_4 (d) HIO_4

CG PET-22.05.2022

Ans. (b) : 2 moles of HIO_3 on heating at 170°C, we get

$$2HIO_3 \xrightarrow{\Delta} I_2O_5 + H_2O$$

1324. Which one of the following will NOT produce carbon dioxide on reacting with an aqueous solution of hydro-chloric acid ?

(a) Limestone (b) Quick Lime
(c) Chalk (d) Marble

NDA (I)-2019

Ans : (b) Quick lime on reaction with HCl does not produce carbon dioxide.

$$\underset{\substack{\text{Quick}\\\text{lime}}}{CaO} + 2HCl \rightarrow CaCl_2 + H_2O$$

1325. Which one of the following is not a monoatomic element ?

(a) Copper (b) Helium
(c) Iodine (d) Barium

NDA (II)-2019

@apna_pdf

Ans : (c) Iodine is not a monoatomic element. It exist in the form of diatomic, I_2. Except Iodine, all the given elements exist in monoatomic.

1326. Which of the following is more stable?
(a) HF (b) HI
(c) HCl (d) HBr

AP-EAMCET (Med.)-1999

Ans. (a) : HF is more stable than the HCl, HBr and HI
$HF > HCl > HBr > HI$

1327. Which of the following statements about the halogen is correct?
(a) They are all diatomic and forms univalent ions
(b) They are all diatomic and forms divalent ions
(c) They are all capable of exhibiting several oxidation states
(d) They can mutually displace each other from the solution of their compound with metals

AP EAMCET- 1991

Ans. (a) : All the halogen are diatomic and form a univalent ions. All halogens perform as both oxidizing and reducing agents and are capable of exhibiting more than one stable oxidation state. Like, F^-, Cl^-, Br^-, I^- etc.

1328. The deep color produced when iodine is dissolved in solution of potassium iodide is caused by the presence of
(a) I_2 (b) KI
(c) I_2^- (d) I_3^-

AP EAMCET- 1993

Ans. (d) : $I_2 + KF \rightarrow KF_3$
$$KI_3 \rightleftharpoons K^+ + I_3^-$$
The deep color produced when iodine is dissolved in a solution of potassium iodide is caused by the presence of I_3^-.

1329. The element which can displace three other halogens from their compounds is
(a) Cl (b) Br
(c) I (d) F

AP EAMCET- 1996, 98

Ans. (d) : In the electrochemical series, F is at the lower position among the halogen. Therefore, it can displace three other halogens from their compounds.

1330. What is the correct order of occurrence (% by weight) in air of Ne, Ar and Kr?
(a) Ne > Ar > Kr (b) Ar > Ne > Kr
(c) Ar > Kr > Ne (d) Ne > Kr > Ar

JHARKHAND CECE

Ans. (b) : All the noble gases are present in earth's atmosphere helium and radon.
The correct order of occurrence (% by weight) in air is-
Ar > Ne > Kr.

1331. Which one of the following reactions does not occur?
(a) $F_2 + 2Cl^- \longrightarrow 2F^- + Cl_2$
(b) $Cl_2 + 2F^- \longrightarrow 2Cl^- + F_2$
(c) $Br_2 + 2I^- \longrightarrow 2Br^- + I_2$
(d) $Cl_2 + 2Br^- \longrightarrow 2Cl^- + Br_2$

AP EAMCET- 2008

Ans. (b) : When we increase in atomic number then the reduction potential of halogens decrease. So, the oxidizing power also decreases.
Therefore, halogen with lower atomic number will oxidize the halide ion of higher atomic number.
Hence, the reaction $Cl_2 + 2F^- \rightarrow 2Cl^- + F_2$ is not feasible.

1332. Bromine can be liberated from KBr solution by reaction with the following:
(a) Iodine solution (b) Chlorine water
(c) Sodium chloride (d) Potassium chloride

MPPET - 2012

Ans. (b) : Bromine can be liberated from KBr solution by the action of Chlorine water.
$$2KBr + Cl_2 \rightarrow 2KCl + Br_2$$
Chlorine can oxidize bromine. Hence, option (b) is correct.

1333. The most basic element is
(a) Fluorine (b) Iodine
(c) Chlorine (d) Bromine

MPPET- 2009

Ans. (b) : When we go from top to bottom in halogen family basic character increases so, iodine is most basic element. The basic order is $F_2 < Cl_2 < Br_2 < I_2$.

1334. In the manufacturing of I_2 from the solution of chile salt petre, left after the crystallization of $NaNO_3$' IO_3^- is generally reduced to I^- with
(a) $NaHSO_3$
(b) adding finely divided zine
(c) Passing SO_2
(d) adding $SNCl_2$

S. C. R. A - 2014

Ans. (a) : Chile salt petre, a source of $NaNO_3$, also contain $NaIO_3$. The $NaIO_3$ is source of I_2 produced as shown in the following equations.
Step-I: $IO_3^- + 3HSO_3^- \rightarrow I^- + 3H^- + 3SO_4^{2-}$
Step-II: $5I^- + IO_3^- + 6H^- \rightarrow 3I_2(s) + 3H_2O$
$NaHSO_3$ required in step-I and what additional volume of chile salt petre must be added in step-II to bring out complete conversion of I^- to I_2.

1335. Tincture of iodine contains
(a) KI (b) KIO_3
(c) HI (d) CHI_3

SCRA-2010

Ans. (a) : Tincture of iodine or iodine tincture also known as weak iodine solution and it is called an antiseptic with dark brown colour and smell of alcohol. Tincture of iodine is a mixture of iodine, sodium or potassium iodide.

1336. Which of this order for the property mentioned is not correct?
(a) $Cl_2 > Br_2 > F_2 > I_2$ [Bond dissociation enthalpy]
(b) HI>HBr>HCl>HF [Acidic strength]
(c) HOI>HOBr>HOCl [Acidic strength]
(d) $HClO_4 > HClO_3 > HClO_2 > HClO$ [Acidic strength]

AP EAPCET-6 Sep. 2021, Shift-II

@apna_pdf

Ans. (c):
Acidity depends upon factors such as–
1. % s character
2. Electro negativity
3. No. of O atoms attached
4. Highest oxidation state

Here, $\boxed{HOI<HOBr<HOCl}$

Electro negativity of Cl is more so, HOCl will be more acidic.

1337. Which of the following facts related to halogens is not correctly matched?
(a) A halogen in the liquid state at room temperature – Bromine
(b) Strongest oxidizing agent – Fluorine
(c) Halogen having the highest $\Delta H_{\text{bond dissociation}}$ – fluorine
(d) Halogen which has least –ve $\Delta H_{e.g}$ –iodine

AP EAPCET-6 Sep. 2021, Shift-II

Ans. (c): Halogens have the following major properties–
1. They have very high electronegativities among them Fluorine has the highest value 4.0
2. They have seven valence electrons. So it can act as strong oxidizing agents.
3. They are highly reactive especially with alkali metals and alkaline earth metals.
4. Bromine only nonmetal which in liquid at room temperature.

1338. Which of the following sequences is the correct order of the size of species ?
(a) $I > I^+ > I^-$
(b) $I^- > I^+ > I^{-1}$
(c) $I^+ > I^- > I^{-1}$
(d) $I^- > I > I^+$

AP EAPCET 24.08.2021, Shift-I

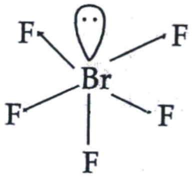
Ans. (d) : As we increase the negative degree in isolated gaseous atom then size of the anion will be increases due to the extra addition of electron in outer orbital of the shell. Hence, the order will be –

$I^- > I > I^+$

1339. Hybridized state of bromine in bromine pentafluoride is
(a) sp^3d
(b) d^2sp^3
(c) dsp^3
(d) sp^3d^2

COMEDK-2015

Ans. (d) : The hybridisation of BrF_5 is Sp^3d^2



(Square pyramidal shape)

1340. The decreasing order of stability of oxides of halogen is
(a) fluorine>chlorine>iodine>bromine
(b) fluorine>chlorine>bromine>iodine
(c) iodine>bromine>chlorine>fluorine
(d) iodine>chlorine>bromine>fluorine.

COMEDK-2015

Ans. (d) : Iodine oxygen bond is stable due to the greater polarity of bond and stability of chlorine oxygen bond is due to multiple bond formation with orbital of chlorine atom now, be lier in better I and Cl, so it lacks both characteristics So, the stability order of oxide is given as
I > Cl > Br > F.

1341. Which halogen element gives Halous acid type of oxoacid?
(a) F
(b) Br
(c) Cl
(d) I

GUJCET-2021

Ans. (c) : Chlorine element gives halous acid type of oxoacids because they contain the halogen atom in tripositive oxidation state. Chlorine forms fours type of oxoacids.
(i) HOCl (hypochlorous acid)
(ii) HOClO (Chlorous acid)
(iii) $HOClO_2$ (Chloric acid)
(iv) $HOClO_3$ (Perchloric acid)
Note:- The strongest acid out of all the acids is the Perchloric acid.

1342. Among the following, the number of halide(s) which is/are inert to hydrolysis is ____.
(a) BF_3
(b) $SiCl_4$
(c) PCl_5
(d) SF_6

JEE Main-25-02-2021, Shift-I

Ans. (d) : SF_6 is inert to hydrolysis due to the presence of sterically protected sulphur atom by six fluorine atoms which does not permit the reactions like hydrolysis to take place.

1343. The correct order of bond dissociation enthalpy of halogens is :
(a) $F_2 > Cl_2 > Br_2 > I_2$
(b) $I_2 > Br_2 > Cl_2 > F_2$
(c) $Cl_2 > Br_2 > F_2 > I_2$
(d) $Cl_2 > F_2 > Br_2 > I_2$

JEE Main-25.02.2021, Shift-II

Ans. (c) : Bond dissociation enthalpy is the energy needed to break one mole of the bond to give separate atoms-everything being in the gas state. A halogen molecule having large size of atoms should have low bond dissociation energy. Bond dissociation energy of halogen family decreases down the group as the size of atom increases. But fluorine is exception because the size of fluorine atom is small which produces inter electronic repulsions. So, order of bond dissociation energy will be : $Cl_2 > Br_2 > F_2 > I_2$

1344. Assertion: Halogens do not occur in free state
Reason: Halogens are highly reactive
(a) If both Assertion and Reason are true and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are true but Reason is not a correct explanation of the Assertion.
(c) If Assertion is true but the Reason is false
(d) If both Assertion ad Reason are false

AIIMS-1994

Ans. (a): It is fact that halogen are highly reactive as they have seven electrons in their outermost orbit and they want to stabilize by acquiring an electron.

@apna_pdf

Therefore, they do not occur in free state.
Hence, both assertion and reason are true and reason is the correct explanation of assertion.

1345. Assertion: Amongst the halogens, fluorine can oxidise the elements to the highest oxidation state.

Reason: Due to small size of fluoride ions, it is difficult to oxidise fluoride ions to fluorine. Hence reverse reaction takes place more easily.

(a) If both Assertion and Reason are true and the Reason is a correct explanation of the Assertion
(b) If both Assertion and Reason are true but Reason is not a correct explanation of the Assertion
(c) If Assertion is true but the Reason is false
(d) If both Assertion and Reason are false

AIIMS-1996

Ans. (b): Assertion is true but reason is false because fluorine can oxidise the other element to the highest oxidation state because of being highly electronegative nature. Fluorine is stronger oxidising agent than other halogens due to the highest electronegativity.

1346. Which of the following reacts most slowly with nitric acid?

(a) Phosphorus
(b) Chlorine
(c) Sulphur
(d) Iodine

AIIMS-26 May 2019 (Morning)

Ans. (b): Chlorine reacts most slowly with nitric acid (HNO_3) among all the given elements because both nitric acid and chlorine are strong oxidising agent.

1347. Assertion: F_2 and Cl_2 when passed through water, F_2 is more reactive.

Reason: F_2 is most electronegative.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

[AIIMS-27 May, 2018 (M)]

Ans. (b) : F_2 is more reactive because of higher electrode potential value.

1348. Assertion: Fe^{3+} does not give brown ring test.

Reason: Because NO_3^- is first converted into NO_2^-.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

[AIIMS-26 May, 2018(M)]

Ans. (c): In brown ring test, Fe^{2+} ion oxidises to Fe^{3+} ion and NO_3^- ion reduces to NO.
Brown ring test is valid for Fe^{2+} ion.

1349. Assertion: $HClO_4$ is a stronger acid than $HClO_3$.

Reason: Oxidation state of Cl in $HClO_4$ is +VII and in $HClO_3$ +V.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

[AIIMS-2004, 2017]

Ans. (b): Both assertion and reason are true but reason is not the correct explanation of assertion. In general, the strengths of acids that have general formula $(HO)_m ZO_n$ can be related to the value of n. As the value of n increases, acidic character also increases. The negative atoms draw electrons away from the Z-atom and make it more positive.

1350. Assertion: HOF bond angle in HFO is higher than HOCl bond angle in HClO.

Reason: Oxygen is more electronegative than halogens.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

[AIIMS-2014]

Ans. (d): HOCl bond angle is greater than HOF bond angle. This is due to very small size of fluorine or, due to op–bp repulsion.
Oxygen is more electronegative than all halogens except fluorine (most electronegative). Thus, Assertion as well as Reason is incorrect.

1351. Assertion: White phosphorus is more reactive than red phosphorus.

Reason: Red phosphorus consists of P_4 tetrahedral units liked to one another to form linear chains.

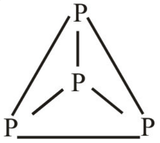
(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

[AIIMS-2012]

@apna_pdf

Ans. (b): White phosphorous is more reactive than red phosphorous because red phosphorous has more stability due to its structure.

Red phosphorus atoms from a network of more number of atoms and are less reactive and not much flammable. White phosphorous (P_4) has a tetrahedral structure that is thermodynamically unstable so that it combusts in air.



1352. Assertion: F is more electronegative than Cl.
Reason: F has high electron affinity than Cl.

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

[AIIMS-2007]

Ans. (c): Chlorine has high electron affinity than fluorine the less negative electron gain enthalpy of fluorine as compared to chlorine is due to very small size of the fluorine atom.

1353. Assertion: Ozone is an allotrope of oxygen.
Reason: Oxygen is bluish colour liquid and in singlet state it is paramagnetic.

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

[AIIMS-2007]

Ans. (c): Ozone (O_3) is a triatomic molecule consisting of three oxygen atoms. It is an allotrope of oxygen that is much less stable than the diatomic O_2.

Liquid O_2 is a clear substance with a light sky blue coloration.

In singlet oxygen, all the electron spins are paired and hence it is not paramagnetic in nature.

1354. Assertion: All halogens are colored.
Reason: The halogens absorb visible light.

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

[AIIMS-2002]

Ans. (a): All the halogens are coloured. The colour deepens with the rise of atomic number from fluorine to iodine. The colour is due to the absorption of energy from visible light by their molecules or excitation of outer electrons to higher energy levels.

F	Cl	Br	I
Light Yellow	Yellow Green	Reddish Brown	Deep Violet

1355. Assertion: The fluorine has lower reactivity.
Reason: F–F bond has low bond dissociation energy.

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

[AIIMS-2002]

Ans. (e): Fluorine is most reactive among halogens because of low bond dissociation of F–F. The low energy is due to high repulsion between non bonding electrons is the small atoms of fluorine.

So, Assertion is incorrect but the reason is correct

1356. Assertion: Fluorine exists only in–1 oxidation state.
Reason: Fluorine has $2s^22p^5$ configuration.

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

[AIIMS-2001]

Ans. (a): The atomic number of flourine is '9' with electronic configuration [He] $2s^22p^5$.

p (orbital) can hold 6 electrons and has valency for only 1 electrons.

Hence, it can accept only 1 electron

So, oxidation state is (–1).

@apna_pdf

1357. Assertion: Iodine is more soluble in water than in carbon tetrachloride.
Reason: Iodine is a polar compound.
(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

[AIIMS-1999]

Ans. (d): Iodine is less soluble in water than in carbon tetrachloride. Iodine is a non-polar compound. Iodine, being a non-polar compound is more soluble in CCl_4 (non-polar compound) than in water because "like dissolve like". So, both assertion and reason are false.

1358. One mole of fluorine is reacted with two moles of hot and concentrated KOH. The products formed are KF, H_2O and O_2. The molar ratio of KF, H_2O and O_2 respectively is
(a) 1 : 1 : 2 (b) 2 : 1 : 0.5
(c) 1 : 2 : 1 (d) 2 : 1 : 2

[AIIMS-27 May, 2018(E)]

Ans. (b): $F_2 + 2KOH \rightarrow 2KF + H_2O + \frac{1}{2}O_2$

$\therefore$ Molar ratio of KF : H_2 : O_2 from balanced chemical equation is 2:1:1/2

1359. In ClF_2^- and ClF_4^- find out the number of lone pair and shape.
(a) 3-Linear, 2-Square planar
(b) 3-Square planar, 2-Linear
(c) 0-Linear, 2-Square planar
(d) 2-Linear, 2-Square planar

[AIIMS-27 May, 2018(M)]

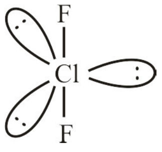
Ans. (a): $Cl \rightarrow 3s^2\ 3p^5$

It has 7 valance e^-

In ClF_2^-,

It has 5σ - bonds and sp^3d hybridization

$\therefore$ 3 L.P's



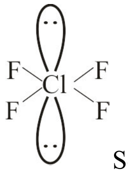
Linear geometry

3-Linear

In ClF_4^-,

It has 6σ - bonds and sp^3d^2 hybridization

$\therefore$ 2 L.P's



Square planar geometry

2-square planar

1360. Which of the following pair of molecules does not have identical structure?
(a) I_3^-, BeF_2 (b) HClO, SO_2
(c) BF_3, ICl_3 (d) BrF_4^-, XeF_4

[AIIMS-26 May, 2018(E)]

Ans. (c): $BF_3 \rightarrow$ Trigonal Planar
$ICl_3 \rightarrow$ T – shape

1361. Which of the following fluorides does not exist?
(a) NF_5 (b) PF_5
(c) AsF_5 (d) SbF_5

[AIIMS-2017]

Ans. (a): Nitrogen does not have empty 2d orbitals. Hence, it is unable to form more than 4 bonds. Hence, NF_5 does not exist but all other pentafluorids of 15 group elements exist as they have vacant d-orbitals.

1362. What is X and Y in the given reactions ?
$2X_2(g) + 2H_2O(l) \rightarrow 4H^+(aq) + O_2(g)$
$Y_2(g) + H_2O(l) \rightarrow HY\ (aq) + HOY\ (aq)$
(a) X = Cl, Y = F (b) X = Cl, Y = Br
(c) X = F, Y = Cl (d) X = I, Y = F

[AIIMS-2016]

Ans. (c): $2F_2(g) + 2H_2O\ (l) \rightarrow 4\ H^+\ (aq) + O_2(g)$
$Cl_2(g) + H_2O(l) \rightarrow HCl\ (aq) + HOCl$

1363. Regarding F^- and Cl^- which of the following statements is/are correct?
(i) Cl^- can give up an electron more easily than F^-
(ii) Cl^- is a better reducing agent than F^-
(iii) Cl^- is smaller in size than F^-
(iv) F^- can be oxidized more readily than Cl^-
(a) (i) and (ii) (b) (i), (ii) and (iv)
(c) (iii) and (iv) (d) Only (i)

[AIIMS-2015]

Ans. (d): The electronegative of F^- ion is high, so it accept an electron and Cl^- ion can give an electron more easily. Also the size of F^- is smaller than chloride ion (Cl^-).

1364. When Br_2 is treated with aqueous solutions of NaF, NaCl and NaI separately
(a) F_2, Cl_2 and I_2 are liberated.
(b) only F_2 and Cl_2 are liberated.
(c) only I_2 is liberated.
(d) only Cl_2 is liberated.

[AIIMS-2014]

@apna_pdf

Ans. (c): Within a group the element above can displace the element below in a redox reaction.

When bromine gas is passed through solutions of NaF, NaCl, NaI, bromine cannot displace fluorine and chlorine compound but it can displace iodine compound.

$2NaI + Br_2 \rightarrow 2\ NaBr + I_2$

Iodine gas is released.

Hence, option 'c' is correct.

1365. When chlorine reacts with cold and dilute solution of sodium hydroxide, the products obtained are

(a) $Cl^- + ClO^-$
(b) $Cl^- + ClO_2^-$
(c) $Cl^- + ClO_3^-$
(d) $Cl^- + ClO_4^-$

[AIIMS-2013]

Ans. (a): When chlorine reacts with cold and dilute sodium hydroxide, the following reaction takes place.

$2NaOH + Cl_2 \rightarrow NaCl + NaClO + H_2O$

Hence, the products are Cl^- and ClO^-

When chlorine reacts with concentrated sodium hydoxide, the following reaction takes places.

$NaOH + Cl_2 \rightarrow 5\ NaCl + NaClO_3 + 3H_2O$

Hence, the products are Cl^- and ClO_3^-

1366. When chlorine water is added to a solution of KBr, the solution immediately turns orange red, because

(a) chlorine is reduced to chloride ion
(b) of the formation of BrCl
(c) bromide ion is oxidized to bromine
(d) of the formation of Br_3^-

[AIIMS-2009]

Ans. (b): When chlorine water is added to solution of KBr chlorine displaces bromine as –

$Cl_2 + 2\ KBr \rightarrow 2KCl + Br_2$

Now, Br_2 which is formed above reacts with chlorine as

$Cl_2 + Br_2 \rightarrow 2BrCl$

The formation of BrCl turns the solution orange red.

1367. Which one of the following halides is the most stable?

(a) CCl_4
(b) CBr_4
(c) CF_4
(d) CI_4

[AIIMS-2010]

Ans. (c): Stability of carbon tetrahalides decreases with increase in the size of halogen atom. So, CF_4 is the most stable halide among the given options.

1368. Iodine exists in which form in iodised salt

(a) I_2
(b) $NaIO_3$
(c) ICl
(d) IO_4^-

[AIIMS-2009]

Ans. (b): Iodised salt is table salt mixed with a minimum amount of one of the four iodine containing salts of hydroiodic acid or iodic acid : potassium iodate or potassium iodine and sodium iodate or sodium iodide.

1369. Which two of the following salts are used for preaparing iodised salt?
(i) KIO_3 (ii) KI (iii) I_2 (iv) HI

(a) (i) and (ii)
(b) (i) and (iii)
(c) (ii) and (iv)
(d) (iii) and (iv)

[AIIMS-2006]

Ans. (a): Iodised salt is table salt mixed with a small amount of various salts of the element iodine. KIO_3 and KI are used for preparing iodised salt. Potassium iodate and potassium iodine is used in the iodized salt to prevent the iodine deficiency.

1370. Strongest reducing agent is :

(a) F^-
(b) Cl^-
(c) Br^-
(d) I^-

JEE Main 2018

Ans. (d) : Reducing agent - It is a compound or element which oxidizes itself (loses e^-) and reduces some other species.

F > Cl > Br > I → O.P decrease

Iodine has a large size→ nuclear charge is less, and thus, it can easily lose an e^- and can oxidize itself.

1371. Which of the following represents the correct order for oxidizing power of the given species -
ClO_4^-, BrO_4^- and IO_4^-

(a) $ClO_4^- > BrO_4^- > IO_4^-$
(b) $BrO_4^- > IO_4^- > ClO_4^-$
(c) $IO_4^- > BrO_4^- > ClO_4^-$
(d) $BrO_4^- > ClO_4^- > IO_4^-$

AP-EAMCET 25-08-2021 Shift - I

Ans. (c) : Oxidizing power of species is -

$IO_4^- > BrO_4^- > ClO_4^-$

1372. The element which can displace three other halogens from their compounds is:

(a) Cl
(b) Br
(c) I
(d) F

AP EAMCET (Medical) -1998

Ans. (d): Fluorine of the halogen which has tendency to displace all the three halogens from their compounds because fluorine is the strongest electronegative element in the periodic table and has strong tendency to take electrons and get reduced so, behaves as strongest oxidising agent.

1373. Bond energy of Cl_2, Br_2 and I_2 follow the order

(a) $Cl_2 > Br_2 > I_2$
(b) $Br_2 > Cl_2 > I_2$
(c) $I_2 > Br_2 > Cl_2$
(d) $I_2 > Cl_2 > Br_2$

AP EAMCET (Engg.) - 2012

Ans. (a) : The bond energies of chlorine, bromine, and Iodine decreases down the group as the size of the atom increases. The bond energy of fluorine, is however, lower than those of chlorine and bromine because of interelectronic repulsions present in the small atom of fluorine.

Bond energy order is $Cl_2 > Br_2 > F_2 > I_2$

@apna_pdf

1374. Which one of the following statements is not correct?

(a) The pH of 1.0×10^{-8} M HCl is less than 7
(b) The ionic product of water at 25°C is 1.0×10^{-14} mol^2L^{-2}
(c) Cl^- is a Lewis acid
(d) Bronsted Lowry theory cannot explain the acidic character of $AlCl_3$

AP EAMCET (Engg.) - 2012

Ans. (c) : Cl^- is not a Lewis acid. It is a Lewis base. Lewis acid is a chemical species that reacts with a Lewis base to form a Lewis adduct. A Lewis base then is any species that donates a pair of electrons to a Lewis acid to from a Lewis adduct.

For example OH^- and NH_3 are Lewis bases, because they can donate a lone pair of electrons.

1375. Fex_2 and Fey_3 are known when x and y are:

(a) x = F, Cl, Br, I and y = F, Cl, Br, I
(b) x = F, Cl, Br, I and y = F, Cl, Br
(c) x = F, Cl, Br and y = F, Cl, Br, I
(d) x = Cl, Br, I and y = F, Cl, Br, I

JEE Main 16.03.2021, Shift-II

Ans. (b) : FeI_3 is unstable whereas FeI_2 is stable in nature.

$$\underset{\text{(unstable)}}{2FeI_3} \longrightarrow \underset{\text{(stable)}}{2FeI_2} + I_2$$

As we know, in 17 group elements, iodine show the strong reducing nature.

$$2Fe^{3+} + 2I^- \longrightarrow 2Fe^{2+} + I_2$$

Rest of all halides of Fe^{2+} & Fe^{3+} are stable.

1376. The correct order of increasing electron affinity of halogens is

(a) F < Cl < Br < I
(b) I < Br < F < Cl
(c) I < Br < Cl < F
(d) Br < I < F < Cl

MPPET-2008

Ans. (b) : The electron affinity of chlorine is greater and less in iodine. The correct order is I < Br < F < Cl

1377. Strongest conjugate base among the following is

(a) $C\ell^-$
(b) F^-
(c) Br^-
(d) I^-

AP EAMCET (Engg.) 18.09.2020, Shift-I

Ans. (b) : We know, an weaker acid produces stronger conjugate base.

	Acid	**Conjugate base**	
Acidic strength ↓ Increases	HF	F^-	Increases ↑ Basic strength of conjugate base
	$HC\ell$	$C\ell^-$	
	HBr	Br^-	
	HI	I^-	

So, here F^- is the strongest conjugate base.

1378. Bond dissociation energies of HF, HCI, HBr follow the order ....

(a) HCI > HBr > HF
(b) HF > HBr > HCI
(c) HF > HCI > HBr
(d) HBr > HCI > HF

AP EAMCET (Engg.) 2001

Ans. (c) : There is a large difference between electronegativity of H and F, so the bond is stronger. As we go down the group, the difference between electronegativity decreases and therefore, bond dissociation energy also decreases.

The order of bond dissociation energies are H–F > H – Cl > H – Br

Also smaller the bond length greater is the bond dissociation energy.

1379. For electron affinity of halogens which of the following is correct?

(a) Br > F
(b) F > Cl
(c) Br > Cl
(d) F > I

[AIIMS-2004]

Ans. (d): Electron affinity is defined as the amount of energy released when an electron is added to the outermost shell of neutral gaseous atom to form an anion. Electron affinity decrease in a group from top to bottom due to increase in size so the expected order of EA for halogen is F > Cl > Br > I.

But fluorine atom is very small in size than other given halogens. Therefore, it release less energy than Cl. So, Cl atom has high electron affinity and the order is –

Cl > F > Br > I

1380. The strongest oxidising agent is :

(a) F_2
(b) Cl_2
(c) I_2
(d) Br_2

[AIIMS-2001]

Ans. (a): F_2 is the strongest oxidizing agent in the whole periodic table. The order of oxidizing power depends on the reduction potential which depends on factors like hydration enthalpy of atomization and electron affinity fluorine has higher electron affinity and also higher hydration on its ion, therefore, fluorine is strongest oxidizing agent.

Here, are the standard reduction potentials of all the halogens.

$F_2 \to 2.87$
$Cl_2 \to 1.36$
$Br_2 \to 1.07$
$I_2 \to 0.54$
$F_2 > Cl_2 > Br_2 > I_2$

1381. Which of the following is not the characteristic of interhalogen compounds?

(a) They are covalent.
(b) More reactive than halogens.
(c) Have low B.P. and high volatile.
(d) Quite unstable but not explosive.

[AIIMS-1999]

Ans. (c): Interhalogen compounds are formed when halogen group elements react with each other.

Inter halogen compounds are covalent in nature. More reactive than halogen because of low bond energy due to dissimilar size of atom in molecule.

1382. Iodide of Millon's base is :

(a) HIO_3
(b) K_2HgI_4
(c) $NH_2HgO.HgI$
(d) $Hg(NH_2)I$

[AIIMS-1999]

@apna_pdf

Ans. (c): When NH_4^+ ions are treated with Nessler's reagent (alkaline solution of K_2HgI_4) a brown ppt. of $NH_2 - Hg - O - HgI$. Or $Hg_2NI.\ H_2O$ (iodide of millon's base) is formed.

$2K_2HgI_4 + NH_2 + 2KOH \rightarrow NH_2.HgO.HgI + 7KI + 2H_2O$ iodine of millon's base.

1383. Chlorine acts as a bleaching agent only in presence of :

(a) Sunlight (b) Moisture

(c) Dry air (d) Pure oxygen

[AIIMS-1998]

Ans. (b): Chlorine acts as bleaching agent only in presence of moisture.

$$Cl_2 + H_2O \rightarrow 2HCl + O$$

1384. The correct order of acid strength of oxyacids is:

(a) $HClO > HClO_2 > HClO_3 > HClO_4$

(b) $HClO_2 > HClO_3 > HClO > HClO_4$

(c) $HClO_4 > HClO_3 > HClO_2 > HClO$

(d) $HClO_3 > HClO_4 > HClO > HClO_2$

[AIIMS-1998]

Ans. (c): The acidic strength of oxyacids depends upon the stability of conjugate base. More stable the conjugate base of an acid is the strongest acid.

Conjugate bases stabilizes by resonance ClO^- does not show resonance thus the stability order of conjugate base due to resonance is.

$ClO_4^- > ClO_3^- > ClO_2^- > ClO^-$

Hence, the acidic strength of given

$HClO_4 > HClO_3 > HClO_2 > HClO$

1385. The correct order of increasing oxidising power is :

(a) $Cl_2 < Br_2 < F_2 < I_2$ (b) $F_2 < Br_2 < Cl_2 < I_2$

(c) $F_2 > Br_2 > Cl_2 > I_2$ (d) $I_2 < Br_2 < Cl_2 < F_2$

[AIIMS-1997]

Ans. (d): Metals are good reducing agents while non-metals are good oxidizing agents further among halogens metallic character increases as we move from top to bottom in a group i.e. the correct order of oxidizing nature is

$$I_2 < Br_2 < Cl_2 < F_2$$

1386. The correct order of the thermal stability of hydrogen halides (H–X) is

(a) $HI > HCl < HF > HBr$

(b) $HCl < HF > HBr < HI$

(c) $HF > HCl > HBr > HI$

(d) $HI < HBr > HCl < HF$

VITEEE-2018

Ans. (c) : The given hydrogen halides are H–F, H–Cl, H–Br and H–I. The stability of these halides decreases moving down in the group due to decrease in bond (H–X) dissociation energy.

the order: H–F > H–Cl > H–Br > H–I.

Thus HF is the most stable and most acidic.

1387. Transition metals usually exhibit highest oxidation states in their

(a) chlorides (b) fluorides

(c) bromides (d) iodides

VITEEE- 2010

Ans. (b) : Due to highest reduction potential of fluorine. Transition metals exhibit highest oxidation states in their fluoride.

1388. Which of the following reactions does not take place?

(a) $F_2 + 2Cl^- \rightarrow 2F^- + Cl_2$

(b) $Br_2 + 2I^- \rightarrow 2Br^- + I_2$

(c) $Cl_2 + 2Br^- \rightarrow 2Cl^- + Br_2$

(d) $Cl_2 + 2F^- \rightarrow 2Cl^- + F_2$

AP-EAMCET – 2016

Ans. (d) : With progressive increase in atomic number the reduction potential of halogens decreases the oxidizing power also decrease.

Cl_2 cannot displace F_2. The relevant stereochemistry relationship is–

$Cl_2 + 3F_2 \rightarrow 2ClF_3$

Fluorine is strong oxidising agent (under goes reduction) oxidising nature $F_2 > Cl_2 > Br_2 > I_2$.

1389. Which of the following is not correct ?

(a) $2F_2 + 4NaOH \rightarrow 4NaF + 2H_2O$

(b) $3F_2 + NaOH \rightarrow 5NaF + NaFO_3$

(c) $F_2 + 2NaOH \rightarrow NaF + NaOF + H_2O$

(d) $2F_2 + 2NaOH \rightarrow 2NaF + OF_2 + H_2O$

AP-EAMCET (Engg.)-2004

Ans. (d) : Fluorine react with NaOH into two reaction condition i.e. at hot concentration and at cold concentration.

At hot concentration of NaOH –

$$F_2 + 2NaOH \rightarrow 2NaF + \frac{1}{2}O_2 + H_2O$$

At cold concentration of NaOH –

$$F_2 + 2NaOH \rightarrow 2NaF + H_2O + \frac{1}{2}O_2$$

1390. Which one of the following is formed apart from sodium chloride when chlorine reacts with hot concentrated sodium hydroxide?

(a) NaOCl (b) $NaClO_3$

(c) $NaClO_2$ (d) $NaClO_4$

AP-EAMCET- (Engg.) - 2010

Ans. (b) : When chlorine is treated with hot concentrated sodium hydroxide then sodium chloride and sodium chlorate is formed.

$$3Cl_2(g) + \underset{\text{(hot conc.)}}{6NaOH} \xrightarrow{70^\circ C} 5\ NaCl + \underset{\substack{\text{Sodium}\\\text{chlorate}}}{NaClO_3} + 3H_2O$$

1391. Assertion (A) : The bond dissociation energy of fluorine is less than bromine.

Reason (R) : In fluorine molecule, large lone pair electronic repulsions and appreciable internuclear repulsions are present.

The correct answer is

(a) Both (A) and (R) are true and (R) is the correct explanation of (A)

(b) Both (A) and (R) are true but (R) is not the correct explanation of (A)

@apna_pdf

(c) Only (A) is true but (R) is not true
(d) (A) is not true but (R) is true

AP - EAMCET(MEDICAL) - 2009

Ans. (a) : The order of bond dissociation energy of halogens can be written as–

$Cl_2 > Br_2 > F_2 > I_2$

Fluorine has less bond dissociation energy than bromine. Due to high inter electronic replusions F-F bond becomes weak and broken easily.

Therefore, Both (A) and (R) are true and (R) is the correct explanation of (A).

1392. Which of the following dissolves in water but does not give any oxyacid solution ?

(a) SO_2
(b) OF_2
(c) SCl_4
(d) SO_3

AP - EAMCET (Medical) - 2007

Ans. (b) : OF_2 dissolves in water but does not give any oxyacid solution. While SO_2, SCl_4 and SO_3 give oxyacid solution in water.

$$SO_2 + H_2O \rightarrow \underset{\text{Sulphurous acid}}{H_2SO_3}$$

$$SCl_4 + 3H_2O \rightarrow \underset{\text{Sulphurous acid}}{H_2SO_3} + \underset{\text{Hydrochloric acid}}{4HCl}$$

$$SO_3 + H_2O \rightarrow \underset{\text{Sulphuric acid}}{H_2SO_4}$$

1393. Which one of the following halogens does not exhibit positive oxidation state in its compounds?

(a) I
(b) Br
(c) Cl
(d) F

AP – EAMCET - (Medical)-1997

Ans. (d) : Fluorine, the most electronegative element, has no positive oxidation states, it exhibits only–1 oxidation state, but the other halogens include chlorine, bromine and iodine commonly exhibit +1, +3, +5, and +7 states.

1394. Which of the following has the maximum vapour pressure?

(a) HCl
(b) HBr
(c) HF
(d) HI

AMU-2018

Ans. (a) : Vapour pressure is inversely proportional to boiling point. so we can say that the vapour pressure decreases as boiling point increases.

HCl has least boiling point due to its week inter molecular force. Thus, HCl has maximum, vapour pressure.

1395. Which of the following is used for he estimation of halogens in organic compounds?

(a) Carius method
(b) Dumas method
(c) Kjelahl's method
(d) Newman method

AMU-2018

Ans. (a) : Carius method is used for estimation of halogens in organic compound.

A known mass of the organic compound is reacted with fuming nitric acid in the presence of silver nitrate then the halogen converted into silver halide.

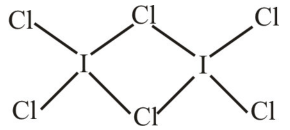
1396. The interhalogen having dimeric structure is

(a) ClF_3
(b) BrF_3
(c) IF_3
(d) ICl_3

AMU-2014

Ans. (d) : Among the given option, interhalogen compounds only ICl_3 exists as I_2Cl_6 i.e. exists in diametric form.

The structure of dimeric



1397. Which of the following statement is not true?

(a) Halogens act as strong oxidizing agents.
(b) Fluorine oxidizes water to oxygen and ozone.
(c) Iodine has good solubility in water.
(d) Solubility of iodine in water much increases by adding KI due to formation of I_3^- ions.

AMU-2013

Ans. (c) : Halogen can shows negative, zero as well as positive oxidation states.

Iodine is not soluble in water.

$I_2 + H_2O \rightarrow$ No reaction

1398. The element with atomic number 117 if discovered would be placed in

(a) noble gas family
(b) alkali family
(c) alkaline earth family
(d) halogen family.

AMU – 2009

Ans. (d) : The atomic number 117 of element tennessin (Ts) is placed in a halogen family. While element 117 may not behave like halogens chemically but follow physical properties like melting and boiling point with halogen.

The electronic configuration of $_{117}TS$ = $[Rn]5f^{14}6d^{10}7s^27p^5$

1399. Which of the following halides is least stable and has a doubtful existence?

(a) Cl_4
(b) GeI_4
(c) SnI_4
(d) PbI_4

AMU – 2008

Ans. (d) : PbI_4 halides is least stable and has a doubtful existence. The thermal stability of tetrahalides of same element decreases with increase in molecular mass of the tetrahalides.

$Cl_4 > SiI_4 > GeI_4 > PbI_4$

Thus, PbI_4 has least stability.

Non existence of PbI_4 can be explained on the base of strong oxidising nature of Pb^{4+}. I^- is a reducing agent i.e. in presence of this ion, Pb^{4+} ions are reducing to Pb^{2+} ions.

$$Pb^{4+} + 2I^- \rightarrow Pb^{2+} + I_2$$

1400. Moist iodine reacts with ozone to give

(a) HI
(b) HIO_3
(c) I_2O_4
(d) I_2O_5

Assam CEE-2014

Ans. (b) : $5O_3 + I_2 + H_2O \rightarrow 2HIO_3 + 5O_2$

It forms oxyacids with moist iodine

@apna_pdf

1401. Iodine stains on clothes can be removed by

(a) NaCl (b) NaBr

(c) KI (d) $Na_2S_2O_3$

Assam CEE-2014

Ans. (d) : $2Na_2S_2O_3 + I_2 \rightarrow Na_2S_4O_6 + 2NaI$

$Na_2S_2O_3$ dissolves I_2 by oxidizing it to HIO_3 thus it can be used to remove free strain of iodine.

1402. Which one will liberate Br_2 from KBr?

(a) I_2 (b) SO_2

(c) HI (d) Cl_2

BCECE-2006

Ans. (d) : Cl is placed below Br in electrochemical series.

$2KBr + Cl_2 \rightarrow 2KCl + Br_2$

The reaction is based on the fact that Cl_2 has greater oxidizing power than Br_2 and therefore Br_2 can liberate from KBr.

1403. When chlorine is passed through concentrated solution of KOH, the compound formed is:

(a) $KClO_4$ (b) $KClO_3$

(c) $KClO_2$ (d) KClO

BCECE-2006

Ans. (b) : The chlorine passed through not concentrated solution of KOH, potassium chlorate is formed.

$$3Cl_2 + 6KOH \rightarrow \underset{\text{potassium chlorate}}{KClO_3} + 5KCl + 3H_2O$$

1404. Strongest oxidising agent among halogen is :

(a) I_2 (b) Br_2

(c) Cl_2 (d) F_2

BCECE-2006

Ans. (d) : The geometry of phosphorus is tetrahedral due to sp^3- hybridization in all the three acids.

The reason for bring the strongest oxidizing agent is as follows the elements has 5 electrons in its valence shell as the nearest stable electronic configuration are held lightly with the nucleus.

Due to the least atomic radii among the halides electrons are attracted towards the nucleus more effectively.

Less energy is required to break the F-F bond

Oxidising power $F_2 > Cl_2 > Br_2 > I_2$

1405. Which of the following is more acidic in nature?

(a) HClO (b) $HClO_2$

(c) $HClO_3$ (d) $HClO_4$

BCECE-2004

Ans. (d) : Acidity of oxycids of halogen increases with increase in oxidation number of halogen.

Oxidation number of HClO is +1, $HClO_2$ is +3, $HClO_3$ is +5 and $HClO_4$ is +7

$\therefore$ $HClO_4$ is most acidic among given choices

1406. Correct order of reactivity :

(a) $I_2 > Br_2 > Cl_2 > F_2$ (b) $Br_2 > I_2 > Cl_2 > F_2$

(c) $Cl_2 > Br_2 > I_2 > F_2$ (d) $F_2 > Cl_2 > Br_2 > I_2$

BCECE-2004

Ans. (d) : Since, reactivity decreases as the electronegativity of the halogen decreases.

So, the correct order of reactivity of halogen is –

$F_2 > Cl_2 > Br_2 > I_2$

1407. Highest electron affinity among the following is–

(a) fluorine (b) chlorine

(c) sulphur (d) xenon

BCECE-2008

Ans. (b) : Halogens have higher electron affinity here chlorine has higher electron affinity than fluorine due to smaller size of fluorine.

1408. In fluorine group of Periodic Table, on going down

(a) ionic radius increases

(b) electro negativity increases

(c) ionisation potential increases

(d) reactivity increases

BCECE-2011

Ans. (a) : In the fluorine group of periodic table as we go down wards ionic radius increases while electro negativity, ionization potential and reactivity decrease this is due to decrease in effective nuclear charge.

1409. Conc·HNO_3 reacts with I_2 to form

(a) HI (b) HOI

(c) HIO_2 (d) HIO_3

BCECE-2010

Ans. (d) : Reaction –

$I_2 + 10HNO_3 \rightarrow 2HIO_3 + 10NO_2 + 4H_2O$

1410. Which of the following statement about halogens is correct?

(a) HF the strongest hydrohallic acid

(b) F_2 is the strongest reducing agent among all type of halogen.

(c) The order of –negative electron gain enthalpy for halogens is F > Cl > Br > I

(d) F_2 has lower bond dissociation energy than Cl_2

BCECE-2017

Ans. (d) : F_2 has lower bond dissociation energy than Cl_2 due to its small size and high electro negativity.

1411. When I_2 is passed through KCl, KBr and KF solution

(a) Cl_2 and Br_2 are evolved

(b) Cl_2 is evolved

(c) Cl_2, Br_2, F_2 are evolved

(d) None of the above

Assam CEE-2014

Ans. (d) : I_2 cannot displace Br_2, Cl_2, F_2 from KBr, KCl, KF because it is weakest oxidizing agent

As I is less reactive than Cl, Br, and F. so, it cannot displace any halogen (Cl, Br, I)

1412. Which of the following halides is not oxidized by MnO_2

(a) F^- (b) Cl^-

(c) Br^- (d) I^-

[BITSAT-2012]

@apna_pdf

Ans. (a) : Fluorine is the strongest oxidizing agent so its oxidizes and itself cannot be oxidized.

1413. The correct order of reactivity of halogens with alkalies is

(a) F>Cl>Br>I
(b) F < Cl > Br < I
(c) F < Cl < Br < I
(d) F < Cl < Br > I

[BITSAT-2010]

Ans. (a) : The correct order of reactivity of halogens with alkalies is

$$F > Cl > Br > I$$

1414. When chlorine water is exposed to sunlight, O_2 is liberated. Hence,

(a) hydrogen has little affinity to O_2
(b) hydrogen has more affinity to O_2
(c) hydrogen has more affinity to chlorine
(d) it is a reducing agent.

[BITSAT-2012]

Ans. (c) : When chlorine water is exposed to sunlight O_2 is liberated hence hydrogen has more affinity to Cl_2

$$Cl_2 + H_2O \longrightarrow 2HCl + \frac{1}{2}O_2$$

Chlorine water = $H_2O + Cl_2$

$$H_2O(l) + Cl_2(g) \xrightarrow{\text{sunlight}} HCl(aq.) + HClO(aq.)$$

$HClO \rightarrow HCl + [O]$

$2HClO \rightarrow 2HCl + O_2$

HClO formed into HCl ,as H has more affinity than Cl_2.

1415. Which of the following halogens exhibit only one oxidation state in its compounds?

(a) Bromine
(b) Chlorine
(c) Fluorine
(d) Iodine

[BITSAT-2014]

Ans. (c) : Fluorine shown only one (-1) state oxidation Cl, Br, and I exhibit -1, +1, +3, +5 and +7 oxidation states. This is because they are less electronegative than F and process empty d-orbital's in the valence shell and therefore, can expand the octed.

1416. Starch can be used as an indicator for the detection of traces of

(a) Glucose in aqueous solution
(b) Proteins in blood
(c) Iodine in aqueous solution
(d) Urea in blood

[BITSAT-2014]

Ans. (c) : The colour of the starch complex is so deep that it can as 0.00002m at 20°C. Starch is colourless.

Starch +Iodine→Starch Iodine

1417. When chlorine water is added to an aqueous solution of sodium iodide in the presence of chloroform, a violet colouration is obtained. On adding more of chlorine water and vigorous shaking, the violet colour disappears. This shows the conversion of ……. into…….

(a) I_2, HIO_3
(b) I_2, HI
(c) HI, HIO_3
(d) I_2, HOI

[BITSAT-2019]

Ans. (a) : Chlorine reacted with aqueons solution of NaI in the presence of $CHCl_3$ then violet colour of I_2 is formed.

$$Cl_2 + 2NaI \rightarrow 2NaCl + I_2$$

Further, iodine reacts with chlorine water then the iodine converts into HIO_3.

$$6Cl_2 + 6H_2O + I_2 \rightarrow \underset{\text{Colourless}}{2HIO_3} + 10HCl$$

So, I_2 formed and it is converted to HIO_3.

1418. Which of the following compounds liberate Cl_2 gas when react with I_2?

(a) Potassium permanganate
(b) Potassium chlorate
(c) Hypo
(d) Potassium dichromate

CG PET- 2016

Ans. (b) : When $KClO_3$ reacted with I_2 then chlorine gas evolved during the process.

$$2KClO_3 + I_2 \longrightarrow 2KIO_3 + Cl_2$$

1419. Which of the following properties increases on going down from F to I in group VII-A of the periodic table?

(a) Electronegativity
(b) Volatile nature
(c) Ionic radius
(d) Oxidising power

CG PET -2007

Ans. (c) : Ionic radius increases on going down the group because number of shells increases.

1420. The strongest oxidising agent amongst F_2, Cl_2, Br_2 and I_2 is

(a) F_2
(b) I_2
(c) Cl_2
(d) Br_2

CG PET -2007

Ans. (a) : An element that can readily accept an electron is a good oxidizing agent. Halogens are good oxidizing agents because they have a strong tendency to accept an electron due to-

(i) Small atomic size
(ii) High electronegativity
(iii) High electron affinity

So, fluorine is the smallest and has the highest electro negativity among halogens and hence, it is best oxidizing agent.

1421. Which is the weakest acid out of HF, HCl, HBr and HI?

(a) HF
(b) HBr
(c) HCl
(d) HI

CG PET -2007

Ans. (a) : It is classified as a weak acid mainly because it fails to completely dissociate in water. HF, due to intermolecular H–bonding is weakest among HX acids.

1422. Which of the following is pseudo halogen?

(a) IF_7
(b) $(CN)_2$
(c) ICl_2^-
(d) I_2^-

CG PET -2007

Ans. (b) : Ions which consists of two or more electronegative atoms of which at least one is nitrogen and have properties similar to those of halide ions are called pseudohalide ions. Just as halide ions have corresponding diatomic molecules, pseudohalide ions

@apna_pdf

have also corresponding dimeric molecules. These are called pseudo halogens and show properties similar to those of halogens.
e.g. $(CN)_2$, $(SCN)_2$, $(OCN)_2$

1423. Which of the following will replace Br_2, from the aqueous solution having bromide ion?

(a) Cl_2 (b) I_3^-
(c) I_2 (d) Cl^-

CG PET -2007

Ans. (a) : Chlorine displaces bromine from an aqueous solution containing bromide. Reactivity of chlorine is more than that of bromine. So chlorine replaces Bromine.

$$Cl_2 + 2Br^- \rightarrow 2Cl^- + Br_2$$

1424. Chlorine cannot displace

(a) Fluorine from NaF (b) Iodine from NaI
(c) Bromine from NaBr (d) None of the above

CG PET -2007

Ans. (a) : $Cl_2 + NaF \rightarrow$ No reaction
Since Cl_2 is less electronegative then F_2, Therefore unable to displace fluorine from its salt.

1425. Fluorine forms chemical compounds with

(a) He (b) Ne
(c) Ar (d) Xe

CG PET -2004

Ans. (d) : The Xe has total of 8 outside shell e^- while the Fluorine has 7 valence electrons. The outside electrons are very far away from the center, therefore Xe can't pay attention to all of the electrons. Fluorine is smaller, therefore it has stronger positive attraction towards the electron.
'F' is only element that react with Xe because it is most electronegative. It is the only element that is strong enough to pull electrons out of the stable Xenon.

1426. Carbon-halogen bond is strongest among the following

(a) CH_3Cl (b) CH_3Br
(c) CH_3F (d) CH_3I

CG PET -2005

Ans. (c) : The carbon-halogen bonds (apart from the carbon-iodine bond) are polar, because the electron pair is pulled closer to the halogen atom than the carbon. This is because (a part from iodine) the halogens are more electronegative than carbon. The carbon-fluorine bond is strongest.

1427. Which of the following elements exhibits the most basic properties?

(a) F (b) Cl
(c) Br (d) I

CG PET -2005

Ans. (d) : A base is a substance which can easily give its lone pair of electrons. All the elements given belong to group 17th and in this group electronegativity decrease down the group. Lesser the electronegativity more is the basic nature. So, iodine is the most basic among the given element.

1428. The correct sequence of decrease in size of the following species is

(a) $I > I^+ > I^-$ (b) $I > I^- > I^+$
(c) $I^+ > I^- > I$ (d) $I^- > I > I^+$

CG PET -2005

Ans. (d) : As the number of electron decreases (but proton number remains same) So effective nuclear charge increases and so size decrease.

$$I^- > I > I^+$$

1429. Chlorine atom differs from chloride in the number of which of the following?

(a) Protons (b) Neutrons
(c) Electrons (d) Both (a) and (c)

CG PET -2005

Ans. (c) : Cl and Cl^- differs in number of electrons. Cl has $17e^-$ while Cl^- has $18e^-$.

1430. Strongest bond among halogens is in

(a) F_2 (b) Cl_2
(c) Br_2 (d) I_2

CG PET- 2015

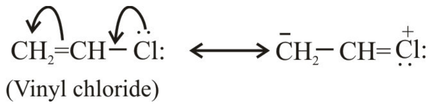
Ans. (b) : In fluorine there is greater lone pair-lone pair repulsion due to its very small size. So, Cl–Cl bond is stronger than F–F bond.
However the bond energy decreases with increase in atomic size in case of bromine and iodine.

1431. Chlorine is least reactive in

(a) methyl chloride (b) ethyl chloride
(c) vinyl chloride (d) allyl chloride

CG PET- 2015

Ans. (c) : The least reactive chlorine is vinyl chloride due to partial double bond character and unstable carbocation formation, vinyl carbocation is least stable.



1432. Hypochlorous acid is

(a) HOCl (b) $HClO_2$
(c) $HClO_3$ (d) $HClO_4$

CG PET- 2010

Ans. (a) : The chemical formula of hypochlorous acid is HOCl.

1433. Which of the following is allyclic halide?

(a) 3-chloro cyclo hex-1-ene
(b) (1 bromo ethyl) benzene
(c) 1-bromo benzene
(d) Benzyl chloride

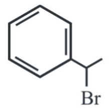
GUJCET-2016

Ans. (a) : Allylic halides are the halides in which the halogen atom is bonded to sp^3 hybridized.
General chemical structure of allylic halides:

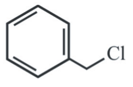
$$CH_2 = CH - CH_2 - X$$

Here, X is any halogen atom.

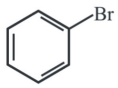
@apna_pdf



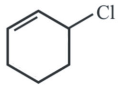
(1-Bromo ethyl) benzene



Benzyl chloride



1-Bromo benzene



3 Chloro cyclohex -1-ene

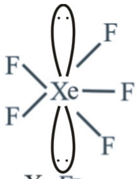
So, according to the rule, only in 3-chloro cyclohex-1-ene halide (Cl) is attached with sp^3 carbon which is next carbon-carbon double bond.

1434. The shape/structure of $[XeF_5]^-$ and XeO_3F_2, respectively, are

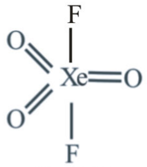
(a) pentagonal planar and trigonal bipyramidal
(b) octahedral and square pyramidal
(c) trigonal bipyramidal and pentagonal planar
(d) trigonal bipyramidal and trigonal bipyramidal

(JEE Main 2020, 2 Sep Shift-II)

Ans. (a) : Pentagonal planar and trigonal bipyramidal



XeF_5^-
sp^3d^3
Pentagonal planar



XeO_3F_2
sp^3d
Trigonal bipyramidal

1435. Identify the incorrect statement among the following

(a) Ozone reacts with SO_2 to give SO_3
(b) Silicon reacts with NaOH (aq) in the presence of air to give Na_2SiO_3 and H_2O
(c) Cl_2 reacts with excess of NH_3 to give N_2 and HCl
(d) Br_2 reacts with hot and strong NaOH solution to give NaBr, $NaBrO_4$ and H_2O

(AIEEE 2007)

Ans. (d) : (a) Ozone reacts with SO_2 to give SO_3.

$3SO_2 + O_3 \rightarrow 3SO_3$ (correct)

(b) Silicon reacts with NaOH(aq.) in the presence of air to give Na_2SiO_3 and H_2O.

$2Si + 2NaOH + 4H_2O \rightarrow 2NaSiO_3 + 5H_2$ (correct)

(c) Cl_2 reacts with excess of NH_3 to give N_2 and HCl

$3Cl_2 + 2NH_3 \rightarrow 6HCl + N_2$ (correct)

(d) Br_2 reacts with hot and strong NaOH solution to give NaBr, $NaBrO_4$ and H_2O

$3Br_2 + 6NaOH \rightarrow NaBrO_3 + 5NaBr + 3H_2O$ (incorrect)

1436. A metal, M forms chlorides in its +2 and +4 oxidation states. Which of the following statements about these chlorides is correct?

(a) MCl_2 is more volatile than MCl_4
(b) MCl_2 is more soluble in anhydrous ethanol than MCl_4
(c) MCl_2 is more ionic than MCl_4
(d) MCl_2 is more easily hydrolysed than MCl_4

(AIEEE 2006)

Ans. (c) : MCl_2 is more ionic than MCl_4 because according to Fajan's rule, compounds of metal in lower oxidation state are more ionic than those in a higher state.

1437. The correct order of the thermal stability of hydrogen halides (H – X) is

(a) HI > HCl > HF > HBr
(b) HCl < HF > HBr > HI
(c) HF > HCl > HBr > HI
(d) HI > HBr > HCl > HF

(AIEEE 2005)

Ans. (c) : As we move down the group in hydrogen halides the thermal stability decreases due to decrease in bond strength. So the correct order of thermal stability is-

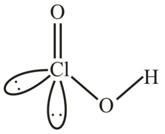
HF > HCl > HBr > HI

1438. Number of Cl = O bonds in chlorous acid, chloric acid and perchloric acid respectively are

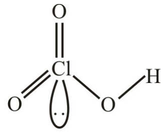
(a) 3, 1 and 1
(b) 4, 1 and 0
(c) 1, 1 and 3
(d) 1, 2 and 3

(JEE Main 2021, 27 July Shift-II)

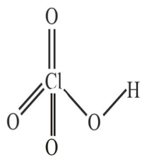
Ans. (d) : To determine the number of Cl = O bonds, structure of the given compounds are to be drawn. The chemical formula of chlorous acid is $HClO_2$, chloric acid is $HClO_3$ and perchloric acid is $HClO_4$. The structures of all those compounds is-



(Chlorous acid)



(Chloric acid)



(Perchloric acid)

From the above structures, it is clear that chlorous acid has one Cl = O bond, chloric acid has two Cl = O bonds and perchloric acid has three Cl = O bonds.

1439. Choose the incorrect statement.

(a) Cl_2 is more reactive than CIF.
(b) F_2 is more reactive than CIF.
(c) On hydrolysis CIF from HOCl and HF.
(d) F_2 is a stronger oxidising agent than Cl_2 in aqueous solution.

(JEE Main 2021, 26 Aug Shift-I)

@apna_pdf

Ans. (a) : Cl_2 is less reactive than ClF because Cl–F bond is weaker than Cl–Cl in Cl_2. Here, F_2 is more reactive than Cl–F and Cl_2 because of bond length of F–F is weak.

- The Hydrolysis of ClF is give the HOCl and HF.

$$ClF + H_2O \rightarrow HOCl + HF$$

- Oxidising power in aqueous solution is-

$$F_2 > Cl_2 > Br_2 > I_2$$

1440. The absolute value of the electron gain enthalpy of halogens satisfies

(a) I > Br > Cl > F (b) Cl > Br > F > I

(c) Cl > F > Br > I (d) F > Cl > Br > I

(JEE Main 2021, 17 March Shift-I)

Ans. (c) : The magnitude of electron gain enthalpy of halogen atoms down the group show abnormal behavior. The $|\Delta H_{eg}|$ of F is lower than of Cl due to its smaller size.

The incoming electron experiences higher repulsive force due to valence electrons of F than Cl. The correct order is-

Cl > F > Br > I

1441. The correct order of bond dissociation enthalpy of halogens is

(a) $F_2 > Cl_2 > Br_2 > I_2$ (b) $I_2 > Br_2 > Cl_2 > F_2$

(c) $Cl_2 > Br_2 > F_2 > I_2$ (d) $Cl_2 > F_2 > Br_2 > I_2$

(JEE Main 2021, 25 Feb Shift-II)

(NEET-I 2016)

Ans. (c) : Correct order of bond dissociation enthalpy of halogens is $Cl_2 > Br_2 > F_2 > I_2$ due to inter electronic repulsions F – F bond becomes weak and easily broken.

1442. The hydrogen Halide which has highest reducing power is

(a) HCl (b) HI

(c) HBr (d) HF

Assam CEE-2020

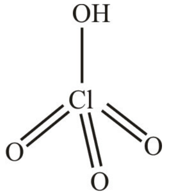
Ans. (b) : The increasing order of the reducing power is HF < HCl < HBr < HI.

So, the HI has highest reducing power

1443. The number of Cl = O bonds in perchloric acid is "..................."

(JEE Main 2020, 6 Sep Shift-I)

Ans. (3) : The molecular formula of perchloric acid is $HClO_4$. The structure of $HClO_4$ is-



Here, the acid contains three Cl=O bonds.

1444. Which inter halogen compound is not possible to form

(a) FCl (b) ClF

(c) ICl (d) lBr

Assam CEE-2019

Ans. (a) : The inter halogen compound is not possible to form FCI .

1445. Among the following reactions of hydrogen with halogens, the one that requires a catalyst is

(a) $H_2 + Cl_2 \rightarrow 2HCl$ (b) $H_2 + I_2 \rightarrow 2HI$

(c) $H_2 + F_2 \rightarrow 2HF$ (d) $H_2 + Br_2 \rightarrow 2HBr$

(JEE Main 2019, 10 Jan Shift-I)

Ans. (b) : Chemical reactivity of halogens decreases down the group ($F_2>Cl_2>Br_2>I_2$)

The chemical reactivity of fluorine is attributed to two factors.

(i) The low dissociation energy of F-F bond (which result in low attraction energy for the reaction).

(ii) Very strong bonds which are formed. Both properties arise from, small size of fluorine. I_2 is being the least reactive halogen it requires a catalyst for the reaction.

$$H_2 + I_2 \rightarrow 2HI$$

1446. What products are expected from the disproportionation reaction of hypochlorous acid?

(a) $HClO_3$ and Cl_2O (b) $HClO_2$ and $HClO_4$

(c) HCl and Cl_2O (d) HCl and $HClO_3$

(AIEEE 2006)

Ans. (d) : In hypochlorous acid, chlorine is in +1 state. So on disproportionation it gets oxidized and get reduced simultaneously to form HCl and $HClO_3$.

$$HOCl \rightarrow HCl + HClO_3$$

Chlorine in HCl is in –1 state that is it get reduced and in $HClO_3$ it has +5 oxidation state, hence it gets oxidised.

1447. The correct statement about ICl_5 and ICl_4^- is

(a) ICl_5 is square pyramidal and ICl_4^- is tetrahedral

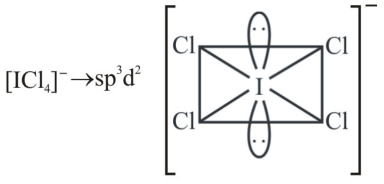
(b) ICl_5 is square pyramidal and ICl_4^- is square planar

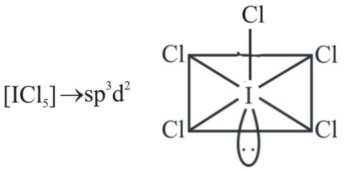
(c) Both are isostructural

(d) ICl_5 is trigonal bipyramidal and ICl_4^- is tetrahedral

(JEE Main 2019, 8 April Shift-II)

Ans. (b) : ICl_5 is square pyramidal and ICl_4^- is square planar.





@apna_pdf

1448. HF has highest boiling point among hydrogen halides, because it has
(a) lowest ionic character
(b) strongest van der Waals' interactions
(c) strongest hydrogen bonding
(d) lowest dissociation enthalpy
(JEE Main 2019, 10 April Shift-I)

Ans. (c) : HF has the highest boiling point among hydrogen halides because it has the strongest hydrogen bonding.
Fluorine being more electronegative will have partial negative charge and hydrogen being less electronegative will have partial positive charge.

1449. The chloride that cannot get hydrolysed is
(a) $SnCl_4$ (b) CCl_4
(c) $PbCl_4$ (d) $SiCl_4$
(JEE Main 2019, 11 Jan Shift-I)

Ans. (b) : CCl_4 cannot hydrolysed due to the absence of vacant orbital at carbon atom and cannot extend its covalency above four but in $SiCl_4$ silicon has vacant d-orbitals which can be used for hydrolysis. Hence CCl_4 cannot undergo hydrolysis.

1450. Iodine reacts with concentrated HNO_3 to yield Y along with other products. The oxidation state of iodine in Y, is
(a) 1 (b) 3
(c) 7 (d) 5
(JEE Main 2019, 12 Jan Shift-I)

Ans. (d) : The reaction of iodine with concentrated nitric acid is given by-

$$I_2 + 10HNO_3 \rightarrow 2HIO_3 + 10NO_2 + H_2O$$

The product Y, is HIO_3
The oxidation state of Y (HIO_3) is-
HIO_3
Let, x be the O.S of I.
$1 + x + (-6) = 0$
$1 + x - 6 = 0$
$x = 6 - 1$
$x = 5$

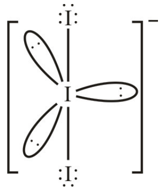
1451. Chlorine on reaction with hot and concentrated sodium hydroxide gives
(a) Cl^- and ClO^- (b) Cl^- and ClO_3^-
(c) ClO_3^- and ClO_2^- (d) Cl^- and ClO_2^-
(JEE Main 2019, 12 Jan Shift-II)

Ans. (b) : Chlorine on reaction with hot and concentrated sodium hydroxide gives Cl^- and ClO_3^-.

$$3Cl_2 + 6OH \rightarrow 5Cl^- + ClO_3^- + 3H_2O$$

1452. Total number of lone pair of electron in I_3^- ion is
(a) 3 (b) 6
(c) 9 (d) 12
(JEE Main 2018)

Ans. (c) : The hybridization of I_3^- is sp^3d. The lone pair of electron in central atom of I_3^- is 3. The structure of I_3^- is-



Hence, it contains the nine lone pairs.

1453. The products obtained when chlorine gas reacts with cold and dilute aqueous NaOH are
(a) ClO^- and ClO_3^- (b) ClO_2^- and ClO_3^-
(c) Cl^- and ClO^- (d) Cl^- and ClO_2^-
(JEE Main 2017)

Ans. (c) : The reaction between chlorine gas and aqueous sodium hydroxide gives chloride and Hypochlorite. Chlorine is a very good oxidiser. When chlorine gas reacts with cold and dilute aqueous NaOH, the chlorine undergoes disproportionation. This reaction produces both chloride and hypochlorite. The Chlorine gas is reduced to chloride and oxidised to hypochlorite at the same time. The reaction is-

$$Cl_2 + 2NaOH \rightarrow NaCl + NaOCl + H_2O$$

1454. Which among the following is the most reactive?
(a) Cl_2 (b) Br_2
(c) I_2 (d) ICl
(JEE Main 2015)

Ans. (d) : Cl_2, Br_2 and I_2 are homonuclear and are not polarised so these are less reactive. On the other hand, ICl is polarised due to the electronegativity difference between I and Cl and so it is the most reactive.

1455. Which one of the following correctly represents the order of stability of oxides, X_2O (X = halogen)?
(a) Br > Cl > I (b) Br > I > Cl
(c) Cl > I > Br (d) I > Cl > Br
JEE Main 13.09.2021 Shift-I

Ans. (d) : In oxides of halogen, the bond polarity however, increases as we move from F to I. The stability of oxides of iodine is greater than those of chlorine. Iodine oxygen bond is stable due to greater polarity of the bond while the stability of the chlorine oxygen bond is due to multiple bond formed involving d orbital's of the chlorine atom. The stability order of oxide is given as-
I > Cl > Br

1456. KI and $CuSO_4$ solutions on mixing produce
(a) $Cu_2I_2 + K_2SO_4$ (b) $Cu_2I_2 + I_2 + K_2SO_4$
(c) $CuI_2 + K_2SO_4$ (d) $CuI_2 + I_2 + K_2SO_4$
BCECE-2007

Ans. (b) : When KI and $CuSO_4$ solution are mixed then–

$$4KI(aq) + 2CuSO_4(aq) \rightarrow Cu_2I_2(s) + I_2(s) + 2K_2SO_4(aq)$$

@apna_pdf

1457. The correct order of decreasing acid strength among the following acids is

(a) HClO >HBrO >HIO
(b) HIO > HBrO > HClO
(c) HBrO >HClO >HIO
(d) HClO > HIO >HBrO

J & K CET-(2019)

Ans. (a) : Acid strength of oxocids of different halogens having same oxidation state decreases with the increase in atomic number i.e. HOCl > HOBr > HOI. As the electronegativity of the halogen decreases from Cl to I, the shared pair of electrons of the oxygen halogen bond moves closer and closer towards the oxygen atom. As a result, O – H bond breaks most readily in HOCl and least readily in HOI.

1458. The most powerful oxidising agent of the following is

(a) I_2 (b) F_2
(c) Br_2 (d) Cl_2

J & K CET-(2009)

Ans. (b) : Fluorine is most powerful oxidizing agent because it consist of $E^o = +2.5$ volt.

1459. The bond dissociation energy of Cl_2, Br_2 and I_2 follow the order

(a) $Cl_2 > I_2 > Br_2$ (b) $I_2 > Br_2 > Cl_2$
(c) $I_2 = Cl_2 = Br_2$ (d) $Cl_2 > Br_2 > I_2$

J & K CET-(2006)

Ans. (d) : As we move from top to bottom in halogen family the bond energy of the molecules decreases as the bond distance increases. As the bond distance increases it requires less energy to break the bond.

So, the order of bond energy of the molecules is $Cl_2 > Br_2 > I_2$

1460. The strongest reducing agent among the following is

(a) F^- (b) Cl^-
(c) Br^- (d) I^-

J & K CET-(2004)

Ans. (d) : A reducing agent is usually a metal or a negative ion.

Strongest reducing agent among the halide ions is I^-. Tendency to lose electrons and reducing power are directly related to each other. Large sized iodide ion has maximum tendency to lose electrons and has maximum reducing power.

1461. The correct order of increasing oxidising power is

(a) $F_2 < Cl_2 < I_2 > Br_2$ (b) $F_2 < Br_2 < Cl_2 < I_2$
(c) $Cl_2 < Br_2 < F_2 > I_2$ (d) $I_2 < Br_2 < Cl_2 < F_2$

J & K CET-(2003)

Ans. (d) : Metals are good reducing agents, while non-metals are good oxidizing agents. Further among halogens, metallic character increases as we move from top to bottom in a group. i.e. the oxidizing nature is

$I_2 < Br_2 < Cl_2 < F_2$

1462. The acidic strength of halogen acids increases from

(a) HI < HBr < HCl < HF
(b) HF < HCl < HBr < HI
(c) HF < HCl > HBr > HI
(d) HF < HCl < HBr < HI

J & K CET-(1997)

Ans. (d) : The acid strength of hydrogen halides follows the following order:

HF < HCl < HBr < HI

– Acid strength increases →

The stability of these halides decreases down the group due to decrease in bond dissociation (H – X) enthalpy.

1463. The oxidizing ability of halogens

(a) increases from fluorine to iodine
(b) decreases from fluorine to iodine
(c) increases from fluorine to chlorine and then decreases
(d) remains constant down the group

J & K CET-(1997)

Ans. (b) : In displacement reactions between halogens and halides, the halogen acts as an oxidizing agent. This means that the halogen oxidizes the halide ion to the halogen and gain electrons and is reduced to form the halide ion since, fluorine is the strongest oxidizing agent amongst halogen. Therefore, it will oxidize all other halide ions to the corresponding halogen in solution.

Therefore, the correct order of oxidizing power of halogen is $F_2 > Cl_2 > Br_2 > I_2$.

Hence, it is clear that the oxidizing ability of halogen decreases from fluorine to iodine.

1464. Which of the following is the correct order of increasing oxidizing character of oxoacids of chlorine?

(a) $HClO_3 < HClO_4 < HClO_2 < HClO$
(b) $HClO_4 < HClO_3 < HClO_2 < HClO$
(c) $HClO < HClO_4 < HClO_3 < HClO_2$
(d) $HClO < HClO_2 < HClO_3 < HClO_4$

J & K CET-(2013)

Ans. (b) : The oxoacids of chlorine are HClO, $HClO_2$, $HClO_3$, $HClO_4$.

The oxidizing power is depend upon the oxidation state of Cl. The oxidation state of oxoacids are given below–

$$\begin{array}{ccc} HClO_4 & HClO_3 & HClO_2 \\ +1+x+4(-2)=0 & 1+x+3(-2)=0 & 1+x+2(-2)=0 \\ x=+7 & x=+5 & x=+3 \end{array}$$

HClO

$+1+x-2 = 0$

$x = +1$

If the oxidation state decreases then the oxidizing power of oxoacids of chlorine is increases. Hence, the correct order of oxidizing power will be–

$HClO_4 < HClO_3 < HClO_2 < HOCl$

1465. Oxidation number of fluorine is – 1 in:

(a) F_2O (b) NF_3
(c) both (a) and (b) (d) none of these

JCECE - 2004

@apna_pdf

Ans. (b) : NF_3

$$(+3) + 3F = 0$$
$$3F = -3$$
$$F = \frac{-3}{3}$$
$$F = -1$$

Oxidation states of F in NF_3 is –1.

1466. Water is oxidized to oxygen by:

(a) ClO_2 (b) $KMnO_4$

(c) H_2O_2 (d) Fluorine

JCECE - 2005

Ans. (d) : H_2O cannot be oxidized by $KMnO_4$, H_2O_2, O_3 or ClO_2. Fluorine being a good oxidizing agent, oxidizes H_2O to O_2.

$$2\overset{0}{F_2}\ (g) + 2H_2O(l) \longrightarrow 4H\overset{-1}{F} + O_2(g)$$

Reduction

Therefore, water is oxidised to O_2 by F_2.

$$3F_2 + 3H_2O \rightarrow 6HF + O_3$$

1467. Freon used as refrigerant is

(a) $CF_2 = CF_2$ (b) CH_2F_2

(c) CCl_2F_2 (d) CF_4

JCECE - 2007

Ans. (c) : Freon is used as refrigerant(cooling agent) is $CCl_2 F_2$.

$$CCl_4 + 2HF \xrightarrow{Sb_2F_5} \underset{\text{(Freon)}}{CF_2Cl_2} + 2HCl$$

1468. In the conversion of Br_2 to BrO_3^-, the oxidation number of Br changes from

(a) zero to + 5 (b) + 1 to + 5

(c) zero to – 3 (d) + 2 to + 5

JCECE - 2009

Ans. (a) : Given that, $Br_2 \rightarrow BrO_3^-$

Bromine has zero oxidation state because it is in free state

In BrO_3^-, let the oxidation number of Br, be x

Therefore, $x + 3 \times (-2) = -1$

$x = -1 + 6 = +5$

$$\overset{0}{Br_2} \rightarrow \overset{+5}{Br}O_3^-$$

∴ In the conversion of Br_2 to BrO_3^- the oxidation state of Br changes from 0 to +5.

1469. Hydrolysis of NCl_3 gives NH_3 and X. Which of the following is X?

(a) $HClO_4$ (b) $HClO_3$

(c) HOCl (d) $HClO_2$

JCECE - 2009

Ans. (c) : Hydrolysis of NCl_3 gives NH_3 or NH_4OH and HClO as

$$NCl_3 + 4H_2O \rightarrow NH_4OH + 3HOCl$$

or $$NCl_3 + 3H_2O \rightarrow NH_3 + \underset{(x)}{3HOCl}$$

Hence, X is HOCl

1470. Which of the following forms acidic halides?

(a) HF (b) HCl

(c) HBr (d) HI

JCECE - 2013

Ans. (a) : $HF + F^- \longrightarrow HF_2^-$

It is an acidic halide.

1471. HBr and HI reduce H_2SO_4, HCl can reduce $KMnO_4$ and HF reduces

(a) H_2SO_4 (b) $KMnO_4$

(c) $K_2Cr_2O_7$ (d) None of these

JCECE - 2016

Ans. (d) : HBr and HI are the strongest reducing hydracids and therefore, they reduce H_2SO_4. Other than that HCl is stable and it is oxidized by strong oxidizing agent such as $KMnO_4$. In the smallest F^- ion, HF is not a reducing agent.

The electron which is reduced at the time of oxidation is nearest to the nucleus and the most difficult to removed. Hence, HF represents a poor reducing agent.

1472. Which one among the following is not correct as per indicated property?

(a) $Br_2 < Cl_2 < F_2$ (Oxidising power)

(b) $Br_2 < F_2 < Cl_2$ (Electron gain enthalpy)

(c) $Br_2 < Cl_2 < F_2$ (Electronegativity)

(d) $Br_2 < Cl_2 < F_2$ (Bond energy)

JCECE - 2016

Ans. (d) : Due to small size and high electron density, electron-electron repulsion between two F-atom, causes increase in bond-length and thus decrease in bond energy. Hence, correct order is $F_2 < Br_2 < Cl_2$.

1473. When Br_2 is treated with aqueous solutions of NaF, NaCl, NaI separately

(a) $F_2Cl_2$and I_2 are liberated

(b) Only F_2 and Cl_2 are liberated

(c) Only I_2 is liberated

(d) Only Cl_2 is liberated

JIPMER-2013

Ans. (c) : Within a group the element above can displace the element below in a redox reaction.

When bromine gas is passed through solutions of NaF, NaCl, NaI, bromine cannot displace fluorine and chlorine compound but it can displace iodine compound

$2NaI + Br_2 \rightarrow 2NaBr + I_2$

It is clear from the above reaction that iodine gas is released.

1474. Affinity for hydrogen decreases in the group from fluorine to iodine. Which of the halogen acids should have highest bond dissociation enthalpy?

(a) HF (b) HCl

(c) HBr (d) HI

JIPMER-2013

Ans. (a) : HF has the highest bond dissociation enthalpy due to the smallest bond length and presence of intermolecular hydrogen bonding.

1475. The most basic element is

(a) fluorine (b) iodine

(c) chlorine (d) bromine

JIPMER-2012

@apna_pdf

Ans. (b) : All the elements given belong to group 17th and in this group electronegativity decreases down the group. Lesser the electronegativity more is the basic nature. So iodine is the most basic among the given element.

1476. Which method is used to find halogen in organic compound?

(a) Duma's method (b) Leibig's method
(c) Kjeldahl method (d) Carius method

JIPMER-2019

Ans. (d) : The Carius halogen is a method used for the quantitative determination of halogen in chemical substance.

1477. Consider the reaction,
$H_2 + X_2 \longrightarrow 2HX$, where X is halogen. The reactivity of halogens decrease in the order of

(a) $Cl_2>F_2>Br_2>I_2$ (b) $I_2>Br_2>F_2>Cl_2$
(c) $F_2>Cl_2>Br_2>I_2$ (d) $I_2>Br_2>Cl_2>F_2$

JIPMER-2016

Ans. (c) : $H - H + X - X \rightarrow 2\,HX$, where X = halogen.
The hydrogen – halogen reactions get gradually less reactive towards the heavier halogens.
The correct decreasing order of reactivity of halogen molecule towards
H_2 is $F_2 > Cl_2 > Br_2 > I_2$

1478. The property which is not true about fluorine is

(a) most of its reactions are exothermic
(b) it forms only one oxo acid
(c) highest electronegative
(d) high F-F bond dissociation enthalpy

Karnataka-CET-2016

Ans. (d) : Due to the presence of 7 valence electrons in a very small volume of fluorine atom, its bond dissociation energy is low (that is why they repel each other strongly).

1479. Neon atom require energy to remove one electron from its outermost orbit, so also to add one electron into the outermost orbit.
Which of the following is correct about fluorine?

(I) Fluorine releases energy when an electron is removed.
(II) Fluorine requires energy to add one electron.

(a) (I) and (II) are correct
(b) (I) is correct, (II) is false
(c) (I) is false, (II) is correct
(d) (I) and (II) are false

Manipal-2020

Ans. (d) : (i) Fluorine required energy when on electron is removed, i.e. ionisation energy.
(ii) Fluorine release energy to add one electron, i.e. electron affinity ($-328 kJ mol^{-1}$)

1480. Ozone when reacts with potassium iodide solution liberates certain product, which turns starch paper blue. The liberated substance is :

(a) oxygen (b) iodine
(c) hydrogen iodide (d) potassium hydroxide

Manipal-2019

Ans. (b) : Ozone when reacts with potassium iodine solution liberates certain product which turns starch paper blue. Thus, the liberated substance is iodine.
Ozone react with KI solution to liberate I_2 gas.
$2KI + O_3 + H_2O \rightarrow 2KOH + I_2 + O_2$

1481. Least stable oxide of chlorine is–

(a) Cl_2O (b) ClO_2
(c) Cl_2O_7 (d) ClO_3

BCECE-2007

Ans. (a) : The stability of oxides increase with increase in the oxidation state of halogen oxidation states

$Cl_2O = +1$
$ClO_2 = +4$
$Cl_2O_7 = +7$
$Cl_2O_6 = +6$

Hence, Cl_2O is the least stable oxide of chlorine
$Cl_2O_7 > Cl_2O_6 > ClO_2 > Cl_2O$

1482. Which among the following does not form polyhalide ion?

(a) Chlorine (b) Bromine
(c) Iodine (d) Fluorine

MHT CET-02.05.2019, SHIFT-II

Ans. (d) : Univalent ions are formed when halide ions react with halogen molecules or interhalogen. F is the only alternative that does not generate a polyhalide ion because it lacks d-orbital's and hence cannot display a higher oxidation state.

1483. With which halogen the reactions of alkanes are explosive?

(a) Fluorine (b) Chlorine
(c) Bromine (d) Iodine

MHT CET-2018

Ans. (a) : Reaction of alkanes with fluorine are explosive. This is an explosive process which is difficult to control. Therefore, it carried out in dark. In this process replacement of one or more hydrogen of alkane by halogen takes place. For this reaction the order of reactivity of halogen is.
$I_2 < Br_2 < Cl_2 < F_2$

1484. What is the highest oxidation state exhibited by group 17 elements?

(a) +1 (b) +3
(c) +5 (d) +7

MHT CET-2016

Ans. (d) : The element of group 17 of the periodic table are known as halogens. Halogens are reactive nonmetals and include fluorine, chlorine, bromine, and iodine. The oxidation state of oxygen is usually -2 except in compounds with fluorine, oxygen has a positive oxidation number. All the elements of group 17 from compounds in odd oxidation states (-1,+1,+3, +5, +7) but down the group importance of the higher oxidation states generally decreases. group 17 elements only required one additional electron to form a full octet.

1485. Which halogen forms an oxyacid that contains the halogen atom in tripositive oxidation state?

(a) Fluorine (b) Chlorine
(c) Bromine (d) Iodine

MHT CET-2015

@apna_pdf

Ans. (b) : Chlorine halogen forms an oxyacid that contains the halogen atom in tripositive oxidation state, the oxyacid is $HClO_2$. In $HClO_2$ the oxidation number of Chlorine is +3.

1486. Which among the following gases can be liquified easily?

(a) Chlorine (b) Nitrogen

(c) Oxygen (d) Hydrogen

MHT CET-2014

Ans. (a) : When the temperature of a gas falls below the critical point, it can be liquefied by cooling or compressing it.

Gases which have high critical temperatures (such as Cl_2, NH_3, CO_3, SO_2 etc) can be liquified by applying a suitable pressure alone. Permanent gases (such as H_2, N_2, O_2 etc) cannot be liquefied by the action of pressures and cooling.

1487. When Cl_2 gas reacts with hot and concentrated sodium hydroxide solution, the oxidation number of chlorine changes from

(a) zero to + 1 and zero to – 5

(b) zero to – 1 and zero to +5

(c) zero to – 1 and zero to +3

(d) zero to +1 and zero to –3

(NEET-2012)

Ans. (b) : The reaction of chlorine gas with hot and concentrated sodium hydroxide solution is

$$3Cl_2 + 6\,NaOH \rightarrow NaClO_3 + 5NaCl + 3H_2O$$

So, in this process the oxidation number of chlorine changes from zero to –1 and zero to +5.

1488. Which of the following is used in the preparation of chlorine?

(a) Both MnO_2 and $KMnO_4$

(b) Only $KMnO_4$

(c) Only MnO_2

(d) Either MnO_2 or $KMnO_4$

BITSAT-2009, (NEET-1999)

Ans. (a) : Chlorine can be prepared by heating concentrated hydrochloric acid with an oxidizing agent such manganese dioxide, potassium permanganate, etc.

$MnO_2 + 4HCl \rightarrow MnCl_2 + 2H_2O + Cl_2$

$2KMnO_4 + 16HCl \rightarrow 2KCl + 2MnCl_2 + 8H_2O + 5Cl_2$

1489. Which of the following elements is extracted commercially by the electrolysis of an aqueous solution of its compound?

(a) CI (b) Br

(c) Al (d) Na

(NEET-1993)

Ans. (a) : Generally alkali metals and alkali earth metals elements extracted by the fused electrolysis method. Chlorine gas is obtained by the electrolysis of an aqueous solution of NaCl.

$$NaCl(aq) \xrightarrow{\text{Electrolysis}} NaOH + H_2 + Cl_2$$

1490. When chlorine is passed over dry slaked lime at room temperature, the main reaction product is

(a) Ca $(ClO_2)_2$ (b) $CaCl_2$

(c) $CaOCl_2$ (d) Ca(OCI)

(NEET-1992)

Ans. (c) : When chlorine is passed over dry slaked lime at room temperature, the main product is $CaOCl_2$ (bleaching powder). The reaction is as follows :

$$\underset{\text{slaked lime}}{Ca(OH)_2} + \underset{\text{Chlorine}}{Cl_2} \longrightarrow \underset{\substack{\text{Bleaching powder}\\ \text{Calciumoxychloride}}}{CaOCl_2} + \underset{\text{Water}}{H_2O}$$

1491. In the manufacture of bromine from sea water, the mother liquor containing bromides is treated with

(a) carbon dioxide (b) chlorine

(c) iodine (d) sulphur dioxide

(NEET-1992)

Ans. (b) : Chlorine bromide in the mother liquor (containing $MgBr_2$ is oxidised to Br_2 by passing Cl_2 which is a stronger oxidising agent.

$MgBr_2 + Cl_2 \rightarrow MgCl_2 + Br_2$

1492. The bleaching action of chlorine is due to

(a) reduction (b) hydrogenation

(c) chlorination (d) oxidation

(NEET-1991)

Ans. (d) : Bleaching action of chlorine is due to oxidation in the presence of moisture.

$Cl_2 + H_2O \rightarrow 2HCl + O$

1493. Among the following the correct order of acidity is

(a) $HClO_2 < HClO < HClO_3 < HClO_4$

(b) $HClO_4 < HClO_2 < HClO < HClO_3$

(c) $HClO_3 < HClO_4 < HClO_2 < HClO$

(d) $HClO < HClO_2 < HClO_3 < HClO_4$

(NEET-I 2016, 2007, 2005)

Ans. (d) : $HClO < HClO_2 < HClO_3 < HClO_4$

The acidic character of the oxoacids increases with increase in oxidation number of the halogen atom i.e. $HClO < HClO_2 < HClO_3 < HClO_4$. They can be explained on the basis of relative stability of the anions left after removal of a proton stability of the anions left after removal of a proton.

The stability of the anion decreases in the order : $ClO_4^- > ClO_3^- > ClO_2^- > ClO^-$

acid strength also decrease in the some order.

1494. The variation of the boiling points of the hydrogen halides is the order HF > HI > HBr > HCI

What explains the higher boiling point of hydrogen fluoride?

(a) There is strong hydrogen bonding between HF molecules

(b) The bond energy of HF molecules is greater than in other hydrogen halides

(c) The effect of nuclear shielding is much reduced in fluorine which polarizes the HF molecule.

(d) The electronegativity of fluorine is much higher than for other elements in the groups

(NEET-2015)

Ans. (a) : The higher boiling point of hydrogen fluoride is due to the presence of strong hydrogen bonding between HF molecules which leads to the association of HF molecules and requires higher energy for boiling.

Hence, HF > HCl > HBr > HI.

@apna_pdf

1495. Among the following which is the strongest oxidizing agent?

(a) Br_2 (b) I_2

(c) Cl_2 (d) F_2

(NEET-2009)

Ans. (d) : An element having higher tendency to get reduced or to accept an electron is a strong oxidizing agent.

Fluorine is the most electronegative element because electronegativity decreases on moving down the group. hence, it gets reduced readily into F^- ion and is a strongest oxidizing agent.

1496. Which statement is wrong?

(a) Bond energy of $F_2 > Cl_2$

(b) Electronegativity of F > Cl

(c) F is more oxidizing than Cl

(d) Electron affinity of Cl > F

(NEET-2000)

Ans. (a) : Actually, bond energy of $Cl_2 > F_2$. As fluorine is small in size and in fluorine 2p sub shell is compact and close no. of electrons are held in a compact volume and there is a strong repulsion amongst non-bonding electrons.

Hence, bond becomes weak though the bond is short.

Due to this reason bond energy of fluorine is less than other halogens.

1497. Which of the following has the greatest electron affinity?

(a) I (b) Br

(c) F (d) Cl

(NEET-1996)

Ans. (d) : The atomic number of Cl is 17, which can be written as (2, 8, 7). Thus, there are 7 electrons in the outermost shell. Every element wants to go to their nearest inert gas Argon's structure by accepting one more electron in its outermost shell, that is why it is get converted into its electronic configuration (2, 8, 8). It is very easy for chlorine too, as it has to and is very easy for chlorine too, as it has to accept only one electron. Therefore, Cl has the greatest affinity for electrons.

1498. Which of the following displaces Br_2 from an aqueous solution containing bromide ions?

(a) I_2 (b) I_3^-

(c) Cl_2 (d) Cl^-

(NEET-1994)

Ans. (c) : Since chlorine is more electronegative than bromine, therefore it will displace bromine from an aqueous solution containing bromide ions.

$$Cl_2 + 2Br^- \longrightarrow 2Cl^- + Br_2$$

1499. Statement I : Acid strength increases in the order given an HF << HCI << HBr << HI.

Statement II : As the size of the element F, CI, Br, I increase down the group, the bond strength of HF, HCI, HBr and HI decreases and so the acid strength increases.

In the light of the above statements, choose the correct answer from the options given below.

(a) Statement I is incorrect but statement II is true

(b) Both statement I and statement II are true

(c) Both statement I and statement II are false

(d) Statement I is correct but statement II is a false

(NEET 2021)

Ans. (c) : Down the group acidic strength increases as bond length increases and bond strength decreases due to which case of release of H^+ increases Acidic strength increases.

1500. Elements of which of the following groups will form anions most readily?

(a) Oxygen family (b) Nitrogen family

(c) Halogen (d) Alkali metals

NEET-1992

Ans. (c) : Halogens have maximum electron gain enthalpy due to the fact that the atoms of these elements have only one electron less than the stable noble gas (ns^2np^6) configuration. Therefore they have maximum tendency to accept the electron to form negative ion (anion).

1501. Iodine value is related to

(a) fats and oils (b) alcohols

(c) ethers (d) esters

UP CPMT-2011

Ans. (a) : Iodine value is the number of gram of iodine required to saturate 100 g oil or fat. In other words, the degree of unsaturation of an oil or fat is expressed in terms of iodine number.

1502. To make a painting glass, we use

(a) fluorine (b) chlorine

(c) bromine (d) hydrogen chloride

UP CPMT-2010

Ans. (a): Fluorine attacks on glass but very slowly. Thus, it is used to make painting over glass.

- Etching is a process used for making designs on plates or any other object. To make the artwork corrosive action of an acid is required.

1503. When I_2 is passed through KCl, KF and KBr solutions,

(a) Cl_2 and Br_2 are evolved

(b) Cl_2 is evolved

(c) Cl_2, Br_2 and F_2 are evolved

(d) None of the above

UP CPMT-2004

Ans. (d) : More electronegative halogen displaces less electronegative halogen from its salt solution.

$\because$ I_2 is least electronegative.

$\therefore$ It cannot liberate F_2, Cl_2, Br_2 from KF, KCl and KBr solutions.

1504. Which of the following elements never show positive oxidation number?

(a) O (b) Fe

(c) Ga (d) F

UP CPMT-2004

@apna_pdf

Ans. (d) : The most electronegative element will never show positive oxidation state.

∴ Fluorine is most electronegative element of periodic table.

∴ It never shows positive oxidation state.

1505. Which of the following is anhydride of perchloric acid?

(a) Cl_2O_7 (b) Cl_2O_5

(c) Cl_2O_3 (d) HClO

UP CPMT-2004

Ans. (a) : Oxy acids form anhydride by giving out water molecule.

$$\underset{\text{Perchloric acid}}{2HClO_4} \xrightarrow{\Delta} \underset{\text{Chlorine heptachloride}}{Cl_2O_7} + H_2O$$

1506. Chloroform, when kept open is oxidized to

(a) CO_2 (b) $COCl_2$

(c) CO_2, Cl_2 (d) None of these

UP CPMT-2004

Ans. (b) : On exposure to oxygen and light, Chloroform is slowly oxidized to phosgene (carbonyl chloride)

$$CHCl_3 + O_2 \longrightarrow \underset{\substack{\text{Phosgene}\\ \text{(carbonyl chloride)}}}{COCl_2} + HCl$$

1507. Fluorine reacts with water to produce

(a) $HF + O_2 + O_3$ (b) $HF + O_2$

(c) $HF + OF_2$ (d) $HF + O_3$

UP CPMT-2001

Ans. (a) : $2F_2 + 2H_2O \longrightarrow 4HF + O_2$

$3F_2 + 3H_2O \longrightarrow 6HF + O_3$

∴ The products of reaction between fluorine and water are HF, O_2 and O_3.

1508. The total number electrons present in all the p-orbitals of bromine is

(a) 5 (b) 15

(c) 17 (d) 35

UP CPMT-2001

Ans. (c) : On writing the electronic configuration of bromine according to atomic orbital theory, we can find the total number of p electrons in bromine.

Atomic number of bromine is 35

∴ $Br = 1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 4s^2, 3d^{10}, 4p^5$

∴ Total number of p-electrons in bromine is 17.

1509. Which among the following factors is the most important in making fluorine the strongest oxidizing agent?

(a) Electron affinity

(b) Ionization enthalpy

(c) Hydration enthalpy

(d) Bond dissociation energy

UPTU/UPSEE-2007

Ans. (c) : Fluorine is the strongest oxidizing agent due to low heat of dissociation and high heat of hydration. It compensate the lower value of electron affinity.

1510. Fluorine exhibits an oxidation state of only-1 because:

(a) It can readily accept an electron

(b) It is very strongly electronegative

(c) It is a non-metal

(d) It belongs to halogen family

UPTU/UPSEE-2006

Ans. (b) : Flourine is the most electronegative atom so it accepts electrons very easily and shows only -1 oxidation state.

Flourine cannot exhibit any positive oxidation state as it does not have d orbitals in its valence shell.

1511. Iodine is a:

(a) electrovalent solid (b) atomic solid

(c) molecular solid (d) covalent solid

UPTU/UPSEE-2005

Ans. (c) : I_2 is a molecular solid. Each Iodine molecule is made up of 2 iodine atoms held together by a strong covalent bond. Each iodine molecule is held to another by weak Vander Waals forces.

1512. The only non-metal which is Liquid at ordinary temperature is:

(a) Hg (b) Br_2

(c) NH_3 (d) None of these

UPTU/UPSEE-2005

Ans. (b) : Bromine (Br, element 35) also found as a diatomic (Br_2) is a liquid at room temperature.

Solidifying at $-7.2°C$.

- NH_3 is used chiefly for refrigerator, and in manufacturing of chemicals.

1513. Oxidation number of chlorine atom in Ca(OCl)Cl is

(a) –1 (b) +1, –1

(c) 0 (d) –1, 0

UPTU/UPSEE-2013

Ans. (b) : Bleaching Powder $(CaOCl_2)$ has two types of chlorine atoms with oxidation number of $+1 \& -1$.

One cl^- ion is in -1 oxidation state.

Other OCl^- ion has a +1 oxidation state.

1514. Which one of the following statements regarding helium is incorrect?

(a) It is used to fill gas balloons instead of hydrogen because it is lighter and non-inflammable

(b) It is used as a cryogenic agent for carrying out experiments at low temperatures

(c) It is used to produce and sustain powerful superconducting magnets

(d) It is used in gas cooled nuclear reactors

UPTU/UPSEE-2012

BCECE-2010

Ans. (c) : Helium is not lighter than hydrogen. Helium is twice as heavy as hydrogen. Its lifting power is 92% of that of hydrogen. Helium has the lowest melting and boiling point of any element which makes liquid helium an ideal coolant for many extremely low temperature application such as superconducting magnet and cryogenic research where temperature close to absolute zero is needed.

@apna_pdf

1515. Transport number of Cl^- is least in

(a) HC*l* (b) NaC*l*

(c) KC*l* (d) CaC*l*

UPTU/UPSEE-2012

Ans. (a) : Transport no (T) = $\frac{\text{Current carried by ion}}{\text{total current}}$

Transport number = Speed of ion

$$T_{Cl}^-(HCl) = \frac{V_{Cl^-}}{V_{Cl^-} + V_{H^+}}$$

$$T_{Cl}^-(NaCl) = \frac{V_{Cl^-}}{V_{Cl^-} + V_{Na^+}}$$

$$T_{Cl}^-(KCl) = \frac{V_{Cl^-}}{V_{Cl^-} + V_{K^+}}$$

$$T_{Cl}^-(CaCl) = \frac{V_{Cl^-}}{V_{Cl^-} + V_{Ca^+}}$$

1516. Which one of the following will dissolve in water most readily?

(a) I_2 (b) $BaCo_3$

(c) KF (d) PbI_2

UPTU/UPSEE-2008

Ans. (c) : All the alkali halides except lithium fluoride are freely soluble in water, I_2 (non-poler) is least soluble in water. Group IIA carbonate ($BaCO_3$) are insoluble in water. PbI_2 is sparingly soluble in cold water but quite soluble in hot water. KF is most readily soluble in water.

1517. The correct order of acidity of the following hydra acids is

(a) HF > HCl > HBr > HI

(b) HF < HCl < HBr < HI

(c) HF < HCl > HBr > HI

(d) HF > HCl < HBr > HI

WB-JEE-30.04.2022

Ans. (b) : HI is most acidic due to weak bonding between H and I. It breaks into H^+ and I^+. HF is weakest acid because of extensive hydrogen bonding. It does not release H^+ ion.

1518. The boiling points of HF, HCI, HBr and HI follow the order

(a) HF > HCI > HBr > HI

(b) HF > HI > HBr > HCI

(c) HI > HBr > HCI > H

(d) HCI > HF > HBr > HI

WB-JEE-2016

Ans. (b) : Boiling point depends upon the hydrogen bonding present between the molecules.

- HF has strong hydrogen bonding and has the highest boiling point.

1519. At room temperature, the reaction between water and fluorine produces

(a) HF and H_2O_2 (b) HF,O_2 and F_2O_2

(c) F^-,O_2 and H^+ (d) HOF and HF

WB-JEE-2018

Ans. (c) : At room temperature, the reaction between water and fluorine produces F^-, O_2 and H^+.

$$F_2 + H_2O \xrightarrow{\text{room temperature}} HF + O_2$$

1520. Cl_2O_7 is the anhydride of

(a) HOCl (b) $HClO_2$

(c) $HClO_3$ (d) $HClO_4$

WB-JEE-2018

Ans. (d) : Cl_2O_7 is the anhydride of $HClO_4$

$$Cl_2O_7 + H_2O \longrightarrow 2HClO_4$$

1521. The reactive species in chlorine bleach is

(a) Cl_2O (b) OCl^-

(c) ClO_2 (d) HCl

WB-JEE-2019

Ans. (b) : OCl^- is used as a bleaching agent

$$OCl^- \rightarrow [O] + Cl^-$$

1522. The electronic configuration of four elements are given below. Which elements does not belong to the same family as others?

(a) $[Xe]4f^{14}5d^{10}4s^2$ (b) $[Kr]4d^{10}5s^2$

(c) $[Ne]3s^2,3p^5$ (d) $[Ar]3d^{10}4s^2$

NEET-1989

Ans. (c) : The electronic configuration of $[Ne]3s^2, 3p^5$ not belong to the same family. Since each one of them have 2 electrons in the outermost shell in contrast element has 7 electrons in the valence shell.

1523. Dipole moment value of the halogen acids follows which trend actually?

(a) HF > HCl > HBr > HI

(b) HI > HBr > HF > HF

(c) HI > HF > HCl > HBr

(d) HI > HCl > HF > HBr

Tripura JEE-2021

Ans. (a) : The increasing order of dipole moment of bond in halogen acids is HF > HCl > HBr > HI

Fluorine is the most electronegative atom.

The electronegativity order is F > Cl > Br > I.

1524. Which of these statement in incorrect?

(a) Alkali metals are good reductants

(b) Halogens are good reducing agents

(c) Chlorine has the maximum electron affinity

(d) Fluorine is the most electronegative element

UP CPMT-2014

Ans. (b) : Halogens are good oxidizing agents, not the reducing agents.

1525. Which one of the following liberate bromine when reacted with KBr?

(a) Iodine (b) Chlorine

(c) Sulphur (d) Carbon

UP CPMT-2012

Ans. (b) : $2KBr+Cl_2 \rightarrow 2KCl+Br_2$

A halogen can oxidize halide ions of higher atomic number. Furthermore, the oxidizing ability of halogens in aqueous solution decreases down the group with increase in atomic number.

@apna_pdf

1526. CS_2 layer gives a test for

(a) Cl^- (b) Br^- and I^-

(c) Br^- only (d) I^- only

UP CPMT-2011

Ans. (b) : CS_2 layer dissolves Br_2 and I_2 which are obtained by oxidation of Br^- and I^- by Cl_2 water.

9. Noble gases

1527. Which noble gas has least tendency to form compounds ?

(a) Ar (b) Kr

(c) He (d) Ne

Karnataka CET-17.06.2022, Shift-II

Ans. (c) : Helium (He) due to highest Ionization potential, electrons are more highly held with nucleus.

1528. Identify the element having zero valency

(a) Sulphur (b) Phosphorous

(c) Lead (d) Radon

NDA (II)-2016

Ans. (d) : Radon is having zero valency because Rn is an inert gas and inert gas has completely filled outer most shell.

1529. Match List I with List II and select the correct answer using the code given below the Lists

	List I (Noble gas)		List II (Use)
A.	Argon	1.	In lights for advertising display
B.	Neon	2.	Airport landing lights and in light houses
C.	Krypton	3.	Light in Photographer's flash gun
D.	Xenon	4.	In tungsten filament to last longer

Code:

	A	B	C	D
(a)	3	1	2	4
(b)	3	2	1	4
(c)	4	2	1	3
(d)	4	1	2	3

NDA (I)-2017

Ans. (d) :

List I (Noble gas)	List II (Use)
A. Argon	In tungsten filament to last longer.
B. Neon	In lights for advertising display
C. Krypton	Airport landing lights and in light houses.
D. Xenon	Light in Photographer's flash guns

1530. Radon is

(a) an inert gas (b) an artificial fibre

(c) an explosive (d) a metal

NDA (I)-2017

Ans : (a) Radon is an inert gas. It is a naturally-occurring radioactive gas that can cause lung cancer. Radon is naturally in the atmosphere in trace amounts.

1531. The property of halogens which is not correctly matched is

(a) I > Br > Cl > F (density)

(b) F > Cl > Br > I (electron gain enthalpy)

(c) F > Cl > Br > I (ionization enthalpy)

(d) F > Cl > Br > I (electronegativity)

Karnataka CET-17.06.2022, Shift-II

Ans. (b) : The electron gain enthalpy of Cl is maximum.

So, the trend is : Cl>F>Br>I.

1532. Polar stratospheric clouds facilitate the formation of:

(a) $ClONO_2$ (b) HOCl

(c) ClO (d) CH_4

JEE Main-26.06.2022, Shift-I

Ans. (b) : In summer season Nitrogen dioxide and methane react with chlorine monoxide and chlorine atom forming, chlorine sinks, preventing much ozone depletion, where as in winter season, special type of clouds are formed over antalica, these polar stratospheric cloud provide surface on which chlorine nitrate formed gels hydrated to form hypochloro acid.

$$ClO(g)+NO_2(g)\longrightarrow ClONO_2(g)$$

$$ClONO_2(g)+H_2O(g)\longrightarrow HOCl(g)+HNO_3(g)$$

Both reaction takes place in stratosphere.

1533. Given below are two statements: one is labelled as Assertion A and the other is labelled as Reason R.

Assertion A: Fluorine forms one oxoacid.

Reason R: Fluorine has smallest size amongst all halogens and is highly electronegative. In the light of the above statements, choose the most appropriate answer from the option given below.

(a) Both A and R are correct and R is the correct explanation of A.

(b) Both A and R are correct but R is NOT the correct explanation of A.

(c) A is correct but R is correct

(d) A is not correct but R is not correct.

JEE Main-27.06.2022, Shift-II

Ans. (a) : Fluorine forms only one oxoacid because of smaller size & high electronegativity.

Both the assertion and reason are correct and Reason is the correct explanation.

1534. HIO_3 On heating at 170°C give:

(a) I_2 (b) I_2O_5

(c) I_2O_4 (d) HIO_4

CG PET-22.05.2022

Ans. (b) : 2 moles of HIO_3 on heating at 170°C, we get

$$2HIO_3\xrightarrow{\Delta}I_2O_5+H_2O$$

1535. Which one of the following will NOT produce carbon dioxide on reacting with an aqueous solution of hydro-chloric acid ?

@apna_pdf

(a) Limestone (b) Quick Lime
(c) Chalk (d) Marble

NDA (I)-2019

Ans : (b) Quick lime on reaction with HCl does not produce carbon dioxide.

$$\underset{\text{Quick lime}}{CaO} + 2HCl \rightarrow CaCl_2 + H_2O$$

1536. Which one of the following is not a monoatomic element ?
(a) Copper (b) Helium
(c) Iodine (d) Barium

NDA (II)-2019

Ans : (c) Iodine is not a monoatomic element. It exist in the form of diatomic, I_2. Except Iodine, all the given elements exist in monoatomic.

1537. Which one of the following reactions of xenon compounds is not feasible?
(a) $3XeF_4 + 6H_2O \rightarrow 2Xe + XeO_3 + 12HF + 1.5O_2$
(b) $2XeF_2 + 2H_2O \rightarrow 2Xe + 4HF + O_2$
(c) $XeF_6 + RbF \rightarrow Rb[XeF_7]$
(d) $XeO_3 + 6HF \rightarrow XeF_6 + 3H_2O$

VITEEE-2016

Ans. (d) : Xenon fluorides easily hydrolysed to give xenon oxides. Reverse form of this reaction is impossible because xenon fluorides will again reverse the reaction to give xenon oxides.
Therefore, $XeO_3 + 6HF \rightarrow XeF_6 + 3H_2O$ is not feasible.

1538. Which of the following can form compounds with xenon?
(a) I_2 (b) F_2
(c) Br_2 (d) Al

AP-EAMCET (Med.)-1999

Ans. (b) : Fluorine is the electronegative element which can only form compound with xenon are –XeF_2, XeF_4 and XeF_6.

1539. The rare gas which is more abundant in atmosphere is
(a) Ne (b) Rn
(c) Xe (d) Ar

AP EAMCET- 1993

Ans. (d) : Argon is the most abundant rare earth (noble) gas in atomosphere. The percentage of argon is 0.934% and that of neon and helium is 0.0018% and 0.00052% respectively.

1540. At what temperature will the total kinetic energy of 0.30 moles of He be same as the total kinetic energy of 0.40 moles of Ar at 400 K?
(a) 400 K (b) 300 K
(c) 273 K (d) 533 K

AP-EAMCET 25-08-2021 Shift - I

Ans. (d) : Given,

K.E. of He = K.E. of Ar

n_{He} = 0.30 mole, T_{He} = ?K

n_{Ar} = 0.40 mole, T_{Ar} = 400K

Now, $\text{K.E.} = \dfrac{3nRT}{2}$

$$\therefore \frac{\text{K.E. of He}}{\text{K.E. of Ar}} = \frac{n_{He} \times T_{He}}{n_{Ar} \times T_{Ar}}$$

$$\frac{1}{1} = \frac{0.30 \times T_{He}}{0.40 \times 400}$$

$$T_{He} = \frac{0.40 \times 400}{0.30}$$

$$T_{He} = 533K$$

1541. Xenon reacts with fluorine at 873 K and 7 bar to form XeF_4. In this reaction, the ratio of xenon and fluorine required is
(a) 1 : 5 (b) 10 : 1
(c) 1 : 3 (d) 5 : 1

TS-EAMCET-2016

Ans. (a) : XeF_4 is obtained by heating a mixture of xenon and fluorine in the ratio of 1:5 at 873 K and 7 bar pressure.

$$\underset{1}{Xe} + \underset{5}{2F_2} \xrightarrow[7\,bar]{873K} XeF_4$$

1542. Match the following –

List-I (Element)	**List-II (Property)**
(A) He	(I) can be used as inert atmosphere
(B) Ar	(II) Radioactive element
(C) Xe	(III) Form fluoride compounds
(D) Rn	(IV) can be used as airship balloons

The correct match is
(a) A-IV, B-III, C-II, D-I
(b) A-IV, B-I, C-III, D-II
(c) A-I, B-II, C-III, D-IV
(d) A-II, B-I, C-IV, D-III

TS-EAMCET (Engg.), 07.08.2021 Shift-II

Ans. (b) :
He → can be used as airship balloons
Ar → Can be used as inert atmosphere
Xe → Form fluoride compounds
Rn → Radioactive element

1543. The formation of oxide ion O^{2-} from oxygen atom requires and exothermic step as shown below. The process of formation of O^{2-} in gas phase in unfavorable (is ΔH^{θ} = +ve), even thought it has stable configuration of the nearest noble gas, Neon. This is because ——

$$O(g) + e^- \rightarrow O^-(g);\ \Delta H^{\theta} = -141\ kJmol^{-1}$$

$$O^-(g) + e^- \rightarrow O^{2-}(g);\ \Delta H^{\theta} = +760\ kJmol^{-1}$$

(a) O^{2-} has larger size than that of Neon
(b) Oxygen is more electronegative than Neon
(c) O^- has larger size than oxygen atom
(d) Electron repulsion in oxide ion is more which over comes the stability achieved by noble.

AP EAPCET 25.08.2021, Shift-II

@apna_pdf

Ans. (d) : The formation of oxide ion O^{2-} from oxygen atom requires an exothermic reaction followed by an endothermic step as –

$$O(g)+e^- \rightarrow O^-(g);\ \Delta H^0=-141\ kJmol^{-1}$$

$$O^-(g)+e^- \rightarrow O^{2-}(g);\ \Delta H^0=+760\ kJmol^{-1}$$

Electron repulsion in oxide ion is more which overcomes the stability achieved by gas configuration.

1544. Assertion (A) : The boiling points of noble gases increases from He to Xe.

Reason (R) : The interatomic van der Waals' attractive forces increases from He to Xe.

The correct answer is

(a) Both (A) and (R) are true, and (R) is the correct explanation of (A)
(b) Both (A) and (R) are true, and (R) is not the correct explanation of (A)
(c) (A) is true but (R) is not true
(d) (A) is not true but (R) is true

AP EAMCET (Engg.) - 2012

Ans. (a) : : The boiling points of noble gases increases from He to Xe because the interatomic van der Waals' attractive forces increases from He to Xe.

1545. The inert gases producing maximum number of compounds are

(a) He and Ne (b) Ar and Ne
(c) Kr and Ne (d) Ar and Xe

MPPET-2008

Ans. (d) : Ar and Xe are inert gases producing maximum number of compounds because of their low ionization energy. Compounds of Xe are XeF_2, $XeOF_2$, XeF_4, $XeOF_4$, XeF_6, XeO_3 etc.

1546. Helium is used in diving apparatus because

(a) It is lighter than nitrogen
(b) It is completely miscible with oxygen
(c) It is insoluble in blood at high pressure
(d) None of the above

SCRA - 2009

Ans. (c) : Helium is used as a diluent for oxygen in modern diving apparatus because of its very low solubility in blood. It reduces decompression and causes less discomfort to the diver in breathing.

1547. Find the product of the following reaction, when Xe is taken in excess,

$$Xe(g) + F_2(g) \rightarrow ?$$

(a) XeF_4 (b) XeF_2
(c) XeF_6 (d) XeF_7

AP EAMCET (Engg.) 21.09.2020, Shift-II

Ans. (b) : When excess of xenon gas react with fluorine gas at high temperature (673 K) and 1 bar pressure xenon difluoride (XeF_2) is formed.

$$Xe(excess)+F_2 \xrightarrow{673K,1bar} XeF_2$$

1548. When helium gas is allowed to expand into vacuum, heating effect is observed. The reason for this is (assume He as a non ideal gas)

(a) He is an inert gas
(b) The inversion temperature of helium is very high
(c) The inversion temperature of helium is very low
(d) He has the lowest boiling point

TS EAMCET-2017

Ans. (c) : Gases which have low inversion temperature gets heated when allowed to expand in vacuum.

- The inversion temperature of helium is very low.

1549. Two compounds X and Y can react with XeF_6 to form cationic and anionic species respectively X and Y can be ________

(a) RbF, PtF_5 (b) BF_3, PtF_5
(c) CsF, SbF_5 (d) BF_3, NaF

AP EAPCET-6 Sep. 2021, Shift-II

Ans. (d): BF_3 reacts with XeF_6 to produce Xenon pentafluoride tetra fluoro borate (III)

$$BF_3+XeF_6 \rightarrow XeF_5^+[BF_4]^-$$

- Reaction of sodium fluoride (NaF) with XeF_6 gives $Na^+[XeF_7]^-$

$$\boxed{XeF_6+NaF \rightarrow Na^+[XeF_7]^-}$$

1550. Which one of the following noble gases is used in miner's cap lamps?

(a) Helium (b) Neon
(c) Argon (d) Krypton

AP EAMCET (Engg.) -2007

Ans. (d) : Krypton is the inert gas which is used in miner's cap lamps, because its light does not produce glare.

1551. Xenon best reacts with_________

(a) Neutral atoms
(b) Most electronegative elements
(c) Most electropositive elements
(d) Transition elements

AP EAPCET 20.08.2021 Shift-II

Ans. (b): Xenon is noble gas. Xenon reacts with most electronegative elements since it has very little tendency to lose electrons.

1552. Assertion (A) The boiling points of noble gases increases from He to Xe.

Reason (R) The interatomic van der Waals' attractive forces increases from He to Xe.

The correct answer is

(a) Both (A) and (R) are true, and (R) is the correct explanation of (A)
(b) Both (A) and (R) are true, and (R) is not the correct explanation of (A)
(c) (A) is true but (R) is not true
(d) (A) is not true but (R) is true

AP EAMCET (Engg.) 2012

Ans. (a) : As the size of noble gases increases from He to Xe, Van der Waal's forces increases and due to which boiling point increases. When looking at the noble gases, the boiling point is predicted to increase in downward, in the order He, Ne, Ar, Kr, Xe, Rn.

1553. Which of the following noble gases has the highest van der Waal's forces of attraction?

(a) Ar (b) Ne
(c) Xe (d) He

COMEDK-2012

@apna_pdf

Ans. (c) : As we know, from He to Xe the size of atom increases, the vander waals forces of attraction also increases.

1554. Identify the incorrect statement, regarding the molecule XeO_4.

(a) XeO_4 molecule is square planar.

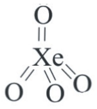
(b) There are four $p\pi - d\pi$ bonds.

(c) There are four $sp^3 - p, \sigma$ bonds.

(d) XeO_4 molecule is tetrahedral.

KARNATAKA NEET 2013

Ans. (a) : The Structure of XeO_4 are given as :



(sp^3–tetrahedral)

The molecule contains the four sp^3-p and σ bonds. The dπ-pπ bonds are also present in XeO_4.

1555. Which of the following inert gas compounds is not formed?

(a) $XeOF_4$ (b) XeO_3

(c) XeF_2 (d) NeF_2

COMEDK 2014

Ans. (d) : The expansion of octal of Ne atom, all the valence electron are closer to the nucleus and suffer the more electrostatic attraction due to which the removing of electron to higher energy state consumed the more amount of energy which cannot be compensated by the formation of the Ne-F bond.

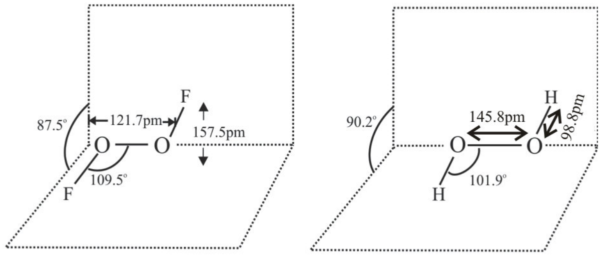
1556. Shape of O_2F_2 is similar to that of

(a) C_2F_2 (b) H_2O_2

(c) H_2F_2 (d) C_2H_2

COMEDK 2018

Ans. (b) : The structure of H_2O_2 is similar to the structure of O_2F_2 both have half open book shape.



1557. The noble gas used in atomic reactors is

(a) Krypton (b) Oxygen

(c) Neon (d) Helium

AP-EAMCET (Medical), 2003

Ans. (d) : • Helium gas used in atomic reactors because helium provides highly efficient form of nuclear power with virtually no waste and no radiation. He is used as a coolant in nuclear reactor as it condenses at very low temp.

• Krypton is used commercially as a filling gas for energy-saving fluorescent lights. It is also used in some flash lamps used for high speed photography.

• Neon is reddish-orange colored in neon lamps and vacuum discharge tubes and a second lightest noble gas.

1558. Which of the following statements about noble gases are correct?

(I) XeO_3 is an explosive tetrahedral molecule.

(II) In Fischer Ringe's method, a mixture of $CaCl_2$ and CaC_2 is used to remove N_2 and O_2.

(III) He and Ne are chemically inert due to lack of d-orbitals and high ionization potential.

(IV) At 173K He and Ne are adsorbed on activated charcoal.

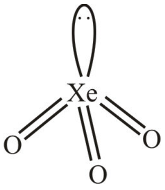
The correct answer is

(a) I and II (b) II and III

(c) II, III and IV (d) I, II, III and IV

AP-EAMCET (Medical), 2008

Ans. (b) : (I) Xe atom contains the one lone pair of electron due to which XeO_3 shows the explosive properties. XeO_3 has the pyramidal geometry with sp^3 hybridisation.



(II) In Fischer-Ringe's method of separation of nobles gas mixture from air, 90% of CaC_2 + 10% $CaCl_2$ is used. Fischer-Ring's method is used for large scale production of noble gases from the air. It is a modern method.

(III) Due to unavailability of d-orbital in He and Ne, they behave as chemically inert and highly ionisation potential.

(IV) As we know all inert gases are absorbed on activated charcoal and the extent of adsorption increases on moving down the group.

Thus, statement II and III are correct.

1559. What is the atomic number (z) of the noble gas that reacts with fluorine?

(a) 54 (b) 10

(c) 18 (d) 2

AP-EAMCET (Medical), 2001

Ans. (a) : There are three fluorides compounds which are formed by Xenon (54).

Ex.:- XeF_2, XeF_4 and XeF_6.

They are obtained by interaction of xenon and fluorine.

1560. What are the products formed in the reaction of xenon hexafluoride with silicon dioxide?

(a) $XeSiO_4 + HF$ (b) $XeF_2 + SiF_4$

(c) $XeOF_4 + SiF_4$ (d) $XeO_3 + SiF_2$

AP-EAMCET (Medical), 2002

AIIMS-2012

Ans. (c) : When Xenon hexafluoride (XeF_6) is treated with silica (SiO_2) then xenon oxyfluoride ($XeOF_4$) and silicon tetrafluoride will be formed.

$$\underset{\text{Xenonhexa Fluoride}}{2XeF_6} + \underset{\text{Silica}}{SiO_2} \longrightarrow \underset{\text{Xenonoxy fluoride}}{2XeOF_4} + \underset{\text{Silicon tetrafluoride}}{SiF_4}$$

@apna_pdf

1561. Which of the following does not exist?

(a) $XeOF_4$ (b) NeF_2

(c) XeF_2 (d) XeF_6

TS-EAMCET (Engg.), 06.08.2021

Ans. (b): NeF_2 does not exist as it would require d-orbital for bonding and Ne is present in a 2nd period of elements. To unpair them and move it to a higher energy orbital will need high amount of energy which cannot be compensated by the formation of the Ne-F bond. Hence NeF_2 does not exist.

1562. Complete hydrolysis of XeF_4 and XeF_6 gives its oxides P and Q, respectively. Identify P and Q

	P	Q
(a)	XeO_2	XeO_3
(b)	XeO	XeO_2
(c)	XeO_3	XeO_3
(d)	XeO_2	XeO_2

TS EAMCET 04.08.2021, Shift-I

Ans. (c) : Complex hydrolysis of XeF_4 and XeF_6 result in the formation of XeO_3.

Complete hydrolysis of XeF_4 –

$$\underset{\substack{\text{Xenon}\\\text{tetrafluoride}}}{6XeF_4} + 12H_2O \longrightarrow \underset{\text{Xenon}}{4Xe^+} + \underset{\substack{\text{Xenon}\\\text{trioxide}}}{2XeO_3} + \underset{\substack{\text{Hydrogen}\\\text{fluoride}}}{24HF} + 3O_2$$

Complete hydrolysis of XeF_6 –

$$\underset{\substack{\text{Xenon}\\\text{hexafluoride}}}{XeF_6} + 3H_2O \longrightarrow \underset{\substack{\text{Xenon}\\\text{trioxide}}}{XeO_3} + \underset{\substack{\text{Hydrogen}\\\text{fluoride}}}{6HF}$$

1563. Which of the following inert gas participates in chemical reaction?

(a) Xe (b) He

(c) Ne (d) None

AIIMS 25 May 2019 (Morning)

Ans. (a): (Xe) Xenon gas takes part in chemical reactions because ionising power of Xe and oxygen are almost same and atomic size of Xe is large.

1564. Assertion: Inert gases are monoatomic.
Reason: Inert gases have stable configuration.

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.

(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.

(c) If the Assertion is correct but Reason is incorrect.

(d) If both the Assertion and Reason are incorrect.

(e) If the Assertion is incorrect but the Reason is correct.

[AIIMS-1999]

Ans. (a): Inert gases have stable electron configuration and their outermost shell is completely filled hence they are stable by themselves and hence they are mono atomic in nature.

1565. In Fischer-Ringe method of separation of noble gases mixture from air, ...is used.

(a) 90% CaC_2+10%$CaCl_2$

(b) coconut charcoal

(c) soda lime + potash solution

(d) 90% $CaCO_3$+10% urea

AP EAMCET- 2005

Ans. (a) : Fischer - Ringe method is used for large scale production of noble gases from the air.

In Fischer - Ringe method of separation of nobles gas mixture from air, 90% CaC_2+10% $CaCl_2$ is used.

1566. Which one of the following noble gases is used in miner's cap lamps?

(a) Helium (b) Neon

(c) Argon (d) Krypton

AP EAMCET- 2007

Ans. (d) : Krypton (kr) is used in miner's cap lamps because krypton's light does not produce glare.

1567. Which of the following compounds of xenon cannot be prepared?

(a) XeF (b) XeF_2

(c) XeF_4 (d) XeF_6

MPPET - 2012

Ans. (a) : Xenon has only three compounds of fluoride which are XeF_2, XeF_4 and XeF_6.

1568. The geometries of XeF_4 and $XeOF_4$ respectively are ________

(a) Pyramidal and distorted octahedral

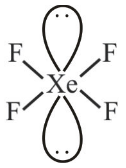
(b) Square-pyramidal and square-pyramidal

(c) Square planar and square pyramidal

(d) Square planar and square planar

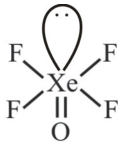
AP EAPCET 23-08-2021 Shift-I

Ans. (c) : Structure of XeF_4 is-



Geometry of XeF_4 is square planar.

Structure of $XeOF_4$ is-



Geometry of $XeOF_4$ is square pyramidal.

1569. The structures of XeF_2 and XeF_4 respectively are_____.

(a) Linear and Square planar

(b) Bent and Square planar

(c) Linear and Tetrahedral

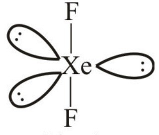
(d) Bent and Trigonal pyramidal

AP-EAMCET 25-08-2021 Shift - I

Ans. (a) :

$XeF_2 \rightarrow$ hybridisation = 3(Lone pair) + 2(Bond pair)

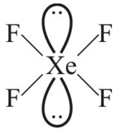
= 5(sp^3d)



(Linear)

@apna_pdf

$XeF_4 \rightarrow$ hybridisation = 2(Lone pair) + 4(Bond pair)
= 6(sp^3d^2)



(Square planar)

1570. Assertion: A mixture of He and O_2 is used for respiration for deep sea divers.
Reason: He is soluble in blood.

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

[AIIMS-1998]

Ans. (c): A mixture of He and O_2 is used for respiration by deep sea divers it reduces decompression and causes less discomfort to the diver in breathing but (He) Helium is not soluble in blood.

1571. Which gas is used as cooling tube of MRI tube?

(a) He
(b) Ar
(c) CO_2
(d) N_2

[AIIMS-26 May, 2018(E)]

Ans. (a): He gas use as cooling agent in superconducting magnet. It cools down the superconducting magnets, which generate images of the human body to a temperature below 4.15 kelvin.

1572. Which one of the following statements regarding helium is incorrect?

(a) It is used to produce and sustain powerful superconducting magnets.
(b) It is used as a cryogenic agent for carrying out experiments at low temperatures.
(c) It is used to fill gas balloons instead of hydrogen because it is lighter and non-inflammable.
(d) It is used in gas-cooled nuclear reactors.

[AIIMS-2015]

Ans. (c) : It is used to fill gas balloons instead of hydrogen because it is lighter and non-inflammable.
Helium gas is light compared to most gases but the only gas lighter than Helium which is hydrogen. Helium is preferred due to its non flammable nature and its light nature.

1573. The reason for not storing XeF_6 in a glass or a quartz vessel is that

(a) It forms an explosive having the formula XeO_2F_2
(b) It forms an explosive having the formula $XeOF_4$
(c) It forms XeO_2 which is explosive substance.
(d) It forms XeO_6^{4-} which is explosive in nature.

[AIIMS-2011]

Ans. (b): It forms an explosive having the formula $XeOF_4$.
Xenon hexafluoride is a compound of noble gas. It is strongest fluorinating agent of the series. It reacts with silica at normal temperature.

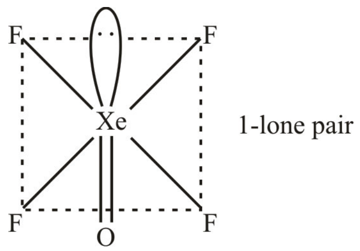
$$\underset{}{2XeF_6} + \underset{(Glass)}{SiO_2} \longrightarrow \underset{(explosive\ nature)}{2XeOF_4} + SiF_4$$

1574. Total number of lone pair of electrons in $XeOF_4$ is

(a) 0
(b) 1
(c) 2
(d) 3

[AIIMS-2011]

Ans. (b): 1
In $XeOF_4$, Xe is sp^3d^2, hybridised (6 electron pairs). 5 bond pairs and 1 lone pair.



1575. Which statements among the following are correct about Helium?

(i) Liquid helium is used to sustain powerful superconducting magnets.
(ii) Liquid helium is useful to carry low temperature experiments.
(iii) It is heavy gas.
(iv) It is a flammable gas.

(a) (i) & (ii) only
(b) (ii) & (iii) only
(c) (i) & (iv) only
(d) (iii) & (iv) only

AP EAPCET 19-08-2021, Shift-II

Ans. (a) : (i) and (ii) only.

- Liquid helium is used as coolant for many super conducting magnets.
- Liquid helium is useful to carry low temperature in many experiments.
- It is the second lighter gas in the periodic table.
- Helium is an inert gas. Inert gases are non-combustible.

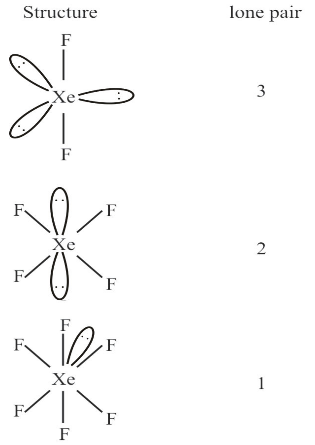
1576. In XeF_2, XeF_4, XeF_6 the number of lone pairs on Xe are respectively

(a) 2, 3, 1
(b) 1, 2, 3
(c) 4, 1, 2
(d) 3, 2, 1

AIEEE-2002

@apna_pdf

Ans. (d) :



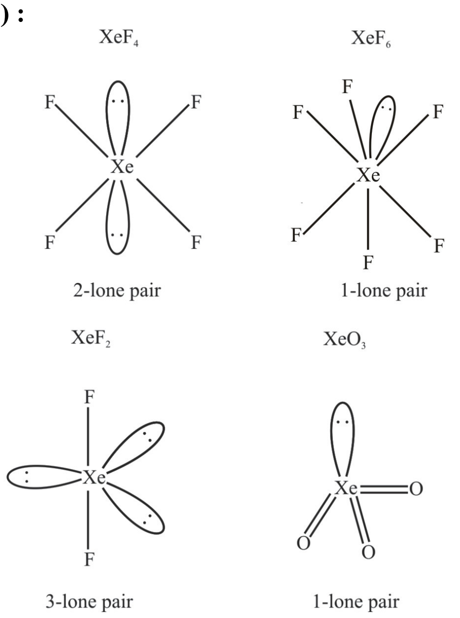
1577. Which of the following has maximum number of lone pairs associated with Xe ?

(a) XeF_4 (b) XeF_6

(c) XeF_2 (d) XeO_3

VITEEE-2017

Ans. (c) :



So, the option (c) has maximum lone pairs.

1578. XeF_4 disproportionate in water to give

(a) Xe + HF (b) Xe and XeO_3

(c) $XeOF_4$ and HF (d) XeO_4Fe and HF

VITEEE-2016

Ans. (b) : $6XeF_4 + 12H_2O \rightarrow 2XeO_3 + 4Xe + 3O_2 + 24HF$

So, XeF_4 disproportionate in water to give Xe and XeO_3.

1579. Assertion (A) :Noble gases have very low boiling points.

Reason (R) : All noble gases have general electronic configuration of ns^2 np^6(except He).

(a) Both (A) and (R) are true and (R) is correct explanation of (A).

(b) (A) is false, but (R) is true.

(c) (A) is true, but (R) is false.

(d) Both (A) and (R) are true and (R) is the not the correct explanation of (A).

AP-EAMCET (Engg.) 2015

Ans. (d) : All the noble gases have general electronic configuration ns^2, np^6 (except He) is correct statement. Boiling point of noble gases are quite low as compared to other elements of comparable atomic masses due to weak Vander Waal's force of attraction which hold the atoms together in the liquid and in the solid states.

1580. Liquid Xe is used in bubble chamber to detect neutral mesons and gamma photons. Then, X is

(a) He (b) Ne

(c) Kr (d) Xe

AP-EAMCET (Engg.) 2013

Ans. (d) : Liquid xenon is used in bubble chamber to detect neutral mesons and gamma photons.

1581. Which one of the following statements is not correct?

(a) In the Dewar's method for the separation of noble gases, activated coconut charcoal is used.

(b) Krypton is used in miners cap lamps.

(c) The electron affinity values of noble gases are nearly equal to zero.

(d) Xenon gives different colors when mixed with mercury vapors.

AP - EAMCET(MEDICAL) - 2009

Ans. (a) : This statement is true because the individual noble gases can be separated by 'Dewar' charcoal adsorption method. Activated coconut charcoal adsorbs all the noble gases excluding helium.

(b) This statement is true Krypton is used in miner's cap lamps because it's light does not produce glare.

(c) As we know, there is no vacant orbital present in the outer shell of noble gases due to which they shows the zero electron affinity. Hence the statement is true.

(d) Xenon produces flash (photographic) when mixed with mercury vapor inspite of different colors. Hence the given statement is false.

1582. In the separation of noble gas mixture from air by Ramsay-Rayleigh's first method, the substances used for the removal of N_2 and O_2 respectively are

(a) Cu and Mg (b) Mg and Cu

(c) C and CaC_2 (d) KOH solution

AP - EAMCET (Medical) - 2007

Ans. (b) : In Ramsay Rayleigh's method, the separation of noble gas mixture from air, magnesium and copper used for the removal of N_2 and O_2 respectively.

1583. Which of the following is not correct?

(a) XeO_3 has four σ and four π bonds

(b) The hybridisation of Xe in XeF_4 is sp^3d^2

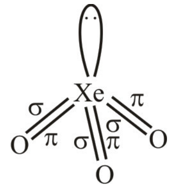
(c) Among noble gases, the occurrence (percent by weight) of argon is highest in air

(d) Liquid helium is used as cryogenic liquid

AP-EAMCET (Engg.)-2005

@apna_pdf

Ans. (a) : The molecular structure of XeO_3 is given as-



Hybridisation - sp^3

number of σ - bond = 3

number of π - bond = 3

Thus, statement (a) is false.

1584. The ease of loss of electron from Ne and Na^+ ion (both isoelectronic) are

(a) 4562 kJ mol^{-1}, 2081 kJ mol^{-1}

(b) 2081 kJ mol^{-1}, 4562 kJ mol^{-1}

(c) 2081 kJ mol^{-1} each

(d) 4562 kJ mol^{-1} each.

SRMJEEE – 2008

Ans. (b) : The Na^+ ion and the Ne atom are isoelectronic. The ease of loss of an electron i.e. ionization energies for Ne and Na^+ are 2081 kJ mol^{-1} and 4562 kJ mol^{-1} respectively.

1585. Hydrolysis of XeF_4 and XeF_6 with water gives

(a) $XeOF_4$ (b) XeO_2F_2

(c) XeO_3 (d) $XeOF_2$

AMU-2011

Ans. (c) : Complex hydrolysis of XeF_4 and XeF_6 result in the formation of XeO_3.

Complete hydrolysis of XeF_4 –

$$\underset{\text{Xenon tetrafluoride}}{6XeF_4} + 12H_2O \longrightarrow \underset{\text{Xenon}}{4Xe^{+}} + \underset{\text{Xenon trioxide}}{2XeO_3} + \underset{\text{Hydrogen fluoride}}{24HF} + 3O_2$$

Complete hydrolysis of XeF_6 –

$$\underset{\text{Xenon hexafluoride}}{XeF_6} + 3H_2O \longrightarrow \underset{\text{Xenon trioxide}}{XeO_3} + \underset{\text{Hydrogen fluoride}}{6HF}$$

1586. Who discovered the first noble gas compound?

(a) Neils Bohr (b) Neil Bartlett

(c) Neil Armstrong (d) William

AMU – 2010
Manipal-2017

Ans. (b) : Neil Bartlett discovered first noble gas compound which is $XePtF_6$. It is formed by deep red vapours PtF_6 of Xenon at room temperature.

1587. Which compound is prepared by the following reaction ?

$$Xe + F_2 \xrightarrow[673K]{Ni}$$

(1:2 volume ratio)

(a) XeF_6 (b) XeF_4

(c) XeF_2 (d) None of these

AMU–2001

Ans. (c) : $Xe + F_2 \xrightarrow[673K]{Ni\,tube} XeF_2$ (1:2 volume ratio)

$Xe + 2F_2 \xrightarrow[873K]{Ni\,tube} XeF_4$ (1 : 5 volume ratio)

$Xe + 3F_2 \xrightarrow[673K]{Ni\,tube} XeF_6$ (1 : 20 volume ratio)

1588. The most abundant inert gas in the atmosphere is

(a) He (b) Ne

(c) Ar (d) Kr

Assam CEE-2014

Ans. (c) : Argon- 0.934% Neon-0.0018%, Helium, 0.00052%

1589. The gas not absorbed by coconut charcoal is-

(a) He (b) Ne

(c) Ar (d) Kr

BCECE-2007

Ans. (a) : Helium is not absorbed by activated coconut charcoal due to its small size. Activated charcoal is used to treat-poisonings, induce intestinal gas.

1590. Which one of the following represents noble gas configuration?

(a) $1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 3d^{10}, 4s^2, 4p^6, 4d^{10}, 5s^2, 5p^6, 5d^6, 6s^2$

(b) $1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 3d^{10}, 4s^2, 4p^6, 4d^{10}, 5s^2, 5p^6, 5d^1, 6s^2$

(c) $1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 3d^{10}, 4s^2, 4p^6, 4d^{10}, 5s^2, 5p^6$

(d) $1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 3d^{10}, 4s^2, 4f^{14}, 5s^2, 5p^6, 5d^1$

BCECE-2007

Ans. (c) : $1s^2, 2s^2, 2p^6, 3s^{10}, 3p^6, 3d^{10}, 4s^2, 4p^6, 4d^{10}, 5s^2, 5p^6$.

Noble gas have completely filled orbitals with general electronic configuration ns^2, np^6.

1591. Ionisation potential for a noble gas is :

(a) maximum in a period

(b) minimum in a period

(c) either minimum or maximum

(d) constant

BCECE-2006

Ans. (a) : Due to extra stability on attaining the complete octet in out a shell.

1592. Which of the following noble gases is most reactive?

(a) He (b) Ne

(c) Ar (d) Xe

BCECE-2008

Ans. (d) : The noble gas (Xe) has most reactive due to its large size.

1593. Which is isoelectronic with hydride ion?

(a) He (b) He^+

(c) Li (d) H^+

BCECE-2009

Ans. (a) :

- hydride ion 1s $\left.\begin{array}{l} H^- = 1s^2 \\ He = 1s^2 \end{array}\right\}$ Isoelectronic species.

1594. Complete hydrolysis of XeF_2 gives

(a) Xe (b) O_2

(c) HF (d) All of these

BCECE-2011

Ans. (d) :

- Hydrolysis of XeF_2:

$$2XeF_2 + 2H_2O \longrightarrow 2Xe + 4HF + O_2.$$

@apna_pdf

1595. Gradual addition of electronic shells in the noble gases causes a decrease in their

(a) Ionization energy (b) Atomic radius

(c) Boiling point (d) Density

[BITSAT-2006]

Ans. (a) : • Ionization energy ∝ nuclear attraction $\propto \frac{1}{\text{size of atom}}$ gradual increase of electronic shell, increases the size of atom and decreases the ionisation energy.

1596. Atomic radii of fluorine and neon in Angstrom units are respectively given by

(a) 0.72; 1.60 (b) 1.60; 1.60

(c) 0.72; 0.72 (d) None

[BITSAT-2006]

Ans. (a) : Atomic no Group

Fe = 9 Fe = 7

Ne = 5 Ne = 8

Fe - $1s^2, 2s^2, 2p^5$

Ne - $1s^2, 2s^2, 2p^6$

In Fe the 2P Orbital occupies only 5 electrons while in Ne the 2P orbital is entirely filled. Fluorine has 5 electrons in 2p-orbitals which is less than the required to ideal configuration inert gas configuration. Hence, nuclear charge is high leading smaller size then the next inert gas neon.

1597. Which of the following fluorides of xenon is impossible?

(a) XeF_2 (b) XeF_3

(c) XeF_4 (d) XeF_6

[BITSAT-2015]

Ans. (b) : Xenon is an inert gas.

[kr], $4d^{10}, 5s^2, 5p^6$.

All orbital's that are filled have paired electrons. When one, two or three electrons are promoted from 5p (filled) to 5d (empty) orbital's, two, four and six half filled orbital's are formed. Xenon can combine with even number of F atoms to forms XeF_2, XeF_4 or XeF_6. It cannot combine with odd number of F atoms. Thus, formation of XeF_3 and XeF_5 is not possible.

1598. In the clathrates of xenon with water, the nature of bonding between xenon and water molecule is

(a) covalent

(b) hydrogen bonding

(c) co-ordinate

(d) dipole-induce dipole interaction

[BITSAT-2019]

Ans. (d) : In the clathrates the bonding between noble gas atom and water is dipole-induce dipole interaction.

1599. Match list-I with List-II and select the correct answer using following codes

List-I		List-II
A.	XeF_2	1. Regular tetrahedral
B.	XeO_3	2. Distorted octahedral
C.	XeO_4	3. Linear
D.	XeF_6	4. Square planar
E.	XeF_4	5. Pyramidal

Code

	A	B	C	D	E
(a)	3	5	1	2	4
(b)	5	3	2	4	1
(c)	1	3	5	2	4
(d)	4	5	2	1	3

CG PET -2019

Ans. (a) :

XeF_2	sp^3d	Linear shape
XeO_3	sp^3	trigonal pyramidal
XeO_4	sp^3	regular tetrahedral
XeF_6	sp^3d^3	Distorted octahedral
XeF_4	sp^3d^2	Square planar

Hence, option (a) is correct.

1600. Which gas behaves abnormally when liquified?

(a) Xenon (b) Krypton

(c) Helium (d) Argon

CG PET- 2013, UP CPMT-2006

Ans. (c) : Gaseous He on cooling below 4.18k changes to liquid known as He (I) which on cooling to 2.2K and 1 atmospheric pressure changes to an abnormal liquid known as He (II). He (II) liquid behaves as a gas and hence thus state of liquid is said to be fourth state of matter, He (II) behaves as super fluid and hence abnormal state. He (I) is a normal liquid.

1601. Noble gases are absorbed by

(a) anhydrous calcium chloride

(b) ferric hydroxide

(c) conc. H_2SO_4

(d) activated coconut charcoal

[AIIMS-2010]

Ans. (d): Activated coconut charcoal is a very good absorbent of gas, whereas anhydrous $CaCl_2$, $Fe(OH)_3$ and concentrated H_2SO_4 are dehydrating agent. The adsorption of different noble gases occurs at different temperature. Hence, charcoal is used to separate these gases. Helium is not observed by charcoal.

1602. The gas most difficult to liquefy is:

(a) He (b) Ne

(c) Xe (d) Ar

HP CET-2018

Ans. (a) :

He

Ne

Ar ↓ Size increase

Kr

liquified easily → Xe

1603. The noble gas that does not occur in the atmosphere is

(a) Ra (b) Kr

(c) He (d) Ne

(JEE Main 2019, 10 April Shift-II)

Ans. (a) : It is a chemical element with symbol Rn and atomic number 86.

- It is radioactive, colorless, orderless, tasteless noble gas, occurring naturally as the decay product of uranium of thorium.
- Radon belongs to the Nobel Gases family
- The placement of Radon is in Group 18 in period 6

@apna_pdf

1604. Which one of the following reaction of xenon compounds is not feasible?

(a) $XeO_3 + 6HF \rightarrow XeF_6 + 3H_2O$

(b) $3XeF_4 + 6H_2O \rightarrow 2Xe + XeO_3 + 12HF + 1.5O_2$

(c) $2XeF_2 + 2H_2O \rightarrow 2Xe + 4HF + O_2$

(d) $XeF_6 + RbF \rightarrow Rb[XeF_7]$

(AIEEE 2009)

Ans. (a) : This reaction is not feasible because the produces again react to give reactants back. All the Xenon fluorides easily undergo hydrolysis, and give Xenon oxides.

1605. Inert gases are mixed in iodine vapours. Then there are ____ between them.

(a) H-bonding

(b) Van der Waal's forces

(c) Electrostatic forces

(d) Metallic bonds

[AIIMS-2007]

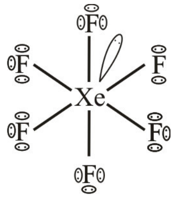
Ans. (b): Noble gases are least reactive, their inertness to chemical reactivity is because of the completing filled ns^2, np^6 electronic configuration in their valance shell except He, hence they only exists the short range force i.e., Vander Waal's force between them.

1606. A xenon compound 'A' upon partial hydrolysis gives XeO_2F_2. The number of lone pair of electrons present in compound A is .... (Round off to the nearest integer).

(JEE Main 2021, 18 March Shift-II)

Ans. (19) :

$$\underset{A}{XeF_6} + 2H_2O \longrightarrow XeO_2F_2 + 4HF$$



Total lone pair = 19

1607. XeF_6 on complete hydrolysis gives

(a) Xe (b) XeO_2

(c) XeO_3 (d) XeO_4

CG PET -2019
J & K CET-(2004)
CG PET -2006

Ans. (c) : Complete hydrolysis of XeF_6 to give

$$\underset{\text{Xenon hexafluoride}}{XeF_6} + 3H_2O \longrightarrow \underset{\text{Xenon trioxide}}{XeO_3} + \underset{\text{Hydrogen fluoride}}{6HF}$$

Highly explosive and act as powerful oxiding agent in solution.

1608. Which noble gas has the highest first ionization energy?

(a) helium (b) xenon

(c) radon (d) neon

J & K CET-(1997)

Ans. (a) : $1s^2$ is the most stable electronic configuration. Hence it has highest first ionisation energy.

1609. Noble gases are used in discharge tubes to give different colours. Reddish-orange glow is due to

(a) Ar (b) Ne

(c) Xe (d) Kr

JCECE - 2007, JIPMER-2008

Ans. (b) :

- Ne (Neon): Orange-red
- Ar (Argon): Purple
- Xe (Xenon): blue-green
- Kr (Krypton): silvery-white

1610. What is the correct order of occurrence (% by weight) in air of Ne, Ar and Kr?

(a) Ne > Ar > Kr (b) Ar > Ne > Kr

(c) Ar > Kr > Ne (d) Ne > Kr > Ar

JCECE - 2009

Ans. (b) :

- Occurance in air Ar = 1.285%

Ne = 1×10^{-3} %

Kr = 2.8×10^{-4} % by weight.

1611. Which one has the highest boiling point?

(a) H_2 (b) Xe

(c) CH_4 (d) He

(JEE Main 2015)
JCECE - 2010
BCECE-2005

Ans. (b) : Boiling point $\propto$ vander Waals' force

Vander Waals' force $\propto$ atomic mass (or molecular mass)

$\because$ Atomic mass of Xe is highest among H_2, He, CH_4, Xe.

$\therefore$ Boiling point of Xe is highest.

1612. XeF_2 on hydrolysis gives

(a) XeO_3 (b) XeO

(c) Xe (d) XeO_2

JCECE - 2015

Ans. (c) : XeF_2 on hydrolysis to give Xe.

$$XeF_2 + H_2O \longrightarrow Xe + HF + O_2$$

1613. In Fischer-Ringe's method of separation of nobles gas mixture from air, ... is used

(a) 90% CaC_2+10%$CaCl_2$

(b) Coconut charcol

(c) soda lime+ Potash solution

(d) 90% $CaCO_3$+ 10% urea

JIPMER-2014

Ans. (a) : • In Fischer - Range's method of separation of noble gas mixture from air, 90% CaC_2 + 10% $CaCl_2$ is used.

• Fisher-Ringe's method is used for large scale production of noble gases from the air.

1614. The correct order of solubility in water for He, Ne, Ar, Kr, Xe is

(a) He > Ne > Ar > Kr > Xe

(b) Xe > Kr > Ar > Ne > He

@apna_pdf

(c) Ne > Ar > Kr > He > Xe
(d) Ar > Ne > He > Kr > Xe

[AIIMS-2002]

Ans. (b): Xe > Kr > Ar > Ne > He
The solubility of noble gases in the water is due to dipole-induced dipole interaction from. as dipole-induced dipole-interaction increases with the increase of molecular mass of noble gases, hence, solubility of noble gases in water increase down the group. Due to increased polarity of heavier inert gas, its solubility in water also increases. So most soluble gas will be Xe and least soluble will be He.

1615. Which of the following rare gas is the abundant in air?

(a) He (b) Ne
(c) Ar (d) Kr

JIPMER-2019
Kerala-CEE-2017

Ans. (c) : The % by volume of rare gases are

	% by volume	% by weight
He	0.0005	0.000037
Ne	0.0015	0.001
Ar	0.932	1.285
Kr	0.0001	0.00028
Xe	0.0001	0.00004

So, Ar is most abundant in air.

1616. Xenon hexafluoride reacts with silica to form a xenon compound X. The oxidation state of xenon in X is

(a) +2 (b) +4
(c) +6 (d) 0

JIPMER-2018

Ans. (c) :

$$2XeF_6 + SiO_2 \longrightarrow 2XeOF_4 + SiF_4$$

The oxidation state of xenon in $XeOf_4$ is + 6 as calculated below:
Let the oxidation state of Xe is a
$\therefore$ a + 1 × (–2) +4 × (–1) = 0
a – 2 – 4 = 0
a = +6

1617. Choose the incorrect statement about noble gas?

(a) Boiling point increases with increasing atomic mass
(b) Helium has least tendency to form compound
(c) Noble gases have some value of electron affinity
(d) Xenon has maximum number of compounds

JIPMER-2016

Ans. (c) : Noble gas have some value of electron affinity. Electron affinity changes on moving down the group from He to Xe. So the is wrong statement.

1618. XeF_6 on hydrolysis produces

(a) $XeOF_6$ (b) XeO_2F_2
(c) XeO_3 (d) XeO_2

[AIIMS-2007]

Ans. (c): XeO_3.

$$XeF_6 + H_2O \longrightarrow XeOF_4 + 2HF$$
$$XeOF_4 + H_2O \longrightarrow XeO_2F_2 + 2HF$$
$$XeO_2F_2 + H_2O \longrightarrow XeO_3 + 2HF$$

XeF_6 on hydrolysis gives XeO_3.

1619. In Ramsay and Rayleigh's isolation of noble gases from air, the nitrogen of the air is finally converted into

(a) $NaNO_2$ only (b) NO and NO_2
(c) $NaNO_3$ only (d) $NaNO_2$ and $NaNO_3$

Karnataka-CET-2011

Ans. (d) : In Ramsay and Rayleigh's isolation of noble gases from air, the nitrogen of the air finally converted into $NaNO_2$ and $NaNO_3$.

$$N_2 + O_2 \xrightarrow{\text{Electric discharge}} 2NO$$
$$2NO_2 + O_2 \longrightarrow 2NO_2(g)$$
$$2NO_2 + 2NaOH \longrightarrow NaNO_2 + NaNO_3 + H_2O$$

1620. Argon is used

(a) in filling airships
(b) to obtain low temperature
(c) in high temperature welding
(d) in radiotherapy for treatment of cancer

JIPMER-2011
KARNATAKA-CET, 2009

Ans. (c) : Argon is used in high temperature welding and other operations which require a non-oxidising atmosphere and the absence of nitrogen.

1621. Which is the most easily liquefiable rare gas?

(a) Xe (b) Kr
(c) Ar (d) Ne

KARNATAKA-CET, 2008

Ans. (a) : Rare gases are relatively difficult to be liquefied as very weak van der Walls' forces of attraction exist in these gases. However, the liquefaction becomes easier from He to Xe as forces increase gradually. So, Xe can be liquefied easily.

1622. The noble gas mixture is cooled in a coconut bulb at 173 K. The gases that are not adsorbed are :

(a) Ne and Xe (b) He and Xe
(c) Ar and Kr (d) He and Ne

Karnataka-CET-2007

Ans. (d) : When the mixture of noble gas is cooled in a a cocount bulb at 173K then Ar, Kr and Xe are adsorbed on charcoal while He and Ne are not adsorbed.

1623. Which one of the following has maximum number of atoms of oxygen?

(a) 2g of carbon monoxide
(b) 2g of carbon dioxide
(c) 2 g of sulphur dioxide
(d) 2g of water

Karnataka-CET-2007

@apna_pdf

Ans. (d) : Number of oxygen atom in 2g of CO

$$= \frac{2}{28} \times 6.022 \times 10^{23} \times 1 = 0.430 \times 10^{23}$$

Number of oxygen atom in 2g of CO_2

$$= \frac{2}{44} \times 6.022 \times 10^{23} \times 2 = 0.547 \times 10^{23}$$

Number of oxygen atom in 2g of SO_2

$$= \frac{2}{64} \times 6.022 \times 10^{23} \times 2 = 0.376 \times 10^{23}$$

Number of oxygen atom in 2g of H_2O

$$= \frac{2}{18} \times 6.022 \times 10^{23} \times 1 = 0.669 \times 10^{23}$$

Hence, 2g of H_2O has maximum number of atoms of oxygen.

1624. Hydroxyl ion concentration of 10^{-2} M HCl is

(a) 1×10^{1} mol dm^{-3} (b) 1×10^{-12} mol dm^{-3}

(c) 1×10^{-1} mol dm^{-3} (d) 1×10^{-14} mol dm^{-3}

Karnataka-CET-2007

Ans. (b) : $[H^+][OH^-] = 10^{-14}$

$[10^{-2}][OH^-] = 10^{-14}$

$$[OH^-] = \frac{10^{-14}}{10^{-2}} = 10^{-12} \text{ mol dm}^{-3}$$

1625. Which of the following noble gases has the highest positive electron gain enthalpy value ?

(a) Helium (b) Krypton

(c) Argon (d) Neon

(e) Xenon

Kerala-CEE-2013

Ans. (d) :

Noble gas	Electron gain enthalpy (kJ/mol^{-1}).
He	48
Ne	116
Ar	96
Kr	96
Xe	77

1626. In which one of the following compounds of xenon, highest number of lone pair of electrons is present in xenon?

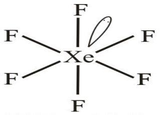
(a) XeF_6 (b) XeF_4

(c) $XeOF_4$ (d) XeO_3

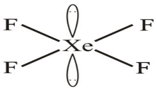
(e) XeF_2

Kerala-CEE-2016

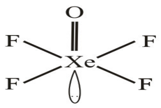
Ans. (e) : XeF_2 = 3 L.P.



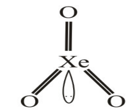
XeF_6 = 1 L.P.



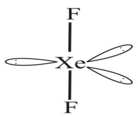
XeF_4 = 2 L.P.



$XeFO_4$ = 1 L.P.



XeO_3 = 1 L.P.



XeF_2 = 3 L.P.

1627. Rare gases are sparingly soluble in water because of

(a) Hydrogen bonding

(b) Dipole-dipole interaction

(c) Induced dipole-induced dipole interaction

(d) Dipole-induced dipole interaction

(e) (A) and (D)

Kerala-CEE-2019

Ans. (d) : Rare gases are sparingly soluble in water because of dipole-induced dipole interaction water (a polar molecule) have permanent dipole that induces a dipole on the electrically neutral atom by deforming its e^- cloud.

1628. Which element among the following does not form diatomic molecules?

(a) Argon (b) Oxygen

(c) Nitrogen (d) Bromine

MHT CET-2017

Ans. (a) : Argon has complete order shell electronic configuration hence stable its in monoatomic state.

1629. Argon possesses

(a) translational motion only

(b) translational + rotational motion

(c) translational + vibrational motion

(d) translational + rotational + vibrational motion

MHT CET-2010

Ans. (a) : • Monoatomic gas have degree of freedom 1, hence possess only translational motion.

1930. Noble gases are named because of their inertness towards reactivity. Identify an incorrect statement about them.

(a) Noble gases have large positive values of electron gain enthalpy

(b) Noble gases are sparingly soluble in water

(c) Noble gases have very high melting and boiling point

(d) Noble gases have weak dispersion force

(NEET 2021)

Ans. (c) : Noble gases have weak interatomic forces and therefore very low boiling and melting points, compared with elements of other groups.

1631. The formation of the oxide ion, $O^{2}_{(g)}$ from oxygen atom requires first an exothermic and then an endothermic step as shown below :

$O_{(g)} + e^- \rightarrow O^-(g)$; $\Delta_f H^0 = -141$ kJ mol^{-1}

$O^-_{(g)} + e^- \rightarrow O^{2-}(g)$; $\Delta_f H^0 = +780$ kJ mol^{-1}

Thus, process of formation of O^{2+} in gas phase is unfavourable even though O^{2+} is isoelectronic with neon. It is due to the fat that,

(a) O^- ion has comparatively smaller size than oxygen atom

(b) Oxygen is more electronegative

(c) addition of electron in oxygen results in larger size of the ion

(d) electronic repulsion out\weights the stability gained by achieving noble gas configuration

NEET-2015

@apna_pdf

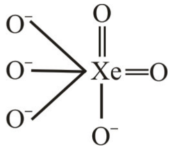
Ans. (d) : Since electro repulsion predominate over the stability gained by achieving noble gas configuration. Hence, formation of O^{2-} in gas phase is unfavourable.

1632. The number of peroxide bonds in perxenate ion $[XeO_6]^{4-}$ is

(a) 0 (b) 2
(c) 3 (d) 1

UP CPMT-2014

Ans. (a) : Structure of $[XeO_6]^{4-}$ is



Thus, it does not contain any peroxide bond.

1633. The noble gas used for treatment of cancer is

(a) helium (b) argon
(c) radon (d) krypton

Manipal-2018
UP CPMT-2011

Ans. (c) : Radon is radioactive with half-life period of 3.8 days and is used for the treatment of cancer.

1634. Which of the noble gas is most reactive?

(a) He (b) Ne
(c) Ar (d) Xenon

UP CPMT-2007

Ans. (d) : Lower is the ionization potential of an element, more would be its reducing power and also reactivity.

As we move down the group, the reactivity of noble gases increases due to the decrease in ionization energy. Hence, xenon is most reactive.

1635. Which type of bond is present in Xe molecule?

(a) Covalent (b) Ion–dipole
(c) van der Walls' (d) Dipole–dipole

UP CPMT-2007

Ans. (c) : Xenon atoms are linked to each other by Van der Wall's forces.

1636. Element having maximum electron

(a) fluorine (b) chlorine
(c) bromine (d) iodine

UP CPMT-2005

Ans. (b) : Electron affinity is the amount of energy released when an electron is added to isolate gaseous atom.

The order of electron affinity among halogen is

Cl >F>Br>I

Unexperedly chlorine has higher electron affinity than fluorine because the size of fluorine is very small and it repels the incoming electron.

1637. Radioactive metal is

(a) Li (b) Ce
(c) Na (d) Ra

UP CPMT-2005

Ans. (d): Elements with atomic number greater than 82 are naturally radiactive.

(a) Li At. no. = 3 (b) Ce At. no.= 58
(c) Na At. no. = 11 (d) Ra At. no. = 88
∴ Ra is radioactive

1638. Number of electrons surrounding Kr in KrF_2 is

(a) 10 (b) 6
(c) 4 (d) 8

UP CPMT-2005

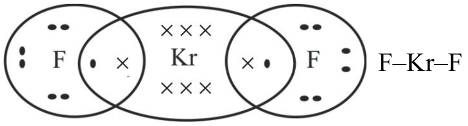
Ans. (a) Krypton(Kr) forms two covalent bonds two fluorine atoms (one with each fluorine).

Number of electrons in valence shell of Kr = 8

Number of electrons it shares with two F-atom=2

∴ Total number of electrons found around Kr in KrF

= 8 + 2 = 10



1639. Which of the following electronic configuration represents noble gas?

(a) ns^2np^6 (b) ns^2np^5
(c) ns^2np^4 (d) ns^2np^3

UP CPMT-2003

Ans. (a) : Noble gases are inert gases. Their valence shell is completely filled and their general electronic configuration is ns^2np^6.

1640. The lightest gas is

(a) N_2 (b) Ar
(c) Rn (d) He

UP CPMT-2002

Ans. (d) : Helium exists as helium gas (He) only with 2 protons present in it. It is the first element of the noble gas group. It is tasteless, colourless, inert and odourless gas. It is a monatomic gas. The atomic mass of helium gas (He) is 4. After hydrogen, He is lightest gas.

1641. For advertisement, the coloured discharged tubes contain:

(a) He (b) Ne
(c) Ar (d) Kr

UPTU/UPSEE-2006

Ans. (b) : Colored lighting in discharge tube are usually filled with neon. Mixing with other gases results, in different colored lights.

1642. The oxidation states of iodine in HIO_4, H_3IO_5 and H_5IO_6 are respectively:

(a) +1, +3, +7 (b) +7, +7, +3
(c) +7, +7, +7 (d) +7, +5, +3

UPTU/UPSEE-2006

Ans.(c): +7, +7, +7.

HIO_4	H_3IO_5	H_5IO_6
$(+1) + x + 4 \times (-2) = 0$ $x = +7$	$3 \times (+1) + x + 5 \times (-2) = 0$ $x = +7$	$5 \times (+1) + x + 6 \times (-2) = 0$ $x = +7.$

@apna_pdf

12.

Hydrocarbons

1. Alkanes

1. 'A' and 'B' respectively are:

(A) $\xrightarrow[(2)Zn-H_2O]{(1)O_3}$ Ethane-1, 2-dicarbaldehyde + Glyoxal/Oxaldehyde

(B) $\xrightarrow[(2)Zn-H_2O]{(1)O_3}$ 5-oxohexanal

(A) 1-methylcyclohex-1, 3-diene and cyclopentene
(B) Cyclohex-1, 3-diene and cyclopentene
(C) 1-methylcyclohex-1, 4-diene and 1-methylcyclopent-1ene
(D) Cyclohex -1, 3-diene and 1-methylcyclopent -1 ene

JEE Main-27.06.2022, Shift-I

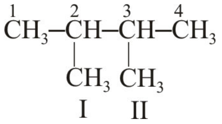
Ans. (d) : When  cyclohex -1, 3 - diene, react with O_3 and then Zn – H_2O it gives ethane - 1,2-dicarbaldehyde + Glyoxal/oxaldehyde.

When  1-methylcyclopent -1-ene react with O_3 and then Zn, H_2O it gives 5 - oxohexanal.
Hence, A is cyclohex-1,3-diene and B is 1 -methylcyclopent-1-ene.

2. Which one of the following molecules contains only primary and tertiary carbon atoms?
(a) 2,2-Dimethylbutane
(b) 3-Methylpentane
(c) 2, 3-Dimethylbutane
(d) n-Hexane
(e) 2-Methylhexane

Kerala CEE -03.07.2022

Ans. (c) : 2, 3 - dimethylbutane contains only primary and tertiary carbon atoms.



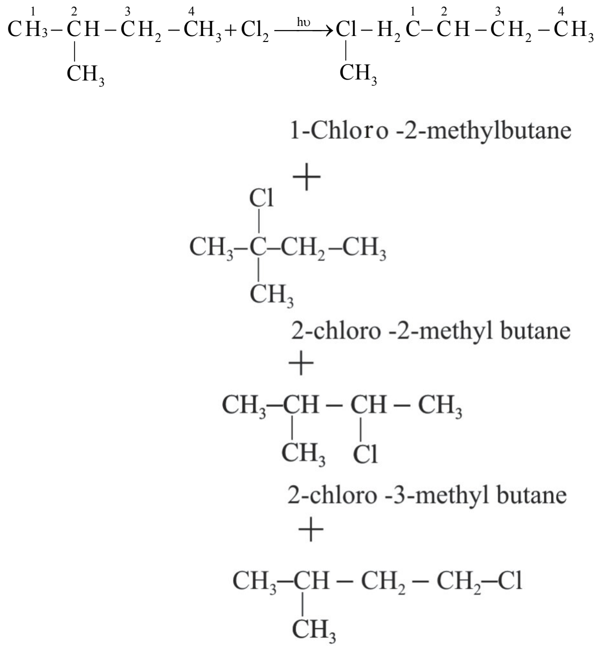
$$\overset{1}{C}H_3-\overset{2}{C}H(\underset{I}{CH_3})-\overset{3}{C}H(\underset{II}{CH_3})-\overset{4}{C}H_3$$

In 2, 3- dimethyl butane, C_1, C_2 C_I, C_{II} are primary carbons and C_2, C_3 are tertiary corbons.

3. Which one of the following molecules gives four isomeric monochlorides on photochemical chlorination?
(a) 2-Methylpropane
(b) n-Butane
(c) 2-Methylbutane
(d) 2,3-Dimethylbutane
(e) Propane

Kerala CEE -03.07.2022

Ans. (c) : 2–Methylbutane gives four isomeric monochlorides on photochemical chlorination.



$$\overset{1}{C}H_3-\overset{2}{C}H(CH_3)-\overset{3}{C}H_2-\overset{4}{C}H_3+Cl_2\xrightarrow{h\upsilon}Cl-H_2\overset{1}{C}-\overset{2}{C}H(CH_3)-\overset{3}{C}H_2-\overset{4}{C}H_3$$

1-Chloro -2-methylbutane

+

$$CH_3-C(Cl)(CH_3)-CH_2-CH_3$$

2-chloro -2-methyl butane

+

$$CH_3-CH(CH_3)-CH(Cl)-CH_3$$

2-chloro -3-methyl butane

+

$$CH_3-CH(CH_3)-CH_2-CH_2-Cl$$

1-chloro -3-methyl butane

4. Correct statement about photo-chemical smog is:
(a) It occurs in humid climate
(b) It is a mixture of smoke, fog and SO_2
(c) It is reducing smog.
(d) It result from reaction of unsaturated hydrocarbon.

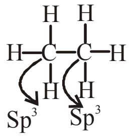
JEE Main-28.06.2022, Shift-II

Ans. (d) : NO_2 and unsaturated hydrocarbons are the primary constituents of photochemical smog. These primary constituents are introduced in the atmosphere via vehicular emissions and industrial processes.

5. The number of sigma bonds in ethane formed by the overlap of *sp*^{3} and *s* orbitals is
(a) 5
(b) 6
(c) 7
(d) 4

AP-EAMCET (Med.)-1999

Ans. (b) : The molecular formula of ethane is C_2H_6



@apna_pdf

The C-atom of ethane is sp^3 hybridised. So, the sigma bond between C-C atom is sp^3-sp^3sigma bond and the bond formed between C and H are sp^3-s sigma bond. Hence, there are 6 sp^3-s sigma bonds in ethane.

6. 18 C-H and 7 C-C sigma bonds are present in:

(a) Cyclo hexane

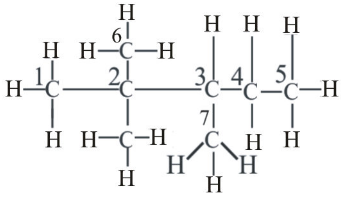
(b) 3,3-dimethyl pentane

(c) 2,2,3-trimethyl pentane

(d) n-heptane

AP-EAMCET (Med.)-1999

Ans. (c) : 2, 2, 3- trimethyl pentane contains the 18C-H and 7-C-C sigma bonds.



2, 2, 3-trimethyl pentane

Number of C-H bond = 18

Number of C-C bond =7

7. A mixture of carbon monoxide, hydrogen and hydrocarbon is known as:

(a) Water gas

(b) Carburetted water gas

(c) Semi water gas

(d) Producer gas

AP-EAMCET (Med.)-1999

Ans. (b) : Mixture of CO + H_2 is water gas.

Mixture of CO+H_2+hydrocarbons is carburetted water gas.

Mixture of CO+H_2+CO_2 is called semi water gas.

Mixture of CO+N_2 is called producer gas.

8. Chloroform is an anesthetic and a small amount of alcohol is added to its bottles because

(a) It retards anesthetic property of chloroform

(b) It accelerates the formation of phosgene

(c) It converts any phosgene formed to harmless carbonate

(d) None of the above

SCRA 2012

Ans. (a) : Chloroform is anesthetic and a small amount of alcohol is added to its bottles because chloroform ($CHCl_3$) easily gets oxidized to form the poisonous gas phosgene. To prevent its oxidation a small amount of ethyl alcohol is added to the bottle containing chloroform.

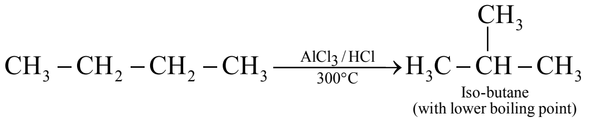
9. The method of converting high boiling hydrocarbons into low boiling hydrocarbons is known as :

(a) pyrolysis (b) isomerisation

(c) cracking (d) inversion

A.P.EAMCET-1994

Ans. (b) : The method of converting high boiling hydrocarbons into low boiling hydrocarbon is known as isomerisation.



$$CH_3-CH_2-CH_2-CH_3 \xrightarrow[300°C]{AlCl_3/HCl} H_3C-\overset{\overset{\displaystyle CH_3}{|}}{C}H-CH_3$$

Iso-butane

(with lower boiling point)

10. Which one of the following compounds is acidic?

(a) C_6H_6 (b) C_2H_6

(c) C_2H_4 (d) C_2H_2

A.P.EAMCET-1994

Ans. (d) : S- character increases then the acidic character increases.

$\boxed{\text{Acidic nature} \propto \text{s-character}}$

$C_6H_6 \rightarrow sp^2$ - s-character (33%)

$C_2H_6 \rightarrow sp^3$ s- character (25%)

$C_2H_4 \rightarrow sp^2$ s-character (33%)

$C_2H_2 \rightarrow sp$ s- character (50%)

In C_2H_2 is sp-hybridisation and s-character is high so it is a acidic nature.

11. Which one of the following compounds is most acidic?

(a) CH_3Cl (b) CH_3OH

(c) $H_2C = CH_2$ (d) $HC \equiv CH$

A.P.EAMCET-1996

Ans. (b) : CH_3OH is most acidic nature because it release H^+ ion (proton).

$$CH_3OH \rightarrow CH_3O^- + H^+$$

12. Liquid benzene burns according to $2C_6H_6(l)$ + $150_2(g) \rightarrow 1200_2(g)$ +$6H_2O$ (g) How many litres of oxygen are required for complete combustion of 39g of liquid C_6H_6 (atomic wt. of C=12, O = 16)?

(a) 11.2 (b) 22.4

(c) 42 (d) 84

A.P.EAMCET-1998, 1996

Ans. (d) :

$$2C_6H_6(l) + 15O_2(g) \rightarrow 12CO_2(g) + 6H_2O(g)$$

2×78gm 15×22.4L

For combustion of 2×78gm of C_6H_6

Volume of O_2 required = 15 ×22.4L

∵ For combustion of 39 gm of C_6H_6

$$\text{Volume of } O_2 \text{ required} = \frac{15 \times 22.4 \times 39}{2 \times 78}$$

= 84 L

13. The number of isomeric structures possible for a molecule having molecular formula C_5H_{12}, is

(a) 2 (b) 3

(c) 4 (d) 5

A.P.EAMCET-1996

@apna_pdf

Ans. (b) : The molecular formula C_5H_{12} has isomeric structure are–

(i) $CH_3–CH_2–CH_2–CH_2–CH_3$
(n – pentane)

(ii) $$CH_3-\underset{}{\overset{CH_3}{\overset{|}{C}}}H-CH_2-CH_3$$
(iso-pentane)

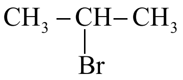
(iii) $$CH_3-\underset{CH_3}{\underset{|}{\overset{CH_3}{\overset{|}{C}}}}-CH_3$$
(neo–pentane)

14. The alkane that yields two isomeric monobromo derivatives is
(a) Neo-pentane (b) Ethane
(c) Methane (d) Propane
A.P.EAMCET-1997

Ans. (d) : Propane is an alkane which react with bromine (Br_2) in the presence of UV light to form two isomeric monobromo derivates.

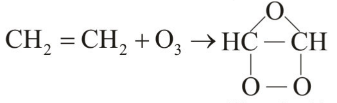
$$CH_3-CH_2-CH_3+Br_2\xrightarrow{\text{UV light}}\underset{\text{1–bromo propane}}{CH_3-CH_2-CH_2-Br}+$$



$$CH_3-\underset{Br}{\underset{|}{CH}}-CH_3$$
2-bromo propane

15. Which of the following compounds does not form an ozonide?
(a) Ethene (b) Propyne
(c) Propene (d) Propane
A.P.EAMCET-1997

Ans. (d) : Propane is a saturated compound ozonide is formed only by alkenes or alkynes. Ozonolysis take place in compounds containing double or triple bonds.



Ethene Ozonide

16. In Wurtz reaction, the reagent used is
(a) Na (b) Na/liq.NH_3
(c) Na/dry ether (d) Na/dry ethanol
A.P.EAMCET-1998

Ans. (c) : Wurtz reaction is the method of preparation of alkane from alkyl halide– explanation

$$RCl+2Na+RCl\xrightarrow[\text{Ether}]{\text{Dry}}2NaCl+\underset{\text{alkane}}{R-R}$$

The reagent used in the Wurtz reaction is sodium in the presence of dry ether.

17. A mixture contains four solid organic compounds A, B, C, D. On heating, only C changes from solid to vapour state. C can be separated from the rest in the mixture by
(a) Distillation (b) Sublimation
(c) Fractional distillation (d) Crystallisation
A.P.EAMCET-1998

Ans. (b) : On heating, only C changes from solid to vapour state.

$$C\rightarrow \text{Solid}\xrightarrow{\text{Sublimation}}\text{Vapour}$$

Hence, C can be separated by sublimation.

18. A solid organic compound X, on heating, directly converted into the vapour phase which on cooling solidifies. The best method for purifying X is
(a) Distillation
(b) Distillation at reduced pressure
(c) Sublimation
(d) Steam distillation
A.P.EAMCET-2000, 1999

Ans. (c) : A solid organic compound X, on heating directly converted into vapour phase which on cooling solidify. The best method for purifying 'X' is sublimation.

19. An organic compound having carbon and hydrogen, has 80% carbon. The empirical formula of the hydrocarbon is
(a) CH (b) CH_2
(c) CH_3 (d) CH_4
A.P.EAMCET-1998

Ans. (c) : Given that, Carbon = 80%
Remaining of Hydrogen = 20%

Element	**Percentage atomic Weight**	**Simple ratio**
C	80/12= 6.66	6.66/6.66 = 1
H	20/1=20	20/6.66 = 3

Hence, the empirical formula is CH_3

20. n – octane and n-nonane have
(a) Same molecular formula
(b) Same molecular weight
(c) Similar chemical properties
(d) Same boiling point
A.P.EAMCET-1999

Ans. (c) :
$CH_3–CH_2–CH_2–CH_2–CH_2–CH_2–CH_2–CH_3$
n-octane
$CH_3–CH_2–CH_2–CH_2–CH_2–CH_2–CH_2–CH_2–CH_3$
n-nonane
Hence, n-octane and n-nonane have similar chemical properties.

21. Which of the following alkanes cannot be prepared by Wurtz reaction?
(a) C_2H_6 (b) C_3H_6
(c) CH_4 (d) C_4H_{10}
Manipal-2016
A.P.EAMCET-1999

Ans. (c) : Methane cannot be prepared by Wurtz reaction. Hence, in methane having one carbon atom chain only. In Wurtz reaction is used for the preparation of only those alkanes that contain at least two carbon atoms.

22. Which of the following reacts with water to give ethane?
(a) CH_4 (b) C_2H_5MgBr
(c) C_2H_5OH (d) $C_2H_5–O–C_2H_5$
A.P.EAMCET-2000

@apna_pdf

Ans. (b) : When C_2H_5MgBr (ethyl magnesium bromide) reacts with water to give ethane.

$$\underset{\text{Ethyl magnesium bromide}}{C_2H_5MgBr} + HOH \rightarrow \underset{\text{Ethane}}{C_2H_6} + Mg(OH)Br$$

23. What is the minimum quantity (in grams) of methyl iodide required for preparing one mole of ethane by Wurtz reaction?
(Atomic weight of iodine=127)

(a) 142 (b) 568
(c) 326 (d) 284

A.P.EAMCET-2002

Ans. (d) From Wurtz reaction preparation of ethane is -

$$\underset{\substack{\text{Methyl Iodine}\\ \text{1Mole}}}{2CH_3I} + Na \xrightarrow[\text{ether}]{\text{dry}} \underset{\text{1Mole}}{C_2H_6} + 2NaI$$

Hence, 1 moles of C_2H_6 is prepared by 2 moles of CH_3I required

So, the weight of 2 moles of CH_3I

$= 2 \times (12 + 3 + 127)$
$= 2 \times 142$
$= 284$ gm

24. 4 g of a hydrocarbon on complete combustion gave 12,571 g of CO_2 and 5.143 g of water. What is the empirical formula of the hydrocarbon?

(a) CH (b) CH_2
(c) CH_3 (d) C_2H_3

A.P.EAMCET-2002

Ans. (b) : % of carbon

$$= \frac{12}{44} \times \frac{\text{weight of } CO_2 \times 100}{\text{weight of organic compound}}$$

$$= \frac{12}{44} \times \frac{12.571}{4} \times 100 = 85.7\%$$

$$\% \text{ of Hydrogen} = \frac{2}{18} \times \frac{\text{weight of water}}{\text{weight of compound}} \times 100$$

$$= \frac{2}{18} \times \frac{5143 \times 100}{4} = 143\%$$

Element	% atomic weight	Simple ratio
C	$\frac{85.7}{12} = 7.15$	$\frac{7.15}{7.15} = 1$
H	$\frac{14.3}{1} = 14.3$	$\frac{14.3}{7.15} = 2$

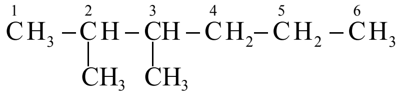
Hence the empirical formula = CH_2

25. 2, 3 dimethylhexane contains ...... tertiary ....secondary and ....primary carbon atoms, respectively.

(a) 2, 2, 4 (b) 2, 4, 3
(c) 4, 3, 2 (d) 3, 2, 4

A.P.EAMCET-2003

Ans. (a) :



$$\overset{1}{C}H_3-\underset{\underset{CH_3}{|}}{\overset{2}{C}H}-\underset{\underset{CH_3}{|}}{\overset{3}{C}H}-\overset{4}{C}H_2-\overset{5}{C}H_2-\overset{6}{C}H_3$$

2, 3 dimethyl hexane

Hence, no. of tertiary carbon atoms = 2
no. of secondary carbon atoms= 2
no. of primary carbon atoms = 4

26. Match the following column.

Column I	**Column II**
(a) Ethane	(1) 2 sp carbons
(b) Ethylene	(2) 6 sp^2 carbons
(c) Acetylene	(3) 2 sp^3 carbons
(d) Benzene	(4) 2 sp^2 carbons
	(5) 1 sp and 1sp^2 carbons

(a) 3 4 1 2
(b) 4 5 3 2
(c) 3 1 2 5
(d) 2 3 4 5

A.P.EAMCET-2004

Ans. (a) :

Column I	**Column II**
Ethane	2sp^3 carbons
Ethylene	2sp^2 carbons
Acetylene	2sp carbons
Benzene	6 sp^2 carbons

27. An organic compound containing C and H has 92.3% of carbon, Its empirical formula is

(a) CH (b) CH_3
(c) CH_2 (d) CH_4

A.P.EAMCET-2004

Ans. (a) : Given that, C = 92.3% and H is 7.7%

Element	Percentage atomic weight	Simple ratio
C	$\frac{92.3}{12} = 7.69$	$\frac{7.69}{7.69} = 1$
H	$\frac{7.7}{1} = 7.7$	$\frac{7.70}{7.69} \simeq 1$

Hence the empirical formula = CH

28. The chemicals and the reaction conditions required for the preparation of ethane are

(a) C_2H_5l, Zn–Cu, C_2H_5OH
(b) CH_3Cl, Na, H_2O
(c) KOOC–CH = CH– COOK, electrolysis
(d) CH_3CO_2Na, NaOH, CaO, Δ

A.P.EAMCET-2005

Ans. (a) : $\underset{\text{Ethyl iodide}}{C_2H_5I} \xrightarrow[C_2H_5OH]{\text{Zn–Cu}} \underset{\text{Ethane}}{C_2H_6} + HI$

29. Which of the following reagents when heated with ethyl chloride, forms ethylene?

(a) Aqueous KOH (b) Zn/HCl
(c) Alcoholic KOH (d) C_2H_4

A.P.EAMCET-2006

Ans. (c) : Ethyl chloride reacts with aq.KOH and alcohol forms.
Ethyl chloride reacts with Zn/HCl and alkane forms.
Ethyl chloride reacts with alc.KOH and ethene forms.
The reaction of the process is–

$$C_2H_5Cl \xrightarrow{\text{alc.KOH}} CH_2 = CH_2 + HCl$$

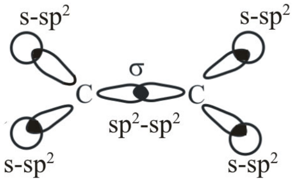
30. A molecule (X) has (i) four sigma bonds formed by the overlap of sp^2 and s orbitals (ii) one sigma bond formed by sp^2 and sp^2 orbitals and (iii) one π bond formed by p_x and p_z orbitals. Which of the following is X?

@apna_pdf

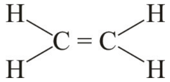
(a) C_2H_6 (b) C_2H_3Cl
(c) $C_2H_2Cl_2$ (d) C_2H_4

A.P.EAMCET-2006

Ans. (d) : A molecule C_2H_4 has four sigma bonds formed by the overlap of sp^2 and s-orbital and one sigma bond formed by sp^2 and sp^2 orbitals and one π-bond formed by p_x and p_z orbitals.



Geometry of molecule is–



31. Which of the following compounds shows maximum boiling point?

(a) Iso-octane
(b) n - octane
(c) 2,2,3,3 – tetramethyl butane
(d) n - butane

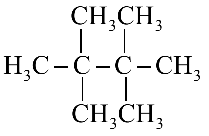
MPPET - 2012

Ans. (b) :

Boiling point ∝ Molecular weight of compound

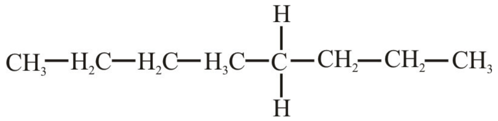
$$\propto \frac{1}{\text{Branching of compound}}$$

(i) $CH_3—CH_2—CH_2—CH_3$
n-Butane

(ii)


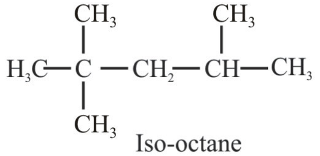
$H_3C-C(CH_3)_2-C(CH_3)_2-CH_3$

2, 2, 3, 3 - tetramethyl butane

(iii)


$CH_3—H_2C—H_2C—H_3C—CH_2—CH_2—CH_2—CH_3$

n-octane

(iv)


$H_3C—C(CH_3)_2—CH_2—CH(CH_3)—CH_3$

Iso-octane

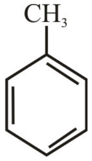
32. The most reactive compound towards nitration is:

(a) Toluene (b) benzene
(c) benzoic acid (d) nitrobenzene

MPPET - 2012

Ans. (a) : Toluene ($C_6H_5CH_3$) is more reactive towards electrophillic nitration due to presence of electron donating group (–CH_3, methyl group).

The structure of toluene is,



33. Alkyl halide reacting with metallic sodium in dry ether solution is called

(a) Friedel-Craft's reaction
(b) Sandmeyer's reaction
(c) Wurtz reaction
(d) Gabriel's reaction

A.P. EAMCET-1996

Ans. (c) : $\underset{\text{Alkyl halide}}{R-X} + \underset{\text{Sodium metal}}{Na} \xrightarrow[-NaCl]{\text{dry ether}} R-R$

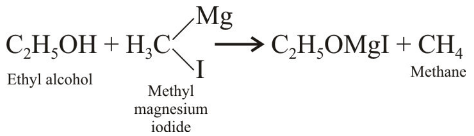
Alkyl halide reacting with metallic sodium in dry ether solution is called as Wurtz reaction.

34. Which one of the following gases is liberated when ethyl alcohol is heated with methyl magnesium iodide?

(a) Methane (b) Ethane
(c) Carbon dioxide (d) Propane

A.P.EAMCET/2003

Ans. (a) : Ethyl alcohol reacts with methyl magnesium iodide as-



$$\underset{\text{Ethyl alcohol}}{C_2H_5OH} + \underset{\text{Methyl magnesium iodide}}{H_3C-Mg-I} \longrightarrow C_2H_5OMgI + \underset{\text{Methane}}{CH_4}$$

35. In the reaction $Cl_2 + CH_4 \xrightarrow{h\nu} CH_3Cl + HCl$ presence of a small amount of oxygen

(a) Increases the rate of reaction of a brief period of time.
(b) Decreases the rate of reaction for a brief period of time.
(c) Does not affect the rate of reaction.
(d) Completely stops the reaction.

MPPET- 2009

Ans. (d) : In the reaction $Cl_2 + CH_4 \xrightarrow{h\nu} CH_3Cl+HCl$ presence of a small amount of oxygen then completely stops the reaction.

36. Which one of the following hydrocarbons has octane number 100?

(a) 2, 2, 3-trimethylpentane
(b) 2, 3, 3-trimethylpentane
(c) 2, 2, 4-trimethylpentane
(d) 2, 3, 4-trimethylpentane

SCRA-2010

Ans. (c) : Isooctane as a reference standard 2,2,4 –trimethylpentane (iso-octane) has as octane rating of 100 where as n-heptane has an octane rating of zero

37. The petrol of octane number 80 has :

(a) 80% n-heptane + 20% iso-octane
(b) 20% n-heptane + 80% iso-octane
(c) 20% n-heptane + 80% n-octane
(d) 80% n-heptane + 20% n-octane

MPPET-2013
UPTU/UPSEE-2010

@apna_pdf

Ans. (b) : Octane Number is a figure indicate the antiknock properties of a fuel based on a comparison with mixture of isooctane and heptane. 80 octane number of petrol means, petrol has 20% n-heptane + 80% isooctance.

38. Among the following reactions, the reaction that "does not" given alkane product is

(a) $CH_3C\equiv CCH_3 \xrightarrow{Pt,\ H_2}$

(b) $CH_3CH_2CH_2CH_2CO_2Na \xrightarrow{Electrolysis}$

(c) $CH_3CH_2Br \xrightarrow{Na,\ dry\ ether}$

(d) $CH_3CH_2CH_2CH_2F \xrightarrow{Zn,\ H^{\oplus}}$

TS-EAMCET (Engg.), 05.08.2021 Shift-II

Ans. (d) :

(a) $CH_3C\equiv CCH_3 \xrightarrow{Pt,H_2} \underset{n\text{-butane}}{CH_3-CH_2-CH_2-CH_3}$

(b) $CH_3(CH_2)_3CO_2Na \xrightarrow{Electrolysis} \underset{n\text{-pentane}}{CH_3-(CH_2)_3-CH_3}$

(c) $CH_3CH_2Br \xrightarrow[\text{Wurtz reaction}]{\text{Na,Dry ether}} \underset{\text{ethane}}{CH_3-CH_3}+2NaBr$

(d) Alkyl halides (except fluorides) on reduction with zinc dilute hydrochloric acid give alkanes.

$$CH_3CH_2CH_2CH_2F \xrightarrow{Zn,H^+} \underset{(\text{No reaction})}{X}$$

This reaction that 'does not' give alkane product.

39. On the basis of which physical property separation of different fractions in fractional distillation technique takes place ?

(a) Solubility (b) Freezing point
(c) Boiling point (d) Melting point

AP EAMCET (Engg.) 17.09.2020, Shift-II

Ans. (c) : Separation of liquids into their pure form to from its liquid mixture is done by fractional distillation technique. It is done, when two liquids have difference in their boiling points (10 – 40 K).

40. Carbon and hydrogen in an organic compound are detected as.......

(a) $CaHCO_3$, $CaCO_3$
(b) $CaHCO_3$, $CuSO_4.\ 5H_2O$
(c) $CaCO_3$, $CuSO_4.\ 5H_2O$
(d) $CaCO_3$, $Cu(OH)_2$

AP EAMCET (Medical) - 2013

Ans. (c) : Carbon and hydrogen in an organic compound are detected as $CaCO_3$, $CuSO_4\ 5H_2O$.

The organic compound is treated with dry copper oxide when C and H of the organic compound are oxidized to carbon dioxide and water.

C of organic compound $+2CuO \xrightarrow{\Delta} CO_2 + 2Cu$

Carbon dioxide is detected by passing it through lime to form calcium carbonate and the presence of hydrogen is detected by passing it through anhydrous copper sulphate (white) which turns blue.

H of organic compound $+\ CuO \xrightarrow{\Delta} H_2O + Cu$

$CuSO_4 + 5H_2O \longrightarrow CuSO_4.5H_2O$
hydrated copper sulphate (blue)

$Ca(OH)_2 + CO_2 \longrightarrow CaCO_3 + H_2O$
milky

41. In an agricultural field, which among the following is the highest producer of methane?

(a) Wheat crop (b) Paddy crop
(c) Cotton crop (d) Groundnut crop

AP EAMCET (Engg.) 21.09.2020, Shift-I

Ans. (b) : Rice is grown in flooded fields, a situation that depletes the soil of oxygen. Soils that are anaerobic (lacking oxygen) allow the bacteria that produce methane from decomposing organic matter to thrive. Some of this methane then bubbles to the surface, but most of it is diffused back into the atmosphere through the rice plants themselves. Hence, the rice Paddy field that produces maximum methane gas into the atmosphere.

42. In Wurtz reaction the reagent used is:

(a) Na (b) Na/liq.NH_3
(c) Na/dry ether (d) Na/dry alcohol

AP EAMCET (Medical) -1998

Ans. (c): In Wurtz reaction, alkyl halide react with Na in the presence of dry ether to give the alkane.

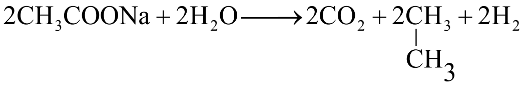
$$2CH_3-Cl+2Na \xrightarrow{ether} \underset{\text{Ethane}}{CH_3-CH_3}+2NaCl$$

43. The gaseous products formed at cathode (X) and anode (Y), when an aqueous solution of sodium acetate is electrolysed are

	X	Y		X	Y
(a)	CO_2	C_2H_6,H_2	(b)	H_2,CO_2	C_2H_6
(c)	$H_2,$	C_2H_6,CO_2	(d)	H_2H_6,H_2	CO_2

AP EAMCET-2017

Ans. (c): When sodium acetate is electrolysed in aqueous medium-



$$2CH_3COONa + 2H_2O \longrightarrow 2CO_2 + 2\underset{\substack{|\\ CH_3}}{CH_3} + 2H_2$$

At anode $-C_2H_6 + CO_2$ (Y) oxidation

At cathode – H_2 (X) reduction.

44. Thermal decomposition of alkane in the absence of air is called as

(a) Cracking (b) Oxidation
(c) Combustion (d) Hydrogenation

MPPET-2008

Ans. (a) : Thermal decomposition of alkane in the absence of air is called as cracking.

45. Consider the following :

At constant pressure, boiling point of a solution is greater than the boiling point of its pure liquid solvent because.

1. solute is non-electrolyte.

2. solute is involatile.

3. chemical potential

@apna_pdf

Which of the above are correct ?

(a) 1 2 and 3 (b) 1 and 2 only

(c) 1 and 3 only (d) 2 and 3 only

SCRA - 2009

Ans. (d) : At constant pressure, the boiling point of a solution is greater than boiling point of pure liquid solvent because most solution have lots of ionic attraction between the different ions in the solution. This ionic attraction makes the solution less volatile. So, higher the boiling point.

46. Match the following?

	Reaction		Nature of Reaction
a.	$RBr \xrightarrow{Na}$	i.	Partial reduction
b.	$RCOO^-Na^+ \xrightarrow[CaO,\Delta]{NaOH}$	ii.	Electrophilic addition
c.	$R-C\equiv C-R' \xrightarrow[Catalyst(H_2)]{Lindlar's}$	iii.	Wurtz reaction
d.	$H_2C=CH_2 \xrightarrow{Br_2/CCl_4}$	iv.	Decarboxylation
		v.	Decarboxylative dimerization

(a) (a – iii), (b – v), (c – i), (d – ii)

(b) (a – iii), (b – iv), (c – i), (d – ii)

(c) (a – ii), (b – iii), (c – i), (d – ii)

(d) (a – v), (b –i), (c –iii), (d – ii)

AP EAPCET 24.08.2021 Shift-II

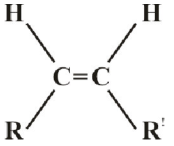
Ans. (b): (a) $RBr \xrightarrow{Na} R–R + 2Na^+X^-$

Wurtz reaction is a coupling reaction of two alkyl halides are reacted with sodium metal to form higher all cane.

(b) $RCOO^-Na^+ \xrightarrow[CaO,D]{NaOH} R – H + Na_2CO_3$

This reaction is known as decorboxylative dimerization

(c) $R-C\equiv C-R' \xrightarrow[Catalyst\ (H_2)]{Lindlar's}$



Partial reduction of alkynes.

(d) $H_2C= CH_2 \xrightarrow{Br_2/CCl_4} Br.N_2C– CH_2Br$

This reaction is electrophilic addition reaction.

So, the option (b) is correct.

47. Assertion (A): Sodium acetate on Kolbe's electrolysis gives ethane.

Reason (B) Methyl free radical is formed at cathode

(a) Both A and R are true and R is a correct explanation for A

(b) Both A and R are true but R is not a correct explanation for A

(c) A is true, R is false

(d) A is false, R is true

AP EAPCET 19-08-2021 Shift-I

Ans. (c) : An aqueous solution of sodium acetate on electrolysis gives alkane i.e. ethane.

$$\underset{\text{sodium acetate}}{2CH_3OONa}+2H_2O \xrightarrow{\text{Electroysis}} \underset{\text{ethane}}{CH_3-CH_3}+2CO_2+H_2 + 2NaOH$$

Hence, first statement is true.

At cathode reaction takes place which is given as –

$$H_2O + e^{\ominus} \longrightarrow OH^{\ominus} + \underset{\text{Hydrogen free radical}}{H^{\bullet}}$$

In this reaction, hydrogen free radical are formed.

48. The chlorination of ethane is an example which type of the following reactions?

(a) Nucleophilic substitution

(b) Electrophilic substitution

(c) Free radical substitution

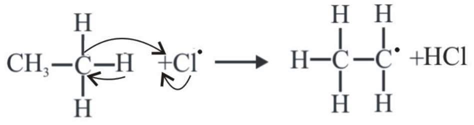
(d) Rearrangement

AP EAMCET (Engg.) 2012

Ans. (c) : Chlorination of ethane take place by free radical substitution in the presence of light, in three steps to form ethyl chloride.

Step-I- Initiation step $Cl_2 \xrightarrow{hv} 2\dot{C}l$

Step-II- Propagation step



ethyl radical

Step-III-Termination Step

$CH_3-\dot{C}H_2+\dot{C}l \longrightarrow CH_3-CH_2Cl$

$\dot{C}l+\dot{C}l \longrightarrow Cl_2$

$2CH_3\dot{C}H_2 \rightarrow CH_3CH_2CH_2CH_3$

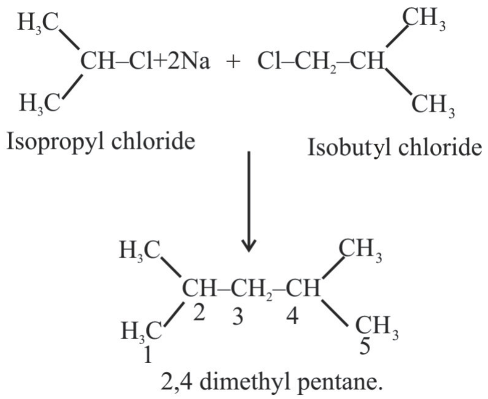
49. Isopropyl chloride and isobutyl chloride reacts with sodium in ether to give

(a) 4-methylhexane (b) 2-methylpentane

(c) 4-methylpentane (d) 2, 4-dimethylpentane.

COMEDK 2011

Ans. (d) :



Isopropyl chloride

Isobutyl chloride

2,4 dimethyl pentane.

@apna_pdf

50. The organic compound obtained during the addition of HBr to propene in the presence of peroxide catalyst is

(a) 2-bromopropane (b) 2-bromopropene
(c) 1-bromopropane (d) 1-bromopropene

COMEDK 2012

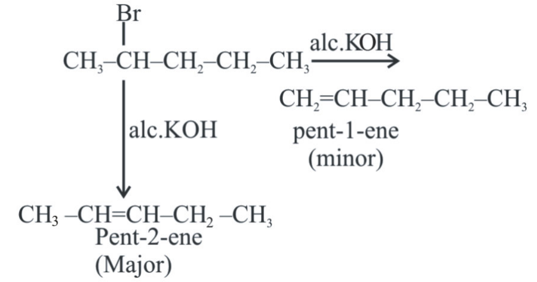
Ans. (c) : $\underset{\text{Propene}}{CH_3-CH=CH_2}+HBr\xrightarrow{\text{Peroxide}}\underset{\text{1-Bromopropane}}{CH_3-CH_2-CH_2Br}$

51. When 2-bromopentane is heated with alcoholic solution of potassium hydroxide, the major product obtained is

(a) Pent-1-ene (b) Pent-2-ene
(c) Pent-1-yne (d) Pent-2-yne

COMEDK 2014

Ans. (b) :



52. Which one of the following is the most energetic conformation of cyclohexane?

(a) Boat (b) Twisted boat
(c) Chair (d) Half chair

COMEDK 2016

Ans. (d) : Half chair is the most energetic and is the most stained and ustable conformation of cyclohexane.

53. Methane can be converted to ethane by the reaction,

(a) Chlorination followed by the reaction with alcoholic KOH
(b) Chlorination followed by the reaction with aqueous KOH
(c) Chlorination followed by Wurtz reaction
(d) Chlorination followed by decarboxylation.

COMEDK 2018

Ans. (c) : Methane can be converted to ethane by the Wurtz reaction,

$$\underset{\text{Methane}}{CH_4}+Cl_2\xrightarrow{h\nu}\underset{\text{Methyl chloride}}{CH_3Cl}+HCl$$

$$2CH_3-Cl+2Na\xrightarrow{\text{dry ether}}\underset{\text{ethane}}{CH_3-CH_3}$$

54. Which of the following reaction is expected to readily given a hydrocarbon product in good yields?

(a) $CH_3CH_3\xrightarrow[h\upsilon]{Cl_2}$
(b) $(CH_3)_2CCl\xrightarrow{C_2H_5OH}$
(c) $RCOOK\xrightarrow[\text{Oxidation}]{\text{Electrolysis}}$
(d) $RCOO\,Ag\xrightarrow{I_2}$

COMEDK 2020

Ans. (c) : When a sodium or potassium salt of a carboxylic acid is electrolysed, hydrocarbon is envolved at anode.

$$2RCOOK\xrightarrow[\text{oxidation}]{\text{electrolysis}}R-R+2CO_2+2KOH+H_2\uparrow$$

This reaction is known as Kolbe's electrolysis.

55. Which among the following is most strained cycloalkane?

(a) Cyclohexane (b) Cyclobutane
(c) Cyclopropane (d) Cyclopentane

COMEDK 2020

Ans. (c) : Cyclopropane has the highest angle strain among the cyclobutane, cyclopentane and cyclohexane.

56. Which one of the following reagents is used for detection of unsaturation in alkenes?

(a) NaOH + CaO
(b) Cold dilute alkaline $KMnO_4$
(c) $Cl_2/h\nu$
(d) KOH / C_2H_5OH

AP-EAMCET (Medical), 2003

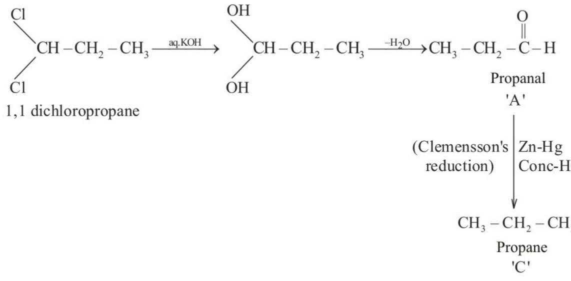
Ans. (b) : Both bromine water or alkaline $KMnO_4$ (Baeyer's reagent) are decolourised after the reaction with unsaturated compound. Unsaturation in alkyne or alkene in any organic compound is defected by reagents the organic compound with alkaline $KMnO_4$ or bromine water.

57. When 1, 1-dichloro propane and 2, 2-dichloro propane are reacted separately with aqueous potassium hydroxide solution, compounds 'A' and 'B' are formed. Both 'A' and 'B' gave the same product 'C' on reduction using amalgamated zinc and HCl Identify 'C'.

(a) Propyl alcohol (b) Isopropyl alcohol
(c) Propyl chloride (d) Propane

AP-EAMCET (Medical), 2008

Ans. (d) :



58. The compound that reacts with CH_3MgBr to yield methane as one of the products is

(a) CH_3CHO (b) CH_3COCH_3
(c) CH_3COOCH_3 (d) CH_3CH_2OH

AP-EAMCET (Medical), 2008

Ans. (d) : Ethyl alcohol reacted with Grignard reagent (CH_3MgBr) to forms the alkane i.e methane.

$$\underset{\text{Ethyl alcohol}}{C_2H_5-OH}+\underset{\text{Grignard reagent}}{CH_3MgBr}\to\underset{\text{Methane}}{CH_4}+CH_3CH_2OMgBr$$

@apna_pdf

59. $C_2H_5OH + SOCl_2 \xrightarrow{\text{Pyridine}} X + Y + Z$, in this reaction X, Y and Z respectively, are

(a) $C_2H_4Cl_2, SO_2, HCl$ (b) C_2H_5Cl, SO_2, HCl
(c) $C_2H_5Cl, SOCl, HCl$ (d) C_2H_4, SO_2, Cl_2

AP-EAMCET (Medical), 2008

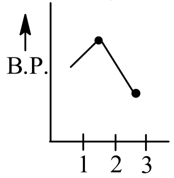
Ans. (b) : When ethyl alcohol reacted with thionyl chloride in the presence of pyridine then the following products are formed-

$$\underset{\text{Ethyl alcohol}}{C_2H_5-OH} + \underset{\text{Thionylchloride}}{SOCl_2} \xrightarrow{\text{Pyridine}} \underset{\substack{\text{'X'}\\ \text{Ethylchloride}}}{C_2H_5-Cl} + \underset{\text{'Y'}}{SO_2} + \underset{\text{'Z'}}{HCl}$$

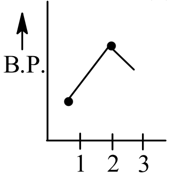
This reaction is called the Darzen reactions.

60. Which one of the following graphs represent the correct order of boiling points (b.p) and ethane (1), ethyl alcohol (2) and acetic acid (3)?

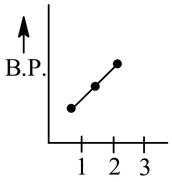
(a)



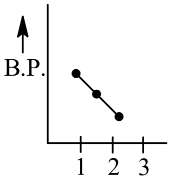
(b)



(c)

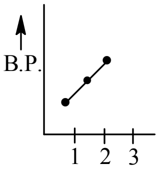


(d)



AP-EAMCET (Medical), 2008

Ans. (c) : The species are given as; ethane (1), ethyl alcohol (2) and acetic acid (3). As we know that acetic acid having more hydrogen bonding than ethyl alcohol. H-bonding increases the boiling point of the compound. Ethane have not hydrogen bonding. Hence, the correct order of boiling point is 3>2>1. Which is illustrated by following graph.



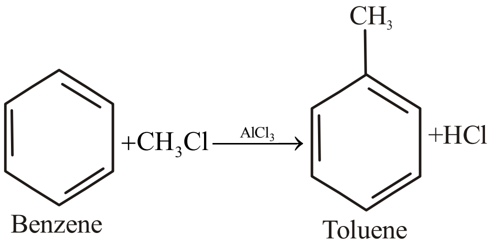
61. In the reaction

$C_6H_6 + R-Cl \xrightarrow{\Delta} C_6H_5-R + HCl$ Δ is

(a) P_2O_5 (b) PCl_5
(c) NaOH (d) $FeCl_3$

AP-EAMCET (Medical), 2001

Ans. (d) : In the Friedal-Craft's reaction benzene reacts with alkyl halide (R-X) in presence of $FeCl_3$ to form alkyl benzene.



62. In the following reaction, A and B respectively are :

$$C_2H_6 \xrightarrow{A} C_2H_5Cl \xrightarrow{Zn/HCl} B$$

(a) Cl_2/UV light and C_2H_6
(b) PCl_3 and C_2H_4
(c) HCl and C_2H_6
(d) Cl_2 and C_2H_2

AP-EAMCET (Medical), 2002

Ans. (a) : The reaction of ethane with chlorine in presence of sun light gives the ethyl chloride. Further ethyl chloride on reduction with Zn/HCl gives the ethane.

$$\underset{\text{Ethane}}{C_2H_6} \xrightarrow[Cl_2/\text{UV-light}]{\overset{A}{\downarrow}} C_2H_5Cl \xrightarrow{Zn/HCl} \underset{\substack{\text{Ethane}\\ \text{'B'}}}{C_2H_6}$$

63. Aluminium reacts with hot concentrated H_2SO_4 to liberate :

(a) SO_2 (b) H_2S
(c) SO_3 (d) S (Vapour)

AP-EAMCET (Medical), 2002

Ans. (a) : Aluminium reacts with not concentrated sulphuric acid to form aluminium sulphate with the evalution of sulphur dioxide gas Sulphuric acid acts as on oxidising agent and get itself reduced to SO_2.

$$\underset{\text{Aluminium}}{2Al} + \underset{\substack{\text{Conc–Sulfuric}\\ \text{acid}}}{6H_2SO_4} \longrightarrow \underset{\substack{\text{Aluminimum}\\ \text{sulfate}}}{Al_2(SO_4)_3} + \underset{\substack{\text{Sulfure}\\ \text{dioxide}}}{3SO_2} + \underset{\text{water}}{6H_2O}$$

Here H_2SO_4 acts as an oxidising agent and get itself reduced to SO_2.

64. In the following reaction, X and Y are :

$$2C_2H_6 + 7O_2 \xrightarrow{\text{combustion}} X + Y + \text{Heat}$$

(a) $2C_2H_5OH, 6O_2$ (b) $4HCHO, 5H_2O$
(c) $4CO, 10H_2O$ (d) $4CO_2, 6H_2O$

AP-EAMCET (Medical), 2002

Ans. (d) : The combustion of any hydrocarbon in presence of air gives carbondioxide and water (CO_2 + H_2O). The equation for the combustion of ethane is given below –

$$\underset{\text{Ethane}}{2C_2H_6} + \underset{\text{Oxygen}}{7O_2} \longrightarrow \underset{\text{Carbondioxide}}{4CO_2} + \underset{\text{water}}{6H_2O}$$

65. The reactants and reaction conditions used in the preparation of ethane are :

(a) $2CH_3I$, Na, C_2H_5OH
(b) electrolysis of $C_2H_5COO^-K^+$
(c) C_2H_4, H_2, 27°C
(d) C_2H_5I, H_2, Zn–Cu, C_2H_5OH

AP-EAMCET (Medical), 2002

Ans. (d) : Preparation of ethane in the reduction of Ethyl iodide by Zn–Cu couple in ethanol gives the ethane.

$$\underset{\text{Ethyl iodide}}{CH_3-CH_2-I} + 2[H] \xrightarrow[C_2H_5-OH]{Zn/Cu} \underset{\text{Ethane}}{C_2H_6} + HI$$

66. Which of the following aqueous solutions should have the minimum boiling point?

(a) 0.1 M Urea (b) 0.1 M K_2SO_4
(c) 0.1 M NaCl (d) 0.1 M $FeCl_3$

GUJCET-2021

@apna_pdf

Ans. (a) : The boiling point of compounds depends upon the van't Hoff factor. The van't Hoff factor is equal to the number of discrete ions in a formula unit of the substance.

$NH_2CONH_2 \rightarrow NH_2CONH^- + H^+$ i = 1

$K_2SO_4 \rightarrow 2K^+ + SO_4^{2-}$ i = 3

$NaCl \rightarrow Na^+ + Cl^-$ i = 2

$FeCl_3 \rightarrow Fe^{3+} + 3Cl^-$ i = 4

Hence, aqueous solution of urea is a covalent compound it show minimum boiling point.

67. The major product of the following synthetic reactions is

$$CH_3CH_2CH_3 \xrightarrow[\substack{\text{(iii) } Cl_2,\, 773K \\ \text{(iv) AgOH(aq)}}]{\substack{\text{(i) } Cl_2,\, h\nu \\ \text{(ii) alc.KOH}}}$$

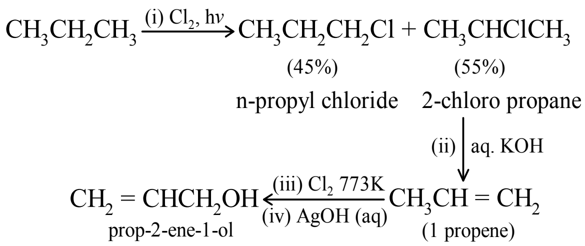
(a) 
(b) CH_3CH_2CHO

(c) $CH_2 = CHCH_2OH$

(d) $CH_3CH_2CH_2OH$

TS-EAMCET (Engg.), 06.08.2021

Ans. (c):



$$CH_3CH_2CH_3 \xrightarrow{\text{(i) } Cl_2,\ h\nu} \underset{\substack{(45\%) \\ \text{n-propyl chloride}}}{CH_3CH_2CH_2Cl} + \underset{\substack{(55\%) \\ \text{2-chloro propane}}}{CH_3CHClCH_3}$$

$$\downarrow \text{(ii) aq. KOH}$$

$$\underset{\text{prop-2-ene-1-ol}}{CH_2 = CHCH_2OH} \xleftarrow[\text{(iv) AgOH (aq)}]{\text{(iii) } Cl_2\ 773K} \underset{\text{(1 propene)}}{CH_3CH = CH_2}$$

68. Which is used as antiknock in petrol?

(a) Tetraethyl Lead

(b) Tetramethyl lead

(c) Tetrapropyl lead

(d) Tetrabuty lead

[AIIMS-1997]

Ans. (a): Tetraethyl lead is used as antiknocking agent. Antiknock agents are the compounds included in little amounts to engine power to improve the antiknocking ratings of fuel.

Generally added to gasoline to raise its octane value. Tetraethyl Lead (TEL) is an organ metallic compound containing the harmful metal lead. TEL was once a major industrial compound of lead because of it is use as an antiknocking agent in gasoline.

69. What happens when chloroform is left open in air in the presence of sunlight?

(a) Polymerisation takes place

(b) Explosion takes place

(c) No reaction takes place

(d) Phosgene, a poisonous gas is formed

AIIMS-1996

Ans. (d): $\underset{\text{Chloroform}}{CHCl_3} + [O] \xrightarrow{\text{Sunlight}} \underset{\text{Phosgene}}{COCl_2} + HCl$

Chloroform in the presence of sunlight and air undergoes reaction with oxygen and form a poisonous phosgene gas.

70. **Assertion:** 2-Bromobutane on reaction with sodium ethoxide in ethanol gives 1-butene as a major product.

Reason: 1-Butene is more-stable than 2-butene.

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.

(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.

(c) If the Assertion is correct but Reason is incorrect.

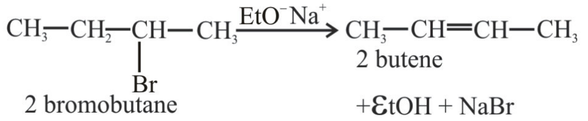
(d) If both the Assertion and Reason are incorrect.

(e) If the Assertion is incorrect but the Reason is correct.

[AIIMS-2004]

Ans. (d): 2-Bromobutane undergo dehydrohalogenation in presence of sodium ethoxide in ethanol.

The elimination is according to Satyzeff rule. Durning dehydrohalogenation H is eliminated so as to form more alkylated alkene i.e. from the carbon atom is less 'H' atm.



$$\underset{\text{2 bromobutane}}{CH_3-CH_2-\underset{\substack{| \\ Br}}{CH}-CH_3} \xrightarrow{EtO^-Na^+} \underset{\text{2 butene}}{CH_3-CH=CH-CH_3} + \mathcal{E}tOH + NaBr$$

Since, 2 – butane is more stable than 1– butane because of number of ∝ – H is maximum.

Hence, option (d) is correct according to the question.

71. **Assertion :** CH_4 does not react with Cl_2 in dark.

Reason: Chlorination of CH_4takes place in sunlight.

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.

(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.

(c) If the Assertion is correct but Reason is incorrect.

(d) If both the Assertion and Reason are incorrect.

(e) If the Assertion is incorrect but the Reason is correct.

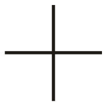
[AIIMS-2001]

Ans. (b): Chlorination of methane (CH_4) does not takes place in dark because it is a free radical reaction and free radicals are obtained in the presence of sunlight.

72. What is the correct decreasing order of boiling point for the following compounds?

(I)

(II)



(III)

(a) I > II > III

(b) II > III > I

(c) I > III > II

(d) III > II > I

[AIIMS-26 May, 2018 (M)]

Ans. (a): The boiling point of alkane increases with increase in molecular mass for the same alkane. The boiling point decrease with branching.

Hence, the decreasing orders of boiling point are–

Pentane (I) > butane (II) > neo pentane (III)

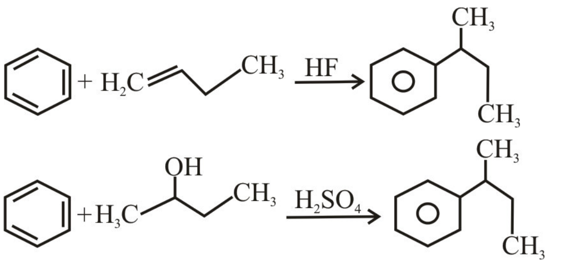
@apna_pdf

73. Which of the following would not give 2-phenylbutane as the major product in a Friedel-Craft's alkylation reaction of benzene?

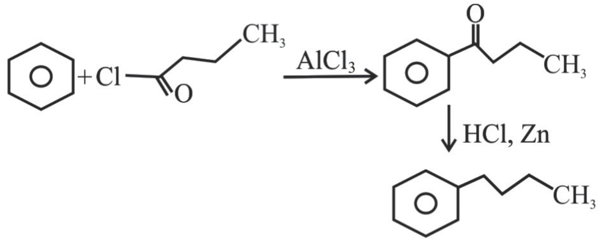
(a) 1-butene +HF
(b) 2-butanol + H_2SO_4
(c) Butanoyl chloride + $AlCl_3$ then Zn, HCl
(d) Butyl chloride + $AlCl_3$

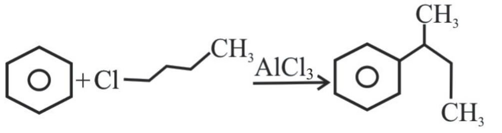
[AIIMS-2014]

Ans. (c):



The Friedal-Crafts alkylation reaction will give propyl phenyl ketone which further on clemnenson's reduction will give butyl benzene.





74. The most important method of preparation of hydrocarbons of lower carbon number is

(a) pyrolysis of higher carbon number of hydrocarbons
(b) electrolysis of salts of fatty acids
(c) Sabatier and Senderen's reaction
(d) direct synthesis

[AIIMS-2009]

Ans. (a): The most important method of preparation of hydrocarbons of lower carbon numbers is by pyrolysis of higher carbon number hydrocarbons.

Eg-

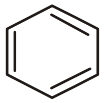
$$\underset{\text{Hexane}}{C_6H_{14}} \xrightarrow{\text{Pyrolysis}} \underset{\text{Ethene}}{C_2H_4} + \underset{\text{Butane}}{C_4H_{10}}$$

75. The size of C – C bond in benzene is

(a) 1.22 Å
(b) 1.54 Å
(c) 1.39 Å
(d) 1.56 Å

[AIIMS-2002]

Ans. (c): The structure of benzene is –



In bond length of C – C single bond is ethane = 1.54 Å and double bond (C = C) in ethane is 1.33 Å. In benzene carbon carbon bond length has 1.39 Å which lies between the single and double bond length value.

76. The boiling points of four saturated hydrocarbons are given below. Which boiling point suggests maximum number of carbon atoms in its molecule:

(a) –162ºC
(b) –88.6ºC
(c) –0.5ºC
(d) –42.2ºC

[AIIMS-2001]

Ans. (c): Boiling Point depends on the number of Carbon atom. Carbon atom is increase then the boiling point is also increase.

Saturated hydrocarbon	Boiling point	
CH_4 (methane)	–161.6°C	Boiling Point increases due to carbon Chain increases ↓
C_2H_6 (ethane)	–89°C	
C_3H_8 (propane)	–42.1°C	
C_4H_{10} (bu tan e)	–0.5°C	

77. What is Z in the following reaction?

$$CH_3-CH_2-CO_2^-Na^{\oplus} \xrightarrow{NaOH/CaO} Z$$

(a) propane
(b) n - butane
(c) ethane
(d) ethyne

AP-EAMCET (Engg.) - 2014

Ans. (c) : Sodium propanoate reacts with sodium hydroxide in presence of CaO to give the ethane.

$$\underset{\text{Sodium propanoate}}{CH_3-CH_2-CO_2^-Na^+} \xrightarrow{NaOH/CaO} \underset{\text{ethane}}{CH_3-CH_3} + Na_2CO_3$$

78. Assertion (A): Cyclohexane is the most stable cycloalkane.

Reason (R): Cyclopropane and cyclobutane are less stable due to angle strain and torsional strain.

The correct answer is

(a) Both (A) and (R) are true but (R) is not the correct explanation of (A).
(b) (A) is true but (R) is not true.
(c) (A) is not true but (R) is true.
(d) Both (A) and (R) are true and (R) is the correct explanation of (A).

AP-EAMCET- (Engg.)-2011

Ans. (a) : In cycloalkane heat of combustion is lowest than cyclohexane so it is most stable cycloalkane. Cyclopropane and cyclobutane are less stable due to angle strain and torsional strain. Therefore cylopropane and cylobutane are reactive cycloalkane.

@apna_pdf

79. Phosgene is formed slowly from which one of the following on exposure to air and sunlight?

(a) $CHCl_3$ (b) H_3CCl

(c) H_3COH (d) C_2H_5Cl

AP-EAMCET- (Engg.)-2011

Ans. (a) : In the presence of air and light, chloroform forms carbonyl chloride (also called phosgene) which is extremely poisonous.

$$\underset{\text{Chloroform}}{CHCl_3} + \frac{1}{2}O_2 \xrightarrow{\text{air and light}} \underset{\text{Phosgene}}{COCl_2} + HCl$$

80. Which of the following belongs to the homologous series of $C_5H_8O_2N$?

(a) $C_6H_{10}O_3\,N$ (b) $C_6H_8O_2\,N_2$

(c) $C_6H_{10}O_2\,N_2$ (d) $C_6H_{10}O_2\,N$

AP-EAMCET – 2016

Ans. (d) : The general formula of alkane family or homologous series is C_nH_{2n+2}. Where, n = no. of carbon atoms and 2n + 2 stand for no. of hydrogen atom in the molecule. Since increasing the carbon atom 1 and hydrogen atom increased by 2. Hence, $C_6H_{10}O_2N$ is homologous series.

81. Wet ether is not used as a solvent in Wurtz reaction, because the water present in it :

(a) hydrolyses RX to ROH

(b) reduces RX to RH

(c) destroy the Na metal

(d) reacts with R-R

AP-EAMCET (Engg.)-2004

Ans. (c) : As we know Na metal is highly reactive in nature due to which we can not use the wet ether because it destroy the Na metal. The product is formed alkane in Wurtz reaction.

$$\underset{\text{Ethylchloride}}{C_2H_5Cl} + \underset{\substack{\text{Sodium}\\\text{metal}}}{2Na} + C_2H_5Cl \rightarrow \underset{\text{Butane}}{C_4H_{10}} + 2NaCl$$

82. The alkane that yields two isomeric monobromo derivatives:

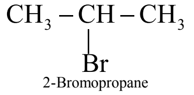
(a) Neo pentane (b) Ethene

(c) Methane (d) Propane

AP – EAMCET - (Medical)-1997

Ans. (d) : Propane exhibit two isomeric monobromo derivatives–

$$\underset{\text{Bromopropane}}{CH_3-CH_2-CH_2-Br}$$



$$\underset{\text{2-Bromopropane}}{CH_3-\underset{\displaystyle Br}{\underset{|}{CH}}-CH_3}$$

83. Hydrolysis of an ester gives a carboxylic acid which on Kolbe's electrolysis yields ethane, The ester is :

(a) Methyl ethanoate (b) Methyl methanoate

(c) Ethyl methanoate (d) Methyl propanoate

AP – EAMCET - (Medical)-1997

Ans. (a) : Hydrolysis of methyl ethanoate (CH_3COOCH_3) gives acetic acid (CH_3COOH) and methyl alcohol (CH_3OH). Acetic acid on electrolysis by Kolbe's method gives ethane. Thus, the ester will be methyl ethanoate (CH_3COOCH_3).

$$\underset{\text{Methyl ethanoate}}{CH_3COOCH_3} + \longrightarrow \underset{\text{Acetic acid}}{CH_3COOH} + \underset{\text{Methanol}}{CH_3OH}$$

In Kolbe's electrolysis, ethane is formed in anode and H_2 gas librated at cathode.

At anode :-

$$\underset{\text{Acetate ion}}{2CH_3COO^-} \longrightarrow 2CH_3COO + 2e^- \xrightarrow{\Delta} \underset{\text{Ethane}}{C_2H_6} + 2CO_2\uparrow$$

At cathode:-

$$H^+ + e^- \longrightarrow H$$

$$H + H \longrightarrow H_2(\uparrow)$$

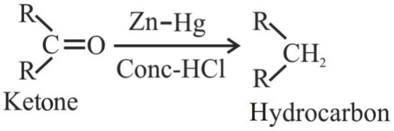
84. Which of the following reagents converts both acetaldehyde and acetone to alkanes?

(a) Ni/H_2 (b) $LiAlH_4$

(c) $I_2/NaOH$ (d) Zn-Hg/conc. HCl

AP-EAMCET (Engg.)-2005

Ans. (d): The reagent Zn-Hg/conc-HCl converts the acetone/acetaldehycle in to the alkanes. This type of reduction is called Clemmenssen reduction reaction.



85. The compounds formed at anode in the electrolysis of an aqueous solution of potassium acetate are:

(a) C_2H_6 and CO_2 (b) C_2H_4 and CO_2

(c) CH_4 and H_2 (d) CH_4 and CO_2

AP-EAMCET (Engg.)-2005

Ans. (a): Kolbe reaction is an organic reaction named after Hermann Kolbe. The Kolbe reaction is formally a decarboxylative dimerization of two carboxylic acids. After electrolysis, alkanes is formed at anode along with the release of carbondioxide.

$$CH_3COO^- \longrightarrow \dot{C}H_3 + CO_2$$

$$\dot{C}H_3 + \dot{C}H_3 \longrightarrow C_2H_6 \text{ (at anode)}$$

86. Which of the following reactions is used to prepare isobutane?

(a) Wurtz reaction of C_2H_5Br

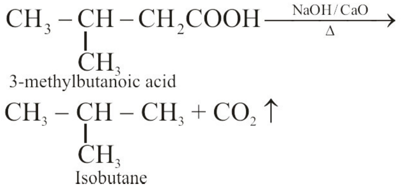
(b) Hydrolysis of n-butylmagnesium iodide

(c) Reduction of propanol with red phosphorus and HI

(d) Decarboxylation of 3-methylbutanoic acid

VITEEE-2015

Ans. (d) :



$$\underset{\text{3-methylbutanoic acid}}{CH_3-\underset{\displaystyle CH_3}{\underset{|}{CH}}-CH_2COOH} \xrightarrow[\Delta]{NaOH/CaO} \underset{\text{Isobutane}}{CH_3-\underset{\displaystyle CH_3}{\underset{|}{CH}}-CH_3} + CO_2\uparrow$$

3-methylbutanoic acid gives isobutane on decarboxylation.

@apna_pdf

87. Which of the following compounds cannot be prepared singly by the Wurtz reaction?

(a) C_2H_6
(b) $(CH_3)_2CHCH_3$
(c) $CH_3CH_2\ CH_2\ CH_3$
(d) All of the above can be prepared

VITEEE-2014

Ans. (b) : Unsymmetrical hydrocarbon cannot be Singly prepared by wurtz reaction. A mixture of two different alkyl halides is heated with sodium metal, three different alkenes will be produced.

88. $\mathbf{CH_3CH_3 + HNO_3 \xrightarrow{675K}}$

(a) $CH_3CH_2NO_2$
(b) $CH_3CH_2NO_2 + CH_3NO_2$
(c) $2CH_3NO_2$
(d) $CH_2 = CH_2$

VITEEE- 2008

Ans. (b) : Aliphatic nitro compounds are prepared by vapour phase nitration of alkanes at 693-793K, under pressure. Alkanes though less reactive do undergo nitration to give a mixture of nitro alkanes resulting through cleavage of carbon-carbon bond along with oxidation product like CO_2, NO_2, H_2O etc.

$$\underset{(\text{fuming})}{CH_3CH_3 + HNO_3} \xrightarrow{675K} \underset{(80\%)}{CH_3CH_2NO_2} + \underset{(20\%)}{CH_3-NO_2}$$

89. The electrode reaction that takes place at the anode of $CH_4 - O_2$ fuel cell is

(a) $2O_2 + 8H^+ + 8e^- \rightarrow 4H_2O$
(b) $CH_4 + 2H_2O \rightarrow CO_2 + 8H^+ + 8e^-$
(c) $CH_4 + 2O_2 \rightarrow CO_2 + 2H_2O$
(d) $2H^+ + 2e^- \rightarrow H_2$

VITEEE- 2006

Ans. (b) : At anode the following reaction takes place

$$CH_4 + 2H_2O \rightarrow CO_2 + 8H^+ + 8e^-$$

90. The product/s of following reaction is (are)

$\mathbf{C_2H_5Br + 2Na + CH_3Br \xrightarrow{dry ether} ?}$

(a) ethane
(b) propane
(c) butane
(d) ethane, propane and butane.

AMU-2014

Ans. (d) :

$$\underset{\text{Ethyl bromide}}{C_2H_5Br} + 2Na + \underset{\text{Methyl bromide}}{CH_3Br} \xrightarrow{\text{dry ether}} \underset{\text{Ethane}}{CH_3-CH_3} + \underset{\text{Propane}}{C_2H_5-CH_3} + \underset{\text{Butane}}{C_2H_5-C_2H_5}$$

When two different alkyl halides are heated with sodium metal in the presence of dry ether, a mixture of different alkenes is obtained. This reaction is known as wurtz reaction

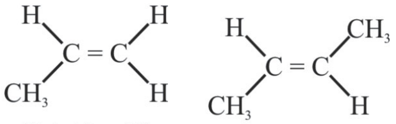
91. Among the following 1–butane (I), cis–2–butene (II), Trans–2–butene (III), the decreasing order of stability is

(a) II > I > III
(b) III > II > I
(c) II > III > I
(d) I > III > II

AMU – 2008

Ans. (b) : Heat of Hydrogenation shows that greater the no. of alkyl group attached to the double bonded carbon atoms, greater is the stability (i.e., Lower is the heat of Hydrogenation) of the alkene.

$$\underset{\text{1-Butene (I)}}{CH_3CH_2CH = CH_2}$$



Cis-but-2-ene(II) Cis-but-2-ene(III)

Relative stability of these alkenes follows the sequence :- III > II > I

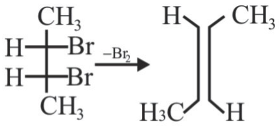
Trans-but-2-ene (III) is more stable than cis-but-2-ene (II) in which the two methyl group are close together and hence then electronic clouds repel each other.

92. During debromination of meso–dibromobutane, the major product formed is

(a) n–butane
(b) l–butane
(c) cis–2–butene
(d) trans–2–butene.

AMU – 2008

Ans. (d) : Elimination of two bromine atoms from meso-dibromobutane are predominantly trans i.e. steroselective.



meso-dibromobutane trans-2-butane

93. Which of the following compounds will be formed as a major product on treatment of 2–bromobutane with ethenolic KOH?

(a) 
(b) 
(c) 
(d) 
AMU–2006

Ans. (b) : 
$$CH_3-CH_2-\underset{\underset{Br}{|}}{CH}-CH_3 \xrightarrow[\text{KOH}]{\text{ethanolic}} CH_3-CH=CH-CH_3$$

According to Saytzeff's rule, during the dehydrohalogenation of secondary and tertiary haloalkanes, the hydrogen atom is preferentially eliminated from the adjacent carbon atom with lesser number of hydrogen atoms.

@apna_pdf

94. The reduction of cyanomethane using H_2/Ni yields

(a) methanamine (b) N-methylmethanamine
(c) ethanamine (d) ethanamide.

AMU-2004

Ans. (c) : $\underset{\text{Ethanamine}}{CH_3CN} \xrightarrow[Ni]{2H_2} CH_3CH_2NH_2$

95. 2, 3-Dimethyl butane is obtained by catalytic hydrogenation of

(a) $CH_3CH_2CH=CHCH_3$

(b) $CH_3-CH_2\underset{\displaystyle CH_3}{\underset{|}{C}}=CH_2$

(c) $CH_3CH=\underset{\displaystyle CH_3}{\underset{|}{C}}CH_3$

(d) $CH_3\underset{\displaystyle CH_3}{\underset{|}{C}}H=\underset{\displaystyle CH_3}{\underset{|}{C}}-CH_3$

AMU–2003

Ans. (d) : $CH_3-\underset{\displaystyle CH_3}{\underset{|}{C}}=\underset{\displaystyle CH_3}{\underset{|}{C}}-CH_3+H_2 \xrightarrow{Ni} CH_3-\overset{\displaystyle H}{\overset{|}{\underset{\displaystyle H_3C}{\underset{|}{C}}}}-\overset{\displaystyle H}{\overset{|}{\underset{\displaystyle CH_3}{\underset{|}{C}}}}-CH_3$

2,3- Dimethylbutane

96. Ethylmagnesium iodide reacts with propylamine to give

(a) propane (b) ethyl alcohol
(c) ethane (d) ethene

Assam CEE-2014

Ans. (c) :

$$\underset{\text{Ethyl magnesium iodide}}{CH_3-CH_2-MgI} + \underset{\text{Prophylamine}}{CH_3-CH_2-CH_2-NH_2}$$
$$\Big\downarrow \text{H–Br}$$
$$\underset{\text{Ethane}}{CH_3-CH_3} + CH_3-CH_2-CH_2-NH(MgI)$$

When ethyl magnesium iodide react with propylamine in presence of HBr to give ethane.

97. The compound having highest boiling point is

(a) $CH_3CH_2OCH_2CH_3$
(b) $CH_3CH_2CH_2CH_2CH_2OH$
(c) $CH_3CH_3CH_2CH(CH)_3OH$
(d) $CH_3CH_2C(CH_3)_2OH$

AIIMS-2006

Ans. (b) : $CH_3CH_2CH_2CH_2CH_2OH$
Here alcohol and ether compounds are given in the given compounds alcohols are having more boiling point than ether due to inter moleculas hydrogen bonding. If isomeric alcoholic compounds are the order of boiling points are primary > secondry > tertiary. So in the given option B is primary alcohol and exbhits high boiling point due to the larger surface are of the primary alcohol.

98. The reaction of choloroform with alcoholic KOH and p-toluidine forms

(a) 
(b) 
(c) 
(d) 
Assam CEE-2018

Ans. (d) : The carbylamine reaction is a chemical test for detection of primary amines in this relations the p-toluidine is heated with allotropic potassium hydroxide and chloroform.
It a primary amine is preset, the isocynaide carbylamines is formed with are fact-smelling substances.

99. The compound having the lowest boiling point is

(a) n-butane (b) isobutane
(c) 1-butene (d) 1-butyne

Assam CEE-2018

Ans. (b) : The boiling point order
Alkyne > Alkene > n-Alkane > Branched alkane
1 butyne > 1 butene > n-butane > isobutene.

100. The correct increasing order of boiling points is

(a) Pentane-1-ol < butane-1-ol < butane-2-ol < ethanol.
(b) Ethanol < butane-2-ol < butane-1-ol < pentane-1-ol

Assam CEE-2021

Ans. (b) : Boiling point increase when number of carbon atom (carbon chain) increas. Boiling point decreases when the branching increase.
Hence, the increasing boiling point is –
Ethanol < butan-2-ol < butan-1-ol < pentan-1-ol

101. By Wurtz reaction, a mixture of methyl iodide and ethyl iodide gives :

(a) butane
(b) ethane
(c) propane
(d) A mixture of the above three

BCECE-2006

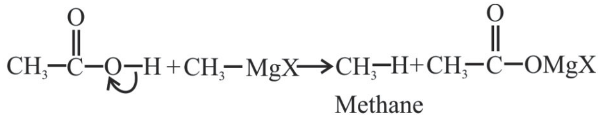
@apna_pdf

Ans. (d) : When methyl iodide and ethyl iodide are reacted with sodium metal in the presence of dry ether, a mixture of different alkanes forms. This reaction is known as Wurtz reaction.

$$CH_3I + CH_3-CH_2I + 2Na \xrightarrow{\text{dry ether}} \underset{\text{ethane}}{CH_3-CH_3} + \underset{\text{propane}}{CH_3-CH_2-CH_3} + \underset{\text{butane}}{C_2H_5-C_2H_5}$$

102. When CH_3COOH reacts (with CH_3-MgX) :
(a) CH_3COX is formed
(b) Hydrocarbon is formed
(c) acetone is formed
(d) alcohol is formed
BCECE-2006

Ans. (b) : When CH_3COOH (acetic acid) reacts with CH_3MgX to give hydrocarbon.



$$CH_3-\overset{O}{\overset{\|}{C}}-O-H + CH_3-MgX \longrightarrow \underset{\text{Methane}}{CH_3-H} + CH_3-\overset{O}{\overset{\|}{C}}-OMgX$$

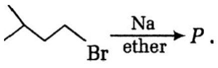
103. Which of the following is present in natural gas?
(a) n-butane
(b) Ethane
(c) Methane
(d) Propane
BCECE-2005, JCECE-2006

Ans. (c) : Methane is present in natural gas. The formula of methane is CH_4. The structure of methane is tetrahedral and an angle is 109°.28'. Methane is make up 70 – 90% of natural gas along with ethane, butane and propane.

104. Gasoline is a mixture of
(a) C_6-C_{11} alkanes
(b) C_3-C_5 alkanes
(c) C_7-C_9 alkanes
(d) $C_{15}-C_{20}$ alkanes
BCECE-2010

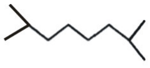
Ans. (c) : Gasoline is a refined product of petroleum consisting of a mixture of hydrocarbons, additives and binding agent. Gasoline is a mixture of C_7-C_9 alkanes.
Fossil fuel like diesel and kerosene how greater weight and density than gasoline.

105.

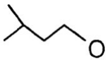


The product P is-

(a)



(b)

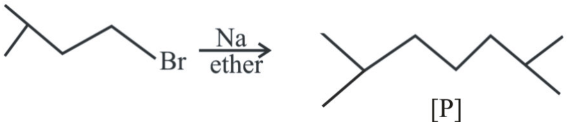


(c)

(d)

BCECE-2016

Ans. (a) : The reaction of alkyl bromide react with sodium in the presence of ether is known wurtz reaction.

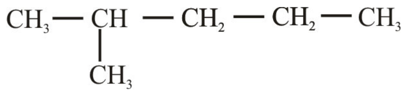


106. Among the following select the alkane that is expected to have lowest boiling point.
(a) hexane
(b) 2-methyl pentane
(c) 3-methyl pentane
(d) 2,2-dimethylbutane
BCECE-2018

Ans. (d) : Boiling point ∝ molecular weight

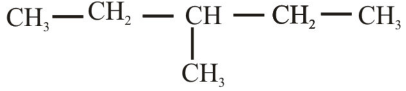
$$\propto \frac{1}{\text{Branching}}$$

The structures of the given alkane are –
(i) Hexane
$CH_3-CH_2-CH_2-CH_2-CH_3$
(ii)



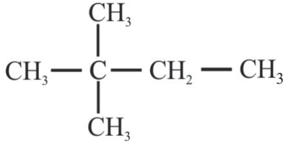
$$CH_3-\underset{CH_3}{\underset{|}{CH}}-CH_2-CH_2-CH_3$$

(iii) 3 – methyl pentane



$$CH_3-CH_2-\underset{CH_3}{\underset{|}{CH}}-CH_2-CH_3$$

(iv) 2, 2 – dimethyl butane

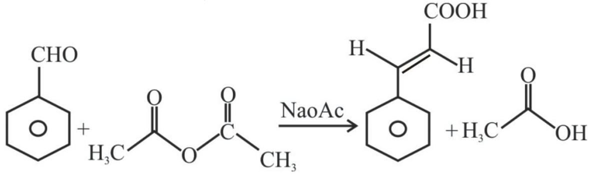


$$CH_3-\underset{CH_3}{\underset{|}{\overset{CH_3}{\overset{|}{C}}}}-CH_2-CH_3$$

Hence, the lowest boiling point is 2, 2-dimethyl butane.

107. Friedel-Crafts reaction, an aromatic aldehyde is treated with acetic anhydride in presence of corresponding salt of the acid to give an unsaturated aromatic acid?
(a) Friedel-Crafts reaction
(b) Perkin's reaction
(c) Wurtz reaction
(d) None of these
[BITSAT-2007]

Ans. (b) : In perkin reaction, aromatic aldehyde is treated with acetic anhydride in presence of corresponding salt of acid (NaOAc) to give ∝ - β - unsaturated carboxylic acid.



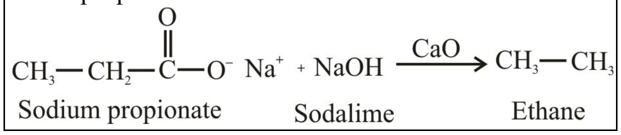
108. Which of the following compound can not be used in preparation of iodoform?
(a) CH_3CHO
(b) CH_3COCH_3
(c) HCHO
(d) 2-propanol
[BITSAT-2009]

Ans. (c) : The compound containing the group $\left(CH_3-\overset{O}{\overset{\|}{C}}-\right)$ give the positive iodoform test but those compound not containing the group $\left(CH_3-\overset{O}{\overset{\|}{C}}-\right)$ not give iodoform test.
In formaldehyde can not used in the preparation of idoform test.

@apna_pdf

109. When sodium propionate is heated with sodalime which product is formed:
(a) Propyl amine (b) Ethane
(c) Acetone (d) Acetaldehyde
[BITSAT-2008]

Ans. (b) : When sodium propionate is heated with sodalime the product is ethane.
While propionate has three carbon.



$$CH_3-CH_2-\overset{O}{\overset{\|}{C}}-O^- Na^+ + NaOH \xrightarrow{CaO} CH_3-CH_3$$

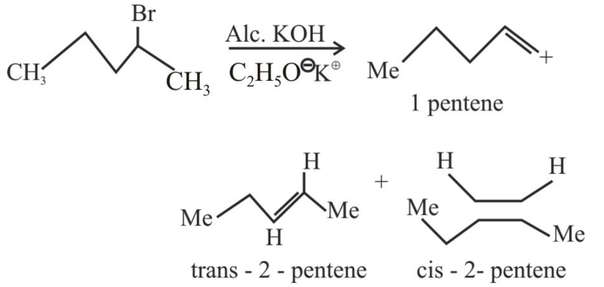
Sodium propionate Sodalime Ethane

110. Function of $AlCl_3$ in Friedel-Craft's reaction is to
(a) produce nucleophile (b) make new bond
(c) produce electrophile (d) break bond
[BITSAT-2006], JCECE-2006

Ans. (c) : $AlCl_3$ is a lewis acid catalyst is aluminium trichloride because the product ketone forms a rather stable complex with lewis acid such as $AlCl_3$.
a stiochiometric amount or more of the catalyst must generally employed.
$AlCl_3$ Will coordinate to halogens and facilitate the breaking of these bonds. It increase the electrophilicity of it's binding partner make it more reactive.

111. 2-bromopentane with alcoholic KOH yields a mixture of three alkenes. Which of the following alkene is predominant?
(a) 1-pentene (b) Cis-2-pentene
(c) Trans-2-pentene (d) Cis-1-pentene
[BITSAT-2021]

Ans. (c) :



According to the Satyzeff rule, trans alkene are more stable than cis.
So, the option (c) is correct.

112. Marsh gas contains
(a) CO_2 (b) CH_4
(c) HCl (d) C_2H_2
[BITSAT – 2006]
CG PET-2004

Ans. (b) : Marsh gas is also known as swamp gas or bog gas is a mixture of primarily methane, and smaller amount of hydrogen sulfide, carbon dioxide etc. methane is the primary gas that make up the product colloquially known as marsh gas. It is produced by the decomposition of biodegrable substance like animal excreta by the action of methanogen.

113. The reaction
$C_6H_6 + CH_3Cl \xrightarrow{AlCl_3} HCl + C_6H_5CH_3$
is called
(a) addition reaction
(b) Friedel-craft acylation
(c) Friedel-craft alkylation
(d) Friedel-craft benzoylation
[BITSAT – 2005]

Ans. (c) : Benzene react with alkyl chloride (Methyl chloride) in the presence of $AlCl_3$ then the product is formed toluene.
This reaction is known of friedal –craft alkylation.

$$\underset{\text{Benzene}}{C_6H_6} + CH_3Cl \xrightarrow{AlCl_3} \underset{\text{Toluene}}{C_6H_5CH_3} + HCl$$

114. Which one of the following contain isopropyl group?
(a) 2, 2, 3, 3-Tetramethylpentane
(b) 2-Methylpentane
(c) 2, 2, 3-Trimethylpentane
(d) 3, 3-Dimethylpentane
[BITSAT – 2009]

Ans. (b) : The structure of the following –

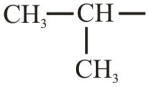
(i) 
2, 2,3,3 tetramethyl butane

(ii) 
2-methyl pentane

(iii) 
2, 2,3 trimethyl pentane

(iv) 
3,3 dimethyl pentane

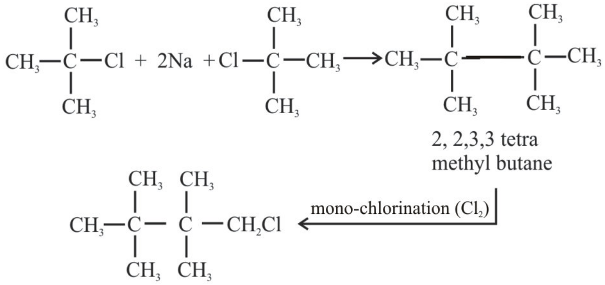
In option (b) have contain isopropyl group



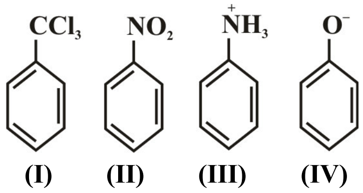
115. An organic compound A (C_4H_9Cl) on reaction with Na/diethyl ether gives a hydrocarbon which on monochlorination gives only one chloro derivative, then A is
(a) tert-butyl chloride (b) sec-butyl chloride
(c) isobutyl chloride (d) n-butyl chloride
[BITSAT – 2014]

@apna_pdf

Ans. (a) : An organic compound A is tertiary butyl chloride react with Na/diethyl ether gives a 2, 2, 3, 3 – tetra methyl butane which on mono chlorination gives a tert butyl chloride



116. In which case the $\overset{+}{N}O_2$ will attack at the meta position



(a) I, II, III (b) II, IV
(c) II and III only (d) II only

[BITSAT- 2012]

Ans. (a) : $\overset{+}{N}O_2$ is an electrophile. The nucleophile attack on meta position the group, –CCl3, $-\overset{+}{N}O_2$, NH_3^+ are electron withdrawing group its generate the positive charge on ortho and para group.
Hence, the nucleophile will be attack on the meta-position.

117. Acetylene reacting with HCN in presence of Ba $(CN)_2$ gives

(a) Vinyl cyanide (b) 1,1- dicyanoethane
(c) 1,2- dicyanoethane (d) None of the above

CG PET -2008

Ans. (a) : Acetylene (CH ≡ CH) react with HCN in the presence of $Ba(CN)_2$ gives vinyl cyanide

$$CH \equiv CH + HCN \xrightarrow{Ba(CN)_2} \underset{\text{vinylcyanide}}{CH_2 = CHCN}$$

118. Which one of the following is the best reagent to accomplish the following conversion?

$$CH_3CH_2Br \xrightarrow{?} CH_3 - CH_3$$

(a) $NaBH_4$ (b) Na|ether
(c) $Zn|C_2H_5OH$ (d) Mg followed by H_3O^+

CG PET- 2011

Ans. (c): Bromo ethane convert to ethane, He reagent Zn/C_2H_5OH.

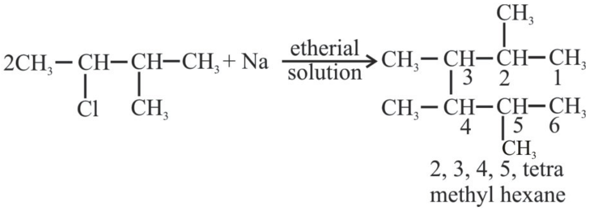
$$\underset{\text{Bromoethane}}{2CH_3 - CH_2 - Br} \xrightarrow{Z_n/C_2H_5OH} \underset{\text{Ethane}}{CH_3 - CH_3}$$

119. 2- chloro-3- methyl butane is treated with sodium in etherial solution, then it will give

(a) 2,4 dimethylhexane
(b) 3,5 dimethylhexane
(c) 2,3,4,5- tetramethylhexane
(d) 2,6- dimethyloctane

CG PET -2009

Ans. (c) : Etherial solution are a solution of an ether.

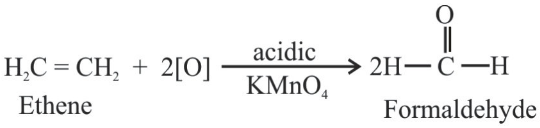


120. Ethene gives with acidic $KMnO_4$ solution

(a) ethylene glycol (b) ethylene oxide
(c) formaldehyde (d) acetaldehyde

CG PET -2007

Ans. (c) : $KMnO_4$ is a oxidising agent. Acidic $KMnO_4$ oxidised carbon – carbon double bond only.



$$\underset{\text{Ethene}}{H_2C = CH_2} + 2[O] \xrightarrow[KMnO_4]{\text{acidic}} \underset{\text{Formaldehyde}}{2H-\overset{\overset{\displaystyle O}{\|}}{C}-H}$$

121. The reaction between an alkyl halide and sodium metal in dry ether is called

(a) Clemmensen reduction
(b) Kolbe's reaction
(c) Wurtz's reaction
(d) Cannizaro's reaction

CG PET -2004,2005

Ans. (c) : The reaction between an alkyl halide and sodium metal in dry ether is called wurtz's reaction.

$$R_1x + 2Na + XR_2 \xrightarrow{Ether} R_1 - R_2 + 2Nax$$

Where, X = Halide group
R = alkyl group

122. DDT is related to

(a) insecticide (b) fungicide
(c) chlorination (d) fluorination

CG PET -2006

Ans. (a) : DDT is a chemical compound its chemical formula is $C_{14}H_9Cl_5$. DDT is dichlorodiphenyltrichloroethane. It is a colorless, crystalline solid at STP. The molecular mass of DDT is 354 – 48 g mol^{-1}, It is a chemical insecticide, dichlorodiphenyltrichloroethane is an organ chlorine compound that was first used as an insecticide.

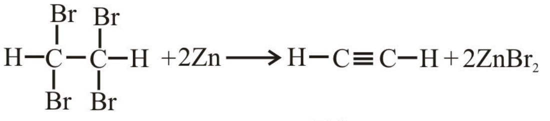
123. Tetrabromoethane on heating with Zn gives

(a) ethyl bromide (b) ethane
(c) ethyne (d) ethene

CG PET- 2015

@apna_pdf

Ans. (c) : Tetrabromoethane on heating with Zn gives ethyne.



$$\mathrm{H-\overset{Br}{\underset{Br}{C}}-\overset{Br}{\underset{Br}{C}}-H + 2Zn \longrightarrow H-C\equiv C-H + 2ZnBr_2}$$

Tetrabromo - methane

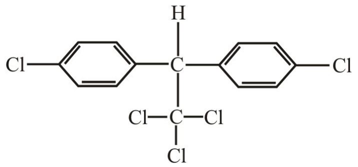
Ethyne (Acetylene)

124. How many numbers of sigma (σ) and pi (π) bonds in DDT respectively ?

(a) 28 and 6	(b) 29 and 6
(c) 30 and 6	(d) 21 and 6

GUJCET-2022

Ans. (d):



1, 1, 1-trichloro -2, 2 – di(4-chlorophenyl) ethane (DDT)

In DDT, number of σ bond is 21 and π bond is 6.

125. R'- Cl $\xrightarrow{Na/ether}$ 2,3 -dimethyl butane. What is R' in the above reaction?

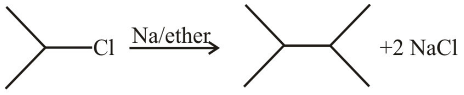
(a) Isopropyl	(b) Isobutyl
(c) Sec-butyl	(d) N-propyl

GUJCET-2020

Ans. (a) : Given,

$R'-Cl \xrightarrow{Na/ether}$ 2, 3-dimethyl butane.

In the product R' is isopropyl'



2, 3 dimethyl butane

126. Which of the following compound gives only one monochloro product on its chlorination in presence of sunlight?

(a) n – butane	(b) Iso pentane
(c) Neo pentane	(d) n – pentane

GUJCET-2017

Ans. (c) : The chlorination of neo pentane with Cl_2 in the presence of diffused sunlight gives only one mono-chloro compound, Neo pentane or 2, 2-dinethyl propane has only primary hydrogen hence it can give only monochloro derivative.

127. The resulting solution obtained at the end of electrolysis of concentrated aqueous solution of NaCl….

(a) Turns red litmus into blue

(b) Turns blue litmus into red

(c) Remains colourless with phenolphthalein

(d) The colour of red or blue litmus does not change

GUJCET-2015, 2016

Ans. (a) : Sodium chloride is dissociated and exists as sodium and chloride ions in aqueous solution, electrolysis of sodium chloride is easier in aqueous solution,

$$NaCl(aq) + H_2O(l) \rightarrow Na^+(aq) + OH^-(aq) + \frac{1}{2}H_2(g) + \frac{1}{2}Cl_2(g)$$

Hence, the resulting solution obtained at the end of electrolysis of concentrated aqueous solution of NaCl turns red litmus into blue.

128. Arrange the following in decreasing order of their boiling points

(A) n - Butane

(B) 2 - Methyl butane

(C) n - Pentane

(D) 2, 2 - Dimethly propane

(a) A > B > C > D	(b) B < C > D < A
(c) D > C > A > B	(d) C > B > D > A

HP CET-2018

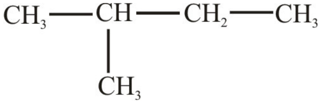
Kerala-CEE, 2011

Ans. (d) : The structure of the following hydrocarbon-

(i) n – butane

$CH_3 - CH_2 - CH_2 - CH_3$

(ii) 2-methyl butane

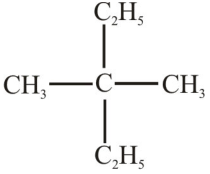


$$\mathrm{CH_3-\underset{CH_3}{CH}-CH_2-CH_3}$$

(iii) n- pentane

$CH_3-CH_2-CH_2-CH_2-CH_3$

(iv) 2, 2-dimethyl propane



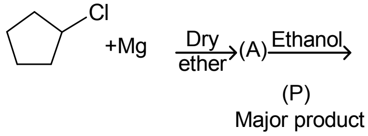
$$\mathrm{CH_3-\overset{C_2H_5}{\underset{C_2H_5}{C}}-CH_3}$$

Boiling point depends upon the number of carbon chain increase boiling point increase.

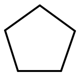
Boiling point decrease when the branching of group increase.

So, the order is C > B > D > A

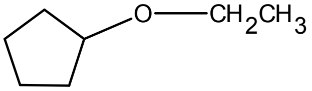
129. In the following sequence of reactions the P is:



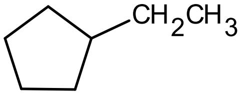
(a)



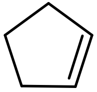
(b)



(c)



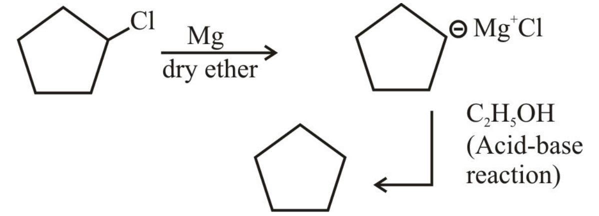
(d)



[2021, 27 Aug Shift-I]

@apna_pdf

Ans. (a) :



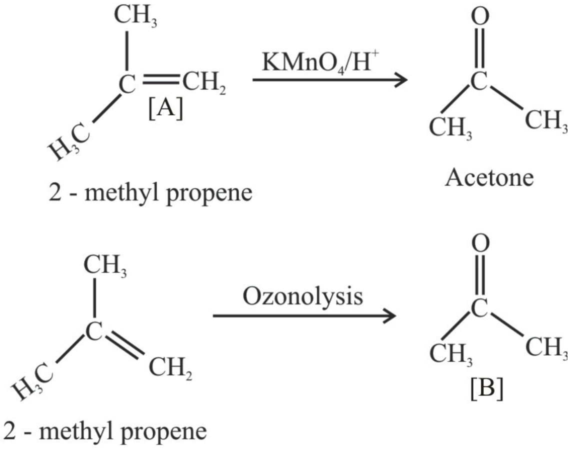
Cl
Mg
dry ether
Mg⁺Cl
C₂H₅OH
(Acid-base
reaction)

130. An organic compound 'A' C_4H_8 on treatment with $KMnO_4/H^+$ yield's compound 'B' C_3H_6O Compound 'A' also yields compound 'B' an ozonolysis. Compound 'A' is

(a) 2-methylpropene
(b) 1-methylcyclopropane
(c) but-2-ene
(d) cyclobutane

(JEE Main-2021, 25 July Shift-I)

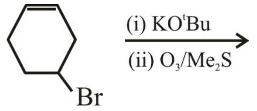
Ans. (a) :



CH₃
C
CH₂
[A]
H₃C
KMnO₄/H⁺
O
C
CH₃
CH₃
2 - methyl propene
Acetone
CH₃
C
H₃C
CH₂
Ozonolysis
O
C
CH₃
CH₃
[B]
2 - methyl propene

Hence, the compounds 'A' are 2-methylpropene and B is acetone.

131. The major product(s) obtained in the following reaction is/are:



(i) KOᵗBu
(ii) O₃/Me₂S
Br

(a) OHC
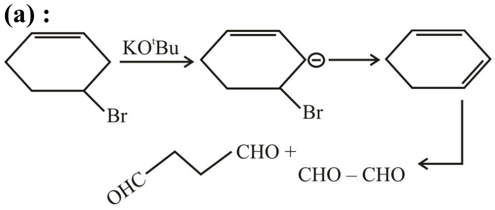
CHO and OHC–CHO

(b) 
(c) 
(d) 
[JEE Main-2019, 12 April Shift-I]

Ans. (a) :



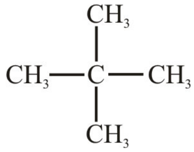
KOᵗBu
Br
Br
OHC
CHO +
CHO – CHO

132. On mixing a certain alkane with chlorine and irradiating it with ultraviolet light, it forms only one monochloroalkane. This alkane could be :

(a) Propane (b) Pentane
(c) Isopentane (d) Neopentane

WB-JEE-2010, [AIEEE 2003]

Ans. (d) : In neopentane contains all hydrogen are equivalent. So, it will give only one monochloroalkane on halogenations.



$C(CH_3)_4$

The IUPAC name of neo pentane is 2, 2-dimethylpropane.

133. Alkyl halides reacts with dialkyl copper reagents to give :

(a) Alkenyl halides (b) Alkanes
(c) Alkyl copper halides (d) Alkenes

[AIEEE 2005]

Ans. (b) : Alkyl halides react with dialkyl copper reagents to form a alkane, this reaction is known as Corey House synthesis.

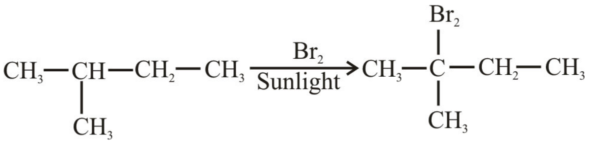
$R'-X+R_2CuLi \rightarrow RR'+RCu+LiX.$

134. 2-methyl butane on reaction with bromine in the presence of sunlight gives mainly:

(a) 1-bromo-3-methylbutane
(b) 2-bromo-3-methylbutane
(c) 2-bromo-2-methylbutane
(d) 1-bromo-2-methylbutane

[AIEEE 2005]

Ans. (c) :



CH₃—CH—CH₂—CH₃
CH₃
Br₂
Sunlight
Br₂
CH₃—C—CH₂—CH₃
CH₃

The reactivity order of abstraction of H atoms towards bromine atom alkane.

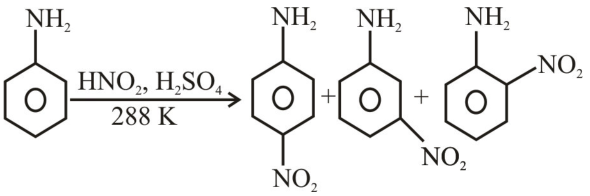
Bromine will be substituted to the hydrogen where carbon has least number of hydrogen atoms.

135. The nitration (using nitration mixture) of aniline gives

(a) p-nitroaniline (b) o-nitroaniline
(c) m-nitroaniline (d) all the above

J & K CET-(2012)

Ans. (d): Nitration of aniline yields tarry oxidation products in addition to the nitro derivatives. In strongly acidic medium aniline is protonated to form a aniline union and mixture of ortho, Para and meta nitro-aniline is formed.



NH₂
HNO₃, H₂SO₄
288 K
NH₂
NO₂
+
NH₂
NO₂
+
NH₂
NO₂

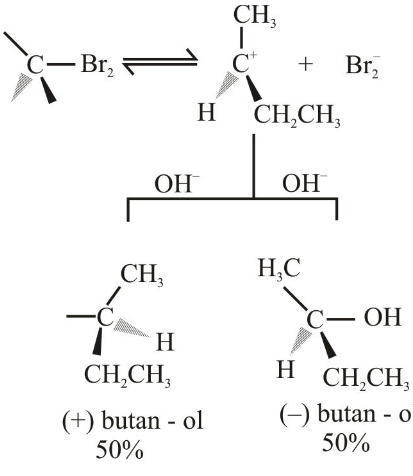
@apna_pdf

136. 2-bromobutane reacts with OH^- in H_2O to give 2-butanol. The reaction involves

(a) retention in configuration
(b) inversion in configuration
(c) racemization
(d) mutarotation

J & K CET-(2012)

Ans. (c) : 2 - bromo butane react with OH^- to give a 2 – butane. The reaction involve a racemization.



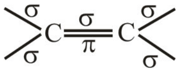
Racemic mixture

137. What kinds of bonds are present in ethene molecule?

(a) 1 pi and 5 sigma bonds
(b) 1 pi and 3 sigma bonds
(c) 1 sigma and 1 pi bond
(d) 3 sigma and 3 pi bonds

J & K CET-(2014)

Ans. (a) : The structure of ethane is –



In ethane no. of σ bond is 5 and π - bond is 1.

138. The order of stability of the following alkenes with the first being the most stable and last being the least stable is

I. $CH_3CH_2CH = CH_2$
II. $(CH_3)_2C = C(CH_3)_2$
III. $CH_3CH = C(CH_3)_2$
IV. $(CH_3)_2C = CH_2$

(a) I > II > III > IV
(b) II > III > IV > I
(c) IV > III > II > I
(d) III > IV > I > II

J & K CET-(2017)

Ans. (b) : The stability of alkene is directly proportional to the number of R-groups attached to double bonded carbon atom.

Therefore more substituted alkene or the alkene has more number of alpha hydrogen atoms are more stable.

Hence, the order is II > III > IV > I

139. Which of the following reaction is used for producing symmetrical alkane with double carbon atom?

(a) Sandmeyer's reaction
(b) wurtz reaction
(c) Gattermann reaction
(d) Riemer- Tiemann reaction

J & K CET-(2019)

Ans. (b) : Wurtz reaction is a coupling reaction which are used in organic chemistry and organ metallic chemistry. Wurtz reaction is used to prepare symmetrical alkene.

In wurtz reaction alkyl halide react with metallic sodium in presence of dry ether to form symmetrical alkanes containing double number of carbon atoms present in the alkyl halide.

$$2R-X+2Na\xrightarrow{\text{dry ether}}R-R+2NaX.$$

140. 1-chlorobutane on reaction with alcoholic potash gives

(a) 1-butanol
(b) 2-butene
(c) 1-butene
(d) 2-butanol

J & K CET-(2011)

Ans. (c) :

$$\underset{\text{1-chlorobutane}}{CH_3-CH_2-CH_2-CH_2Cl}\xrightarrow{\text{alc.KOH}}\underset{\text{1-butene}}{CH_3-CH_2-CH=CH_2}+HCl$$

When 1- chloro butane on reaction with alcoholic potash gives 1 – butane.

Alcoholics potash (KOH) is a dehydrohalogenation agent, it react with an alkyl halide and alkene forms as a product.

141. Which one of the following does not give iodoform?

(a) 
(b) CH_3OH

(c) CH_3CH_2OH

(d) $CH_3-\underset{OH}{CH}-CH_3$

J & K CET-(2008)

Ans. (b) : The compound containing either the $R(CH_3)CHOH$, CH_3 = $CH_3-\overset{O}{\overset{|}{C}}-$ or $ROCH_3$ Group, on reaction with sodium hypoiodite (NaOI) form yellow – colored iodoform (CH_3I) and sodium salts of corresponding carboxylic acid, this is called as iodoform test.

Hence, CH_3OH is not give iodoform test.

142. In a group of isomeric alkylhalides, the order of boiling points is

(a) Primary < Secondary < Tertiary
(b) Primary > Secondary < Tertiary
(c) Primary < Secondary > Tertiary
(d) Primary > Secondary > Tertiary

J & K CET-(2007)

Ans. (d) : Alkyl halides with branched and more spherical shapes have lower boiling point as a result of their smaller surface area.

Hence, the order of boiling points is –

Primary > Secondary > Tertiary.

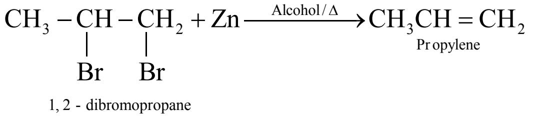
@apna_pdf

143. The reaction conditions used for converting 1,2-dibromopropane to propylene are

(a) KOH, alcohol/Δ (b) KOH, water/Δ
(c) Zn, alcohol/Δ (d) Na, alcohol/Δ

J & K CET-(2006)

Ans. (c) : 1, 2-dihalogen (vicinal) derivatives of the alkanes on reaction with zinc dust and methanol produces alkenes by loss of two halogen atoms (dehalogenation).



$$\underset{\text{1, 2 - dibromopropane}}{CH_3-\underset{Br}{\underset{|}{CH}}-\underset{Br}{\underset{|}{CH_2}}}+Zn\xrightarrow{\text{Alcohol}/\Delta}\underset{\text{Propylene}}{CH_3CH=CH_2}$$

144. Chloroform is slowly oxidised by air in the presence of light and air to form

(a) formyl chloride (b) trichloro methanol
(c) phosgene (d) formaldehyde

J & K CET-(2003)
JCECE-2006

Ans. (c) : Chloroform is slowly oxidised by air in the presence of light and air to form a phosgene.

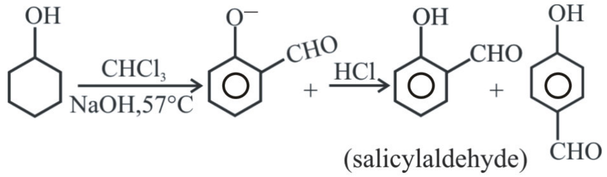
$$CHCl_3+O_2\rightarrow \underset{\text{Phosgene}}{COCl_2}+HCl$$

145. The reaction of chloroform and sodium hydroxide with phenol to form salicylaldehyde is called

(a) aldol condensation
(b) Cannizzaro reaction
(c) Claisen reaction
(d) Reimer-Tiemann reaction

J & K CET-(2002)

Ans. (d) : The reaction of chloroform and sodium hydroxide with phenol to form salicylaldehyde is called Reimer-Tiemann reaction.



146. If chloroform is left open in the presence of sunlight, then

(a) polymerization takes place
(b) explosion takes place
(c) poisonous phosgene gas is formed
(d) no reaction takes place

J & K CET-(2000)

Ans. (c) : Chloroform in the presence of sunlight and air undergoes reaction with oxygen in air and forms poisonous phosgene gas.

$$\underset{\text{Chloroform}}{CHCl_3}+\frac{1}{2}O_2\rightarrow \underset{\text{Phosgene}}{COCl_2}+HCl$$

147. The organic reaction product from the reaction of methyl magnesium bromide and ethyl alcohol is

(a) methane (b) ethane
(c) propane (d) butane

J & K CET-(1999)

Ans. (a) : Methyl magnesium bromide reacts with ethanol to give methane. Methyl group in the Grignard reagent has a lone pair with a negative charge. This methyl group attacks the hydrogen atom of –OH group and takes that hydrogen atom towards methyl group.
Its form methane.

$$CH_3-CH_2OH\xrightarrow{CH_3MgBr}\underset{\text{Methane}}{CH_3-H}+CH_3-CH_2-OMgBr$$

148. 1-Bromopropane is converted into propene in the presence of alcoholic KOH solution. The reaction involves elimination of a molecule of

(a) HBr (b) H_2
(c) H_2O (d) Br_2

J & K CET-(1997)

Ans. (a) : 1-bromopropane is converted into propene in the presence of alcoholic KOH solution

$$CH_3-CH_2-CH_2-Br\xrightarrow{\text{Alc.KOH}}CH_3-CH_2=CH_2+HBr$$

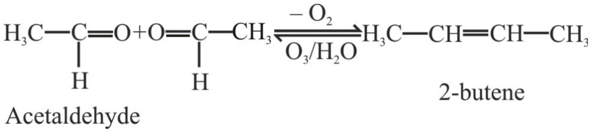
In this reaction involves elimination of a molecule of HBr.

149. Which of the following alkenes gives only acetaldehyde on ozonolysis?

(a) ethene (b) propene
(c) 1-butene (d) 2-butene

J & K CET-(2008)

Ans. (d) : Ozonolysis involves the breaking of double bond and insertion of O atoms in place of double bond. Therefore, the structure of alkene is as-



$$\underset{\text{Acetaldehyde}}{H_3C-\underset{H}{\underset{|}{C}}=O+O=\underset{H}{\underset{|}{C}}-CH_3}\underset{O_3/H_2O}{\overset{-O_2}{\rightleftharpoons}}\underset{\text{2-butene}}{H_3C-CH=CH-CH_3}$$

150. Bromination of alkanes involves

(a) Carbanions (b) Carbocations
(c) Carbenes (d) Free radicals

J & K CET-(2005)

Ans. (d) : In bromination of alkane involve in the presence of uv light, alkane will reaction.
Uv light is the condition under the reaction will form a free radicals. During this reaction, bromine atoms substitute this hydrogen atom to producing bromo alkane.

151. Methane is produced by the hydrolysis of

(a) Al_4C_3 (b) CaC_2
(c) dry ice (d) n-C_3H_7MgBr

J & K CET-(2003)

Ans. (a) : $Al_4C_3+12H_2O\rightarrow \underset{\text{Methane}}{3CH_{14}}+4Al(OH)_3$

$$n-C_3H_7MgBr+4H_2O\rightarrow \underset{\text{Propyne}}{CH_3-CO\equiv CH}$$

$$CaC_2\xrightarrow{H_2O}\underset{\text{Ethyne}}{CH\equiv CH}+Ca(OH)_2$$

Aluminium carbide by reaction with water produces a methane and aluminium hydroxide.

152. A fuel containing 25% n-heptane and 75% iso-octane has got octane number

(a) 25 (b) 50
(c) 75 (d) 100

J & K CET-(2000)

@apna_pdf

Ans. (c) : Octane is one of the most important product qualities for gasoline. Octane is a measure of the tendency of gasoline to resist auto-igniting when compressed with air in a spark ignition engine.

High octane naturals are more valuable to a refiner because they allow the refiner to make higher octane gasoline.

Octant is measured using an index reflecting the degree to which a fuel will knock under specific operating conditions A mixture of 75% isooctane mixed with 25% n-heptanes would have an octane rating of 75.

153. Lindlar's catalyst is

(a) pd and CO_2

(b) pd and H_2

(c) Palladised charcoal deactivated with sulphur

(d) Pd and $CaCO_3$

J & K CET-(2000)

Ans. (d) : A Lindlar catalyst is a heterogeneous catalyst that consists of palladium deposed on calcium carbonate or barium sulfate which is then poisoned with venous forms of lead or sulfur. It is used for the hydrogenation of alkynes to alkene. The palladium content of the supported catalyst is usually 5% by weight.

154. Which of the following is the correct statement for C_4H?

(a) It must have a double bond

(b) It must have a triple bond

(c) It should not have either a double or triple bond

(d) Such a compound is impossible

J & K CET-(2000)

Ans. (d) : For C_4H compound is impossible because carbon has four valency not satisfied by the carbon. So, such a compound is impossible.

155. The hydrocarbon which decolourises alkaline $KMnO_4$ solution and also but does not give any precipitate with ammoniacal silver nitrate is

(a) Benzene (b) Acetylene

(c) Propyne (d) Butyne-2

J & K CET-(1999)
AIIMS-1994

Ans. (d) : In butyne -2 has terminal acidic hydrogen atom to give decolorizes alkaline $KMnO_4$ solution but does not give any precipitate with ammoniacal silver nitrate. Ammoniacal silver nitrate solution is also known as Toller's reagent in chemical reaction.

156. What is the chief product obtained when n-butane is treated with bromine in the presence of light at 130^0C?

(a) $CH_3–CH_2–CH_2–CH_2–Br$

(b) $CH_3–CH_2–CH–Br$

$|$
CH_3

(c) $CH_3–\underset{\underset{CH_3}{|}}{CH}–CH_2–Br$

(d) $CH_3–\overset{\overset{CH_3}{|}}{\underset{\underset{CH_3}{|}}{C}}–Br$

J & K CET-(1998)

Ans. (b) : Br_2 has a much regioselectivity so chief product formed is -2-bromo but –one. Br – Br bond cleavage forms 2 Br radicals. One radical reacts with n-butane and a n-butane radicals are formed. This n – butane radicals abstract a Br atom form another Br – Br Molecule. The reaction proceeds via free radicals mechanism. As 2° free radical are more stubble than 1°.

Hence,  is formed.
$CH_3—CH_2—\underset{\underset{CH_3}{|}}{CH}—Br$

157. Term 'Hexadecane' in petroleum is commonly called as

(a) Octane (b) Petrol

(c) Cetane (d) LPG

J & K CET-(1997)

Ans. (c) : Hexadecane is also known as cetane it is an alkane hydrocarbon with the chemical formula $C_{16}H_{34}$. Hexadecane consists of a chain of 16 carbon atom.

Cetane number is a measurement of the quality or performance of diesel fuel. Higher the number, the better the fuel burns within the engine of a vehicle. The cetane number is similar to octane rating. Pure cetane represents the highest purity of diesel fuel possible, and thus has a cetane rating at 100.

158. At room temperature the eclipsed and staggered forms of ethane can not be isolated because

(a) They inter convert rapidly

(b) Both the conformers are equally stable

(c) The energy difference between the conformers is large

(d) There is a large energy barrier of rotation about the O bond

J & K CET-(1997)
AFMC-2010

Ans. (a) : At room temperature the eclipsed and staggered forms of ethane cannot be isolated because they inter convert rapidly the energy difference between two conformations of ethane is not so large, so the eclipsed and staggered conformation interconvert rapidly. Thus, it is impossible to isolates these forms at room temperature.

159. An alkane with a molecular formula C_6H_{14} reacts with chlorine in the presence of light and heat to give two constitutionally isomeric monochlorides of molecular formula $C_6H_{13}Cl$. What is the most reasonable starting alkane?

@apna_pdf

(a) n-Hexane (b) 2,2 Dimethylbutane
(c) 2,3-Dimethylbutane (d) 3-Methylpentane

J & K CET-(2011)

Ans. (c) : An alkane with a molecular formula, C_6H_{14} reacts with chlorine in the presence of light and heat to give two constitution isomeric monochlorides of molecular formula $C_6H_{13}Cl$. Hexane reacts with chlorine in the presence of light and heat it gives two isomene products of 2, 3 dimethyl chloride has two constitutional isomers with molecular formula of $C_6H_{13}Cl$.

160. Which of the following has lowest boiling point?

(a) NaCl (b) CuCl
(c) $CuCl_2$ (d) CsCl

JCECE - 2004

Ans. (c) : Sodium and Cesium chlorides are solid with high melting and boiling points because of the large amount of heat which is needed to break the strong ionic attractions. Copper chlorides are liquids and low melting points solids.

$$\text{Boiling Points} \propto \frac{1}{\text{Covalent character}}$$

Since, the anion that is chlorides is the same in all four compounds, compare the covalent character based on the polarizing power of the cations

In NaCl has +1 charge on catian
CuCl has +1 charge on catian
$CuCl_2$ has +2 charge on catian
C_5Cl has + 1 charge on catian
Hence, the covalent character is maximum in $CuCl_2$
So, $Cucl_2$ has the minimum boiling point.

161. Which of the following alcohol give positive iodoform test?

(a) Methanol (b) Ethyl carbinol
(c) Pentanol-3 (d) Methyl carbinol

JCECE - 2004
Haryana PMT-2003

Ans. (d) : The molecular formula of methyl carbinal (CH_3CH_2OH). It gives a iodoform test and it is oxidised to acetaldehyele in basic conditions.

$$CH_3CH_2OH + 6NaOH + 4I_2 \rightarrow CHI_3 + HCOONa + 5NaI + 3H_2O$$

162. Which of the following gas, diffuse most slowly?

(a) C_2H_6
(b) C_2H_4
(c) CH_4
(d) All of these diffuse at equal rate

JCECE - 2004

Ans. (a) : According to Graham's law of diffusion, r $\propto \frac{1}{\sqrt{M}}$ where, M = molar mass. The gas which least molar mass that can diffuse easily. The gas which has high molar mass that can diffuse slowly. Therefore, among the given gases C_2H_6 diffuse slowly.

163. Which one of the following aqueous solution will exhibit highest boiling point?

(a) 0.01 M Na_2SO_4 (b) 0.01 M KNO_3
(c) 0.015 M urea (d) 0.015 M glucose

JCECE - 2008

Ans. (a) : Molecular mass is highest then boiling point is highest. The elevation in boiling point is a colligative property of the solution i.e. elevation in boiling point is directly proportional to solute particle concentration.

The dissociation of sodium sulphate

$$Na_2SO_4 \rightarrow 2Na^+ + SO_4^{2-}$$

$\therefore$ Concentration of ions is –

0.01 M Na_2SO_4 solution is = 3 × 0.01 = 0.03 M.

164. The compound with highest boiling point

(a) n-hexane (b) n-pentane
(c) 2, 2-dimethylpropane (d) 2-methylbutane

JCECE - 2010

Ans. (a) : Boiling point $\propto$ molecular mass

$$\propto \frac{1}{\text{branching}}$$

($\because$ Surface area decreases)

$\therefore$ n-hexane has the highest boiling point among the given.

165. Which of the following liquid on electrolysis produce H_2 at cathode and Cl_2 at anode?

(a) NaCl solution in water
(b) $CuCl_2$ solution in water
(c) Pure water
(d) H_2SO_4 Solution

JCECE - 2016

Ans. (a) : NaCl solution in water gives H_2 at cathode and Cl_2 at anode because of low discharge potential of H^+ ions as compared to Na^+ (at cathode) and of Cl^- as compared to OH^- ions (due to over voltage).

$$2H^+ \xrightarrow{+2e^-} H_2(g) \text{ (at cathode)}$$

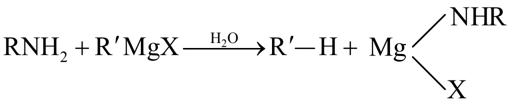
$$2Cl^- \xrightarrow{-2e^-} Cl_2(g) \text{ (at anode)}$$

166. Which of the following will give alkane?

(a) $RNH_2 + R'MgX \xrightarrow{H_2O}$
(b) $RCH_2OH + R'MgX \xrightarrow{H_2O}$
(c) $R—X—Mg \xrightarrow{H_2O}$
(d) All of the above

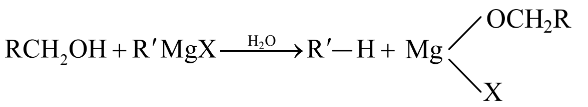
JCECE - 2016

Ans. (d) : (i) In the presence of H_2O and Grignard reagent, all compounds having acidic (reactive-H) hydrogen will give alkane.



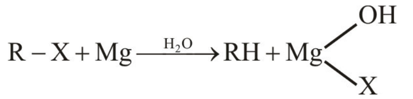
$$RNH_2 + R'MgX \xrightarrow{H_2O} R'-H + Mg\begin{matrix} NHR \\ X \end{matrix}$$

@apna_pdf



$RCH_2OH + R'MgX \xrightarrow{H_2O} R'-H + Mg\begin{smallmatrix} OCH_2R \\ X \end{smallmatrix}$

(ii) R-X in the presence of H_2O gives alkane in place of Grignard reagent.



$R-X + Mg \xrightarrow{H_2O} RH + Mg\begin{smallmatrix} OH \\ X \end{smallmatrix}$

167. Which of the following is least soluble in water?

(a) C_2H_6 (b) CH_3OH

(c) CH_3NH_2 (d) C_6H_5OH

JIPMER-2017

Ans. (a) : Alkanes is saturated hydrocarbon molecule and are non-polar molecules. The general formula of alkane is C_nH_{2n+2}. Hence, C_2H_6 is being a non-polar and least soluble in water.

168. Which one of the following does not undergo iodoform reaction

(a) Secondary butyl alcohol

(b) ISo-propels alcohol

(c) Diethyl ketone

(d) Ethyl alcohol

JIPMER-2014

J&K-CET, 2009

Ans. (c) : Those compound which have methyl Keto group  $(CH_3-\overset{\overset{O}{\|}}{C}-)$ have give iodoform reaction.

Those compound that contains terminal methyl keto group or can be oxidised to methyl keto group can undergo iodoform reaction.

So, diethyl ketone does not undergo iodoform reaction because it does not contain methyl keto group.

169. Which of the following reagents converts both acetaldehyde and acetone alkanes?

(a) Ni/H_2 (b) $LiAl/H_4$

(c) $I_2/NaOH$ (d) Zn-Hg/conc. HCI

JIPMER-2009

Ans. (d) : The reagent which convert to both acetaldehyde and acetone alkane. By Zn – Hg/conc. HCl reagent.

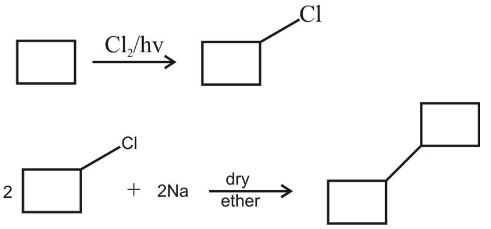
The reduction of ketones aldehydes to alkane using zinc amalgam and hydrochloric acid.

170. If  **react with Cl_2 in presence of light and then react with Na metal in dry ether, final product is**

(a) 
(b) 
(c)

(d) 
JIPMER-2019

Ans. (d) : Cyclobutane react with Cl_2 in presence of light and then react with Na Metal in dry ether dicyelobutane.



171. $\mathbf{CH_3-Br \xrightarrow{Mg/ether} \xrightarrow[\text{(ii) Water}]{\text{(i) } CO_2} \xrightarrow[\Delta]{CH_3OH/H^+} P}$

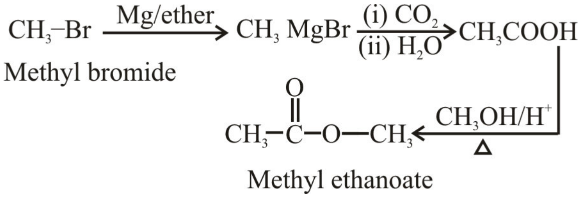
What is the product of 'P' is the above reaction?

(a) methyl ethanoate (b) Ethanoic acid

(c) Propanal (d) Methyl propanoate

JIPMER-2018

Ans. (a) :



172. Prolonged exposure of chloroform in humans many cause damage to liver. It is due to the formation of the following compound.

(a) CCl_4 (b) $COCl_2$

(c) CH_2Cl_2 (d) Cl_2

Karnataka-CET-2020

Ans. (b) : Prolonged exposure of chloroform in humans many cause damage to liver. It is due to the formation of phosgene.

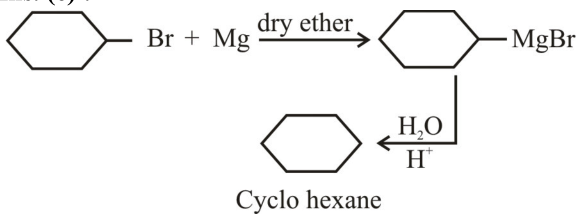
When chloroform is oxidised, it forms phosgene with is poisonous.

$$\underset{\text{Chloroform}}{CHCl_3} \xrightarrow{(O)} \underset{\text{Phosgene}}{COCl_2} + HCl$$

173. 
The product B is

(a) 
(b) 
(c) 
(d) 
Karnataka-CET-2015

Ans. (c) :



@apna_pdf

174. Iodoform reaction is answered by all, except

(a) $CH_3-CH(OH)-CH_2-COOH$

(b) CH_3CHO

(c) CH_3-CH_2-OH

(d) $CH_3-CH_2-CH_2OH$

Karnataka-CET-2014

Ans. (d) : Iodoform test is used in laboratories for the detection of aldehydes and ketones containing an alpha methyl group.

The compound CH_3-CH_2-OH does not have either CH_3CO non $CH_3CH(OH)$ group.

Therefore the compound which not show positive result in iodoform test.

175. Methane can be converted into ethane by the reactions

(a) Chlorination followed by the reaction with alcoholic KOH

(b) Chlorination followed by the reaction with aqueous KOH

(c) Chlorination followed by Wurtz reaction

(d) Chlorination followed by decarboxylation

Karnataka-CET-2013

Ans. (c) : Methane can be converted into ethane by the wurtz reaction.

$$\underset{\text{Mehhane}}{CH_4} + Cl_2 \rightarrow CH_3Cl + HCl$$

$$2CH_3Cl + Na \rightarrow \underset{\text{Ethane}}{C_2H_6}$$

CH_4 (Methane) is treated with chlorine gas in the presence of ultraviolet light to form chloromethane. Chloromethane is treated with sodium metal and dry ether to form the ethane.

This process is called wurtz synthesis.

176. Cycloalkane formed when 1, 4-dibromopentane is heated with sodium is

(a) Methyl cyclobutane

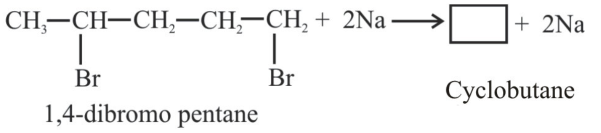
(b) Cyclopentane

(c) Cyclobutane

(d) Methyl cyclopentane

Karnataka-CET-2013

Ans. (a) :



1, 4-dibromopentane are treated with sodium or zinc then the product form cyclo alkane.

This reaction is undergoes free radical mechanism.

177. Which one of the following is not formed when a mixture of methyl bromide and bromobenzene heated with sodium metal in the presence of dry ether?

(a) Diphenyl (b) Propane

(c) Toluene (d) Ethane

Karnataka-CET-2012

Ans. (b) :

(i) $\underset{\text{Methy bromide}}{2CH_3-Br} + 2Na \xrightarrow[\text{ether}]{\text{dry}} \underset{\text{ethane}}{CH_3-CH_3} + 2NaBr$

(ii) 
(iii) 
Hence, Propane cannot be prepared from this reaction.

178. For preparing an alkane, a saturated solution of sodium or potassium salt of a carboxylic acid is subjected to

(a) Hydrolysis (b) Oxidation

(c) Hydrogenation (d) Hydration

(e) Electrolysis

Karnataka-CET-2017
Kerala-CEE-2011

Ans. (e) : When an concentrated aqueous solution of sodium or potassium salt of a mono carboxylic acid is electrolyzed an alkane is produced.

$$\underset{\text{Sodium ethanoate}}{2CH_3-COONa} + 2H_2O \xrightarrow{\text{Electrolysis}} \underset{\text{Ethane}}{CH_3-CH_3} + 2NaOH + H_2 + 2CO_2$$

179. n-butylamine (I), diethylamine (II) and N, N-dimethylethylamine (III) have the same molar mass. The increasing order of their boiling point is

(a) III < II < I (b) I < II < III

(c) II < III < I (d) II < I < III

(e) III < I < II

Kerala-CEE-2011

Ans. (a) : The structure of the following amine are –

(i) $CH_3-CH_2-CH_2-CH_2-NH_2$
n–butylamine (1° amine)

(ii) $CH_3-CH_2-NH-CH_2-CH_3$
Diethylamine (2° amine)

(iii) 
N,N - dimethyl amine (3° amine)

The order of boiling point of amine depend on the no. of hydrogen atom attached to the amines.

Number of hydrogen increase on amine boiling point increases.

So, the order is – 1° > 2° > 3° amine.

@apna_pdf

180. Chloroform reacts with oxygen in the presence of light to give

(a) Carbon tetrachloride
(b) Carbonyl chloride
(c) Methyl chloride
(d) Methylene dichloride
(e) Acetaldehyde

Kerala-CEE-2014

Ans. (b) : Chloroform reacts with the oxygen in the presence of light to give carbonyl chloride. Carbonyl chloride is a poisonous gas and also known as phosgene.

$$CHCl_3 + \frac{1}{2}O_2 \xrightarrow{hv} COCl_2 + HCl$$

181. Which one of the following is not expected to undergo idoform reaction?

(a) Propan-2-ol
(b) 1-phenylethanol
(c) 2-butanol
(d) Ethanol
(e) Diphenyl methanol

Kerala-CEE-2014

Ans. (e) : The compound having a methyl keto group to give iodoform reaction.

The structure of the following are –

(a) 
$CH_3-\underset{}{\overset{OH}{\overset{|}{C}H}}-CH_3$

Propen -2-ol

(b) 
$C_6H_5-\underset{CH_3}{\underset{|}{C}H}-OH$

1-phenyl ethanol

(c) 
$CH_3-CH_2-\overset{OH}{\overset{|}{C}H}-CH_3$

2-butanol

(d) CH_3-CH_2-OH

Ethanol

(e) 
$C_6H_5-\underset{C_6H_5}{\underset{|}{C}H}-OH$

diphenyl methanol (not present the methyl keto group)

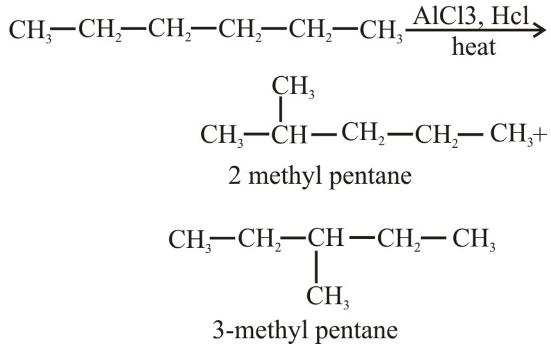
Hence, diphenyl methanol not give the iodoform reaction

182. When n=hexane is heated with anhydrous AlCl₃ and HCl gas, the major product obtained is

(a) 1-chlorohexane
(b) 2-chlorohexane
(c) 3-chlorohexane
(d) hex-3-ene
(e) mixture of 2-methylpentane and 3-methylpentane

Kerala-CEE-2014

Ans. (e) : When n-hexane is heated with anhydrous AlCl₃ and HCl gas, at 573 k and 30 – 35 atm to give a mixture of branched chain alkanex.



$$CH_3-CH_2-CH_2-CH_2-CH_2-CH_3 \xrightarrow[\text{heat}]{\text{AlCl3, Hcl}}$$

$$CH_3-\overset{CH_3}{\overset{|}{C}H}-CH_2-CH_2-CH_3 +$$

2 methyl pentane

$$CH_3-CH_2-\underset{CH_3}{\underset{|}{C}H}-CH_2-CH_3$$

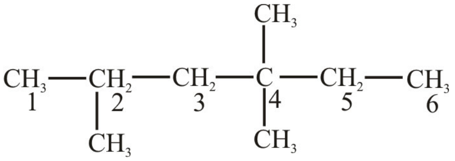
3-methyl pentane

183. The total number of monohalogenated products formed by halogenation of 2, 4, 4-trimethylhexane are,

(a) 5
(b) 7
(c) 6
(d) 8
(e) 9

Kerala-CEE-2016

Ans. (c) : The structure of 2, 4, 4 trimethyl hexane are -



$$\overset{1}{CH_3}-\underset{CH_3}{\underset{|}{\overset{2}{C}H_2}}-\overset{3}{CH_2}-\underset{CH_3}{\underset{|}{\overset{CH_3}{\overset{|}{C}}}}{}_4-\overset{5}{CH_2}-\overset{6}{CH_3}$$

In -2 monohalogenated product by replacing two CH_3 group at C_2 and C_4 Position and 4-monohalogenated product by replacing four CH_3 group by C_2, C_3, C_5, C_6 Position.

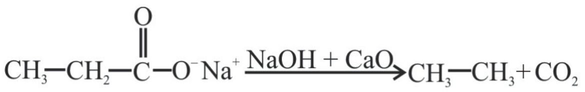
Thus, the total no. of monohalogenated product formed by halogenation of 2, 4, 4 trimethylhexane are 6.

184. Decarboxylation of sodium propionate leads to the formation of :

(a) Methane
(b) Ethene
(c) Propanone
(d) Ethane

Manipal-2017

Ans. (d) :



$$CH_3-CH_2-\overset{O}{\overset{||}{C}}-O^-Na^+ \xrightarrow{NaOH + CaO} CH_3-CH_3 + CO_2$$

Ethane

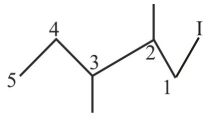
Hence, decarboxylation of sodium propionate leads to the formation of ethane.

185. The bond line formula of 1-iodo -2, 3-dimethyl pentane is

(a) 
(b) 
(c) 
(d) 
MHT CET-02.05.2019, SHIFT-III

@apna_pdf

Ans. (c) : The bond line formula of 1-iodo -2, 3 – dimethyl pentane.



186. In the reaction,

$$2n\,R\text{-}X \xrightarrow[\text{Dry ether}]{+2n\,Na} \text{product}$$

The product obtained is

(a) 2n-alkene (b) n-sodium halide
(c) n-alcohol (d) n-alkane

MHT CET-02.05.2019, SHIFT-III

Ans. (d) : $2nR-X \xrightarrow[\text{dry ether}]{+2nNa} \underset{(n-\text{alkane})}{nR-R}$

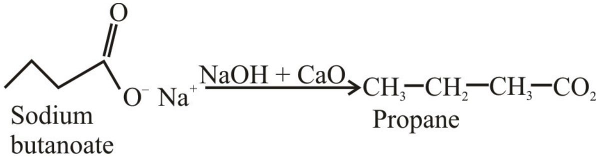
When alkyl halide react with sodium metal in the presence of dry ether to form a alkane this reaction is known as Wurtz reaction.

187. The alkane formed on heating sodium butanoate with sodaline is

(a) Methane (b) Ethane
(c) Propane (d) Butane

MHT CET-03.05.2019, SHIFT-I

Ans. (c) :



188. Which of the following compounds has lowest boiling point?

(a) n-butyl alcohol (b) Iso-butyl alcohol
(c) Tert-butyl alcohol (d) Sec-butyl alcohol

MHT CET-2017

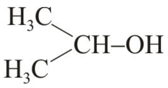
Ans. (c) : Boiling point of alkane increase as the hydrocarbon chain length or molecular weight increase or branching decrease tert-butyl alcohol has the most branched structure.
Hence, it has lowest boiling point.

189. Which of the following compound will give positive iodoform test?

(a) Isopropyl alcohol (b) Propionaldehyde
(c) Ethylphenyl ketone (d) Benzyl alcohol

MHT CET-2017

Ans. (a) : The structure of the isopropyl alcohol is –



Isopropyl alcohol will give a positive iodoform test because it has methyl keto group. Isopropyl alcohol easily oxidised to acetone.
Hence, the methyl ketone group gives a positive iodoform test.

190. The compound which is not formed when a mixture of n-butyl bromide and ethyl bromide treated with sodium metal in the presence of dry ether is

(a) Butane (b) Octane
(c) Hexane (d) Ethane

MHT CET-2016

Ans. (d) : The compound which is not formed when a mixture of n-butyl bromide and ethyl bromide treated with sodium metal in the presence of dry ether is ethane.

$$CH_3CH_2CH_2CH_2Br + CH_3CH_2Br + 2Na \xrightarrow[\text{ether}]{\text{Dry}}$$

$$\underset{\text{Octane}}{C_4H_9-C_4H_9} + \underset{\text{Hexane}}{C_4H_9-C_2H_5} + \underset{\text{Butane}}{C_2H_5-C_2H_5}$$

191. Which of the following compounds has highest boiling point?

(a) Propan-1-ol (b) n-butane
(c) Chloroethane (d) Propanal

MHT CET-2015

Ans. (a) : In propan -1-ol has the hydrogen bond have the potential to occur because strongly electronegative oxygen atom, intermolecular hydrogen bonding develop in propan-1-ol. It has the greatest boiling point.

192. Chlorination of ethane is carried out in the presence of

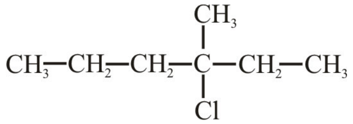
(a) Anhydrous $AlBr_3$ (b) Mercuric chloride
(c) Ultraviolet light (d) Zinc chloride

MHT CET-2015

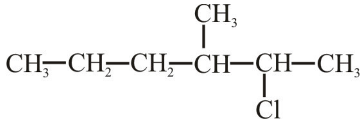
Ans. (c) : Chlorination of ethane is carried out in the presence of ultraviolet light resulting free radical reaction forming ethyl chloride.

$C_2H_6 \xrightarrow[hv]{Cl_2} C_2H_5Cl$

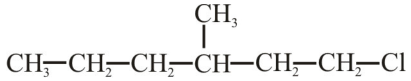
193. 'X' is an optically active alkane having lowest molecular mass, Predict the structure of the major product obtained on monochlorination of 'X'.

(a)


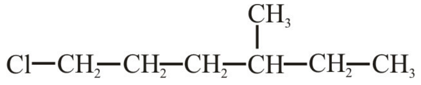
$CH_3-CH_2-CH_2-\underset{Cl}{\overset{CH_3}{C}}-CH_2-CH_3$

(b)


$CH_3-CH_2-CH_2-\overset{CH_3}{CH}-\underset{Cl}{CH}-CH_3$

(c)


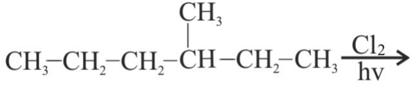
$CH_3-CH_2-CH_2-\overset{CH_3}{CH}-CH_2-CH_2-Cl$

(d)


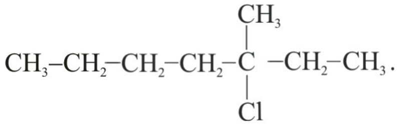
$Cl-CH_2-CH_2-CH_2-\overset{CH_3}{CH}-CH_2-CH_3$

MHT CET-2014

Ans. (a) : The compound having carbon which has four different substituent attached to it is called asymmetric carbon or chiral carbon. This, it is optically active compound. 6-methyl-hexane is an optically actually active alkane having lowest molecular mass.



$CH_3-CH_2-CH_2-\overset{CH_3}{CH}-CH_2-CH_3 \xrightarrow[hv]{Cl_2}$



$CH_3-CH_2-CH_2-CH_2-\underset{Cl}{\overset{CH_3}{C}}-CH_2-CH_3.$

@apna_pdf

194. Among the following select the alkane that is expected to have lowest boiling point

(a) Hexane (b) 2-methylpentane

(c) 3-methylpentane (d) 2,2-dimethylbutane

MHT CET-2014

Ans. (d) : The boiling point depend upon the number carbon atom increases and decrease when branching. Boiling point increase when molecular mass increase the 2, 2-dimethyl butane has the highest branching as compared to other structure. Hence, 2, 2-dimethyl butane has lowest boiling point.

195. The number of alkenyl groups possible from C_4H_7 are

(a) 7 (b) 5

(c) 3 (d) 8

MHT CET-2012

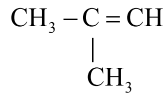
Ans. (b) : In C_4H_7 the possible number of alkenyl group are –

(i) $CH_3-CH_2-CH=CH-$

(ii) $CH_3-CH=CH-CH_2-$

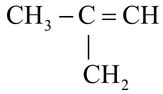
(iii) $CH_2=CH-CH_2-CH_2$

(iv)



$$\underset{\substack{|\\CH_3}}{CH_3-C=CH}$$

(v)



$$\underset{\substack{|\\CH_2}}{CH_3-C=CH}$$

So, the no. of alkenyl group in C_4H_7 is 5.

196. $C_6H_6+CH_3Cl\xrightarrow{\text{Anhy.AlCl}_3}C_6H_5CH_3+HCl$ the name of the above reaction is

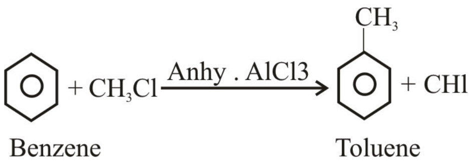
(a) Gattermann (b) Reimer-tiemann

(c) Friedel-Craft (d) Cannizzaro

MHT CET-2012, NEET-2009

Ans. (c) : The reaction of benzene react with alkyl halide in presence of anhy. $AlCl_3$ to give a toluene.

This reaction is known as Friedel-craft alkylation reaction.



197. Which of the following aromatic compound gives sulphonation reaction very easily?

(a) Chlorobenzene (b) Nitrobenzene

(c) Toluene (d) Benzene

MHT CET-2012

AIEEE-1982

Ans. (c) : Sulphonation reaction is an electrophilic substitution reaction. Toluene is more readily sulphonated among these because methyl group is electron donating (+I effect). Activate the benzene ring for electrophilic aromatic substitution. Methyl group activates the ring and it easier to undergo electrophilic substitution reaction.

198. The false statement regarding alkane is

(a) This does not perform polymerization reaction

(b) This does not gives elimination reaction

(c) It does not disappear the colour of dilute $KMnO_4$ solution

(d) It does not decolourise bromine water

MHT CET-2012

Ans. (b) : Alkane show the elimination reaction Higher alkane eliminate hydrogen and lower alkane on heating in the absence of air at 500 – 700°C.

$$CH_3-CH_2-CH_3\xrightarrow{600°C}\underset{\text{Propene}}{CH_3-CH=CH_2}+$$

$$\underset{\text{Ethene}}{CH_2=CH_2}+\underset{\text{Methane}}{CH_4}+H_2$$

199. By which of the following process hydrocarbons are found from petroleum?

(a) Combustion

(b) Fractional distillation

(c) Addition

(d) All of the above

MHT CET-2012

Ans. (b) : Fractional distillation is separate a mixture into a number of different parts called fractions. Crude oil is a mixture of hydrocarbons. The crude oil is evaporated and its vapours condense at different temperature in the fractionating column. Each fraction contains hydrocarbon molecule with a similar number of carbon atoms and a similar range of boiling points.

200. LPG mainly consist of the following

(a) Methane (b) Hydrogen

(c) Acetylene (d) Butane

MHT CET-2012

UPTU/UPSEE-2006

Ans. (d) : Liquefied petroleum gas (LPG) is a blend of light hydrocarbon compound. It is mainly consist of butane or propane or a mixture of both. At room temperature, both gases are colourless and odourless. LPG transforms into a liquid state. LPG in domestic cylinder used for cooking generally comparises more butane than propane, because the fuel value of per kilogram of butane is higher than propane.

201. Which of the following compounds do not give different isomers on monochlorination?

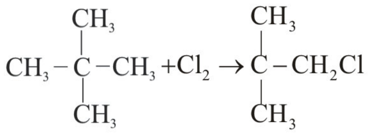
(a) Neo-pentane (b) n-butane

(c) Iso-butane (d) Iso-pentane

Odisha-NEET-2019

MHT CET-2011

Ans. (a) : The structure of neo pentane is –



$$CH_3-\overset{\substack{CH_3\\|}}{\underset{\substack{|\\CH_3}}{C}}-CH_3+Cl_2\rightarrow\overset{\substack{CH_3\\|}}{\underset{\substack{|\\CH_3}}{C}}-CH_2Cl$$

Neo pentane

@apna_pdf

In neo pentane, the structure of neo pentane consist of two distinct carbon atom and all hydrogen atoms are equivalent, on monochlorination of neo-pentane give only one compound neo-pentyl chloride. Hence, it does not give a different isomers on monochlorination.

202. Ziegler-Natta catalyst catalyses preparation of which of the following compounds?

(a) Preparation of Ti-metal

(b) Preparation of low density plastic

(c) Preparation of high resistance plastic

(d) Preparation of high density plastic

MHT CET-2011

Ans. (d) : Ziegler-Natta catalyst preparation of high density polythene is prepared by heating ethylene at about 330 – 350 k under a pressure of 1 – 2 atm.

$$nCH_2=CH_2 \xrightarrow[330-350k,1,2\ atm]{Ziegler-Natta\ catalyst} \underset{Polythene}{\left(CH_2-CH_2\right)_n}$$

203. Chloroform on reduction with zinc dust and water gives

(a) Methyl chloride (b) Dichloro methane

(c) Chloro methane (d) Methane

MHT CET-2009

Ans. (d) : Chloroform $(CHCl_3)$ on reduction with zinc dust and water x give methane.

$$\underset{Chloroform}{CHCl_3} \xrightarrow[\substack{6[H] \\ -ZnCl_2 \\ -HCl}]{zn/H_2O} \underset{Methane.}{CH_4}$$

204. Iodoform test is not given by

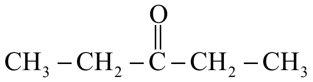
(a) 2-pentanone (b) ethanol

(c) ethanal (d) 3-pentanone

MHT CET-2008

Ans. (d) : The compound having a CH_3CO – or $\underset{OH}{\underset{|}{CH_3CH-}}$ group undergo iodoform reaction This test is performed by heating the substance with aqueous sodium hydroxide and iodine solution. On warming the mixture, a yellow precipitate of iodoform indicate positive iodofrom etc.

The structure of 3-pentanone are –



$$CH_3-CH_2-\overset{\overset{O}{||}}{C}-CH_2-CH_3$$

have not CH_3-CO- group and does not undergo the iodoform reaction.

$CH_3–CH_2–CO–CH_2–CH_3+3I_2+NaOH \rightarrow$ No reaction

205. The correct order of boiling point for primary (1°), secondary (2°) and tertiary (3°) alcohols is

(a) 1° > 2° > 3° (b) 3° > 2° > 1°

(c) 2° > 1° > 3° (d) 2° > 3° > 1°

MHT CET-2008

Ans. (a) : Alcohol which carries at least one function hydroxyl group (–OH) binding to a saturated carbon atom. The hydrogen bonds and the dipole-dipole interactions through out the series of alcohol will remain relatively the same. The boiling point of alcohol depend on the molecular weight are significant namely H – bonding and molecular surface area. The boiling order of alcohol is – 1° > 2° > 3°

206. 1-Chlorobutane on reaction with alcoholic potash gives

(a) but-1-ene (b) butan-1-ol

(c) but-2-ene (d) butan-2-ol

MHT CET-2007

Ans. (a) : 1-Chlorobutane on reaction with alcoholic potash give but -1-ene.

$$\underset{1-chlorobu\tan e}{CH_3-CH_2-CH_2-CH_2Cl} \xrightarrow[\Delta]{alc.KOH} \underset{butene-1}{CH_3-CH_2-CH=CH_2} +HCl$$

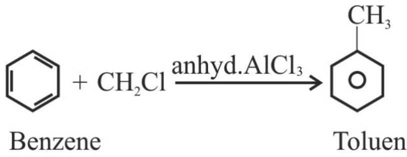
207. In Friedel-Crafts reaction, toluene can be prepared by

(a) C_6H_6+CH_3Cl (b) C_6H_5Cl + CH_4

(c) C_6H_6+CH_2Cl_2 (d) C_6H_6+CH_3COCl

NEET-2000,1999

Ans. (a) : In Friedel-Craft reaction, toluene can be prepared by methyl chloride on presence of anhydrous lewis is acid to give toulene.



208. Which one of the these is not compatible with arenes?

(a) Electrophilic additions

(b) Delocalisation of π-electrons

(c) Greater stability

(d) Resonance

NEET-1998

Ans. (a) : Arenes undergoes electrophilic substitution reaction. Arenes do not give electrophilic addition reaction in normal state due to resonance stabilization. Benzene is a resonance hydride of two structure and greater stability of benzene is due to delocalization of π-electron.

209. Using anhydrous $AlCl_3$ as catalyst, which one of the following reactions produces ethylbenzene (PhEt)?

(a) $H_3C-CH_2OH+C_6H_6$

(b) $CH_3-CH=CH_2+C_6H_6$

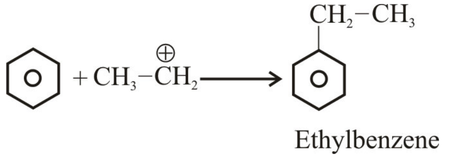
(c) $H_2C=CH_2+C_6H_6$

(d) $H_3C-CH_3+C_6H_6$

NEET-2004

Ans. (c): Using anhydrous $AlCl_3$ as catalyst, $CH_2=CH_2+C_6H_6$ react with to produces a ethylbenzene (PhEt).

$$CH_2=CH_2 \xrightarrow{AlCl_3/HCl} CH_3-\overset{+}{C}H_2+AlCl_4^-$$



@apna_pdf

210. Among the following compounds the one that is most reactive towards electrophilic nitration is

(a) Benzoic acid (b) Nitrobenzene

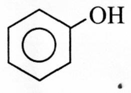
(c) Toluene (d) Benzene

NEET-2012, 1992

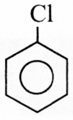
Ans. (c) : Toluene have most reactive towards electrophilic nitration because in toluene CH_3 group has +R effect on benzene is more reactive towards on benzene is more reactive towards electrophilic substitution reaction.

211. Which one of the following is most reactive towards electrophilic attack?

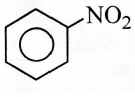
(a)



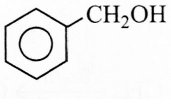
(b)



(c)



(d)



NEET-2008, 1998, 1999

Ans. (a) : The group having electron donating effect should have stablise the intermediate ion. i.e makes the ring more reactive towards electrophilic substitution on benzene and called activing group. Hence, phenol is more readily attacked by an electrophilc.

212. Which of the following compounds will not undergo Friedel-Crafts reaction easily?

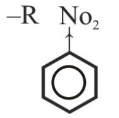
(a) Nitrobenzene (b) Toluene

(c) Cumene (d) Xylene

NEET-2013

WB-JEE-2012

Ans. (a) : In Friedel-Crafts reaction, involving an electrophilic aromatic substitution is used to attach a substituent to aromatic rings is Friedel-crafts reaction, which reaction are two type-alkylation and acylation. In this reaction aluminium chloride is used as a catalyst and involves the replacement of hydrogen atom with electrophile in an aromatic ring. Nitrobenzene does not undergo Friedel-Craft reaction because nitro group in nitro benzene is a strong withdrawing group and this group repels the electrophile from it.



Nitrobenezene

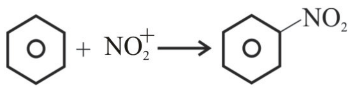
213. Consider the nitration of benzene using mixed conc, H_2SO_4 and HNO_3. If a large amount of $KHSO_4$ is added to the mixture, the rate of nitration will be

(a) Unchanged (b) Doubled

(c) Faster (d) Slower

NEET-I 2016

Ans. (d) : $HNO_3 + H_2SO_4 \rightleftharpoons NO_2^+ + HSO_4^- + H_2O$



In the nitration of benzene in the presence of conc, H_2SO_4 and HNO_3 benzene is formed. It large amount of $KHSO_4$ is added to this mixture more HSO_4^- in furnisnes and hence the concentration of electrophile decreases, rate of electrophilic aromatic reaction slow down.

214. The shortest C–C bond distance is found in

(a) Diamond (b) Ethane

(c) Benzene (d) Acetylene

NEET-1991

Ans. (d) : The distance between them shortens and bond length decreases. In acetylene has a triple bond between two adjacent carbon atoms and the bond length is even shorter. It is close to 120 pm.

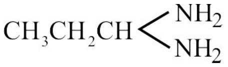
In diamond carbon atom is surrounded by four other carbon atoms and connected to them by strong single covalent bond Hence, the strongest type of chemical bond and bond length is 154 pm.

215. When $CH_3CH_2CHCl_2$ is treated with $NaNH_2$, the product formed is

(a) $CH_3-CH=CH_2$

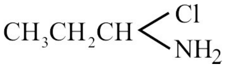
(b) $CH_3-C\equiv CH$

(c)



$CH_3CH_2CH\begin{cases}NH_2\\NH_2\end{cases}$

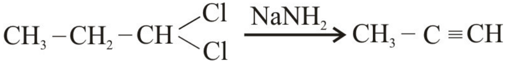
(d)



$CH_3CH_2CH\begin{cases}Cl\\NH_2\end{cases}$

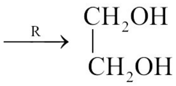
NEET-2002

Ans. (b) : When alkyl halide is treated with reducing agent like alc. KOH or sodamide to form alkyne as a product.



$CH_3-CH_2-CH\begin{cases}Cl\\Cl\end{cases} \xrightarrow{NaNH_2} CH_3-C\equiv CH$

216. In a reaction, $CH_2{=}CH_2 \xrightarrow[\text{acid}]{\text{Hypochlorous}} M$



$\xrightarrow{R} \begin{array}{c}CH_2OH\\|\\CH_2OH\end{array}$

Where, M = Molecule and R = Reagent, M and R are

(a) CH_3CH_2OH and HCl

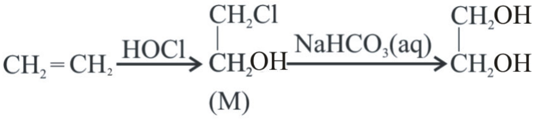
(b) $CH_2=CH_2$ and heat

(c) CH_3CH_2Cl and NaOH

(d) CH_2Cl-CH_2OH and aq. $NaHCO_3$

NEET-1997

Ans. (d) :



$CH_2=CH_2 \xrightarrow{HOCl} \underset{(M)}{\begin{array}{c}CH_2Cl\\|\\CH_2OH\end{array}} \xrightarrow{NaHCO_3(aq)} \begin{array}{c}CH_2OH\\|\\CH_2OH\end{array}$

So, M = CH_2Cl-CH_2OH and R = aq. $NaHCO_3$.

@apna_pdf

217. Reactivity of hydrogen atoms attached to different carbon atoms in alkanes has the order

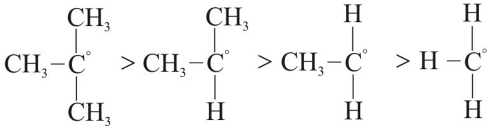
(a) teritary > primary > secondary
(b) primary > secondary > tertiary
(c) both (a) and (b)
(d) teritiary > secondary > primary

NEET-1993

Ans. (d) : The reactivity of H-atoms depend upon the stability of free radical follows the order-Tertiary > Secondary > Primary.

Therefore, reactivity of H – atom follows the same order i.e., tertiary > secondary > primary.

Tertiary alkanes are more reactive because they form tertiary free radical which is more stable.



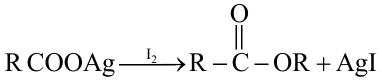
$$(CH_3)_3\overset{\circ}{C} > (CH_3)_2\overset{\circ}{C}H > CH_3\overset{\circ}{C}H_2 > H-\overset{\circ}{C}H_2$$

218. Which of the following reaction is expected to readily give a hydrocarbon product in good yields?

(a) $CH_3CH_3 \xrightarrow[hv]{Cl_2}$
(b) $(CH_3)_2CHCl \xrightarrow{C_2H_5OH}$
(c) $RCOOK \xrightarrow[Oxidation]{Electrolysis}$
(d) $RCOOAg \xrightarrow{I_2}$

NEET-1997

Ans. (c) : $CH_3-CH_3 \xrightarrow[hv]{Cl_2} CH_3-CH_2Cl + HCl$



$$RCOOAg \xrightarrow{I_2} R-\overset{\overset{O}{\|}}{C}-OR + AgI$$

Electrolysis of sodium or potassium salt of carboxylic acid gives good yield of hydrocarbon.

$$2RCOOK \xrightarrow[Oxidation]{Electrolysis} R-R+2CO_2$$

219. In the commercial gasolines, the type of hydrocarbons which are more desirable is

(a) Linear unsaturated hydrocarbon
(b) Toluene
(c) Branched hydrocarbon
(d) Straight-chain hydrocarbon

NEET-1997

Ans. (c) : The knocking property of engine related to with the nature of fuel. The branched hydrocarbons have more desirable. Branching increases the octane number of a fuel. Octane number of means better fuel. So, branched chain hydrocarbons have less knocking and more desirable.

220. Liquid hydrocarbons can be converted to a mixture of gaseous hydrocarbons by

(a) Oxidation
(b) Cracking
(c) Distillation under reduced pressure
(d) Hydrolysis

NEET-2010

Ans. (b) : Liquid hydrocarbons can be converted to a mixture of gaseous hydrocarbons by cracking. On cracking or pyralysis, the hydrocarbon with higher molecular mass gives a mixture of hydrocarbon having lower molecular mass. Lower hydrocarbon exists in a gaseous state while higher ones are in liquid state or solid state.

221. Hydrocarbon (A) reacts with bromine by substitution to form an alkyl bromide which by Wurtz reaction is converted to gaseous hydrocarbon containing less than four carbon atoms (A) is

(a) $CH \equiv CH$
(b) $CH_2 \equiv CH_2$
(c) CH_3-CH_3
(d) CH_4

NEET-2018

Ans. (d) : Hydrocarbon (A) reacts with bromine by substitution to form an alkyl bromide

$$\underset{\text{Methane}}{CH_4} + Br_2 \rightarrow \underset{\text{Alkyl bromide.}}{CH_3-Br} + HBr$$

Methyl bromide by wurtz reaction is converted into a gaseous hydrocarbon containing less than four carbon.

$$2CH_3Br + 2Na \rightarrow CH_3-CH_3 + 2NaBr$$

222. Freezing point is minimum for

(a) 0.1 M $Al_2(SO_4)_3$
(b) 0.1 M $BaCl_2$
(c) 0.1 M Urea
(d) 0.1 M NaCl

UP CPMT-2014

Ans. (a) : Depression in freezing point is a colligative property it depends upon the number of particles. Thus, as the number of particles increases, freezing point decreases.

Thus 0.1 M $Al_2(SO_4)_3$ shows minimum freezing point.

223. Which compound cannot be formed from Wurtz reaction ?

(a) Propane
(b) Butane
(c) Ethane
(d) Methane

AIIMS-2012
UP CPMT-2010

Ans. (d) : In Wurtz reaction, alkyl halides are combined and produce higher alkane and a metal hailide compound. Methane is simplest alkane, which is only one carbon atom, will not be formed by Wurtz reaction. Compounds containing two or more carbon atoms are prepared by Wurtz reaction. Thus, methane, CH_4, cannot be prepared by Wurtz reaction.

224. Iodoform gives a precipitate with $AgNO_3$ on heating but chloroform dose not because

(a) C — I bond in iodoform is weak and C — Cl bond in chloroform is strong
(b) Choroform is covalent
(c) iodoform is ionic
(d) None of the above

UP CPMT-2008

Ans. (a): On heating C — I bond in CHI_3 break, but C — Cl bond in $CHCl_3$ does not break. Thus, $AgNO_3$ gives precipitate AgI with iodoform.

@apna_pdf

225. The compounds formed at anode in the electrolysis of an aqueous solution of potassium acetate, are

(a) C_2H_6 and CO_2 (b) C_2H_4 and CO_2
(c) CH_4 and H_2 (d) CH_4 and CO_2

UP CPMT-2008

Ans. (a): This is an example of Kolbe's electrolysis.

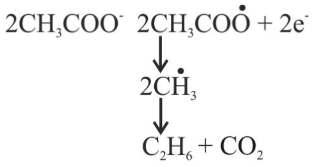
$$2CH_3COOK \xrightarrow{\text{electrolysis}} 2CH_3COO^- + 2K^+$$

At cathode:

$$2k^+ + 2e^- \rightarrow 2K$$

$$2K + 2H_2O \rightarrow 2KOH + H_2\uparrow$$

At anode:



$$2CH_3COO^- \; 2CH_3CO\dot{O} + 2e^- \downarrow 2\dot{C}H_3 \downarrow C_2H_6 + CO_2$$

From above reaction it is clear that ethane formed anode.

226. Compound reacting with alkaline $KMnO_4$

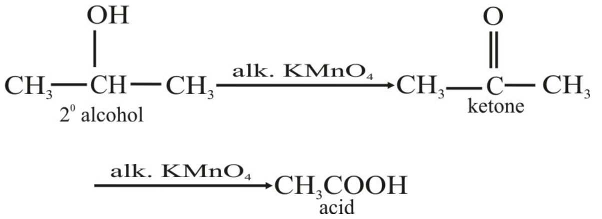
(a) 
$CH_3-C(OH)(CH_3)-CH_3$

(b) 
$CH_3-CH(OH)-CH_3$

(c) $(CH_3)_3-C-CH_2OH$ (d) None of the above

UP CPMT-2005

Ans. (b) : Only 1° and 2° alcohol are oxidised by alkaline $KMnO_4$. 3° alcohols do not react with alkaline $KMnO_4$



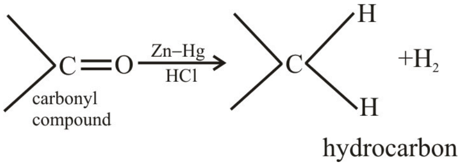
$$\underset{2^\circ\text{ alcohol}}{CH_3-CH(OH)-CH_3} \xrightarrow{\text{alk. }KMnO_4} \underset{\text{ketone}}{CH_3-\overset{O}{\overset{\|}{C}}-CH_3} \xrightarrow{\text{alk. }KMnO_4} \underset{\text{acid}}{CH_3COOH}$$

227. Which of the following converts carbonyl compounds into hydrocarbons?

(a) H_2/Pt (b) $LiAlH_4$
(c) $K_2Cr_2O_7/H_2SO_4$ (d) Zn–Hg/HCl

UP CPMT-2003

Ans. (d) :



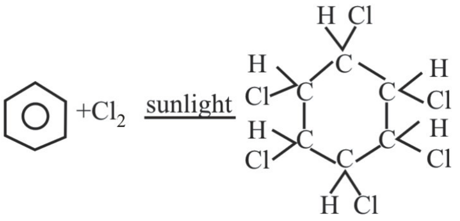
Carbonyl compounds are converted into hydrocarbon by reaction with Zn–Hg and HCl. This reaction is called Clemmensen's reduction.

228. The number of double bonds in gammexane is

(a) 0 (b) 1
(c) 2 (d) 3

UP CPMT-2002

Ans. (a) : Gammexane is commonly known as benzene hexachloride (BHC) It is used as insecticide.
Gammexane – $C_6H_6Cl_6$ (Lintaen)



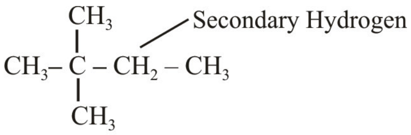
No. of sigma bond = 18
No .of double bond = 0

229. The number of secondary hydrogens in 2, 2-dimethyl butane is:

(a) 8 (b) 6
(c) 4 (d) 2

UPTU/UPSEE-2004

Ans. (d) : In 2, 2-dimethyl butane the secondary hydrogen is two.



$CH_3-C(CH_3)_2-CH_2-CH_3$

2, 2 dimetnyl-butane

230. Which of the following will not give iodoform test?

(a) Isopropyl alcohol (b) Ethanol
(c) Ethanal (d) Benzyl alcohol

UPTU/UPSEE-2004

Ans. (d) : Those compound which have $CH_3-\overset{O}{\overset{\|}{C}}-$ or $CH_3-\underset{OH}{\underset{|}{CH}}-$ group gives a iodoform test .

In Benzyl alcohol have no methyl keto group it does not give a iodoform test.

231. Which of the following is an anti-knocking compound?

(a) TEL (b) LTC
(c) Freon (d) Gasoline

UPTU/UPSEE-2014, 2009
NEET-1996

Ans. (a) : Tetra Ethyl lead is an organ metallic compound containing the toxic metal lead that for much of the 20th century was the chief anti-knocking compound for automotive gasoline or petrol. It is used for raising octane number of petrol. Tetraethyl lead in petrol was used as anti-knocking agent which creates lead pollution in order to avoid lead pollution. The substitute of TEL is used in unleaded petrol.

232. In the reaction.

$$CHCl_3 + 4OH^- \longrightarrow HCOO^- + 2H_2O$$

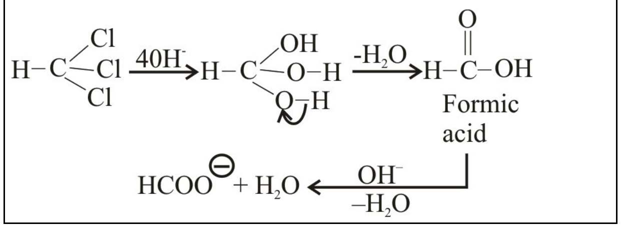
The intermediate species formed is/are

@apna_pdf

(a) CCl_2
(b) CCl_2^-
(c) Both (a) and (b)
(d) None of the above

UPTU/UPSEE-2014

Ans. (c) : $CHCl_3 + OH^- \rightarrow :CCl_3^{\ominus} \xrightarrow{-Cl^-} :CCl_2$



233. Octane number of petrol can be improved by admixing it with which of the following chemicals?
(a) Et_4Pb
(b) $CH_3OC(CH_3)_3$
(c) 1-methyl naphthalene
(d) Pyrene

UPTU/UPSEE-2011

Ans. (a,b) : Octane number of petrol can be increased by adding some small amount of certain chemicals known as anti-knock agent or compound. e.g – TEL or Et_4Pb. In the modern days some special types of antiknock agents are used to increase the octane number of petrol by increasing the number of carbons in the chain known as methyltert-butyl ether $CH_3OC(CH_3)_3$. Hence, the option A and B are correct.

234. The reaction of sodium ethoxide with iodoethane to form diethyl ether is termed as
(a) Electrophilic substitution
(b) Nucleophilic substitution
(c) Electrophilic addition
(d) Radical substitution

UPTU/UPSEE-2009

Ans. (b) : When sodium ethoxide with iodoethane to form a diethyl ether is termed as nucleophilic.

$$C_2H_5ONa + C_2H_5 - I \rightarrow C_2H_5OC_2H_5 + I^-$$

This reaction is known as William synthesis. It is an nucleophilic substitution reaction via SN_2 mechanism.

235. Which of the following compounds would have the highest boiling point?
(a) $CH_3CH_2CH_2CH_3$ (b) CH_3NH_2
(c) CH_3OH (d) CH_2F_2

UPTU/UPSEE-2009

Ans. (c) : CH_3OH (methanol) has highest boiling point because there is a intermolecular hydrogen bonding in methanol and high electronegative of O-atom, is strong. Therefore, CH_3OH has the highest boiling point.

236. Mustard gas is a
(a) Oil gas (b) Poisonous gas
(c) Fuel gas (d) Life gas

UPTU/UPSEE-2009

Ans. (b) : Sulfur mustard is more commonly as mustard gas. This name was first used when the chemical was sprayed durning the attacks of world war-I.
It yellow colour of mustard and may take on when mixed with other chemicals mustard gas are extremely poisonous gas and have powerful blistering effects on victims.

237. $CH_3CH_2CH_3 \xrightarrow{400-600^{o}C} X + Y$ Xand Y are
(a) Hydrogen (b) Methane
(c) Hydrogen (d) Ethylene

UPTU/UPSEE-2008

Ans. (b) :

$$CH_3 - CH_2 - CH_3 \xrightarrow{400-600°C} \underset{(X)}{CH_4} + \underset{(Y)}{CH_2 = CH_2}$$

In this reaction X is methane and Y is ethylene. Hence, the option b and d are correct.

238. In cyclopropane, cyclobutane and cyclohexane, the common group is

(a) $-\overset{|}{\underset{|}{C}}-$

(b) $\overset{|}{\underset{|}{CH_2}}$

(c) $-CH_3$

(d) $-\overset{|}{\underset{|}{CH}}$

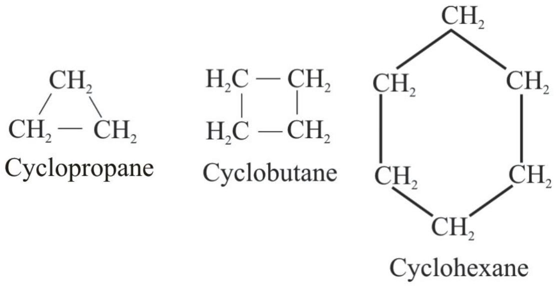
UPTU/UPSEE-2008

Ans. (b) : The structure of the cyclobutane, cyclobutane and cyclohexane are –



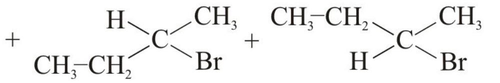
In this structure we can observe that common structure present in all hydrocarbon is $\overset{|}{\underset{|}{CH_2}}$.

239. How many monobriminated product (s) (including stereoisomers) would form in the free radical bromination of n-butane?
(a) 2 (b) 1
(c) 3 (d) 4

WB-JEE-30.04.2022

Ans. (c) :

$$CH_3-CH_2-CH_2-CH_3 + Br_2 \xrightarrow{hv} CH_3-CH_2-CH_2-CH_2-Br$$



In n-butane monobrominated of product will 3 (including stereoisomer's).

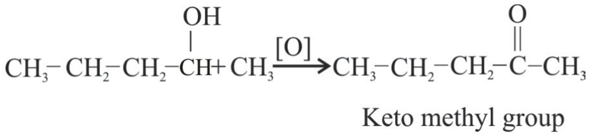
@apna_pdf

240. Upon treatment with I_2 and aqueous NaOH, which of the following compounds will form iodoform?

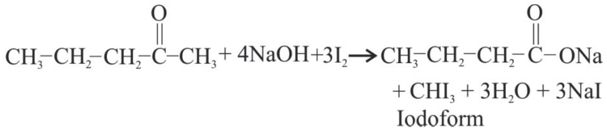
(a) $CH_3CH_2CH_2CH_2CHO$
(b) $CH_3CH_2COCH_2CH_3$
(c) $CH_3CH_2CH_2CH_2CH_2OH$
(d) $CH_3CH_2CH_2CH(OH)CH_3$

WB-JEE-2012

Ans. (d) :



$$CH_3-CH_2-CH_2-\overset{OH}{\overset{|}{CH}}-CH_3\xrightarrow{[O]}CH_3-CH_2-CH_2-\overset{O}{\overset{\|}{C}}-CH_3$$



$$CH_3-CH_2-CH_2-\overset{O}{\overset{\|}{C}}-CH_3+4NaOH+3I_2\rightarrow CH_3-CH_2-CH_2-\overset{O}{\overset{\|}{C}}-ONa+\underset{\text{Iodoform}}{CHI_3}+3H_2O+3NaI$$

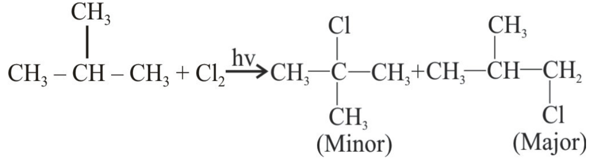
Those compound which have $\left(CH_3-\overset{O}{\overset{\|}{C}}-\right)$ group to give a iodoform reaction.

241. 2-methylpropane on monochlorination under photochemical condition give

(a) 2-chloro-2-methylopropane as major product
(b) (1:1) mixture of 1-chloeo-2-methylopropane and 2-chloro-2-methylpropane
(c) 1-chloro-2-methylpropane as a major product
(d) (1:9) mixture of 1-chloro-2-methylpropane and 2-cholro-2-methylpropane

WB-JEE-2013

Ans. (c) : 2-methyl propane on monochlorination under photochemical condition to give a 1-chloro -2-methyl propane.



$$CH_3-\overset{CH_3}{\overset{|}{CH}}-CH_3+Cl_2\xrightarrow{hv}\underset{\text{(Minor)}}{CH_3-\underset{\underset{CH_3}{|}}{\overset{\overset{Cl}{|}}{C}}-CH_3}+\underset{\text{(Major)}}{CH_3-\overset{\overset{CH_3}{|}}{CH}-\underset{\underset{Cl}{|}}{CH_2}}$$

242. The 4th higher homologue of ethane is

(a) Butane
(b) Pentane
(c) Hexane
(d) Heptane

WB-JEE-2014

Ans. (c) : We know that the molecular formula of ethane is C_2H_6.

The 4th higher homologue is –

$4\times CH_2=C_4H_8$

$\therefore$ The fourth 4th homologue of ethane is

$C_2H_6+C_4H_8=C_6H_{14}$ (Hexane).

Thus, hexane is the fourth higher homologue of ethane.

243. The major products obtained during ozonolysis of 2, 3-dimethyl-1- butane and subsequent reductions with Zn and H_2O are

(a) methanoic acid and 2- methyl -2-butanone
(b) methanal and 3- methyl -2-butanone
(c) methanol and 2,2- dimethyl -3-butanone
(d) methanoic acid and 2- methyl -3-butanone

WB-JEE-2016

Ans. (b) : 2, 3-dimethyl-1-butane react with O_3 and reduction with Zn and H_2O to give a methanol and 3-methyl-2-butanone.

244. Amongst the following compounds, the one which would not respond to iodofrom test is

(a) $CH_3CH(OH)CH_2CH_3$
(b) $ICH_2COCH_2CH_3$
(c) CH_3COOH
(d) CH_3CHO

WB-JEE-2016

Ans. (c) : Those compound which have keto methyl group $\left(CH_3-\overset{O}{\overset{\|}{C}}-\right)$ to give a iodoform test.

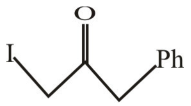
In acetic acid (CH_3COOH) would not respond to iodoform test.

In first step base deprotonates most acidic alpha H atom. In acetic acid, the most acidic proton is attached to O atom

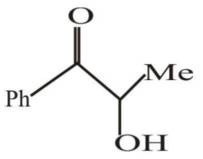
So, deprotonation of $\propto$-hydrogen does not occur so CH_3COOH not respond the iodoform test.

245. Haloform reaction with I_2 and KOH will be responded by

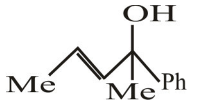
(a)



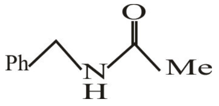
(b)



(c)



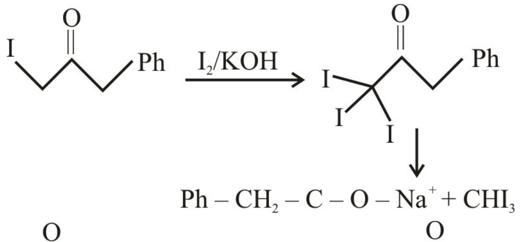
(d)



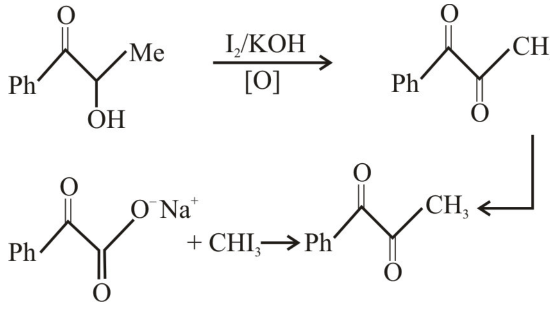
WB-JEE-2019

Ans. (a,b) :

(a)



(b)

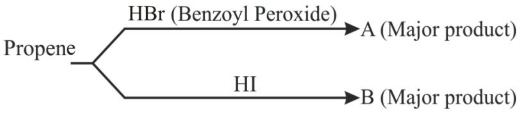


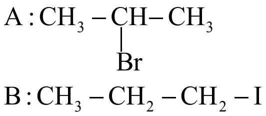
Halo form reaction is oxidising in nature. It requires a methyl group near a carbonyl group near a carbonyl carbon to give a positive test.

@apna_pdf

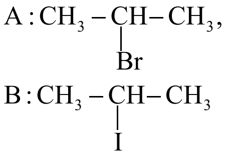
2. Alkenes

246. Identify A and B in the reaction



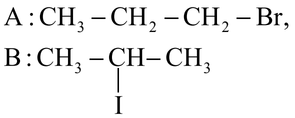
(a)


$A: CH_3-\underset{Br}{\underset{|}{C}}H-CH_3$
$B: CH_3-CH_2-CH_2-I$

(b)


$A: CH_3-\underset{Br}{\underset{|}{C}}H-CH_3,$
$B: CH_3-\underset{I}{\underset{|}{C}}H-CH_3$

(c) $A: CH_3-CH_2-CH_2-Br,$
$B: CH_3-CH_2-CH_2-I$

(d)


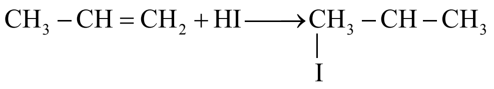
$A: CH_3-CH_2-CH_2-Br,$
$B: CH_3-\underset{I}{\underset{|}{C}}H-CH_3$

Karnataka CET-17.06.2022, Shift-II

Ans. (d) :

$$\underset{\text{Propene}}{CH_3-CH=CH_2}\xrightarrow[\text{(Peroxide)}]{\text{HBr}}\underset{\text{1–bromo propane}}{CH_3-CH_2-CH_2-Br}$$

(A)



$$CH_3-CH=CH_2+HI\longrightarrow CH_3-\underset{I}{\underset{|}{C}}H-CH_3$$

2 – Iodo Propane

(B)

247. Given below are two statements.

Statement I : The presence of weaker π - bonds make alkenes less stable than alkanes.

Statement II : The strength of the double bond is greater than that of carbon-carbon single bond.

In the light of the above statements, choose the correct answer from the options given below.

(a) Both statement I and Statement II are correct.
(b) Both Statement I and Statement II are incorrect.
(c) Statement I is correct but statement II is incorrect.
(d) Statement I is incorrect but statement II is correct.

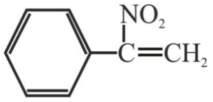
JEE Main-24.06.2022, Shift-II

Ans. (a) : As π bond is weaker than σ bonds the presence of weaker π- bonds makes alkenes less stable than alkanes and the strength of the double bond is greater than C – C.

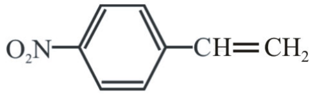
248. In the given reaction sequence, the major product 'C' is:

$$C_8H_{10}\xrightarrow[H_2SO_4]{HNO_3}A\xrightarrow[\Delta]{Br_2}B\xrightarrow[KOH]{\text{alcoholic}}C$$

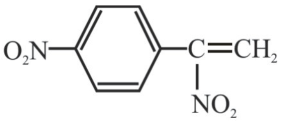
(a)



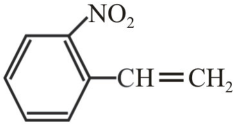
(b)



(c)

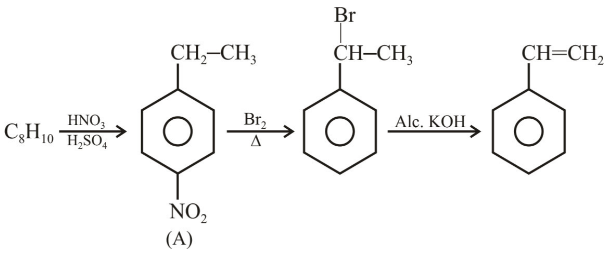


(d)



JEE Main-24.06.2022, Shift-I

Ans. (b) :



249. Calculate the number of σ and π bonds in 2-n-propylpent-1-ene.

(a) 22 σ bonds, 2π bonds
(b) 23 σ bonds, 1π bond
(c) 21 σ bonds, 1π bond
(d) 23 σ bonds, 2π bond
(e) 20 σ bonds, 1π bond

Kerala CEE -03.07.2022

Ans. (b) : There are 23 sigma covalent bonds and 1pi bond is present in the 2 – propylpent -1-ene.

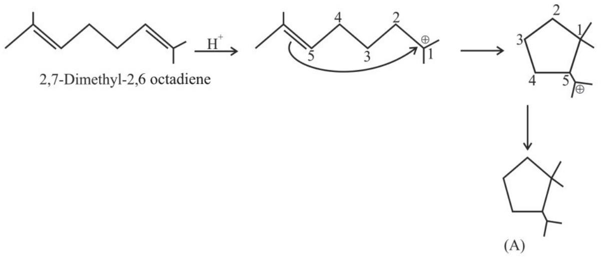
250. The major product 'A' of the following given reaction has ________ sp^2 hybridized carbon atoms.

2,7- Dimethyl-2,6-octadiene $\xrightarrow{H^+}$ A Major Product.

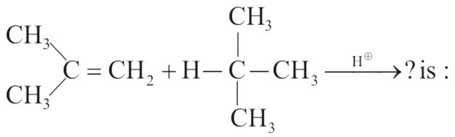
JEE Main-24.06.2022, Shift-I

@apna_pdf

Ans. (2) :

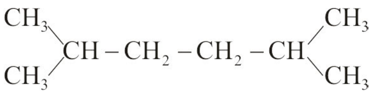


251. The product formed in the following reaction



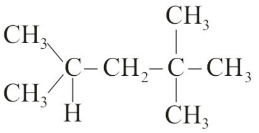
$(CH_3)_2C=CH_2 + H-C(CH_3)_3 \xrightarrow{H^{\oplus}}$? is :

(a)



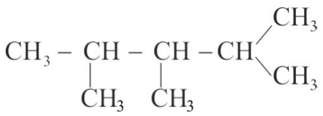
$(CH_3)_2CH-CH_2-CH_2-CH(CH_3)_2$

(b)



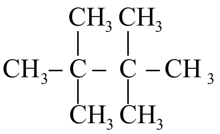
$(CH_3)_2CH-CH_2-C(CH_3)_3$

(c)



$CH_3-CH(CH_3)-CH(CH_3)-CH(CH_3)_2$

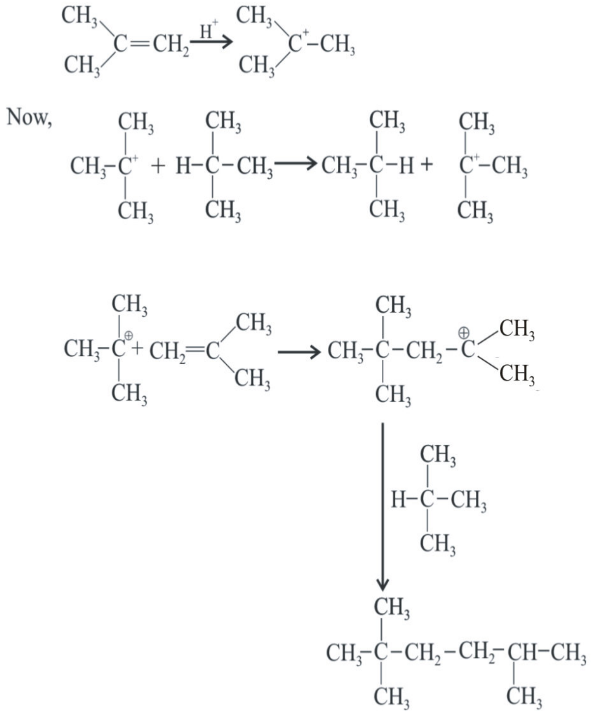
(d)



$CH_3-C(CH_3)_2-C(CH_3)_2-CH_3$

JEE Main-25.06.2022, Shift-I

Ans. (b) :



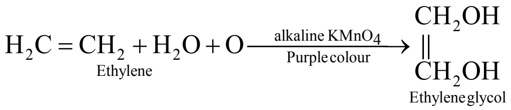
252. The test used for carbon-carbon double bond in an alkene is:

(a) Baeyer's (b) Carbyl amine

(c) Lassaignes (d) Silver mirror

AP-EAMCET (Med.)-1999

Ans. (a) : The unsaturation test performed by Baeyer's reagent. The alkaline $KMnO_4$ and Br_2 water known as Baeyer's reagent. When unsaturated compound reacts with Baeyer's reagent then the colour of Baeyer's reagent and Br_2 water is discharged.



$$\underset{\text{Ethylene}}{H_2C=CH_2} + H_2O + O \xrightarrow[\text{Purple colour}]{\text{alkaline } KMnO_4} \underset{\text{Ethylene glycol}}{CH_2OH-CH_2OH}$$

253. Consider the following statements:

Statement-I : 1- Butene reacts with HBr to give 1-bromobutane.

Statement-II : Reactive intermediate of the reaction is carbocation.

Which one of the following is correct in respect of the above statements?

(a) Both statement-I and statement-II are correct and statement-II is the correct explanation of statement-I

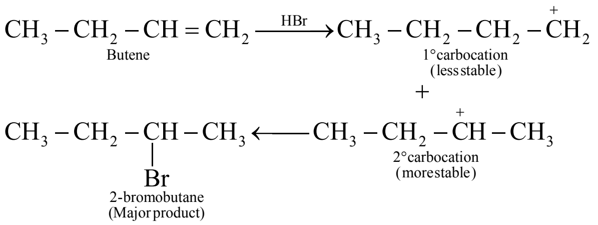
(b) Both statement-I and statement-II are correct but statement-II is not correct explanation of statement-I

(c) Statement-I is correct but statement-II is incorrect.

(d) Statement-I is incorrect but statement-II is correct.

SCRA 2012

Ans. (d) :



$$\underset{\text{Butene}}{CH_3-CH_2-CH=CH_2} \xrightarrow{HBr} \underset{\substack{1^\circ\text{carbocation}\\(\text{less stable})}}{CH_3-CH_2-CH_2-\overset{+}{C}H_2} + \underset{\substack{2^\circ\text{carbocation}\\(\text{more stable})}}{CH_3-CH_2-\overset{+}{C}H-CH_3} \longrightarrow \underset{\substack{\text{2-bromobutane}\\(\text{Major product})}}{CH_3-CH_2-CH(Br)-CH_3}$$

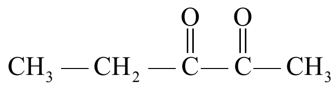
254. Compound *A* on ozonolysis yielded a mixture of propanoic acid and acetic acid The structure of compound *A* is

(a) $CH_3CH_2C\equiv C-H$

(b) $CH_3CH_2C\equiv C-CH_3$

(c) $CH_3CH_2CH=CH-CH_3$

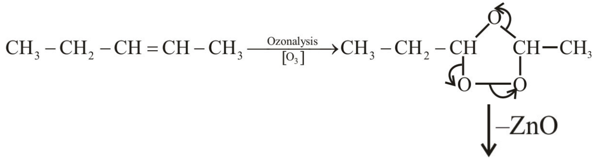
(d)



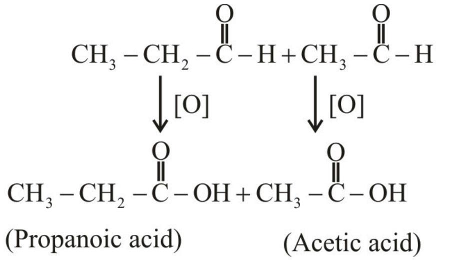
$CH_3-CH_2-\overset{O}{\overset{\|}{C}}-\overset{O}{\overset{\|}{C}}-CH_3$

SCRA-2015

Ans. (c):



@apna_pdf



$$CH_3-CH_2-\overset{\overset{\displaystyle O}{\|}}{C}-H + CH_3-\overset{\overset{\displaystyle O}{\|}}{C}-H \xrightarrow{[O]} \underset{\text{(Propanoic acid)}}{CH_3-CH_2-\overset{\overset{\displaystyle O}{\|}}{C}-OH} + \underset{\text{(Acetic acid)}}{CH_3-\overset{\overset{\displaystyle O}{\|}}{C}-OH}$$

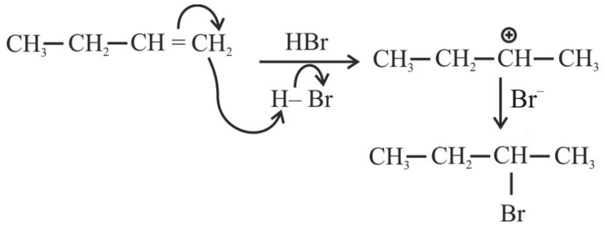
255. In the addition reaction of HBr to 1-butene, the first step involves the addition of

(a) H^+ (b) H^-

(c) $H^{\bullet}$ (d) $Br^{\bullet}$

SCRA-2015

Ans. (a):



In the addition reaction of HBr to 1-butene the first step involves the addition of H^+

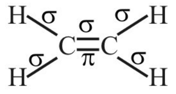
256. The number of σ bonds in the ethylene molecule is

(a) 4 (b) 5

(c) 6 (d) 7

A.P.EAMCET-1991

Ans. (b) :



Ethylene

Hence, the total no. of σ bonds = 5 and 1π bond are present in the ethylene molecule.

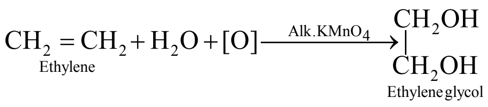
257. Baeyr's reagent reacts with which of the following compounds to give glycol?

(a) Methane (b) Ethane

(c) Ethylene (d) Acetylene

A.P.EAMCET-1991

Ans. (c) : Baeyr's reagent reacts with ethylene to give glycol.



$$\underset{\text{Ethylene}}{CH_2=CH_2}+H_2O+[O]\xrightarrow{\text{Alk.}KMnO_4}\underset{\text{Ethylene glycol}}{\begin{array}{l}CH_2OH\\ \vert\\ CH_2OH\end{array}}$$

258. Among the following the hydrocarbon which decolorises bromine water but does not give precipitate bromine water but does not give precipitate with ammonical $AgNO_3$ is

(a) CH_4 (b) C_2H_4

(c) C_2H_2 (d) C_6H_6

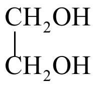
A.P.EAMCET-1994

Ans. (b) : Bromine water is decolourized by unsaturated compounds. Ammonical silver nitrate solution is also known as Toller's reagent. But ethene does not give any precipitate with ammonical silver nitrate.

259. The compound formed when 2-butene is treated with acidified $KMnO_4$, is

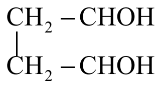
(a) acetaldehyde (b) acetic acid

(c)



$$\begin{array}{l}CH_2OH\\ \vert\\ CH_2OH\end{array}$$

(d)



$$\begin{array}{l}CH_2-CHOH\\ \vert\\ CH_2-CHOH\end{array}$$

A.P.EAMCET-1995

Ans. (b) : When 2-butene is treated with acidified $KMnO_4$ to give acetic acid.

$$\underset{\text{2-butene}}{CH_3-CH=CH-CH_3}\xrightarrow[KMnO_4]{\text{Acidified}}\underset{\text{Acetic acid}}{2CH_3COOH}$$

260. Among the following compounds which have more than one type of hybridisation for carbon atoms.

1. $CH_3CH_2CH_2CH_3$

2. $CH_3CH=CH\ CH_3$

3. $CH_2=CH-CH=CH_2$

4. $H-C\equiv C-H$

(a) 2 and 3 (b) 2

(c) 3 and 4 (d) 3

A.P.EAMCET-1998

Ans. (a) : (1) $CH_3-CH_2-CH_2-CH_3$

This compound having only one type of hybridization is sp^3

(2) $CH_3-CH=CH-CH_3$

This compound having two type of hybridization sp^3 and sp^2.

(3) $CH_2=CH-C\equiv CH$

This compound having three type of hybridization sp^3, sp^2 and sp.

(4) $H-C\equiv C-H$

This type of compound having only one type of hybridization sp.

261. The structural formula of 2-methyl-2-butene is

(a) $CH_3–CH(CH_3)–CH=CH_2$

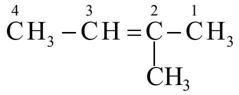
(b) $CH_3–CH_2–C(CH_3)=CH_2$

(c) $CH_3–CH=CH–CH_3$

(d) $CH_3–CH=C(CH_3)-CH_3$

A.P.EAMCET-2001

Ans. (d) :



$$\overset{4}{C}H_3-\overset{3}{C}H=\underset{\underset{\displaystyle CH_3}{\vert}}{\overset{2}{C}}-\overset{1}{C}H_3$$

2-methyl-2-butene

262. Identify 'B' in the following reaction

$$CH_2=CH_2+HCl\xrightarrow{\text{Anhy }AlCl_3}A+2[H]$$

$$\xrightarrow[C_2H_5OH]{Zn-Ca}B+HCI$$

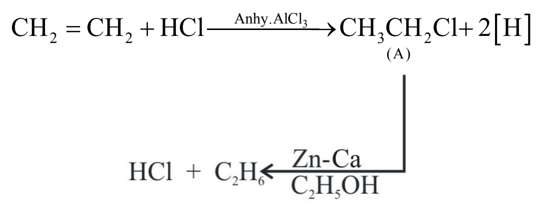
(a) CH_4 (b) C_2H_6

(c) C_2H_5CI (d) C_2H_3OH

AP EAMCET (Engg.) -2007

@apna_pdf

Ans. (b) :



$$\begin{tikzcd} CH_2=CH_2+HCl \arrow[r, "Anhy.AlCl_3"] & \underset{(A)}{CH_3CH_2Cl}+2[H] \arrow[d] \\ HCl + C_2H_6 & \arrow[l, "Zn\text{-}Ca"', "C_2H_5OH"] \end{tikzcd}$$

263. C_2H_5Br, on boiling with alcoholic solution of NaOH, forms

(a) Ethyl alcohol (b) Methyl alcohol

(c) Ethyne (d) Ethene

A.P. EAMCET-1992

Ans. (d) : $\underset{\text{Ethyl bromide}}{CH_3CH_2Br} \xrightarrow{alc\cdot NaOH} \underset{\text{ethene}}{CH_2=CH_2} + HBr$

264. Chloroethane is treated with alc KOH. The product formed, is

(a) C_2H_6O (b) C_2H_6

(c) C_2H_4 (d) C_2H_4O

A.P. EAMCET-1999

Ans. (c) :

$\underset{\text{Chloroethane}}{C_2H_5Cl} + KOH \xrightarrow{\text{Dehydrohalogenation}} \underset{\text{Ethene}}{C_2H_4} + H_2O + KCl$

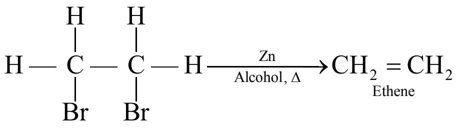
265. The reaction conditions used for converting 1, 2-dibromoethane to ethylene are

(a) Zn, alcohol, Δ (b) KOH, alcohol, Δ

(c) KOH, water, Δ (d) Na, alcohol, Δ

A.P. EAMCET-2002

Ans. (a) :



$$H-\overset{H}{\underset{Br}{C}}-\overset{H}{\underset{Br}{C}}-H \xrightarrow[\text{Alcohol, }\Delta]{Zn} \underset{\text{Ethene}}{CH_2=CH_2}$$

1, 2 – dibromoethane

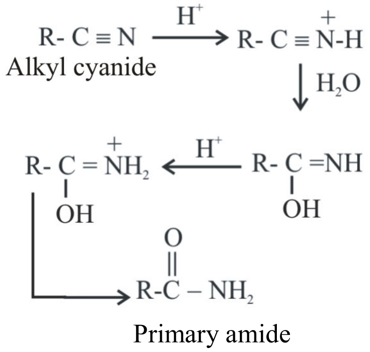
266. What is the initial product of the acidic hydrolysis of cyanide

(a) A primary amide (b) An isocyanide

(c) An isocyanate (d) A nitrile

MPPET- 2009

Ans. (a) :



$$\underset{\text{Alkyl cyanide}}{R\text{-}C\equiv N} \xrightarrow{H^+} R\text{-}C\equiv \overset{+}{N}\text{-}H \xrightarrow{H_2O} R\text{-}\underset{OH}{C}=NH \xrightarrow{H^+} R\text{-}\underset{OH}{C}=\overset{+}{N}H_2 \longrightarrow \underset{\text{Primary amide}}{R\text{-}\overset{O}{\overset{\|}{C}}-NH_2}$$

267. In the following reaction :

$2CH_2 = CH_2 + S_2Cl_2 \rightarrow$ Product. The product is.

(a) Mustard gas (b) Lewisite

(c) Polythene (d) Teflon

MPPET- 2009

Ans. (a) : $2CH_2 = CH_2 + S_2Cl_2 \rightarrow (ClCH_2CH_2)_2\,S + S$

Mustard gas is intesized by treating sulfur dichloride with ethylene.

- It is called mustard gas because impure forms of the gas have an odor that resembles of mustard.

268. Towards electrophilic reagents

(a) Ethene is more reactive than ethyne

(b) Ethene is less reactive than ethyne

(c) Both have equal reactivity

(d) The reactivity of both cannot be predicted

MPPET- 2009

Ans. (a) : Towards electrophilic addition reaction, ethene is more reactive than ethyne because ethene has less percent S character than ethyne due to which ethene donate our pi-cloud more than that to ethyne.

269. Which of the following reactions can be used for the synthesis of an alkene

(a) Chugaev reaction

(b) Dakin reaction

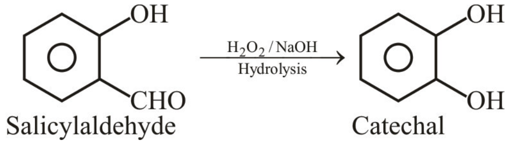
(c) Reimer-Tiemann reaction

(d) Wurtz fitting reaction

MPPET- 2009

Ans. (a) : The Chugaev elimination is a chemical reaction that involves the elimination of water from alcohols to produce alkene.

- The replacement of the aldehyde or acetyl group in phenolic aldehydes or ketone by a hydroxyl group on reaction with alkaline hydrogen peroxide is known as Dakin reaction.



- The Reimer-Tiemann reaction is a chemical reaction used for the ortho-formylation of phenols with the simplest example being the conversion of phenol to salicylaldehyde.
- Wurtz-Fitting reaction is a chemical reaction of aryl halides with alkyl halides and sodium metal in the presence of dry ether to give substituted aromatic compound.

270. The product Z of the following reaction is

$$H_3CC\equiv CH \xrightarrow{2HBr} Z$$

(a) $H_3CCH_2CHBr_2$ (b) $H_3CCBr_2CH_3$

(c) $H_3CCHBrCH_2Br$ (d) $BrCH_2CH_2CH_2Br$

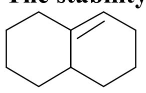
TS-EAMCET-2016

Ans. (b) : $H_3C-C\equiv CH \xrightarrow{2HBr} H_3C-CBr_2-CH_3$

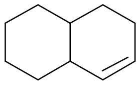
This reaction is followed as Markovnikovs addition.

@apna_pdf

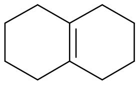
271. The stability order of the given alkenes is



(I)



(II)

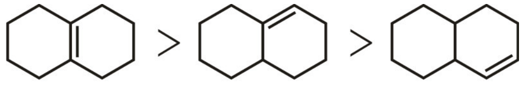


(III)

(a) (I) > (II) > (III) (b) (I) > (III) > (II)
(c) (III) > (II) > (I) (d) (III) > (I) > (II)

TS-EAMCET (Engg.), 05.08.2021 Shift-II

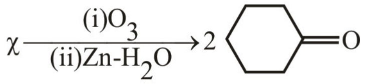
Ans. (d) : The stability order of alkenes will be –



(III) (I) (II)

The stability of alkene depends upon the number of carbon atom substituted with the double bond. More substitution, more will be stability of alkenes. Hence, the correct option is (d).

272. Identify 'X' in the following reaction.



(a) 
(b) 
(c) 
(d) 
AP EAMCET (Engg.) 17.09.2020, Shift-II

Ans. (d) :

(a) 
(c) 
will give 
(d) 
(X)

273. The gaseous substance which decolourises bromine but does not give a precipitate with ammoniacal silver nitrate is :

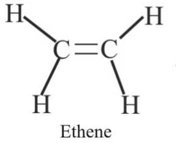
(a) C_2H_6 (b) C_2H_4
(c) C_2H_2 (d) CH_4

AP EAMCET (Medical) -1998

Ans. (b): Ethylene and acetylene decolourise Br_2 water. Acetylene gives precipitate with ammonical $AgNO_3$ but with ammonical $AgNO_3$, ethylene do not give any reaction.

$$C_2H_2 \xrightarrow{Ag(NH_3)_2NO_3} CH \equiv C.Ag \xrightarrow{Ag(NH_3)_2NO_3} Ag \cdot C \equiv C \cdot Ag$$

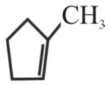
(White ppt)
Disilver acetylide



Ethene

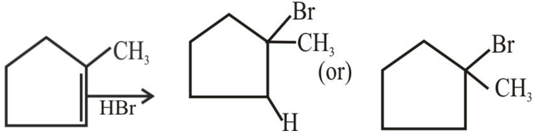
$\xrightarrow{Ag(NH_3)_2NO_3}$ No reaction

274. What is the major product obtained from the addition of HBr to the following compound?



(a) 
(b) 
(c) 
(d) 
TS EAMCET 10.08.2021, Shift-I

Ans. (b) :

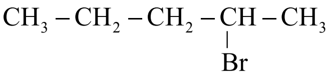


275. Indentify the statement which is not correct?

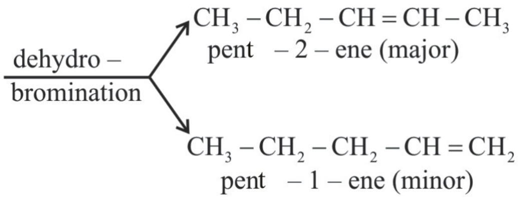
(a) Dehydrobromination of 2-bromopentane gives pent-1-ene as the major product
(b) Freon 12 is manufactured by Swarts reaction
(c) $CHCl_3$ is stored in closed, dark coloured bottles
(d) Chronic exposure to $CHCl_3$ cases liver damage

AP EAMCET-2017

Ans. (a):



$$CH_3-CH_2-CH_2-\underset{\underset{Br}{|}}{CH}-CH_3$$

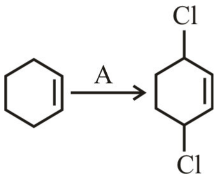


$CH_3-CH_2-CH=CH-CH_3$
pent – 2 – ene (major)

$CH_3-CH_2-CH_2-CH=CH_2$
pent – 1 – ene (minor)

@apna_pdf

276.

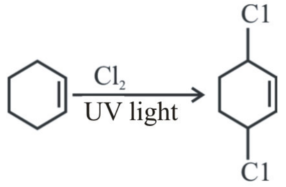


Identify the reagent(s) 'A' and condition(s) for the reaction

(a) A = Cl_2 ; dark, Anhydrous $AlCl_3$
(b) A = HCl, $ZnCl_2$
(c) A = Cl_2 ; UV light
(d) A = HCl ; Anhydrous $AlCl_3$

JEE Main 16.03.2021, Shift-II

Ans. (c) : This reaction is free radical halogenations in which substitution of Cl_2 take place at allylic position



277. Consider the following statements :

1. Alkenes are more reactive than alkynes for electrophilic addition.

2. Benzaldehyde is more reactive than acetaldehyde for nucleophilic addition.

Which of the statements given above is/are correct ?

(a) 1 only
(b) 2 only
(c) Both 1 and 2
(d) Neither 1 nor 2

SCRA - 2009

Ans. (a) : (i) In electrophilic addition reaction, alkenes are more reactive than alkynes due to in this case, π electrons are more tightly in –C≡C bond than –C=C– bonds. It is also more sterically difficult to form a bromonium ion from an alkyne than from an alkene.

(ii) Benzaldehyde is less reactive than acetaldehyde for nucleophilic addition. C-atom of carbonyl group in benzaldehyde is less electrophilic due to resonance while in case of acetaldehyde, it as more electrophilic center for nucleophilic addition.

So, only (i) option correct.

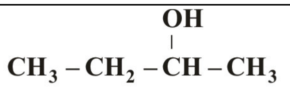
278. What is the major product [Y] of the reaction

 $+ CH_2=CH-CH_2Cl \xrightarrow{AlCl_3} [Y]$?

(a) 
(b) 
(c) 
(d) 
SCRA - 2009

Ans. (d) : When benzene reacts with Allyl chloride in the presence of anhydrous $AlCl_3$,  formed.

279. Optically active



$CH_3-CH_2-\overset{\overset{\displaystyle OH}{|}}{CH}-CH_3$

was found to have lost its optical activity after standing in water containing a few drops of acids, mainly due to the formation of

(a) $CH_3-CH_2-CH=CH_2$
(b) $CH_3-CH=CH-CH_3$
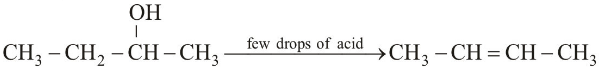
(c) $CH_3-\underset{}{\overset{\overset{\displaystyle CH_3}{|}}{CH}}-CH_2-OH$
(d) $CH_3-CH_2-CH_2-CH_2-OH$

TS EAMCET-2017

Ans. (b) :



$CH_3-CH_2-\overset{\overset{\displaystyle OH}{|}}{CH}-CH_3 \xrightarrow{\text{few drops of acid}} CH_3-CH=CH-CH_3$

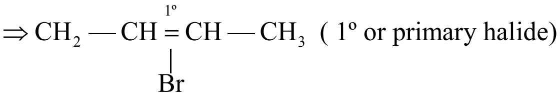
On adding a few drops of optically active compound undergo dehydration to form a stable alkene.

280. Identify the primary halide among the following compounds.

(a) 1-bromo-but-2-ene
(b) 4-bromo-pent-2-ene
(c) 2-bromo-2-methyl propane
(d) t-butyl bromide

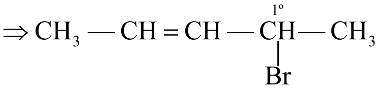
AP EAMCET (Engg.) 18.9.2020 Shift-I

Ans. (a) : 1 - bromo- but - 2 - ene



$\Rightarrow \underset{\underset{\displaystyle Br}{|}}{CH_2}-\overset{1^o}{CH}=CH-CH_3$ (1° or primary halide)

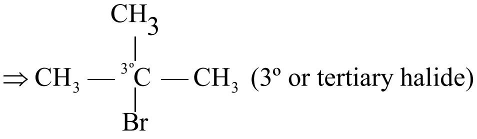
(b) 4- bromo-pent-2ene



$\Rightarrow CH_3-CH=CH-\underset{\underset{\displaystyle Br}{|}}{\overset{1^o}{CH}}-CH_3$

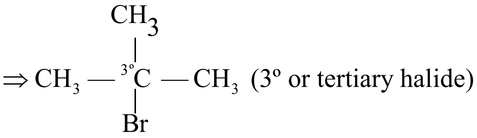
(2° or secondary halide)

(c) 2-bromo- 2 - methyl - propane



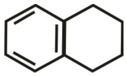
$\Rightarrow CH_3-\underset{\underset{\displaystyle Br}{|}}{\overset{\overset{\displaystyle CH_3}{|}}{{}^{3^o}C}}-CH_3$ (3° or tertiary halide)

(d) t-bulyl bromide



$\Rightarrow CH_3-\underset{\underset{\displaystyle Br}{|}}{\overset{\overset{\displaystyle CH_3}{|}}{{}^{3^o}C}}-CH_3$ (3° or tertiary halide)

281. Number of hydrogen atoms in the given compound is

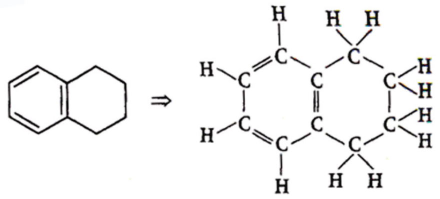


(a) 10
(b) 12
(c) 14
(d) 16

AP EAMCET (Engg.) 18.9.2020 Shift-I

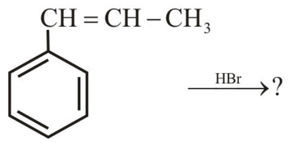
@apna_pdf

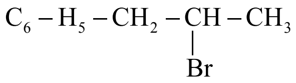
Ans. (b) :



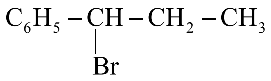
Total number of H-atoms in the hydrocarbon = 12

282. Identify the product of the following reaction



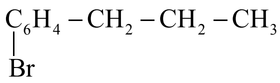
(a)


$C_6 - H_5 - CH_2 - \underset{Br}{CH} - CH_3$

(b)


$C_6H_5 - \underset{Br}{CH} - CH_2 - CH_3$

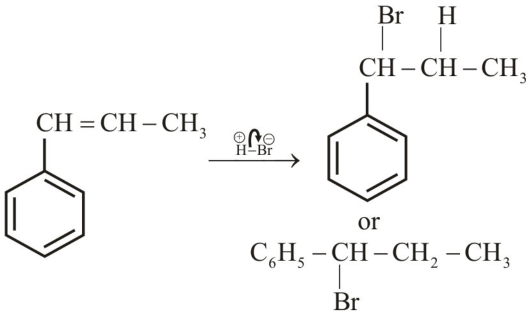
(c) $C_6H_5 - CH_2 - CH_2 - CH_3 - Br$

(d)


$\underset{Br}{C_6H_4} - CH_2 - CH_2 - CH_3$

AP EAPCET 20.08.2021 Shift-I

Ans. (b) :

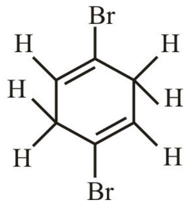


283. An organic compound of molecular formula $C_6H_6Br_2$ has six carbon atoms in a ring system two non-conjugate double bonds and two bromo groups at 1, 4 positions. Then the compound is —

(a) Aromatic but non-homo-cyclic
(b) Aromatic and hetero-cyclic
(c) Homo-cyclic but not aromatic
(d) Neither homo-cyclic nor hetero-cyclic

AP EAPCET 20.08.2021 Shift-I

Ans. (c) :



Compound is homo-cyclic but not aromatic.

284. Consider the following reactions,

$C_2H_2 \xrightarrow[500^\circ C]{\text{red hot iron tube}} A$

$A \xrightarrow[70^\circ C]{\text{conc. } HNO_3\text{, conc. } H_2SO_4} B$

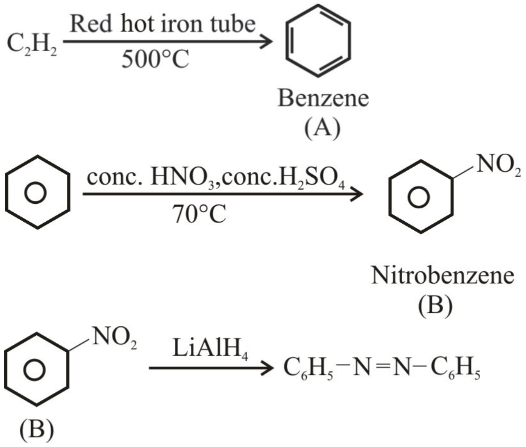
$B \xrightarrow{LiAlH_4} C_6H_5 - N = N - C_6N_5$

A and B are

(a) $A=C_2H_4, B=C_6H_6$
(b) $A=C_2H_6, B=C_6H_5NH_2$
(c) $A=C_2H_4, B=C_6H_5NH_2$
(d) $A=C_6H_6, B=C_6H_5NO_2$

AP EAMCET (Engg.) 2001

Ans. (d) :



285. Identify the substrate in this reaction:

$$? \xrightarrow[443K]{H_2SO_4} H_2C{=}CH_2$$

(a) Isopropyl alcohol
(b) Methyl alcohol
(c) Ethyl alcohol
(d) n-propyl alcohol

AP EAPCET-6 Sep. 2021, Shift-II

Ans. (c) : When ethanol is heated with concentrated sulphuric acid at 443 K, dehydration takes place and ethane is formed. In this reaction concentrated sulphuric acid (H_2SO_4) acts as a dehydrating agent.

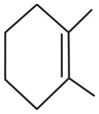
The balanced chemical equation is given by.

$$CH_3CH_2OH \xrightarrow[\text{Conc.}H_2SO_4]{443K} CH_2 = CH_2 + H_2O$$

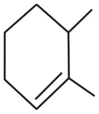
Therefore, concentrated sulphuric acid removes water from ethanol, thereby act as a dehydrating agent.

286. The order of stability among the following alkenes is:

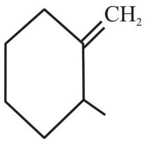
(i)



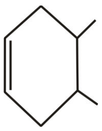
(ii)



(ii)



(iv)



@apna_pdf

(a) (i)>(iv)>(ii)>(iii)
(b) (ii)>(i)>(iii)>(iv)
(c) (i)>(ii)>(iv)>(iii)
(d) (iii)>(iv)>(ii)>(i)

AP EAPCET-6 Sep. 2021, Shift-II

Ans. (c): Alkenes with higher number of alkyl groups connected with it are more stable. Alkenes that have higher number of hyper conjugation are more stable. Conjugated alkenes are more stable.

287. Which one of the following gives sooty flame on combustion?

(a) C_2H_4
(b) CH_4
(c) C_2H_6
(d) C_6H_6

AP EAMCET (Engg.) -2014

Ans. (d) : Unsaturated hydrocarbon undergoes burn with sooty flame which is yellow in colour. Saturated hydrocarbons undergo complete combustion with oxygen to produce a clean blue flame.

Hydrocarbon having double or triple bond do not burn completely in air and have burnt carbon which result in blackish smoky flame.

Unsaturated Hydrocarbon like C_2H_5 and C_6H_6 have relatively more hydrocarbon.

Benzene is aromatic compound having relatively more carbon content.

So it does not completely oxidized durning combustion and give a sooty flames.

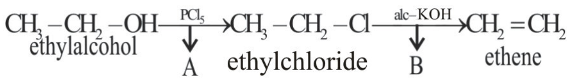
288. $$CH_3-CH_2-OH \xrightarrow{A} CH_3-CH_2-Cl \xrightarrow{B} CH_2=CH_2$$

A and B in this sequence of reaction are

(a) $KOH_{(aq.)}$ and PCl_5
(b) PCl_5 and $KOH_{(aq.)}$
(c) Cl_2 and $KOH_{(alc.)}$
(d) PCl_5 and $KOH_{(alc.)}$

COMEDK 2012

Ans. (d) : Ethanol reacts with phosphorus tetrachloride to give the ethylchloride . Now, ethyl chloride reacts with alcoholic KOH to form the alkene followed by elimination reaction.



$CH_3-CH_2-OH \xrightarrow{PCl_5} CH_3-CH_2-Cl \xrightarrow{alc-KOH} CH_2=CH_2$
ethylalcohol
A
ethylchloride
B
ethene

289. Markovnikov's rule is applicable to

(a) C_3H_6+HBr
(b) C_2H_4+HCl
(c) $C_3H_6+Cl_2$
(d) C_2H_4+HBr

COMEDK 2012

Ans. (a) : Markovnikov's rule is applicable to addition of unsymmetrical reagents like HX, H_2O to unsymmetrical alkene.

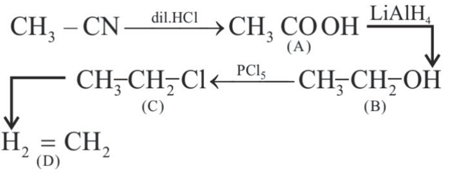
290. $$\begin{array}{l} CH_3-CN \xrightarrow{dil.HCl} A \xrightarrow{LiAlH_4} B \xrightarrow{PCl_5} C \\ \qquad\qquad\qquad\qquad\qquad\qquad\qquad D \xleftarrow{alc.KOH} \end{array}$$

The product 'D' in the above sequence of reaction is

(a) acetaldehyde
(b) ethene
(c) ethyne
(d) acetyl chloride.

COMEDK 2011

Ans. (b) :



$CH_3-CN \xrightarrow{dil.HCl} CH_3COOH$
(A)
$LiAlH_4$
$CH_3-CH_2-Cl \xleftarrow{PCl_5} CH_3-CH_2-OH$
(C)
(B)
$CH_2=CH_2$
(D)

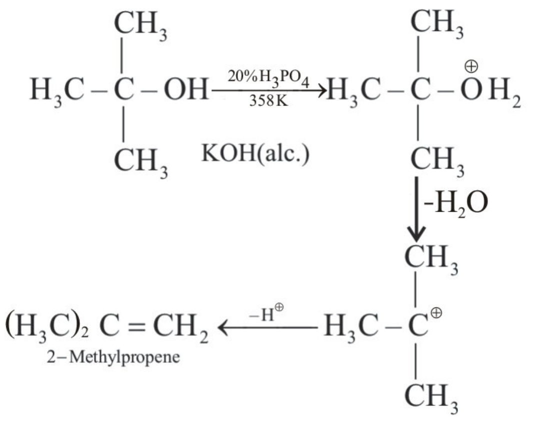
291. Identify the main product in the reaction

$$C(CH_3)_3OH \xrightarrow[358K]{20\%H_3PO_4} ?$$

(a) $(CH_3)_2C=CH_2$
(b) $(CH_3)_2CHOH$
(c) $CH_3CH=CHCH_3$
(d) $CH_3CH_2CH=CH_2$

COMEDK 2015

Ans. (a) :



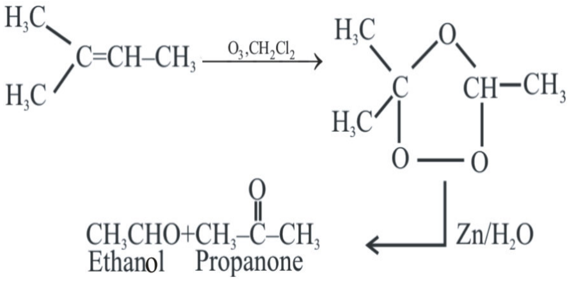
20%H_3PO_4
358K
KOH(alc.)
$-H_2O$
$-H^\oplus$
2–Methylpropene

292. The compound which on ozonolysis produces a mixture of propanone and ethanal is

(a) 2-methylbut-1-ene
(b) 2-pentene
(c) 2-pentyne
(d) 2-methylbut-2-ene.

COMEDK 2014

Ans. (d) :



O_3,CH_2Cl_2
Zn/H_2O
$CH_3CHO+CH_3-\overset{O}{\overset{\|}{C}}-CH_3$
Ethanol
Propanone

@apna_pdf

293. Which of the following is the most stable alkene?

(a) $RCH=CH_2$
(b) $CH_2=CH_2$
(c) $RCH=CHR$
(d) $R_2C=CR_2$

COMEDK 2018

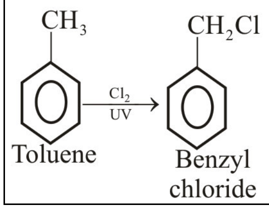
Ans. (d) : Greater the number of alkyl groups attached to double bonded carbon atoms, more stable is the alkene (Satyzeff's rule). Hence the $R_2C=CR_2$ more stable alkene

294. When chlorine is passed through boiling toluene we get

(a) o-chlorotoluene
(b) p-chlorotoluene
(c) mixture of O and p-chlorotoluene
(d) benzyl chloride.

COMEDK 2017

Ans. (d) :



295. One mole of a symmetrical alkene on ozonolysis gives two moles of an aldehyde having a molecular mass of 44 u. The alkene is

(a) Ethene
(b) Propene
(c) 1-butene
(d) 2-butene

COMEDK-2017

Ans. (d) :

$$\underset{\text{2-Butene}}{CH_3CH=CH-CH_3}\xrightarrow[\text{(ii) Zn/H}_2\text{O}]{\text{(i) O}_3}2\underset{\text{Acetaldehyde}}{CH_3CHO}$$

(Symm alkene)
The aldehyde with molecular mass 44u is CH_3CHO (acetaldehyde).
Therefore, the symmetrical alkene is 2-butene.

296. A reagent used to test for unsaturation in alkenes is

(a) Ammonical $AgNO_3$
(b) conc. H_2SO_4
(c) Solution of Br_2 in CCl_4
(d) Ammoniacal Cu_2Cl_2.

COMEDK 2018

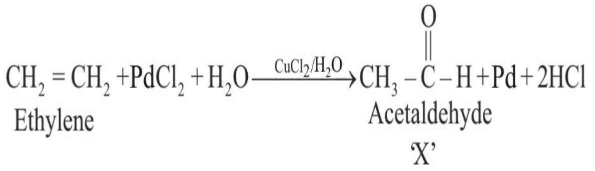
Ans. (c) : The solution of bromine (Br_2) in carbon tetrachloride (CCl_4) as solvent is used to test for unsaturation in alkene, because alkene will turn brown bromine water colourless as the bromine reacts with the carbon-carbon double bond.

297. Ethylene is converted to X on passing through a mixture of an acidified aqueous solution of palladium chloride and cupric chloride. Which of the following reagents readily take part in addition reaction with X?

(a) Br_2 (b) HBr
(c) HCl (d) HCN

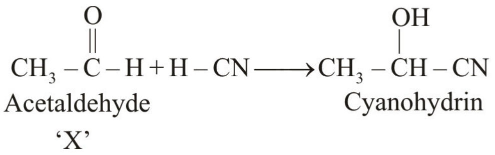
AP-EAMCET (Medical), 2003

Ans. (d) : Ethylene (C_2H_4) is converted to acetaldehyde on passing through a mixture of an acidified aqueous solution of palladium chloride and cupric chloride. This process is called Wacker process. The reaction is given below –



$$\underset{\text{Ethylene}}{CH_2=CH_2}+PdCl_2+H_2O\xrightarrow{CuCl_2/H_2O}\underset{\substack{\text{Acetaldehyde}\\ \text{'X'}}}{CH_3-\overset{\overset{\displaystyle O}{||}}{C}-H}+Pd+2HCl$$

Acetaldehyde on addition with hydrogen cyanide (HCN) gives the cyanohydrins.



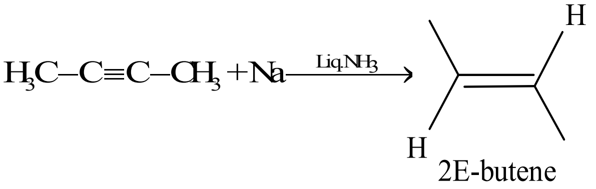
$$\underset{\substack{\text{Acetaldehyde}\\ \text{'X'}}}{CH_3-\overset{\overset{\displaystyle O}{||}}{C}-H}+H-CN\longrightarrow\underset{\text{Cyanohydrin}}{CH_3-\overset{\overset{\displaystyle OH}{|}}{CH}-CN}$$

298. Which one of the following reactions yield 2E-butene as the major product?

(a) $CH_3-C\equiv C-CH_3+Na/NH_3(\text{liq.})$
(b) $CH_3-CH=CH-CH_3+Li/NH_3(\text{liq.})$
(c) $CH_3-CH=CH-CH_3+Na/NH_4OH$
(d) $CH_3-C\equiv C-CH_3+Pd/BaSO_4$

AP-EAMCET (Medical), 2008

Ans. (a) : At low temperature, when alkynes are reacted with Li or Na metal in NH_3 then anti addition of hydrogen atoms take place and E product is obtained.



299. Acetylene has ...... bonds:

(a) 2σ, 2π (b) 2σ, 3π
(c) 3σ, 2π (d) 3σ, 3π

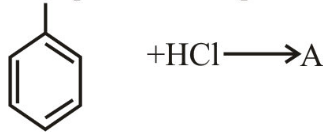
AP-EAMCET (Medical), 2001

Ans. (c) : The chemical formula of acetylene is given below-

$$\underset{\text{Acetylene}}{H-C\equiv C-H}$$

So, acetylene have 3σ and 2π bonds.

300. What is A in following reaction?



@apna_pdf

(a) CH2–CH=CH2
Cl

(b) CH2–CH2–CH2–Cl

(c) Cl–CH–CH2–CH3

(d) CH2–CH–CH3
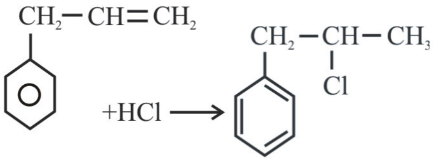
Cl

GUJCET-2021

Ans. (d) :



CH2–CH=CH2
+HCl
CH2–CH–CH3
Cl

In this reaction addition of HCl take place on doubly bonded carbons in accordance with **MarkovniKov's rule**.

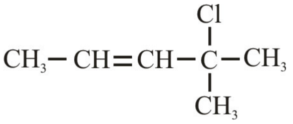
301. $CH_3CH = CHC(Cl)(CH_3)_2$ is which type of halide based on position of - Cl?

(a) Allylic (b) Secondary

(c) Vinylic (d) Aryl

GUJCET-2021

Ans. (a) :



$$CH_3-CH=CH-\overset{\overset{\displaystyle Cl}{|}}{\underset{\underset{\displaystyle CH_3}{|}}{C}}-CH_3$$

Position of — Cl is attached at allylic.

302. The reaction

$$CH_2 = CH_2 + H_2 \xrightarrow[300^\circ C]{Ni} CH_3 - CH_3$$

(a) Wurtz reaction

(b) Kolbe reaction

(c) Sabatier – Sender's reaction

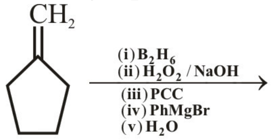
(d) Dow's reaction

TS EAMCET 05.08.2021, Shift-I

Ans. (c) : $CH_2 = CH_2 + H_2 \xrightarrow[300^\circ C]{Ni} CH_3 - CH_3$

Sabatier-Sender's reaction is the reaction in which preparation of ethane is done by the catalytic hydrogenation of ethene. This reduction is carried out in the presence of catalyst like nickel.

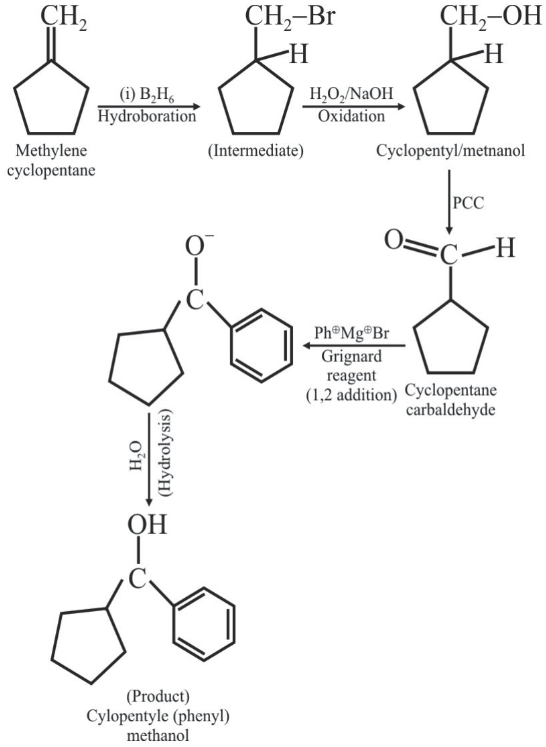
303. The major product of the following reaction is



CH2
(i) B2H6
(ii) H2O2 / NaOH
(iii) PCC
(iv) PhMgBr
(v) H2O

(a) 
(b) 
(c) 
(d) 
TS EAMCET 04.08.2021, Shift-I

Ans. (c) : In given reaction, first two step is hydroboration-oxidation reaction which form alcohol. PCC is used for oxidation of alcohol into aldehyde. PhMgBr is used as a Grignard reagent to attack in a carbonyl carbon.



CH2
Methylene cyclopentane
(i) B2H6
Hydroboration
CH2–Br
H
(Intermediate)
H2O2/NaOH
Oxidation
CH2–OH
H
Cyclopentyl/metnanol
PCC
O=C–H
Cyclopentane carbaldehyde
Ph⊕Mg⊕Br
Grignard reagent
(1,2 addition)
O−
C
H2O
(Hydrolysis)
OH
C
(Product)
Cylopentyle (phenyl) methanol

@apna_pdf

304. The major product of the following reaction is:

$$CH_3CH_2CH = CH_2 \xrightarrow[\text{Rh catalyst}]{H_2/CO}$$

(a) $CH_3CH_2CH_2CH_2CHO$

(b) $CH_3CH_2CH_2CHO$

(c) $CH_3CH_2CH = CH - CHO$

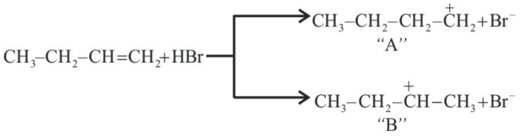
(d) $CH_3CH_2\underset{\underset{CHO}{|}}{C} = CH_2$

JEE Main 25.02.2021, Shift-II

Ans. (b) : Reaction of alkene with H_2/CO in the presence of Rhodium as catalyst is given below:–

$$CH_3 - CH_2 - CH = CH_2 \xrightarrow[\text{Rh catalyst}]{H_2/CO} CH_3CH_2CH_2CHO$$

305. Choose the correct statement regarding the formation of carbocations A and B given.



(a) Carbocation A is more stable and formed relatively at slow rate

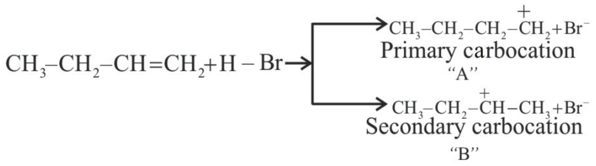
(b) Carbocation B is more stable and formed relatively at slow rate

(c) Carbocation A is more stable and formed relatively at faster rate

(d) Carbocation B is more stable and formed relatively at faster rate.

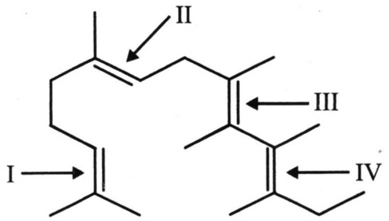
JEE Main 17.03.2021, Shift-II

Ans. (d) :



The above reaction is an example of Marcovnicoff's rule. As we know secondary carbocation is more stable than primary carbocation and stable intermediate follow the fast rate of the reaction.

306. In the following structure, the double bonds are marked as I, II, III and IV



Geometrical isomerism is not possible at site (s):

(a) III (b) I

(c) I and III (d) III and IV

AIIMS 25 May 2019 (Evening)

Ans. (b) : The geometrical isomerism is not possible at site I as two identical methyl group are attached to same carbon atom bearing double bond.

307. Assertion: Propene reacts with HI in presence of peroxide to give 1-iodopropane.

Reason: 1º free radical is more stable than 2º free radical.

(a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.

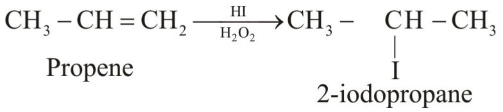
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.

(c) If Assertion is correct but Reason is incorrect.

(d) If both the Assertion and Reason are incorrect.

AIIMS 26 May 2019 (Evening)

Ans. (d):



$CH_3 - CH = CH_2 \xrightarrow[H_2O_2]{HI} CH_3 - \underset{\underset{I}{|}}{CH} - CH_3$

Propene 2-iodopropane

In presence of peroxide, the addition of HBr on alkene follows the anti-Markovnikov's rule.

The stability of radical is –

3° > 2° > 1°

Hence, both assertion and reason are false.

308. The formation of 2-butene as a major product by dehydration of 2-butanol is in accordance with

(a) Blanc rule

(b) Huckel rule

(c) Markiownikoff's rule

(d) Saytzeff's rule

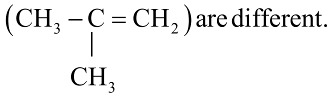
AIIMS-1994

CGPET-2005, 2007

Ans. (d): The formation of 2-butene as a major product by dehydration of 2-butanol is according to saytzeff rule. The minor product is 1-butene.

According to satyzeff rule in the dehydration of secondary and tertiary alcohols when there is a possibility of formation of two isomers the hydrogen atom is preferentially eliminated from the adjacent carbon atom with the fewer number of hydrogen atom.

309. Assertion: All C–C–C bond angles in isobutene



$\left(CH_3 - \underset{\underset{CH_3}{|}}{C} = CH_2\right)$ are different.

Reason: CH_3 (Methyl group) show steric crowding.

(a) If both Assertion and Reason are correct and the reason is the correct explanation of Assertion.

(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.

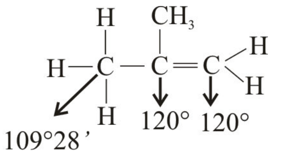
@apna_pdf

(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

[AIIMS-27 May, 2018 (M)]

Ans. (a): In isobutene, all the bond angle are different due to CH_3 (methyl group) show steric crowding.

The structure of isobutene.



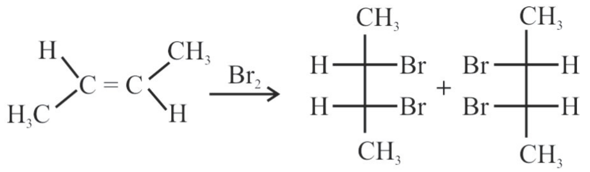
310. Assertion: Trans-2-butene on reaction with Br_2 gives meso-2, 3-dibromobutane.

Reason: The reaction involves syn-addition of bromine.

(a) If both Assertion and Reason are correct and the reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

[AIIMS-2014, 2009, 2003]

Ans. (c): j



Trans-2-butene

Meso compound

Trans-2-butene on reaction with Br_2 gives meso-2, 3-dibromobutane.

311. Assertion: 1-Butene on reaction with HBr in the presence of a peroxide produces 1-bromo-butane.

Reason: It involves the free radical mechanism.

(a) If both Assertion and Reason are correct and the reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

[AIIMS-2009]

Ans. (a): The reaction of 1-butene react with HBr in the presence of a peroxide produces 1-bromo-butane. This reaction is antimarkovnikov's addition and involves the free radical mechanism.

$$CH_3-CH_2-CH=CH_2+HB_r\xrightarrow{\text{Peroxide}}CH_3-CH_2-CH_2-CH_2-Br$$

1-butane 1-bromo-butane

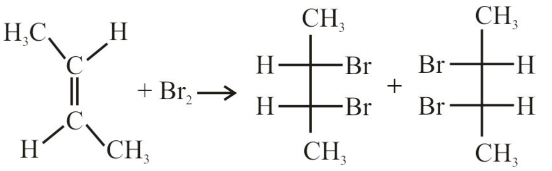
312. Asertion: trans-butene-2 on reaction with bromine forms racemic mixture.

Reason: trans-Compound in trans addition forms two types of stereoisomers.

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

[AIIMS-2007]

Ans. (d):



In trans - compound in trans addition forms a racemic mixture

Hence, the assertion and reason both are false.

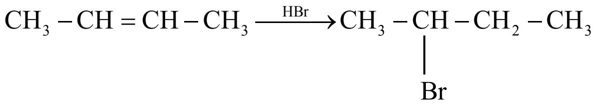
313. Assertion: Addition of HBr on 2-butene give two isomeric products.

Reason: Addition of HBr on 2-butene follows Markovnikov rule.

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

[AIIMS-2006]

Ans. (c):



$$CH_3-CH=CH-CH_3\xrightarrow{HBr}CH_3-\underset{\substack{|\\Br}}{CH}-CH_2-CH_3$$

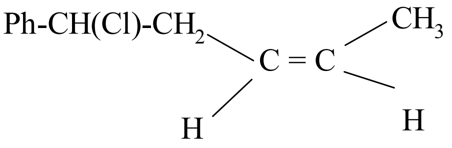
2-butane 2-bromobutane

2-butene is a symmetrical and not follow the Markovnikov rule. 2-butane react with HBr to give a one product.

@apna_pdf

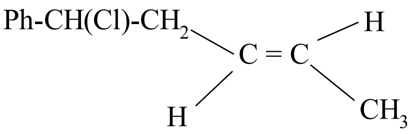
314. In the reaction, Ph –CH$_2$ – CH$_2$–C ≡ C–CH$_3$ $\xrightarrow{Na/NH_3}$ A $\xrightarrow{Cl_2/hv}$ B, B is

(a)



Ph-CH(Cl)-CH2
CH3
C = C
H
H

(b)

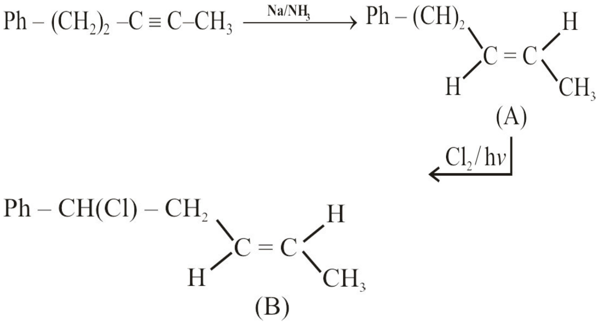


Ph-CH(Cl)-CH2
H
C = C
H
CH3

(c) Ph–CH$_2$–CH(Cl)–CH=CH–CH$_3$
(d) None of these

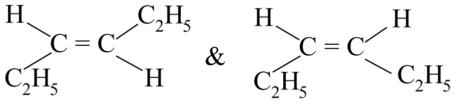
[AIIMS-26 May, 2018 (E)]

Ans. (b):



Ph – (CH2)2 –C ≡ C–CH3
Na/NH3
Ph – (CH)2
H
C = C
H
CH3
(A)
Cl2/hν
Ph – CH(Cl) – CH2
H
C = C
H
CH3
(B)

315. For geometrical isomers of 3–hexene:

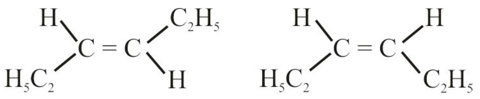


H
C2H5
C = C
C2H5
H
&
H
H
C = C
C2H5
C2H5

(a) M.P. is high and dipole moment high for trans.
(b) M.P. is low and dipole moment low for trans.
(c) M.P. is high and dipole moment low for trans.
(d) M.P. is low and dipole moment high for trans.

[AIIMS-26 May, 2018 (E)]

Ans. (c): The geometrical isomers of 3–hexane



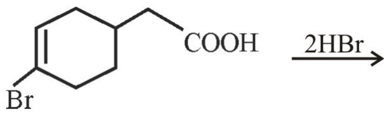
H
C2H5
C = C
H5C2
H
H
H
C = C
H5C2
C2H5

Trans -3- hexane $\mu = 0$

Cis-3- hexane $\mu \neq 0$

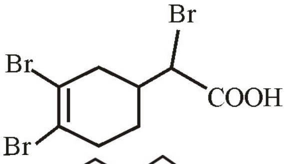
In trans 3-hexane dipole moment is zero and cis 3-hexene dipole moment is zero so melting point is high and dipole moment low for trans.

316.



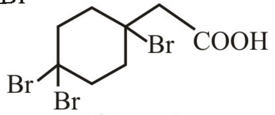
COOH
2HBr
Br

(a)



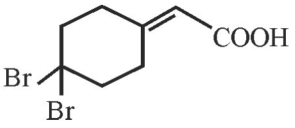
Br
Br
COOH
Br

(b)

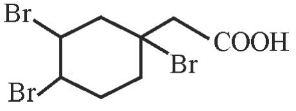


Br
COOH
Br
Br

(c)



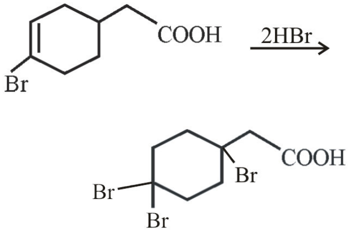
(d)



Br
COOH
Br
Br

[AIIMS-27 May, 2018 (M)]

Ans. (b):



COOH
2HBr
Br
COOH
Br
Br
Br

317. In the given reaction

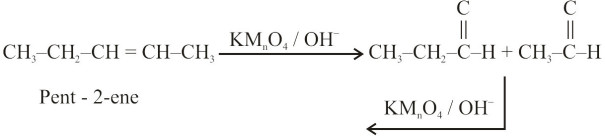
$$CH_3CH_2CH = CHCH_3 \xrightarrow{x} CH_3CH_2COOH + CH_3COOH$$

The X is

(a) C$_2$H$_5$ONa
(b) Conc. HCl + Anhy. ZnCl$_2$
(c) Anhyd. AlCl$_3$
(d) KMnO$_4$/ OH$^-$

[AIIMS-2017]

Ans. (d):



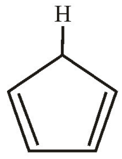
$CH_3–CH_2–CH = CH–CH_3 \xrightarrow{KM_nO_4 / OH^-} CH_3–CH_2–\overset{\overset{C}{||}}{C}–H + CH_3–\overset{\overset{C}{||}}{C}–H$

Pent - 2-ene

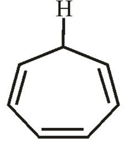
$\xleftarrow{KM_nO_4 / OH^-}$

CH$_3$ – CH$_2$ – COOH + CH$_3$COOH
This reaction is oxidative cleavage KMnO$_4$ / OH$^-$ act as an oxidizing agent.
Hence, pent-2-ene react and ethanoic acid.

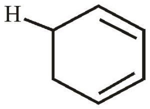
318. The correct order of increasing acidic strength for the following compounds is



(i)



(ii)



(iii)

@apna_pdf

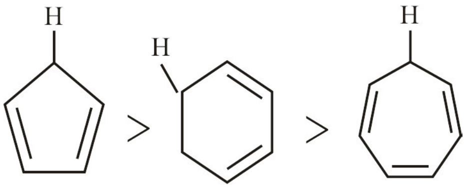
(a) 1 > II > III (b) II > III > I

(c) I > III > II (d) III > II > I

[AIIMS-26 May, 2018(M)]

Ans. (c): Acidic strength depend upon the negative inductive effect (–I) –I effect increase then the acidity increase. Acidic strength depend on the size of ring increase then acidic strength decreases.

So, the acidic strength order is –



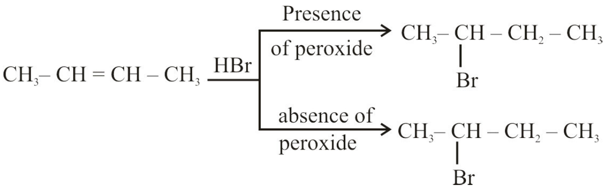
319. The alkene that will give the same product with HBr in the absence as well as in the presence of peroxide is

(a) 2-butene (b) 1-butene

(c) propene (d) 1-hexene

[AIIMS-2016]

Ans. (a): When an unsymmetrical alkene is treated with the unsymmetrical reagent in the presence of peroxide, then addition takes place against the markownikoff's rule i.e negative part of reagent adds to that carbon to carbon-carbon double bond which carries more number of hydrogen atoms. In 2-butene will give the same product with HBr in the absence as well as presence of peroxide when treated with HBr.



$CH_3-CH=CH-CH_3$
HBr
Presence of peroxide
$CH_3-CH-CH_2-CH_3$
Br
absence of peroxide
$CH_3-CH-CH_2-CH_3$
Br

320. Consider the following statements : A hydrocarbon of molecular formula C_5H_{10} is a

I. Monosubstituted alkene

II. disubstituted alkene

III. trisubstituted alkene

Which of the following statement (s) is (are) correct?

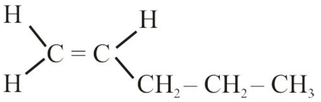
(a) I, II and III (b) I and II

(c) II and III (d) I and III

[AIIMS-2012]

Ans. (a): Given a hydrocarbon of molecular formula C_5H_{10} is an alkene. The general formula of alkene is C_nH_{2n}.

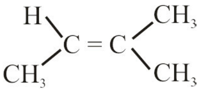
(I) Monosubstituted alkene



(II) Disubstituted alkene

$H_3C-CH=CH-CH_2-CH_3$

(III) Trisubstituted



Hence, the isomer of hydrocarbon of molecular formula C_5H_{10} are correct.

321. Compound X of molecular formula C_4H_6 takes up one equivalent of hydrogen in presence of Pt to form another compound Y which on ozonolysis gives only ethanoic acid. The compound X can be

(a) $CH_2=CH-CH=CH_2$

(b) $CH_2=C=CHCH_3$

(c) $CH_3C\equiv CCH_3$

(d) All of these

[AIIMS-2011]

Ans. (d):

(i) 
$CH_2=CH-CH=CH_2+H_2\xrightarrow{Pt}CH_3-CH=CH-CH_3$
(Y)
Ozonolysis
$2\,CH_3COOH$

(ii) 
$CH_2=C=CHCH_3+H_2\xrightarrow{Pt}CH_3-CH=CH-CH_3$
(Y)
Ozonolysis
$2\,CH_3COOH$

(iii) 
$CH_3-C\equiv C-CH_3+H_2\xrightarrow{Pt}CH_3-CH=CH-CH_3$
(Y)
Ozonolysis
$2\,CH_3COOH$

So, but-1,3 diene , but 1,2 diene and but-2- yne to give ethanoic acid on under Ozonolysis -

322. The alkene R–CH=CH$_2$ reacts readily with B_2H_6 and formed the product B which on oxidation with alkaline hydrogen peroxide produces

(a) $R-CH_2-CHO$

(b) $R-CH_2-CH_2-OH$

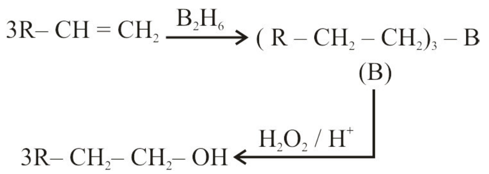
(c) 
$R-\underset{\displaystyle CH_3}{\underset{|}{C}}=O$

(d) 
$R-\underset{\displaystyle OH}{\underset{|}{CH}}-\underset{\displaystyle OH}{\underset{|}{CH_2}}$

AIIMS-2010, 1995

@apna_pdf

Ans. (b):



$$3R-CH=CH_2 \xrightarrow{B_2H_6} (R-CH_2-CH_2)_3-B \ (B) \xrightarrow{H_2O_2\,/\,H^+} 3R-CH_2-CH_2-OH$$

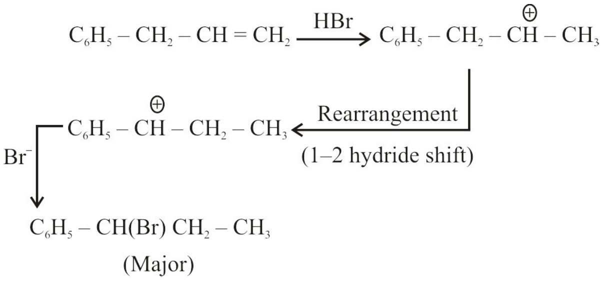
When (R–CH=CH$_2$) alkene react with B_2H_6 and formed a alkyl borane which on oxidation with alkaline hydrogen peroxide to give R – CH$_2$ – CH$_2$ – OH

323. 3-Phenylpropene on reaction with HBr gives (as a major product) :

(a) $C_6H_5CH(Br)CH_2CH_3$
(b) $C_6H_5CH(Br)CH_2CH_2OCH_3$
(c) $C_6H_5CH_2CH_2CH_2Br$
(d) $C_6H_5CH(Br)CH=CH_2$

[AIIMS-2005]

Ans. (a):



$$C_6H_5-CH_2-CH=CH_2 \xrightarrow{HBr} C_6H_5-CH_2-\overset{\oplus}{C}H-CH_3$$

$$\xrightarrow[\text{(1–2 hydride shift)}]{\text{Rearrangement}} C_6H_5-\overset{\oplus}{C}H-CH_2-CH_3 \xrightarrow{Br^-} C_6H_5-CH(Br)\,CH_2-CH_3$$

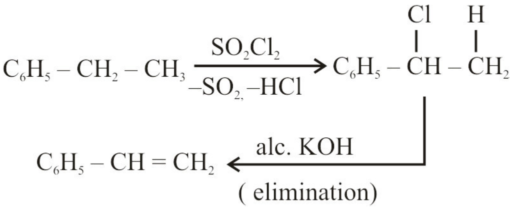
(Major)

324. Which of the following sequence of reactions (reagents) can be used for the conversion of $C_6H_5CH_2CH_3$ into $C_6H_5CH=CH_2$?

(a) $SOCl_2:H_2O$ (b) SO_2Cl_2 : alc. KOH
(c) $Cl_2/h\nu:H_2O$ (d) $SOCl_2$:alc. KOH

[AIIMS-2006]

Ans. (b):



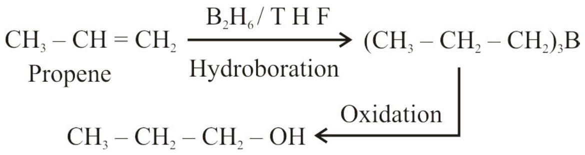
$$C_6H_5-CH_2-CH_3 \xrightarrow[-SO_2,\,-HCl]{SO_2Cl_2} C_6H_5-\overset{Cl}{\overset{|}{C}H}-\overset{H}{\overset{|}{C}H_2} \xrightarrow[\text{(elimination)}]{\text{alc. KOH}} C_6H_5-CH=CH_2$$

325. Propene on hydroboration and oxidation produces

(a) $CH_3CH_2CH_2OH$ (b) $CH_3CHOHCH_3$
(c) $CH_3CHOHCH_2OH$ (d) CH_3CH_2CHO

[AIIMS-2007]

Ans. (a):
Propene (CH$_3$ – CH = CH$_2$) on hydroboration and oxidation produces a propane.



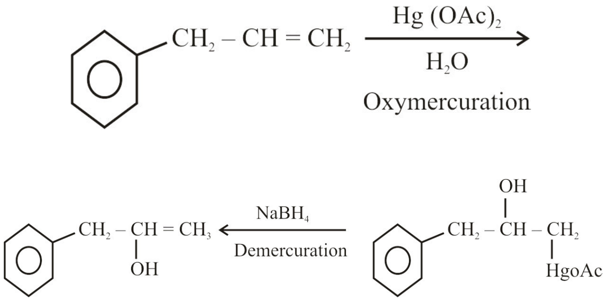
$$\underset{\text{Propene}}{CH_3-CH=CH_2} \xrightarrow[\text{Hydroboration}]{B_2H_6\,/\,THF} (CH_3-CH_2-CH_2)_3B \xrightarrow{\text{Oxidation}} CH_3-CH_2-CH_2-OH$$

326. 
On mercuration and demercuration produces

(a) 
(b) 
(c) 
(d) none of these

[AIIMS-2007]
JEE Main-2014

Ans. (a): In oxymercuration demercuration of alkene in an alcohol as the solvent, the product is an ether.

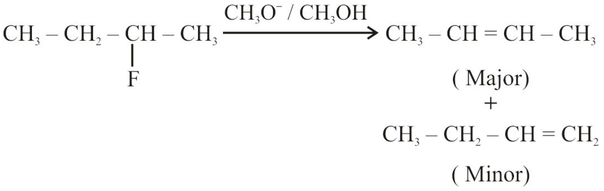


327. The major product obtained on treatment of $CH_3CH_2CH(F)CH_3$ with CH_3O^-/CH_3OH is:

(a) $CH_3CH_2CH(OCH_3)CH_3$
(b) $CH_3CH = CHCH_3$
(c) $CH_3CH_2CH = CH_2$
(d) $C_6H_5CH(Br)CH=CH_2$

[AIIMS-2005]

Ans. (b): According to satyzeff rule, the major product will be that one which contain more number of substituent's around the double bond.



$$CH_3-CH_2-\underset{F}{\underset{|}{C}H}-CH_3 \xrightarrow{CH_3O^-\,/\,CH_3OH} \underset{\text{(Major)}}{CH_3-CH=CH-CH_3} + \underset{\text{(Minor)}}{CH_3-CH_2-CH=CH_2}$$

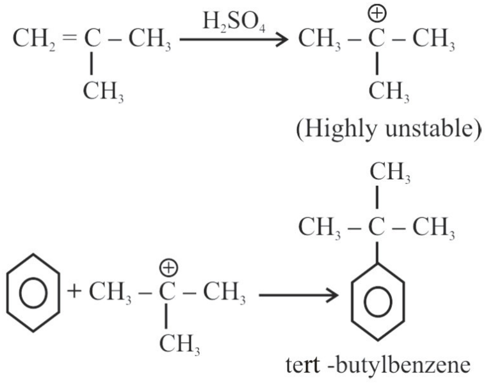
328. The treatment of benzene with isobutene in the presence of sulphuric acid gives:

(a) iso-butylbenzene (b) tert-butylbenzene
(c) n-butylbenzene (d) no reaction

VITEEE-2019
AIIMS-2003

@apna_pdf

Ans. (b): The reaction of benzene with isobutene in the presence of sulphuric acid give test – butylbenzene.



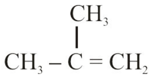
329. **The compound having only primary hydrogen atoms is:**

(a) Isobutene
(b) 2, 3-dimethylbutene-1
(c) Cyclohexane
(d) propane

[AIIMS-2004]

Ans. (a): The given compound are –

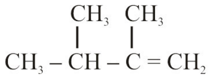
(i)



$CH_3-\overset{CH_3}{\overset{|}{C}}=CH_2$

Isobutene
8- Primary hydrogen

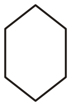
(ii)



$CH_3-\overset{CH_3}{\overset{|}{CH}}-\overset{CH_3}{\overset{|}{C}}=CH_2$

2-3, dimethyl
butene - 1.
II - Primary and 1 test hydrogen

(iii)



Cyclohexane
12 – secondary hydrogen.

(iv) $CH_3-CH_2-CH_3$
Propane 6- primary, 2 secondary hydrogen

Hence, isobutene has only primary hydrogen atom.

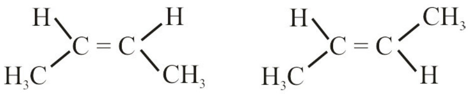
330. **Geometrical isomerism is possible in case of:**

(a) tartaric acid
(b) 1-butene
(c) 2-butene
(d) propene

[AIIMS-1999]

Ans. (c): Those compound have same structural formula but differ in the spatial arrangement of the groups around the double bond are called geometrical isomers.

In 2-butene, cis and trans isomers can exist because free rotation of the substituent's is restricted by C = C

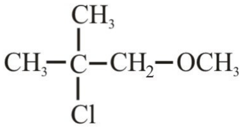


Cis-2- butene Trans-2-butene

Hence, 2-butene exhibits geometrical isomerism

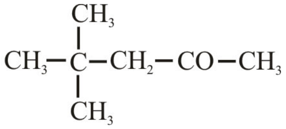
331. **Indicate the structure of the product expected when 2-methyl-propene is heated with acetyl chloride in presence of anhydrous $ZnCl_2$.**

(a)



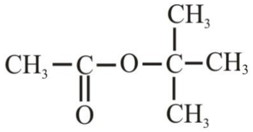
$CH_3-\overset{CH_3}{\overset{|}{\underset{Cl}{\underset{|}{C}}}}-CH_2-OCH_3$

(b)



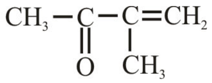
$CH_3-\overset{CH_3}{\overset{|}{\underset{CH_3}{\underset{|}{C}}}}-CH_2-CO-CH_3$

(c)



$CH_3-\underset{O}{\underset{||}{C}}-O-\overset{CH_3}{\overset{|}{\underset{CH_3}{\underset{|}{C}}}}-CH_3$

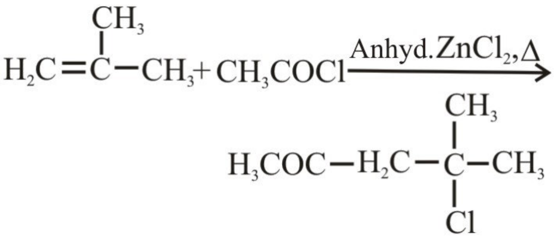
(d)



$CH_3-\underset{O}{\underset{||}{C}}-\underset{CH_3}{\underset{|}{C}}=CH_2$

SRMJEEE – 2008

Ans. (a) :



$H_2C=\overset{CH_3}{\overset{|}{C}}-CH_3+CH_3COCl\xrightarrow{Anhyd.ZnCl_2,\Delta}H_3COC-H_2C-\overset{CH_3}{\overset{|}{\underset{Cl}{\underset{|}{C}}}}-CH_3$

332. **Geomtrical isomerism is exhibited by (i) 1-pentene (ii) 2-pentene (iii) 2-chloro-2-pentene (iv) 3-methyl-2-pentene**

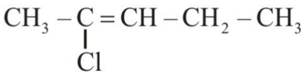
(a) (i) and (ii)
(b) (ii) and (iii)
(c) (iii) and (iv)
(d) (ii), (iii) and (iv),

SRMJEEE – 2015

Ans. (d) :

(ii) $CH_3-CH=CH-CH_2-CH_3$
2–Pentene

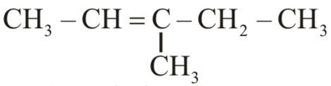
(iii)



$CH_3-\underset{Cl}{\underset{|}{C}}=CH-CH_2-CH_3$

2-chloro-2-pentene

(iv)



$CH_3-CH=\underset{CH_3}{\underset{|}{C}}-CH_2-CH_3$

3-methyl 2-pentene.

Will show geometrical isomerism

333. **In the following reactions; A and B respectively are**

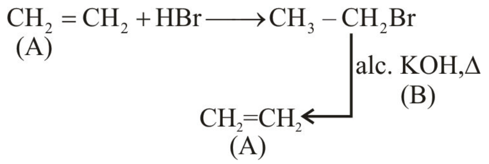
$$A\xrightarrow{HBr}C_2H_5Br\xrightarrow{B}A$$

(a) C_2H_4, alc. KOH/Δ
(b) C_2H_5Cl; aq. KOH/Δ
(c) CH_3OH; aq. KOH/Δ
(d) C_2H_2; PBr_3

SRMJEEE – 2014

@apna_pdf

Ans. (a) :



$$CH_2=CH_2 + HBr \longrightarrow CH_3-CH_2Br \xrightarrow[\text{(B)}]{\text{alc. KOH},\Delta} \underset{\text{(A)}}{CH_2=CH_2}$$

334. **$C_6H_6 + CCl_4 \xrightarrow{AlCl_3} X \xrightarrow{H_2O} Z$**

The product Z is

(a) C_6H_5COOH

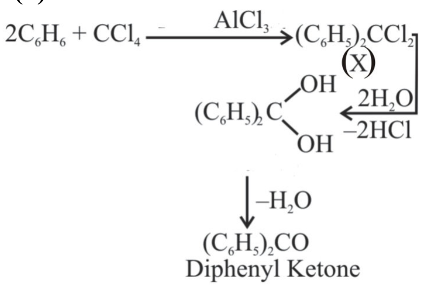
(b) C_6H_5CHO

(c) $C_6H_5CCl_2C_6H_5$

(d) $C_6H_5COC_6H_5$

SRMJEEE – 2014

Ans. (d) :



$$2C_6H_6 + CCl_4 \xrightarrow{AlCl_3} \underset{(X)}{(C_6H_5)_2CCl_2} \xrightarrow[-2HCl]{2H_2O} (C_6H_5)_2C(OH)_2 \xrightarrow{-H_2O} (C_6H_5)_2CO$$

Diphenyl Ketone

335. **Select the substance which has only one pi (π) bond in its molecule.**

(a) Acetylene

(b) Acrolein

(c) Propene

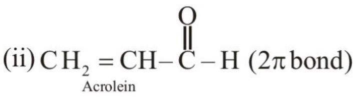
(d) 2-Butenoic acid

SRMJEEE – 2013

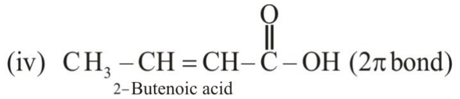
Ans. (c) :

(i) $\underset{\text{Acetylene}}{H-C\equiv C-H}\ (2\pi\,\text{bond})$

(iii) $\underset{\text{Propene}}{CH_2=CH-CH_3}\ (1\pi\,\text{bond})$



(ii) $\underset{\text{Acrolein}}{CH_2=CH-\overset{\overset{O}{\|}}{C}-H}\ (2\pi\,\text{bond})$



(iv) $\underset{\text{2-Butenoic acid}}{CH_3-CH=CH-\overset{\overset{O}{\|}}{C}-OH}\ (2\pi\,\text{bond})$

336. **Diels-Alder reaction will not take place with which of the following reactants?**

(a) 
(b) 
(c) 
(d) 
AP-EAMCET- (Engg.) - 2010

Ans. (a) : In Diels-Alder reaction conjugated dienes react with enes or olefinic compounds and gives cycloalkenes. Penta-1,4-diene is not conjugated alkene. So, it will not take part in Diels-Alder's reaction.

337. **$C_2H_6 \xrightarrow{450^\circ C} C_2H_4 + H_2$**

Above reaction is called as

(a) combustion

(b) rearrangement

(c) pyrolysis

(d) cleavage

AP-EAMCET (Engg.) 2013

Ans. (c) : $\underset{\text{Ethane}}{C_2H_6} \xrightarrow{450°C} \underset{\text{Ethene}}{C_2H_4} + H_2$

Decomposition of a compound of heat is called pyrolysis. Pyrolysis of higher alkane convert into lower alkane, alkene etc.

It is different from combustion. It happens in the absence of air and hence oxidation of compounds does not take place. Generally pyrolysis of alkanes is also named as cracking.

338. **An alkene of molecule formula C_9H_{18} on ozonolysis gives 2, 2-dimethylpropanal & 2-butanone, then the alkene is**

(a) 2, 2, 4-trimethyl-3-hexene

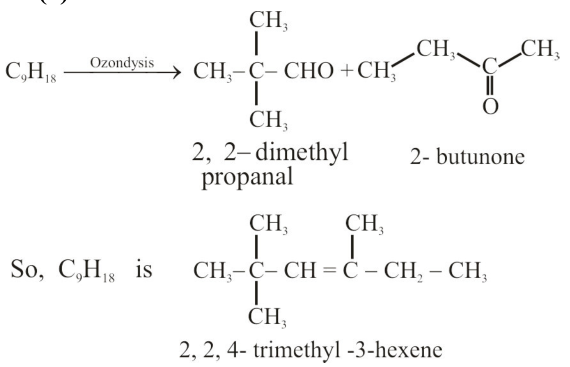
(b) 2, 2, 6-trimethyl-3-hexene

(c) 2, 3, 4-trimethyl-2-hexene

(d) 2, 2,-dimethyl-2-hexene

VITEEE-2019

Ans. (a) :



$$C_9H_{18} \xrightarrow{\text{Ozondysis}} \underset{\text{2, 2– dimethyl propanal}}{CH_3-\underset{CH_3}{\overset{CH_3}{C}}-CHO} + \underset{\text{2- butunone}}{CH_3-\overset{\overset{}{}}{\underset{\underset{O}{\|}}{C}}-CH_2-CH_3}$$

$$\text{So, } C_9H_{18} \text{ is } \underset{\text{2, 2, 4- trimethyl -3-hexene}}{CH_3-\underset{CH_3}{\overset{CH_3}{C}}-CH=\overset{CH_3}{C}-CH_2-CH_3}$$

339. **HBr reacts with $CH_2 = CH – OCH_3$ under anhydrous conditions at room temperature to give**

(a) $BrCH_2 – CH_2 – OCH_3$

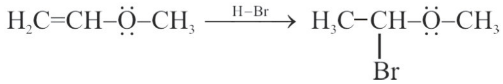
(b) $H_3C – CHBr – OCH_3$

(c) CH_3CHO and CH_3Br

(d) $BrCH_2CHO$ and CH_3OH

AIEEE-2006

Ans. (b) : HBr protanates the double bonded C of alkene which make a resonance - stabilized cation–



$$H_2C=CH-\ddot{\underset{..}{O}}-CH_3 \xrightarrow{H-Br} H_3C-\underset{Br}{CH}-\ddot{\underset{..}{O}}-CH_3$$

@apna_pdf

340. B
(i) B_2H_6/THF
(ii) H_2O_2/OH^-
CH_2
H_3O^+
A

A and B respectively are

(a) Both 
(b) Both 
(c) CH_2OH,
CH_3
OH

(d) CH_3
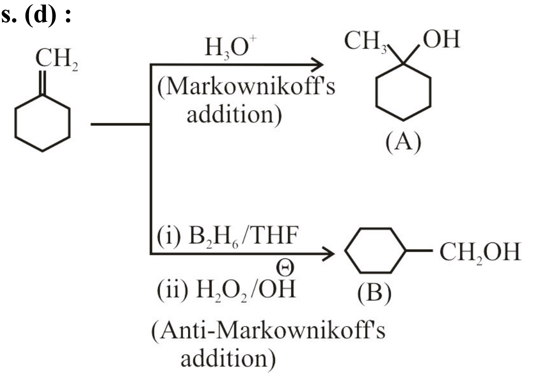
OH,
CH_2OH

VITEEE-2014

Ans. (d) :



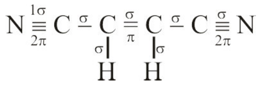
CH_2
H_3O^+
(Markownikoff's addition)
CH_3
OH
(A)
(i) B_2H_6/THF
(ii) $H_2O_2/\overset{\Theta}{O}H$
CH_2OH
(B)
(Anti-Markownikoff's addition)

341. How many sigma and pi-bonds are there in the molecule of dicyanoethene (CN–CH=CH–CN)?

(a) 3 sigma and 3 pi
(b) 5 sigma and 2 pi
(c) 7 sigma and 5 pi
(d) 2 sigma and 3 pi

VITEEE-2014

Ans. (c) :



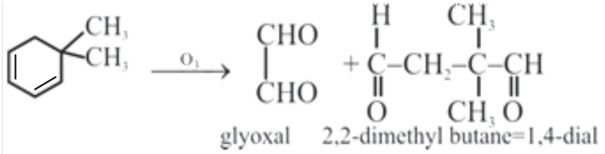
$$N\underset{2\pi}{\overset{1\sigma}{\equiv}}C\overset{\sigma}{-}\underset{\sigma|\,H}{C}\underset{\pi}{\overset{\sigma}{=}}\underset{|\sigma\,H}{C}\overset{\sigma}{-}C\underset{2\pi}{\overset{\sigma}{\equiv}}N$$

7σ and 5 pi.

342. An alkene having molecular formula C_8H_{12} on ozonolysis yields glyoxal and 2, 2-dimehtyl butane-1, 4-dial. The structure of alkene is

(a) 
(b) 
(c) 
(d) 
VITEEE- 2011

Ans. (b) : Alkene reacted with ozone to give the following products :



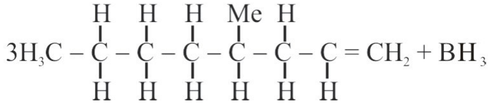
CH_3
CH_3
O_3
CHO
CHO
H
CH_3
C–CH_2–C–CH
O
CH_3 O
glyoxal
2,2-dimethyl butane=1,4-dial

343. Hydroboration oxidation of 4-methyl-octene would give

(a) 4-methyl octanol
(b) 2-methyl decane
(c) 4-methyl heptanol
(d) 4-methy-2-octaone

VITEEE- 2008

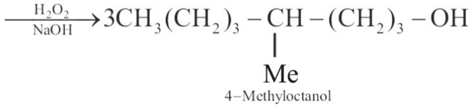
Ans. (a) : Hydroboration-oxidation of alkenes give alcohols containing same number of carbon atoms. The addition follow anti-Markovnikov's rule. Boron atom act as an electrophile. Main two steps are involved. Reagent used BH_3 & NaOH/H_2O_2.



$$3H_3C-\overset{H}{\underset{H}{C}}-\overset{H}{\underset{H}{C}}-\overset{H}{\underset{H}{C}}-\overset{Me}{\underset{H}{C}}-\overset{H}{\underset{H}{C}}-\underset{H}{C}=CH_2+BH_3$$

4- methyl octane

$$\longrightarrow \underset{\text{where R=4-methyl octyl}}{R_3B}$$



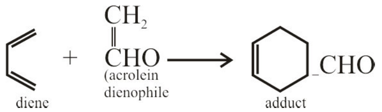
$$\xrightarrow[NaOH]{H_2O_2}3CH_3(CH_2)_3-\underset{\underset{\text{4-Methyloctanol}}{Me}}{CH}-(CH_2)_3-OH$$

344. In which of the below reaction do we find α, β–unsaturated carbonyl compounds undergoing a ring closure reaction with conjugated dienes?

(a) Perkin reaction
(b) Diels-Alder reaction
(c) Claisen rearrangement
(d) Hoffiman reaction

VITEEE- 2007

Ans. (b) : The addition of α, β unsaturated carbonyl compound, with conjugated diene is called Diel's Alder reaction.



CH_2
CHO
(acrolein dienophile
diene
CHO
adduct

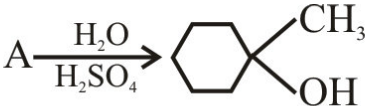
345. Ziegler catalyst to manufacture polyethylene is made by the reaction

(a) $TiCl_4$ with $Al(CH_3)_3$
(b) $TiCl_3$ with CH_3Cl
(c) $TiCl_4$ with $(C_6H_5)_3CCl$
(d) $TiCl_4$ with $ZnCl_2$

AMU-2017

Ans. (a) : Ziegler natta catalyst which is a combination of diethyl aluminum with titanium tetrachloride at a temperature of 333 k to 342 k and a pressure of 6-7 atm. Polythene is made by the reaction of multiple ethylene molecule in the presence of catalyst (Ziegler natta) to break the double bond and connect the carbon atoms into a chain.

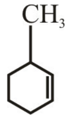
346. In the given reaction, A may be



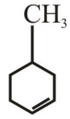
A
H_2O
H_2SO_4
CH_3
OH

@apna_pdf

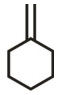
(a)



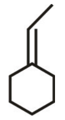
(b)



(c)

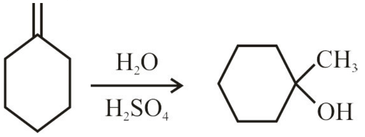


(d)

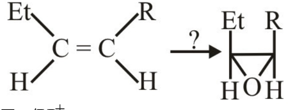


AMU-2013

Ans. (c) :



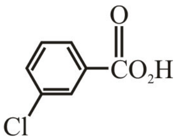
347. What reagent(s) is (are) needed to accomplish the following conversion?



(a) O_3, Zn/H^+

(b) $KMnO_4$, $\bar{O}H$, cold

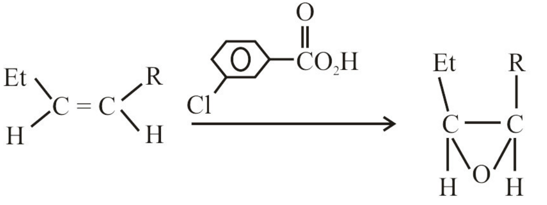
(c)



(d) H_3O^+

AMU-2013

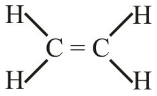
Ans. (c) : Alkene on react with m – chloroperbenzoic acid to give oxirane or epoxide



Oxirane (epoxide)

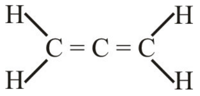
348. Which of the following compounds is strongest acid?

(I)

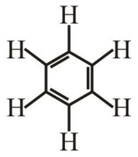


(II) H – C ≡ C – H

(III)



(IV)



(a) I (b) II
(c) III (d) IV

AMU-2013

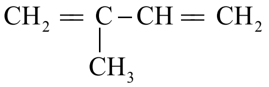
Ans.(b): Acetylene $(CH \equiv CH)$ is strong acid than other because it is more penetrated to the nucleus. So the electrons in s-orbitals are more attracted to the nucleus and the electro negativity of the element having more S-character is more
Hence C in ethyne is more electronegative than in other.

349. The following is a conjugated diene

(a) $CH_3 - CH = C = CH - CH_3$

(b) $CH_2 = CH - CH_2 - CH = CH_2$

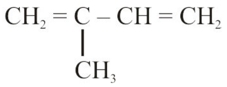
(c) $CH_2 = CH - CH_2 - CH_2 - CH = CH_2$

(d)


$CH_2 = \underset{\underset{CH_3}{|}}{C} - CH = CH_2$

AMU-2012

Ans. (d) : A conjugated diene is a molecule that has two double bonds. It the molecule is also a hydrocarbon. It is called alkadiene. When the double bond are separated from each other by two or more single bond, they are called isolated double bonds. Isolated double bonds undergo normal alkene reactions revealing that no interaction occurs between then, the double bond are separated by single bond atypical reaction occur. Such arrangement is called conjugated double bond or conjugated diene.

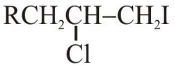
e.g -


$CH_2 = \underset{\underset{CH_3}{|}}{C} - CH = CH_2$

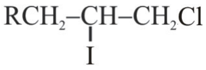
350. In the following reaction,

$RCH_2CH = CH_2 + ICl \rightarrow [A]$

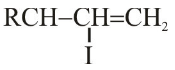
Markownikoff's product [A] is

(a)


$RCH_2\underset{\underset{Cl}{|}}{C}H{-}CH_2I$

(b)


$RCH_2{-}\underset{\underset{I}{|}}{C}H{-}CH_2Cl$

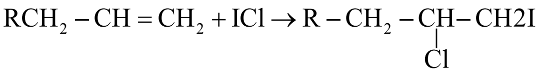
(c)


$RCH{-}\underset{\underset{I}{|}}{C}H{=}CH_2$

(d) $RCH{=}CH{-}CH_2I$

AMU – 2009

Ans. (a) : In Markownikoffs rule the unsymmetrical reagent adds to a less hydrogenated carbon atom of the double bond.



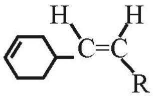
$RCH_2 - CH = CH_2 + ICl \rightarrow R - CH_2 - \underset{\underset{Cl}{|}}{C}H - CH2I$

351. The main product (A) of the reaction is

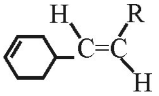
(a)

(b)

(c)



(d)



AMU – 2008

@apna_pdf

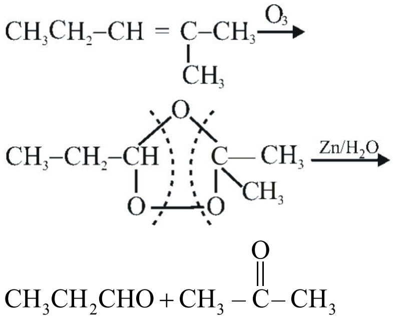
Ans. (d) :

In Birch reduction isolated  are not affected but —≡— in reduced and gives trasn-product.

352. Which of the following alkenes will give propanone and propanal on ozonolysis followed by reaction of ozonide with Zn/H$_2$O ?

(a) 
(b) 
(c) 
(d) 
AMU – 2007, 2004

Ans. (c) : 2–Methyl–2–pentene will give propanone and propanal on ozonolysis followed by reaction of ozonide with Zn/H$_2$O.



$CH_3CH_2-CH=\underset{CH_3}{\underset{|}{C}}-CH_3 \xrightarrow{O_3}$

$\xrightarrow{Zn/H_2O}$

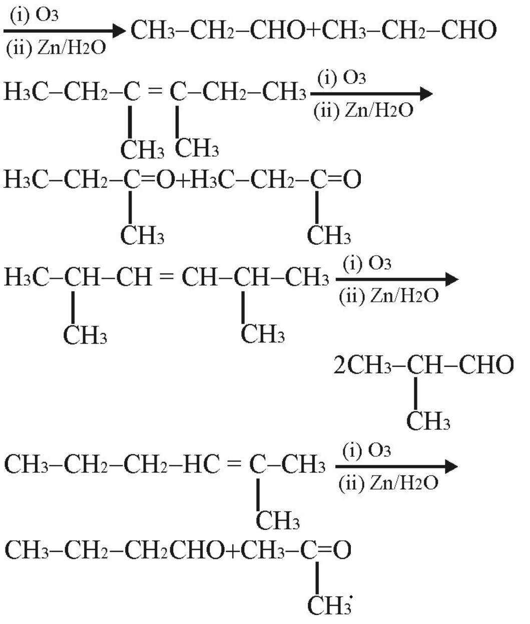
$CH_3CH_2CHO+CH_3-\overset{O}{\overset{||}{C}}-CH_3$

353. Which of the following alkenes will give 2-methyl propanal on ozonolysis followed by the reaction of ozonide with Zn/H$_2$O?

(a) 
(b) 
(c) 
(d) 
AMU–2006

AP-EAMCET (Engg.)-21.09.2020, Shift-II

Ans. (c) : $H_3C-CH_2-CH=CH-CH_2-CH_3$



$\xrightarrow[\text{(ii) Zn/H}_2\text{O}]{\text{(i) O}_3} CH_3-CH_2-CHO+CH_3-CH_2-CHO$

$H_3C-CH_2-\underset{CH_3}{\underset{|}{C}}=\underset{CH_3}{\underset{|}{C}}-CH_2-CH_3 \xrightarrow[\text{(ii) Zn/H}_2\text{O}]{\text{(i) O}_3}$

$H_3C-CH_2-\underset{CH_3}{\underset{|}{C}}=O+H_3C-CH_2-\underset{CH_3}{\underset{|}{C}}=O$

$H_3C-\underset{CH_3}{\underset{|}{CH}}-CH=CH-\underset{CH_3}{\underset{|}{CH}}-CH_3 \xrightarrow[\text{(ii) Zn/H}_2\text{O}]{\text{(i) O}_3}$

$2CH_3-\underset{CH_3}{\underset{|}{CH}}-CHO$

$CH_3-CH_2-CH_2-HC=\underset{CH_3}{\underset{|}{C}}-CH_3 \xrightarrow[\text{(ii) Zn/H}_2\text{O}]{\text{(i) O}_3}$

$CH_3-CH_2-CH_2CHO+CH_3-\underset{CH_3}{\underset{|}{C}}=O$

354. In the sequence of reaction below

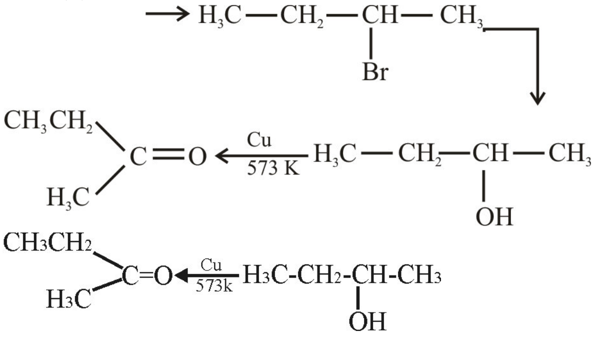
the compound 'C' is

(a) butanal (b) butan-2-one

(c) butan–1–ol (d) butan–2–ol

AMU–2006

Ans. (b) : $H_3C-CH_2-CH=CH_2$



$\to H_3C-CH_2-\underset{Br}{\underset{|}{CH}}-CH_3$

$\begin{matrix}CH_3CH_2\\H_3C\end{matrix}\!\!>C=O \xleftarrow[573\,K]{Cu} H_3C-CH_2-\underset{OH}{\underset{|}{CH}}-CH_3$

$\begin{matrix}CH_3CH_2\\H_3C\end{matrix}\!\!>C=O \xleftarrow[573k]{Cu} H_3C-CH_2-\underset{OH}{\underset{|}{CH}}-CH_3$

Butan-2-one

355. In the sequence of reaction ,

the product 'Y' is

(a) butan –1– o1 (b) butan –2–o1

(c) butanal (d) butan–2–one

AMU–2006

Ans. (a) : $H_3C-CH_2-CH=CH_2$

$\xrightarrow{B_2H_6}(H_3C-CH_2-CH_2-CH_2)_3B$

(X)

$\Big\downarrow H_2O_2 \mid OH^-$

356. Which of the following reactions is the example of electrophilic substitution ?

(a) $CH_2=CH_2+HCl\to CH_3CH_2Cl$

(b) $2CH_3=CH_2+HCl\to CH_3CH_2Cl$

(c) $CH_2=CH_2+H_2\xrightarrow{Ni}CH_3-CH_3$

(d) $C_6H_6+CH_3Cl\xrightarrow{AlCl_3}C_6H_5\,CH_3+HCl$

AMU-2004

Ans. (d) : $C_6H_6+CH_3Cl\xrightarrow{AlCl_3}C_6H_5\,CH_3+HCl$

it is electrophilic substitution reaction.

Here, AlCl$_3$ converts the alkyl chloride into an alkyl carbonium ion.

$CH_3-Cl+AlCl_3\to CH_3^{\oplus}+AlCl_4^{\ominus}$

357. Propene when heated with chlorine at about 500°C form.

(a) $CH_2Cl—CH=CH_2$

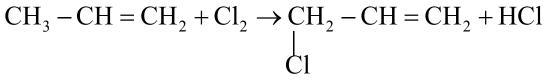
(b) $CH_3—CHCl—CH_2Cl$

(c) $CH_2Cl—CHCl—CH_2Cl$

(d) all of above

AMU 2002

Ans. (a) :



$CH_3-CH=CH_2+Cl_2\to \underset{Cl}{\underset{|}{CH_2}}-CH=CH_2+HCl$

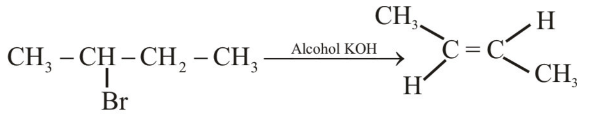
@apna_pdf

358. **When 2- bromobutane reacts with alcoholic KOH then the product is**

(a) equimolar mixture of 1- butane and 2-butene
(b) Predominantly 2-butene
(c) Predominantly 1-butene
(d) Predominantly 2-butyne

Assam CEE-2019

Ans. (b) : When 2-bromobutane reacts with alcoholic KOH to form trans-2-butene. Trans-2-butene is highly substituted alkene.



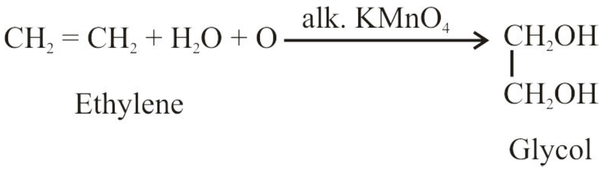
(trans-2-butene)

359. **Which of the following reacts with $KMnO_4$ but does not react with $AgNO_3$?**

(a) C_2H_6
(b) CH_4
(c) C_2H_4
(d) C_2H_2

BCECE-2005

Ans. (c) : Ethylene reacts with KM_nO_4 but does not react with $AgNO_3$. Ethylene is not an acidic nature.



$$CH_2=CH_2+H_2O+O\xrightarrow{\text{alk. }KMnO_4}\begin{array}{l}CH_2OH\\ |\\ CH_2OH\end{array}$$

Ethylene

Glycol

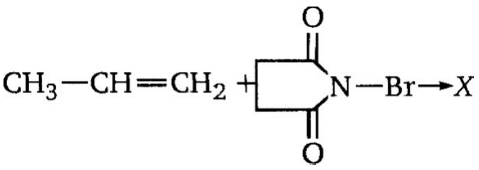
360. **The most stable alkene is :**

(a) $R_2C=CR_2$
(b) $RCH=CHR$
(c) $CH_2=CH_2$
(d) $RCH=CR_2$

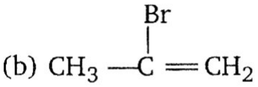
BCECE-2004
AIIMS-1998

Ans. (a) : The more substituted alkene is more stable than less substituted alkene. Alkene is more reactive due to the presence of double bond. So, more the number of electron releasing group of alkyl on the double bond lesser is the stability.

361. **The product 'X', in the following reaction is :**



(a) $CH_2Br—CH=CH_2$

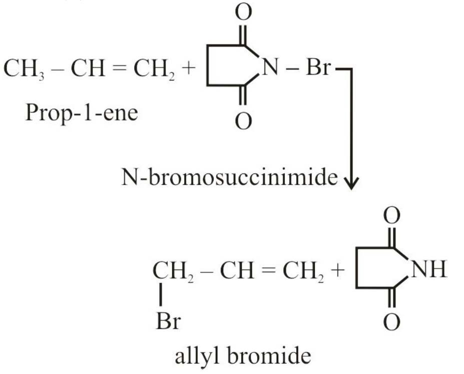


(b) $CH_3—\overset{\overset{\large Br}{|}}{C}=CH_2$

(c) $CH_3CH=CHBr$
(d) none of the above

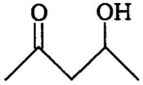
BCECE-2003

Ans. (a) :

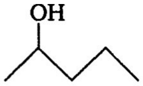


362. **Which one of the following will most readily be dehydrated in acidic conditions?**

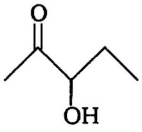
(a)



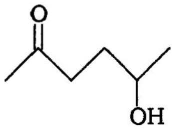
(b)



(c)

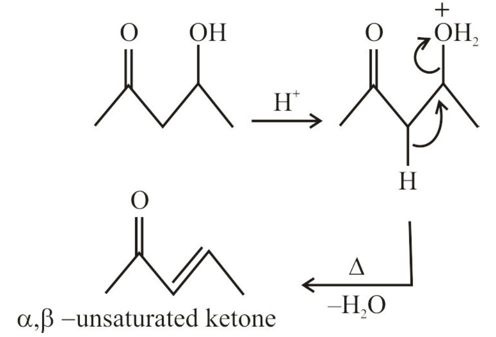


(d)



BCECE-2008

Ans. (a) : The stability increase then greater the conjugation. Β-hydroxyaldehydes or β-hydroxyketones readily undergoes dehydrodion of from more stable α,β - unsaturated aldehydes or ketones.



363. **Ethyl chloride on treatment with alcoholic alkali gives**

(a) C_2H_6
(b) CH_3CHO
(c) C_2H_5OH
(d) $CH_2=CH_2$

BCECE-2009

Ans. (c) : Ethyl chloride can undergo both nucleophilic substitution as well as elimination reaction with strong alkali like KOH. When it undergoes nucleophilic substitution, ethyl alcohol is formed as major product

$$C_2H_5Cl+KOH(aq)\longrightarrow C_2H_5OH+KCl$$

364. **In which of the following can peroxide effect operate?**

(a) $CH_3CH_2CH=CH_2+HCl$
(b) $CH_3CH_2CH=CH_2+HBr$
(c) $CH_3CH=CH{\cdot}CH_3+HBr$
(d) $CH_3CH_2CH=CH_2+HI$

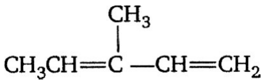
BCECE-2009

@apna_pdf

Ans. (b) : Peroxide effect is also known as kharasch effect. When unsymmetrical alkene react with alkyl halide (only presence of HBr) in the presence of peroxide and reaction proceed via a free radical mechanism.

$CH_3–CH_2–CH=CH_2+HBr \xrightarrow{H_2O_2} CH_3–CH_2–CH_2\ CH_2Br$

365. Which set of products is expected on reductive ozonolysis of the following diolefin?



$CH_3CH=\overset{CH_3}{\overset{|}{C}}—CH=CH_2$

(a) $CH_3CHO; CH_3COCH=CH_2$

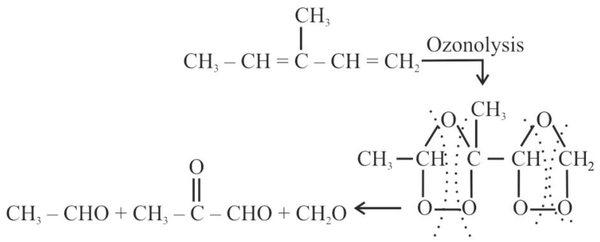
(b) 
$CH_3CH=\underset{CH_3}{\underset{|}{C}}—CHO; CH_2O$

(c) $CH_3CHO; CH_3COCHO; CH_2O$

(d) $CH_3CHO; CH_3COCH_3; CH_2O$

BCECE-2010

Ans. (c) :



366. In the preparation of alkene from alcohol using Al_2O_3 which is effective factor?

(a) Porosity of Al_2O_3

(b) Temperature

(c) Concentration

(d) Surface area of Al_2O_3

BCECE-2012
NEET-2003
BITSAT-2006

Ans. (b) : In the preparation of alkene from alcohol using Al_2O_3 temperature is the effective factor for dehydration of alcohol by Al_2O_3.

e.g–

$R-CH_2-CH_2OH \xrightarrow[350\,^{\circ}C-380\,^{\circ}C]{Al_2O_3} R-CH=CH_2+H_2O$

367. The decreasing order of reactivity towards electrophilic addition of the following is–

I. $CH\equiv CH$

II. $CH_2=CH_2$

III. $H_2C=CH—Cl$

IV. 
$\underset{Cl}{\underset{|}{HC}}=\underset{Cl}{\underset{|}{CH}}$

(a) I > II > III > IV
(b) II > I > III > IV
(c) IV > III > I > II
(d) IV > III > II > I

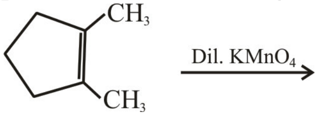
BCECE-2015

Ans. (b) : Ethene is more reactive than Acetylene due to acetylene has more electronegative so the electrophilic addition. Alkene attached with the electron withdrawing group electron.

Density decrease so the reactive of electrophilic addition increases.

Hence, the order is II > I > III > IV

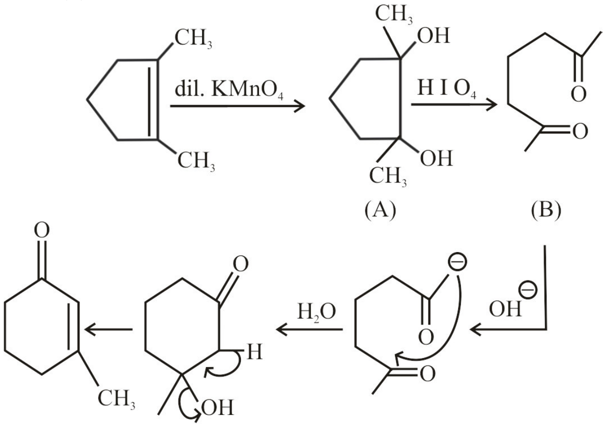
368. What will be the correct structural formula of product for the following reaction?



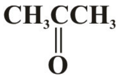
$A \xrightarrow{HIO_4} B \xrightarrow{OH^-} C$

(a) 
(b) 
(c) 
(d) 
[BITSAT-2013]

Ans. (a) :



369. Which alkene on ozonolysis gives CH_3CH_2CHO and CH_3CCH_3



$CH_3\underset{O}{\underset{||}{C}}CH_3$

(a) 
$CH_3CH_2CH=C(CH_3)_2$

(b) $CH_3CH_2CH=CHCH_2CH_3$

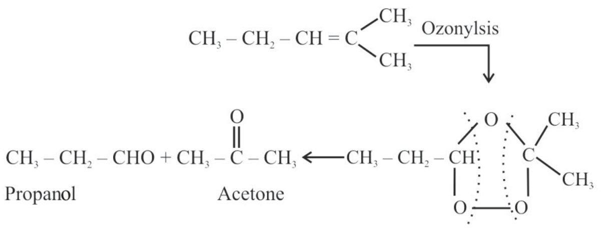
(c) $CH_3CH_2CH=CHCH_3$

(d) 
$CH_3–\underset{CH_3}{\underset{|}{C}}=CHCH_3$

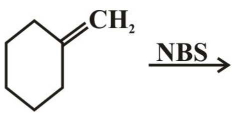
[BITSAT – 2012]

@apna_pdf

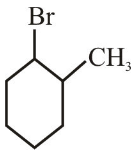
Ans. (a)



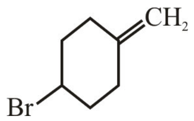
370. What will be the product in the following reaction?



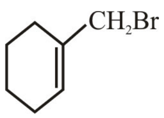
(a)



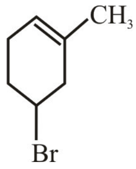
(b)



(c)

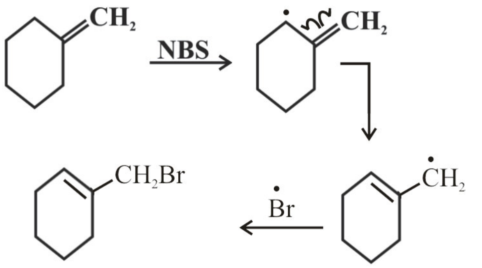


(d)



BITSAT – 2011
BHU-2005

Ans. (c) :

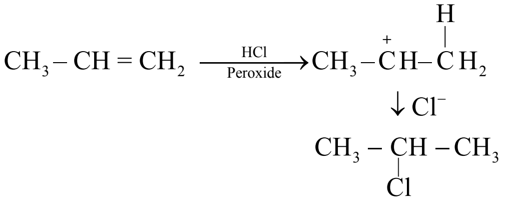


371. The intermediate formed during the addition of HCl to propene in the presence of peroxide is

(a) $CH_3\dot{C}HCH_2Cl$
(b) $CH_2\overset{+}{C}HCH_3$
(c) $CH_3CH_2\dot{C}H_2$
(d) $CH_3CH_2\overset{+}{C}H_2$

[BITSAT- 2009]

Ans. (b) :
The intermediate formed during the addition of HCl to propene in the presence of peroxide is $CH_3–CH^+–CH_3$.



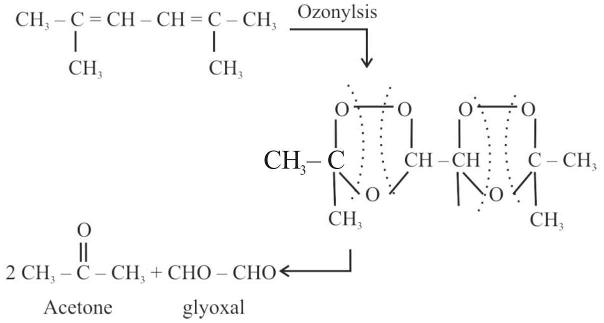
$$CH_3-CH=CH_2 \xrightarrow[Peroxide]{HCl} CH_3-\overset{+}{C}H-\overset{H}{C}H_2 \xrightarrow{Cl^-} CH_3-\underset{Cl}{CH}-CH_3$$

372. Compounds (A) gives two mol acetone and glyoxal on ozonolysis?

(a) 2,5-dimethyl hexyne
(b) 2,5- dimethyl hex-3- ene
(c) 2,5 dimethyl hex-2-yne
(d) 2,5- dimethyl hexa-2,4-diene

CG PET- 2016

Ans. (d) : Ozonolysis refer to the organic chemical reaction where ozone is employed to cleave the unsaturated bands of alkenes and azo compounds.

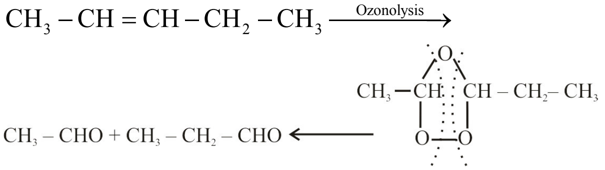


373. The olefin which on ozonolysis gives CH_3CH_2CHO and CH_3CHO is

(a) 2- butene
(b) 1-pentene
(c) 1-butene
(d) 2- pentene

CG PET- 2016

Ans. (d) : 2-Pentene on ozonolysis to give a $CH_3 – CH_2CHO$ and CH_3CHO.



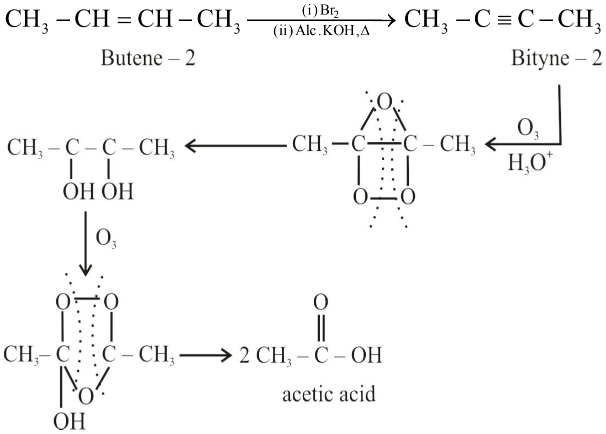
374. Butene-2 $\xrightarrow[2.alc.KOH,\Delta]{1.Br_2}[A]\xrightarrow[H_3^+O]{O_3}[B]$

Compounds A and B are

(a) But-1, 3-diene, formaldehyde
(b) allene, formaldehyde
(c) Butyne-2acetic acid
(d) Butyne-1,formicacid

CG PET -2019, 2021

Ans. (c) :



@apna_pdf

375. Propyne and propene can b distinguished by

(a) cone, H_2SO_4 (b) Br_2 in CCl_4

(c) dil, H_2SO_4 (d) $AgNO_3$ in ammonia

CG PET- 2012

Ans. (d) : Propene and propyne are distinguished by common chemicals tests namely ammonical silver nitrate or ammonical cuprous chloride. Ammonical silver nitrate is also called as Tollen's reagent.

When propyne is mixed with ammonical silver nitrate a white precipitate is formed. Whereas there is no reaction when Tollen's reagent to propene.

Propyne + ammonical silver nitrate → silver acetylide (white ppt.) + NH_3 + H_2O Propene + ammonical silver nitrate → No reaction.

376. $C_2H_2 \xrightarrow[H_2SO_4, H_2O]{Hg^{2+}} A \xrightarrow{[O]} B$

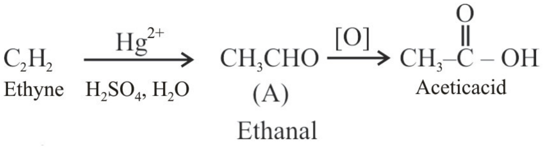
The compound B is

(a) an acid (b) an aldehyde

(c) ketone (d) ethanol

CG PET- 2012

Ans. (a) :



$$\underset{\text{Ethyne}}{C_2H_2} \xrightarrow[H_2SO_4,\ H_2O]{Hg^{2+}} \underset{\substack{(A)\\ \text{Ethanal}}}{CH_3CHO} \xrightarrow{[O]} \underset{\text{Aceticacid}}{CH_3-\overset{\overset{O}{\|}}{C}-OH}$$

377. The addition of HBr is easiest with

(a) $CH_2{=}CHCI$

(b) $CHCI{=}CHCI$

(c) $CH_3 - CH_2{=}CH_2$

(d) $(CH_3)_2C{=}CH_2$

MPPMT-2000

Ans. (d) : Addition of HBr to alkene involves the formation of carbocation intermediate. The carbocation is stabilized by the presence of alkyl group due to +I effect and presence of electron donating group. The number of α - hydrogen is maximum then stability of carbocation increase.

Hence, the $(CH_3)_2$ C = CH_2 is addition of HBr is easiest.

378. Alkene which on ozonolysis yields acetone, is

(a) $CH_2{=}CH{-}CH_2{-}CH_3$

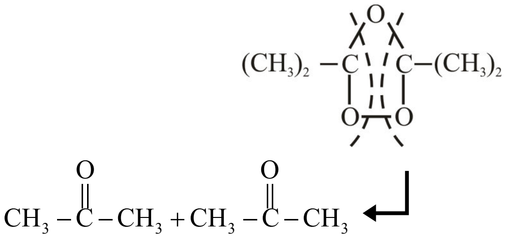
(b) $CH_3{-}CH{=}CH_2$

(c) $CH_3 - CH{=}CH{-}CH_3$

(d) $(CH_3)_2{-}C{=}C{-}(CH_3)_2$

CGPET-2012

Ans. (d) : $(CH_3)_3 – C = C – (CH_3)_2 \xrightarrow{\text{Ozonolysis}}$



379. Baeyer's reagent decolourises which of the following?

(a) Alkane

(b) Alkene

(c) Alkene and alkyne both

(d) None of the above

CG PET -2006

Ans. (c) : Baeyer's reagent is an alkaline solution of cold potassium permanganate ($KMnO_4$) of violet colour solution. It decolourizes by alkene and alkyne both compound which decolourizes Baeyer's reagent. Baeyer's reagent will dissolve in water to give an intense violet or purple colour. It is used for detection of unsaturation in an molecule.

380. The conversion of cis-1 2-dichloroethene to trans-1,2- dichloroethene is an example of

(a) pseudo-unimolecular reaction

(b) the reaction having order between 1 and 2

(c) unimolecular reaction

(d) The conversion is spontaneous so zero-order reaction

CG PET -2017

Ans. (c) : The conversion of cis-1,2-dichloroethene to trans-1,2-dichloroethene is an example of unimolecular reaction. This reaction follow 1st order rate kinetics. It is a reversible reaction. At equilibrium, both isomers are present, with their equilibrium concentrations determined by the rate at which the forward and reverse reaction takes place

$$A \underset{k-1}{\overset{k_1}{\rightleftharpoons}} B$$

381. The compound X(C_5H_8) reacts with ammoniacal $AgNO_3$ to give a white precipitate and reacts with excess of $KMnO_4$ to give the acid, $(CH_3)_2 CH-COOH$. Therefore, X is

(a) $CH_2{=}CH{-}CH{=}CH{-}CH_3$

(b) $CH_3(CH_2)_2C{\equiv}CH$

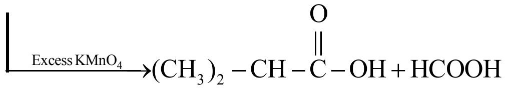
(c) $(CH_3)_2CH{\cdot}{\equiv}CH$

(d) $(CH_3)_2C{=}C{=}CH_2$

CG PET- 2010

Ans. (c) :

$(CH_3)_2-CH-C\equiv CH \xrightarrow{AgNO_3} \underset{\text{White precipitate}}{(CH_3)_2-CH-C\equiv Ag^+}$



$$\xrightarrow{\text{Excess KMnO}_4} (CH_3)_2-CH-\overset{\overset{O}{\|}}{C}-OH+HCOOH$$

Hence, the compound 'X' is 3-methyl but-1-yen.

382. In the reaction,

$$\mathbf{CH_3COOH \xrightarrow{LiAlH_4} A \xrightarrow{PCl_5} B \xrightarrow{alc.KOH} C}$$

the product C is

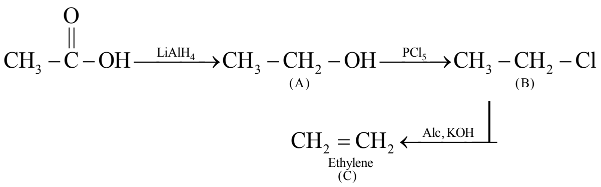
(a) acetaldehyde (b) acetylene

(c) ethylene (d) acetylchloride

JEE Main -2014

@apna_pdf

Ans. (c) :



LiAlH4
(A)
PCl5
(B)
Alc, KOH
Ethylene
(C)

$CH_3-\overset{O}{\overset{\|}{C}}-OH \xrightarrow{LiAlH_4} \underset{(A)}{CH_3-CH_2-OH} \xrightarrow{PCl_5} \underset{(B)}{CH_3-CH_2-Cl} \xrightarrow{Alc, KOH} \underset{(C)}{\underset{Ethylene}{CH_2=CH_2}}$

In the reaction, the produce 'C' is ethylene.

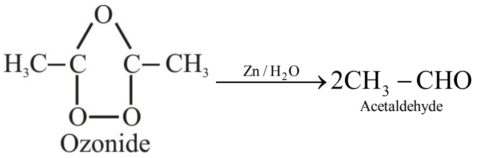
383. One mole of a symmetrical alkene on ozonolysis gives two moles of an aldehyde having a molecular mass of 44 u. The alkene is

(a) propene (b) 1-butene
(c) 2-butene (d) ethene

AIEEE 2010, 2008

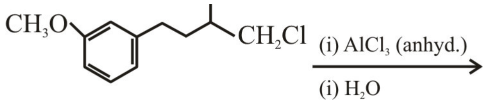
Ans. (c) :
2-butene which is a symmetrical alkene. Therefore, it will undergo ozonolysis and will give two moles of an aldehyde whose molecular mass equals to 44g/mole.

$$CH_3-CH=CH-CH_3+O_3 \xrightarrow[196K]{CHCL_3/CCl_4}$$



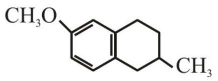
Zn / H2O
2CH3 – CHO
Acetaldehyde
Ozonide

384. The major product of the following reaction is:

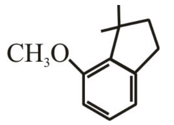


CH3O
CH2Cl
(i) AlCl3 (anhyd.)
(i) H2O

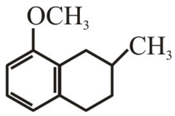
(a)



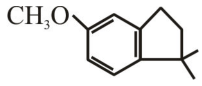
(b)



(c)

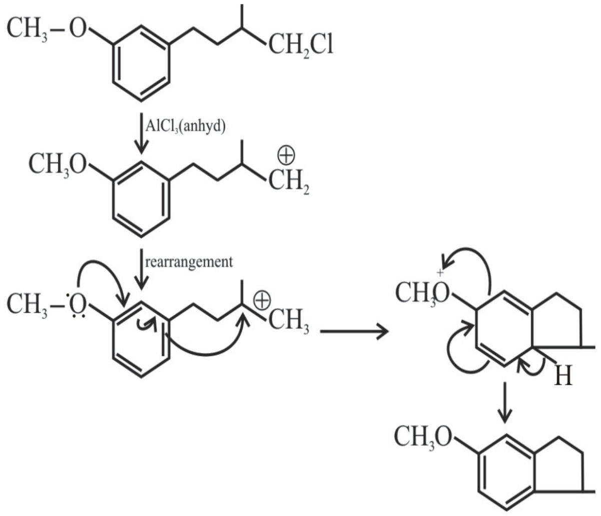


(d)



[JEE Main-2019, 10 Jan Shift-I]

Ans. (d) :



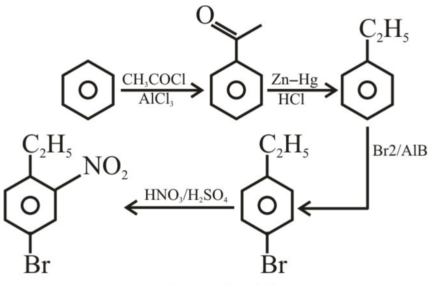
CH3–O
CH2Cl
AlCl3(anhyd)
CH3O
⊕
CH2
rearrangement
CH3–Ö
⊕
CH3
CH3O
H
CH3O

385. The correct sequence of reagents used in the preparation of 4-bromo-2-nitroethyl benzene from benzene is:

(a) $CH_3COCl/AlCl_3$, $Br_2/AlBr_3$, HNO_3/H_2SO_4, Zn/HCl
(b) $CH_3COCl/AlCl_3$, Zn-Hg/HCl, $Br_2/AlBr_3$, HNO_3/H_2SO_4
(c) $Br_2/AlBr_3$, $CH_3CoCl/AlCl_3$, HNO_3/H_2SO_4, Zn/HCl
(d) HNO_3/H_2SO_4, $Br_2/AlCl_3$, $CH_3COCl/AlCl_3$, Zn-Hg/HCl

[JEE Main-2021, 25 Feb Shift-II]

Ans. (b):



O
CH3COCl
AlCl3
Zn–Hg
HCl
C2H5
Br2/AlBr3
C2H5
NO2
HNO3/H2SO4
C2H5
Br
Br

4-Bromo-2-nitroethyl benzene

386. Acetylene does not react with:

(a) Na
(b) Ammoniacal $AgNO_3$
(c) HCl
(d) NaOH

AIEEE 2002
JIPMER-2016

Ans. (d) : We know that acetylene is a weak acid and it has terminal hydrogen

$$\underset{\substack{Weak\\acid}}{CH\equiv CH}+\underset{\substack{Weaker\\base}}{NaOH}\longrightarrow\underset{\substack{Strong\\base}}{CH\equiv C^-Na^+}+\underset{\substack{Strong\\acid}}{H_2O}$$

Acetylene does not react with NaOH because weak acid and strong base not give a strong acid.

387. Acetylene reacts with hypochlorous acid to form

(a) Cl_2CHCHO (b) $ClCH_2COOH$
(c) CH_3COCl (d) $ClCH_2CHO$

AIEEE 2002
UP CPMT-2012

Ans. (a) : Acetylene reacts with hypochlorous acid to form a dichloroacetaldehyde.

$$HC\equiv CH+2HOCl\longrightarrow[CHCl_2-CH(OH)_2]$$
$$\underset{Dichloro\,acetaldehyde}{CHCl_2CHO}\xleftarrow{H_2O}$$

388. 2-hexyne gives trans-2-hexene on treatment with :

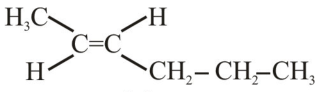
(a) Pt/H_2 (b) Li/NH_3
(c) $Pd/BaSO_4$ (d) $LiAlH_4$

AIEEE 2012, 2004
JEE Main-2018

@apna_pdf

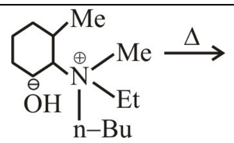
Ans. (b) : 2-hexyne react with Li/NH₃ to give a trans - 2-hexene.

$$\underset{\text{2–hexyne}}{CH_3-C\equiv C-CH_2-CH_2-CH_3}\xrightarrow{Li/NH_3}$$



trans-2-hexene

389.

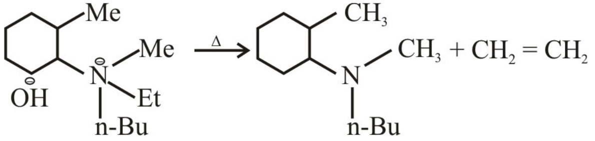


The alkene formed as a major product in the above elimination reaction is :

(a)  (b) $CH_2{=}CH_2$

(a)  (b) 
[AIEEE 2008]

Ans.(b) :



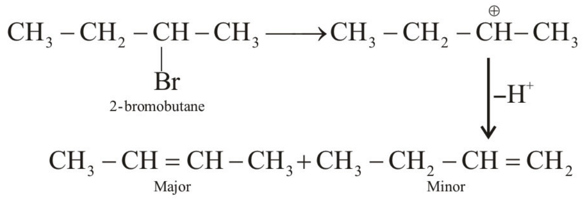
In Hoffmann reaction less substituted alkene is major product.

390. Elimination of bromine from 2-bromobutane results in the formation of:

(a) Predominantly 2-butyne
(b) Predominantly 1-butene
(c) Predominantly 2-butene
(d) Equimolar mixture of 1 and 2-butene

[AIEEE 2005]

Ans. (c) :



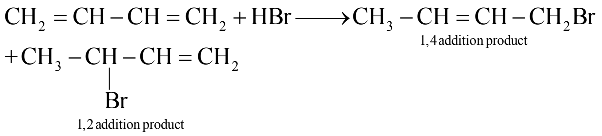
$$\underset{\text{2-bromobutane}}{CH_3-CH_2-\underset{|}{\overset{}{CH}}(Br)-CH_3}\longrightarrow CH_3-CH_2-\overset{\oplus}{C}H-CH_3\xrightarrow{-H^+}\underset{\text{Major}}{CH_3-CH=CH-CH_3}+\underset{\text{Minor}}{CH_3-CH_2-CH=CH_2}$$

391. Reaction of one molecule of HBr with one molecule of 1, 3-butadiene at 40°C gives predominantly :

(a) 1-bromo-2-butene under kinetically controlled conditions
(b) 3-bromobutene under thermodynamically controlled conditions
(c) 1-bromo-2-butene under thermodynamically controlled conditions
(d) 3-bromobutene under kinetically controlled conditions

[AIEEE 2005]

Ans. (c) : 1, 2-addition product is kinetically controlled product while 1, 4-addition product is thermodynamically controlled product and formed at comparatively higher temperature.



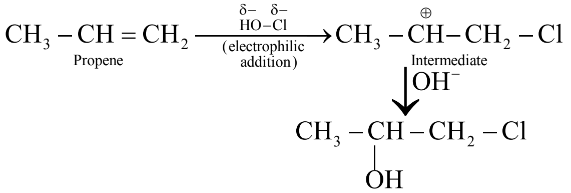
$$CH_2=CH-CH=CH_2+HBr\longrightarrow\underset{\text{1,4 addition product}}{CH_3-CH=CH-CH_2Br}+\underset{\text{1,2 addition product}}{CH_3-\underset{\underset{Br}{|}}{CH}-CH=CH_2}$$

392. The reaction of propene with HOCl (Cl_2 + H_2O) proceeds through the intermediate:

(a) $CH_3\overset{+}{C}HCH_2Cl$ (b) $CH_3CH(OH)\overset{+}{C}H_2$
(c) $CH_3CHCl\overset{+}{C}H_2$ (d) $CH_3\overset{+}{C}HCH_2OH$

[JEE Main 2016]

Ans. (a) : The reaction of propene with HOCl proceeds through the intermediate $CH_3-\overset{\oplus}{C}H-CH_2Cl$.



$$\underset{\text{Propene}}{CH_3-CH=CH_2}\xrightarrow[\text{(electrophilic addition)}]{\overset{\delta-\ \ \delta-}{HO-Cl}}\underset{\text{Intermediate}}{CH_3-\overset{\oplus}{C}H-CH_2-Cl}\xrightarrow{OH^-}CH_3-\underset{\underset{OH}{|}}{CH}-CH_2-Cl$$

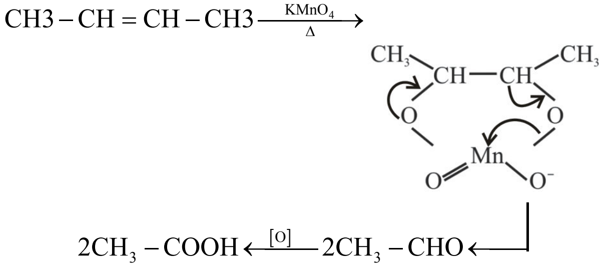
393. But-2-ene on reaction with alkaline $KMnO_4$ at elevated temperature followed by acidification will give:

(a) 
$CH_3-\underset{OH}{CH}=\underset{OH}{CH}-CH_3$

(b) One molecule of CH_3CHO and one molecule of CH_3COOH
(c) 2 molecules of CH_3COOH
(d) 2 molecule of CH_3CHO

[JEE Main-2019, 12 April Shift-I]

Ans. (c) : But-2-ene on reaction with alkaline $KMnO_4$ at elevated temperature is give a acetic acid.



$$CH3-CH=CH-CH3\xrightarrow[\Delta]{KMnO_4}\ \cdots\ \longrightarrow 2CH_3-CHO\xrightarrow{[O]}2CH_3-COOH$$

394. Butene-1 may be converted to butane by reaction with :

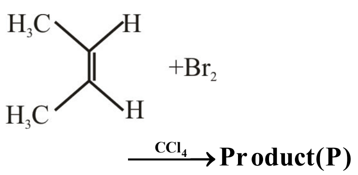
(a) Zn-HCl (b) Sn-HCl
(c) Zn-Hg (d) Pd/H_2

[AIEEE 2003]

Ans. (d) : Alkene can be converted to alkanes by addition of hydrogen (H_2). In a hydrogenation reaction, two hydrogen atom are added across the double boond of an alkene, resulting in a saturated alkane. The reaction occurs in the presence of a catalyst like nickel, platinum or palladium.

@apna_pdf

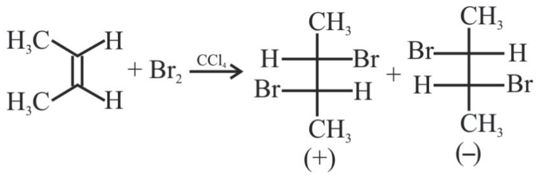
395.



Consider the above chemical reaction. The total number of stereoisomers possible for product P is ....

[JEE Main-2021, 25 July Shift-II]

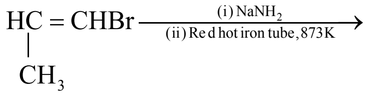
Ans. (2) :



2, 3 dibromobutane

Hence, the total number of stereoisomer is two.

396. For the given reaction :

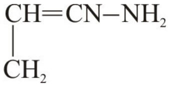


$$\underset{\displaystyle CH_3}{\underset{|}{HC}} = CHBr \xrightarrow[\text{(ii) Red hot iron tube, 873K}]{\text{(i) NaNH}_2}$$

(A)
Major product

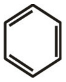
(a) $CH_3CH_2CH_2NH_2$

(b)

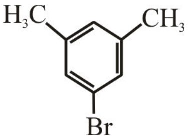


$$\underset{\displaystyle CH_2}{\underset{|}{CH}}=CN-NH_2$$

(c)

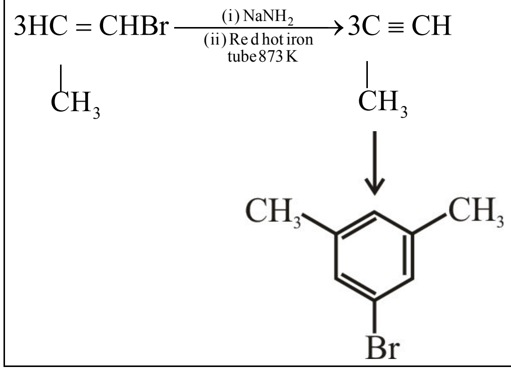


(d)

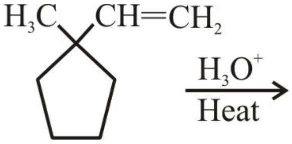


[JEE Main-2021, 26 Feb Shift-I]

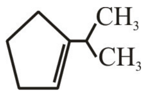
Ans. (d) :



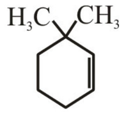
397. The major product in the following reaction is:



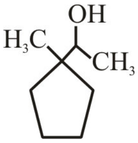
(a)



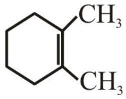
(b)



(c)

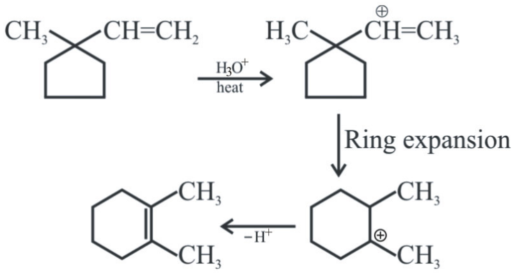


(d)



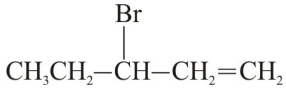
[JEE Main-2020, 5 Sep Shift-II]

Ans. (d) :



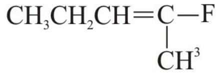
398. The major product obtained from E_2 – elimination of 3-bromo-2-fluoropentane is :

(a)



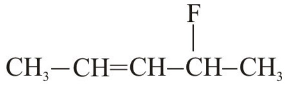
$$CH_3CH_2-\overset{\displaystyle Br}{\overset{|}{CH}}-CH_2=CH_2$$

(b)



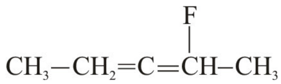
$$CH_3CH_2CH=\underset{\displaystyle CH^3}{\underset{|}{C}}-F$$

(c)



$$CH_3-CH=CH-\overset{\displaystyle F}{\overset{|}{CH}}-CH_3$$

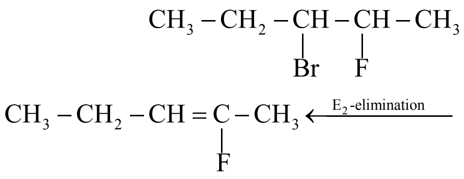
(d)



$$CH_3-CH_2=C=\overset{\displaystyle F}{\overset{|}{CH}}-CH_3$$

[JEE Main-2020, 2 Sep Shift-II]

Ans. (b) :

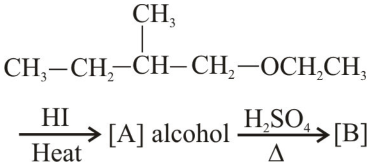


$$CH_3-CH_2-\underset{\displaystyle Br}{\underset{|}{CH}}-\underset{\displaystyle F}{\underset{|}{CH}}-CH_3$$

$$CH_3-CH_2-CH=\underset{\displaystyle F}{\underset{|}{C}}-CH_3 \xleftarrow{E_2\text{-elimination}}$$

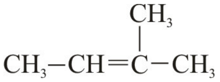
Stable alkene having 5 α–H

399. The major product [B] in the following reactions is :



$$CH_3-CH_2-\overset{\displaystyle CH_3}{\overset{|}{CH}}-CH_2-OCH_2CH_3 \xrightarrow[\text{Heat}]{\text{HI}} [A]\text{ alcohol} \xrightarrow[\Delta]{H_2SO_4} [B]$$

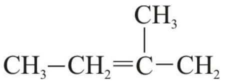
(a)



$$CH_3-CH=\overset{\displaystyle CH_3}{\overset{|}{C}}-CH_3$$

(b) $CH_2=CH_2$

(c)



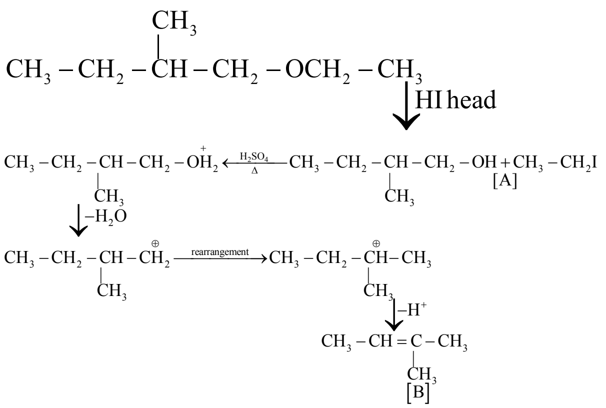
$$CH_3-CH_2=\overset{\displaystyle CH_3}{\overset{|}{C}}-CH_2$$

(d) $CH_3–CH_2–CH=CH–CH_3$

[JEE Main-2020, 4 Sep Shift-II]

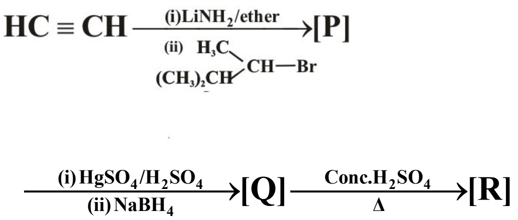
@apna_pdf

Ans. (a)



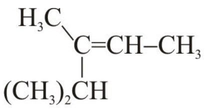
HI head
H_2SO_4 Δ
[A]
$-H_2O$
rearrangement
$-H^+$
[B]

400. The major product [R] in the following sequence of reactions is:

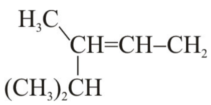


$$HC\equiv CH \xrightarrow[\text{(ii) } \underset{(CH_3)_2CH}{\overset{H_3C}{\ }}\!\!>CH-Br]{\text{(i) } LiNH_2/\text{ether}} [P] \xrightarrow[\text{(ii) } NaBH_4]{\text{(i) } HgSO_4/H_2SO_4} [Q] \xrightarrow[\Delta]{Conc.H_2SO_4} [R]$$

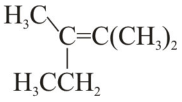
(a)



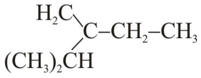
(b)



(c)

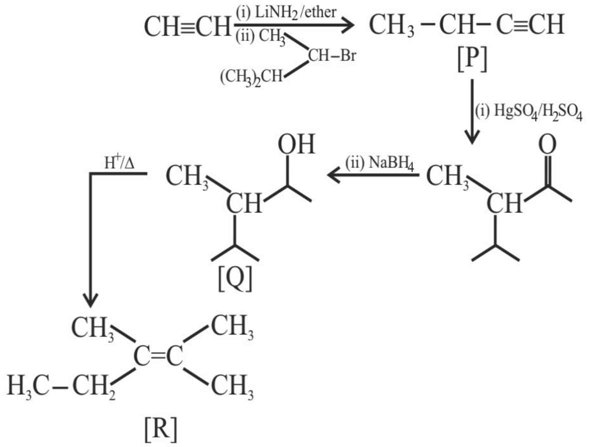


(d)



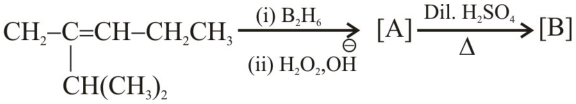
[JEE Main-2020, 4 Sep Shift-II]

Ans. (c) :



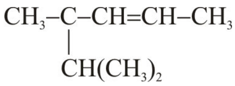
(i) $LiNH_2$/ether
(ii)
[P]
(i) $HgSO_4/H_2SO_4$
(ii) $NaBH_4$
[Q]
H^+/Δ
[R]

401. The major product [B] in the following sequence of reactions is :



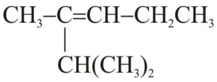
$$CH_2-\underset{CH(CH_3)_2}{C}=CH-CH_2CH_3 \xrightarrow[\text{(ii) } H_2O_2,\overset{\ominus}{O}H]{\text{(i) } B_2H_6} [A] \xrightarrow[\Delta]{\text{Dil. } H_2SO_4} [B]$$

(a)



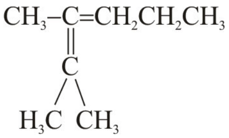
$$CH_3-\underset{CH(CH_3)_2}{C}-CH=CH-CH_3$$

(b)

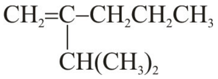


$$CH_3-\underset{CH(CH_3)_2}{C}=CH-CH_2CH_3$$

(c)



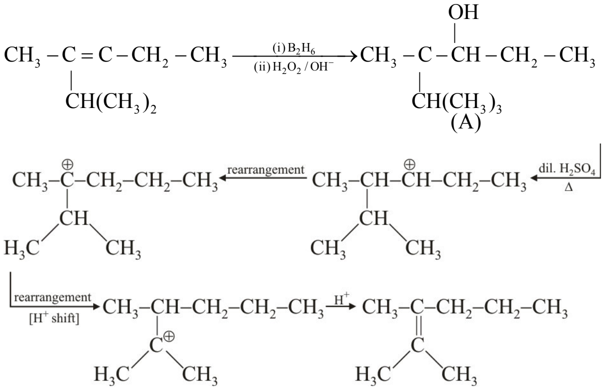
(d)



$$CH_2=\underset{CH(CH_3)_2}{C}-CH_2CH_2CH_3$$

[JEE Main-2020, 8 Jan Shift-II]

Ans. (c) :



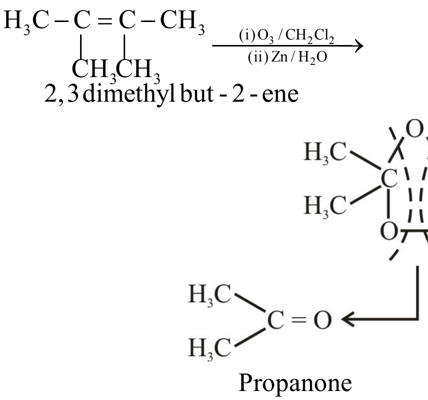
(i) B_2H_6
(ii) H_2O_2/OH^-
(A)
rearrangement
dil. H_2SO_4 Δ
rearrangement [H^+ shift]
H^+

402. Which among the following alkenes on reductive ozonolysis produces only propanone?

(a) 2-Methylpropene
(b) 2-Methylbut-2-ene
(c) 2,3-Dimethylbut-1-ene
(d) 2.3-Dimethylbut-2-ene

J & K CET-(2016)

Ans. (d) :



$$H_3C-\underset{CH_3}{C}=\underset{CH_3}{C}-CH_3 \xrightarrow[\text{(ii) } Zn/H_2O]{\text{(i) } O_3/CH_2Cl_2}$$

2,3 dimethyl but-2-ene

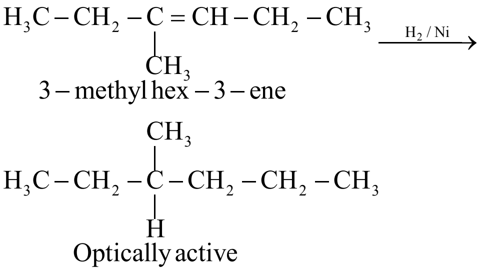
Propanone

403. Which of one of the following alkenes on hydrogenation produces an optically active product?

(a) 2- Methylbut-2-ene (b) 3-Methylhex-3-ene
(c) 2-Methylpent-2-ene (d) 3-Methylpent-2-ene

J & K CET-(2016)

Ans. (b) :



$$H_3C-CH_2-\underset{CH_3}{C}=CH-CH_2-CH_3 \xrightarrow{H_2/Ni}$$

3 – methyl hex – 3 – ene

$$H_3C-CH_2-\overset{CH_3}{\underset{H}{C}}-CH_2-CH_2-CH_3$$

Optically active

@apna_pdf

404. Ethylene can be converted into alcohol by treatment of

(a) aq.KOH
(b) H_2SO_4 as catalyst
(c) moist silver oxide
(d) Zn/HCl.

J & K CET-(2014)

Ans. (b) : Ethene is converted into ethanol by passing its vapour through water in the presence of sulphuric acid. This reaction is called as hydration of ethane.

$$\underset{\text{Ethylene}}{CH_2=CH_2} + H_2O \xrightarrow{H_2SO_4} \underset{\text{Ethanol}}{CH_3-CH_2-OH}$$

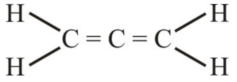
By passing ethane vapours through water in the presence of catalyst sulfuric acid, ethane is transformed to ethanol.

405. Allene (C_3H_4) contains

(a) one triple and two double bonds
(b) two double and four single bonds
(c) two triple and one double bonds
(d) one double and one triple bond.

J & K CET-(2017)
UPTU/UPSEE-2005

Ans. (b) : Allene are organic compound in which one carbon atom has double bond with each of its two adjacent carbon centres. Allenes are classified as cumulated dienes. The parent compound of this clause is propadiene, which is itself also called allene.



In allene (C_3H_4) contains two double bond and four single bond.

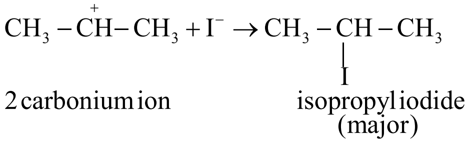
406. Addition of HI on the double bond of propene isopropyl iodide and not n-propyl iodide as the major product. This is because the addition proceeds through

(a) a more stable carbonium ion
(b) a more stable carbanion
(c) a more stable free radical
(d) none of these

J & K CET-(1998)

Ans. (a) :

$$CH_3-CH=CH_2+HI \rightarrow \underset{\text{(Major)}}{CH_3-\overset{\oplus}{C}H_2-CH_3} + \underset{\text{(Minor)}}{CH_3-CH_2-\overset{\oplus}{C}H_2}$$



$$CH_3-\overset{+}{C}H-CH_3+I^- \rightarrow CH_3-\underset{\underset{I}{|}}{CH}-CH_3$$

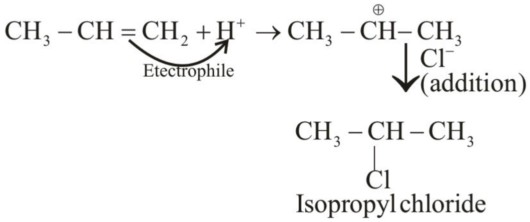
2 carbonium ion isopropyl iodide (major)

407. Reaction between propene and HCl to form isopropyl chloride takes place through

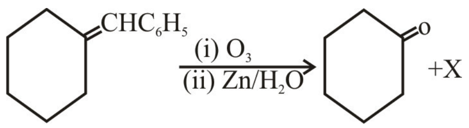
(a) nucleophilic addition reaction
(b) electrophilic substitution reaction
(c) nucleophilic substitution reaction
(d) electrophilic addition reaction

J & K CET-(2010)

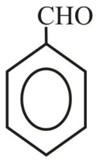
Ans. (d) : Reaction between propene and HCl to form isopropyl chloride take places through electrophilic addition reaction.



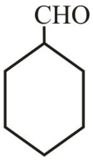
408. Identify the compound X in the following reaction:



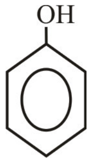
(a)



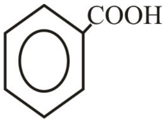
(b)



(c)

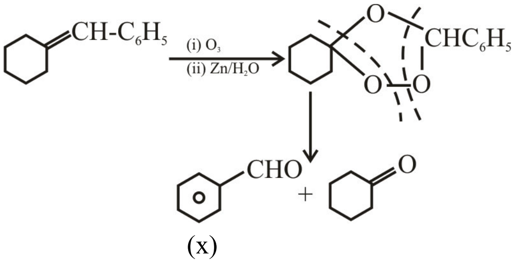


(d)



J & K CET-(2010)

Ans. (a) :



409. But-2-ene could exist as

(a) E and Z is isomers
(b) R and S isomers
(c) geometrical isomers
(d) only one compound

J & K CET-(2002)

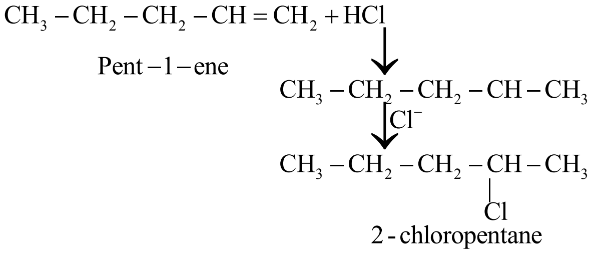
Ans. (c) : Geometrical isomer is shown by the compound having the same molecular formula but differ in the arrangement of atoms in space. It is also known as Cis and trans isomerism or configurational isomerism. In but-2-ene, the group attached to double bonded carbon are different, that is H and CH_3 on one carbon and other side also has H and CH_3 can be rotated on same side of double bond to form Cis - 2 - butane and on rotating opposite sides of double bonded carbon atom it form trans-2-butene. So but-2-ene shows geometrical isomerism.

@apna_pdf

410. Which of the following is formed when pent-1-ene reacts with HCl?
(a) 3-chloropentane
(b) 2-chloropentane
(c) 1,2-dichloropentane
(d) 1-chloropentane

J & K CET-2002

Ans. (b) :



$$CH_3-CH_2-CH_2-CH=CH_2+HCl$$

Pent – 1 – ene

$$\downarrow$$

$$CH_3-CH_2-CH_2-CH-CH_3$$

$$\downarrow Cl^-$$

$$CH_3-CH_2-CH_2-\underset{\substack{|\\ Cl}}{CH}-CH_3$$

2 - chloropentane

This reaction procced through Markownikoff's rule.

411. Which of the following does not react with ammoniacal $AgNO_3$, but decolourises bromine water?
(a) C_2H_6 (b) C_3H_8
(c) C_2H_2 (d) C_2H_4

J & K CET-(2002)

Ans. (d) : C_2H_4 (ethane) decolourise Br water it does not give any white precipitate on reacting with ammonical $AgNO_3$

412. The general molecular formula for a cycloalkyl group is
(a) C_nH_{2n+1} (b) C_nH_{2n-1}
(c) C_nH_{2n} (d) none of these

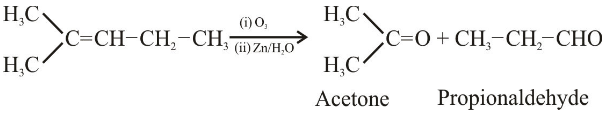
J & K CET-(2002)
UPCPMT-2013

Ans. (b) : The general formula of cycloalkyl group is C_nH_{2n-1}.

413. If ozonolysis of an organic compound A yields acetone and propionaldehyde, then A is
(a) iso-butylene
(b) 3-methyl-2-pentene
(c) 2-methyl-2 pentene
(d) 2- methyl-1-pentene

J & K CET-(2001)

Ans. (c) : 2-methyl-2-pentene on ozonolysis to give a acetone and propionaldehyde



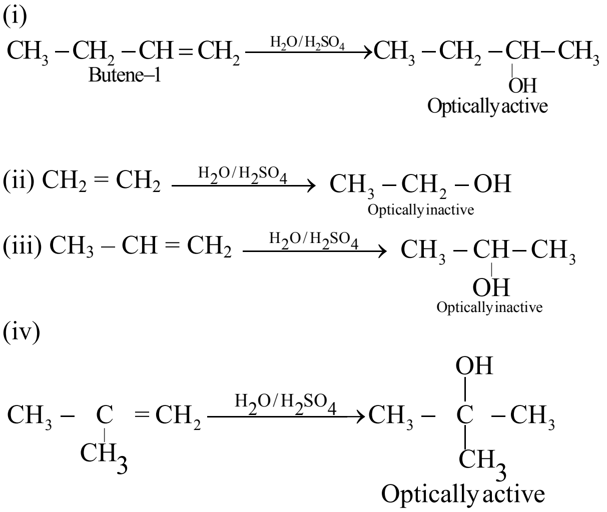
$$\begin{matrix}H_3C\\ H_3C\end{matrix}\!\!>\!C=CH-CH_2-CH_3\xrightarrow[\text{(ii) Zn/}H_2O]{\text{(i) }O_3}\begin{matrix}H_3C\\ H_3C\end{matrix}\!\!>\!C=O+CH_3-CH_2-CHO$$

Acetone Propionaldehyde

414. Which of the following alkenes will not give an optically active alcohol when treated with H_2O/H_2SO_4?
(a) Butene-l (b) Ethene
(c) Propene (d) 2-Methylpropene

J & K CET-(1997)

Ans. (b) :



(i)

$$\underset{\text{Butene–1}}{CH_3-CH_2-CH=CH_2}\xrightarrow{H_2O/H_2SO_4}CH_3-CH_2-\underset{\substack{|\\ OH}}{CH}-CH_3$$

Optically active

(ii) $$CH_2=CH_2\xrightarrow{H_2O/H_2SO_4}\underset{\text{Optically inactive}}{CH_3-CH_2-OH}$$

(iii) $$CH_3-CH=CH_2\xrightarrow{H_2O/H_2SO_4}CH_3-\underset{\substack{|\\ OH}}{CH}-CH_3$$

Optically inactive

(iv)

$$CH_3-\underset{\substack{|\\ CH_3}}{C}=CH_2\xrightarrow{H_2O/H_2SO_4}CH_3-\overset{\substack{OH\\ |}}{\underset{\substack{|\\ CH_3}}{C}}-CH_3$$

Optically active

415. The preparation of ethene from ethanol can be described as
(a) addition (b) dehydration
(c) hydrogenation (d) oxidation

J & K CET-(1999)

Ans. (b) : Ethene is prepared by the dehydration of ethyl alcohol in the presence of conc H_2SO_4 at 160ºC.

$$\underset{\text{Ethanol}}{C_2H_5OH}\xrightarrow[160^\circ C]{\text{Conc.}H_2SO_4}\underset{\text{Ethene}}{CH_2=CH_2}+H_2O$$

416. For the industrial manufacture of high density polyethylene, identify the process that is generally adopted out of the following.
(a) free-radical liquid phase polymerisation
(b) free-radical gas phase polymerisation
(c) Zeigler-Natta or oxide catalysed polymerisation
(d) anionic polymerization

J & K CET-(2001)

Ans. (c) : High density polyethylene is manufacture of low pressure (1.0 – 80 atm) in the presence of a Ziegler - Natta or oxide catalysed polymerization Typical temperature range between 350 – 420K. Hydrogen is mixed with the ethane to control the chain length of polymer.

417. Acid catalysed hydration of alkenes except ethene leads to the formation of
(a) mixture of secondary and tertiary alcohols
(b) mixture of primary and secondary alcohols
(c) secondary or tertiary alcohol
(d) primary alcohol

JCECE - 2008
UPTU/UPSEE-2007

Ans. (c) : Acid catalysed hydration of alkenes except ethane leads to the formation secondery and tertiary alcohols. The alkene involves replacing the π-bond on an alkene with a water molecule. This is done by adding of an alcohol to the more substituted carbon atom and hydrogen to the less substituted carbon atom. This reaction follow Markovinkov's rule and may undergo a carbocation rearrangement.

@apna_pdf

418. Which of the following reagents when heated with ethyl chloride, forms ethylene?

(a) Aueous KOH

(b) Zn/HCl

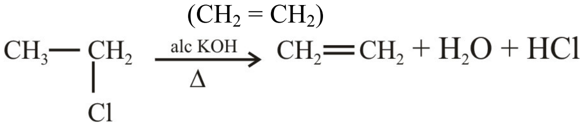
(c) Alcoholic KOH

(d) HI

JCECE - 2009

AP EAMCET-2006

Ans. (c): When ethylchloride ($CH_3 - CH_2Cl$) react with alcoholic KOH in presence of heat the product is ethylene



$$CH_3-\underset{\underset{Cl}{|}}{CH_2} \xrightarrow[\Delta]{alc\ KOH} \overset{(CH_2=CH_2)}{CH_2=CH_2} + H_2O + HCl$$

419. Ziegler-Natta catalyst is

(a) $(Ph_3P)_3$ RhCl

(b) $K[PtCl_3(C_2H_4)]$

(c) $[Al_2(C_2H_6)_6 + TiCl_4]$

(d) $[Fe(C_2H_5)_2]$

JCECE - 2010

WBJEE-2009

UPTU/UPSEE-2014

Ans. (c) : $Al_2(C_2H_6)_6 + TiCl_4$ is Ziegler-Natta catalyst.

420. Anti-Markownikoff's addition of HBr is not observed in

(a) propene (b) 1-butene

(c) but-2-ene (d) pent-2-ene

JCECE - 2011

J & K CET -2012, 1998

Manipal-2016

NEET-1994

BCECE-2005

Ans. (c) : Anti-Markownikoff's rule is not applicable in case of symmetrical alkenes.

The structures of the given compounds are

$$\underset{\text{propene}}{CH_3CH{=}CH_2}\quad \underset{\text{1-butene}}{CH_3CH_2CH{=}CH_3}$$

$$\underset{\substack{\text{but-2-ene}\\\text{(symmetrical)}}}{CH_3CH{=}CHCH_3}\quad \underset{\text{pent-2-ene}}{CH_3CH_2CH{=}CHCH_2}$$

Thus, anti-Markownikoff's rule is not applicable to but-2-ene.

421. An alkene 'A' contains three C—C, eight C—H σ-bonds and one C—C-π bond. 'A' on ozonolysis gives two moles of an aldehyde of molar mass 44u. IUPAC name of A is

(a) but-1-ene

(b) but-2-ene

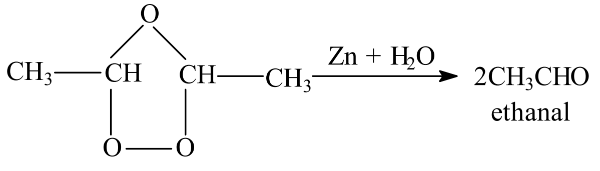
(c) 2-methylpropane

(d) None of these

JCECE - 2013

Ans. (b) : Compound 'A' is but-2-ene.

$CH_3-CH{=}CH-CH_3 \xrightarrow{O_3}$



ozonoid

C — H bonds = 8 σ

C — C bonds = 3 σ

C ═ C bonds = 1 π

422. One mole of a symmetrical alkene on ozonolysis gives two moles of an aldehyde having a molecular mass of 44u. The alkene is

(a) ethene (b) propene

(c) but-1-ene (d) but-2-ene

JCECE - 2013

Ans. (d) : The aldehyde with molecular mass 44 u is CH_3CHO (acetaldehyde). Therefore, the symmetrical alkene is but-2-ene.

$$\underset{\text{but-2-ene}}{CH_3CH{=}CHCH_3} \xrightarrow[\text{(ii) Zn/H}_2\text{O}]{\text{(i)}O_3} \underset{\text{acetaldehyde}}{2CH_3CHO}$$

423. Which of the following statements is not true about low density polythene?

(a) Tough

(b) Highly branched structure

(c) Poor conductor of electricity

(d) Hard

JCECE - 2013

Ans. (b) : Low density polythene has biotin. It is neither soluble in water nor in fat.

424. The main product of the reaction would be

2-butene + chloroform $\xrightarrow{NaOH}$?

(a) butanoic acid

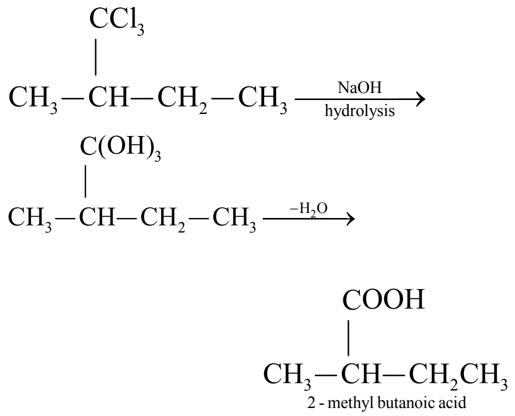
(b) 2-methyl butanoic acid

(c) 1, 1,1-trichloro-2methyl butane

(d) 1, 4-butane diol

JCECE - 2014

Ans. (b) : $CH_3CH{=}CH_3 + CHCl_3 \longrightarrow$



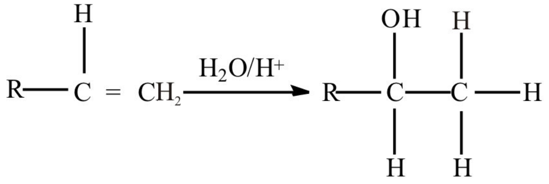
$$CH_3-\overset{\overset{CCl_3}{|}}{CH}-CH_2-CH_3 \xrightarrow[\text{hydrolysis}]{NaOH} CH_3-\overset{\overset{C(OH)_3}{|}}{CH}-CH_2-CH_3 \xrightarrow{-H_2O} \underset{\text{2 - methyl butanoic acid}}{CH_3-\overset{\overset{COOH}{|}}{CH}-CH_2CH_3}$$

@apna_pdf

425. Acid catalysed hydration of alkenes except ethene leads to the formation of
(a) secondary or tertiary alcohol
(b) primary and secondary alcohol
(c) secondary alcohol
(d) tertiary alcohol

JCECE - 2017

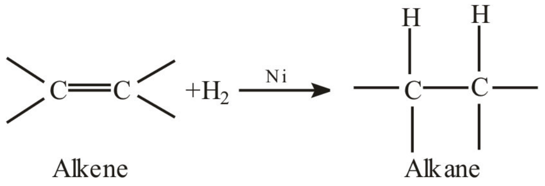
Ans. (a) : Ethene being a 2-carbon compound always forms primary alcohol.



426. Catalyst used in hydrogenation
(a) V_2O_5
(b) Fe
(c) Ni
(d) Pd

JCECE - 2018

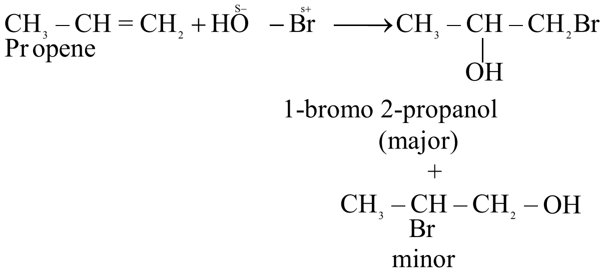
Ans.(c) Catalyst used in hydrogenation is Ni. Hydrogenation reaction is used to reduce the unsaturated compound. This reaction reduces double and triple bonds in hydrocarbons.



427. Which of the following is the major product in the reaction of HOBr with propene?
(a) 2-bromo, 1-propanol
(b) 3-bromo, 1-propanol
(c) 2-bromo, 2-propanol
(d) 1-bromo, 2-propanol

JIPMER-2017
JCEC-2010

Ans. (d) :



$$CH_3-CH=CH_2+\overset{\delta-}{HO}-\overset{\delta+}{Br}\longrightarrow CH_3-\underset{OH}{\underset{|}{CH}}-CH_2Br$$

Propene

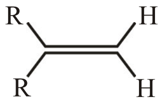
1-bromo 2-propanol
(major)
+

$$CH_3-\underset{Br}{CH}-CH_2-OH$$

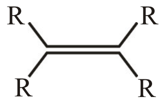
minor

428. Which one of the following alkenes will react faster with H_2 under catalytic hydrogenation conditions?
(R = Alkyl substriuent)

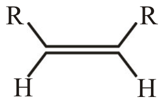
(a)



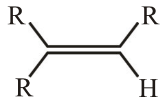
(b)



(c)

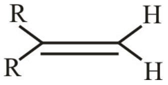


(d)

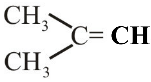


JIPMER-2007
NEET-2005

Ans. (a) : The stability of alkene, greater the number of alkyl group attached to the doubly bonded carbon atom, more stable is the alkene.
Less substituted alkene is more react faster with H_2 under catalytic hydrogenation condition.

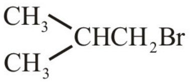
Hence, the


give more faster

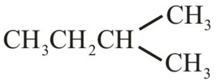
429. The reaction of HBr with


$C= CH_2$ in the presence of peroxide will give:

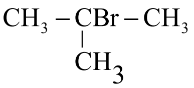
(a)



(b)



(c)

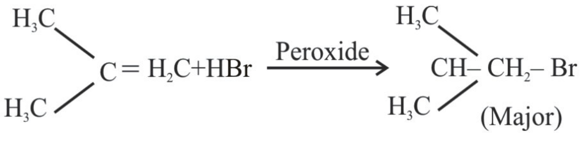


$CH_3-\underset{CH_3}{\underset{|}{C}}Br-CH_3$

(d) $CH_3CH_2CH_2CH_2Br$

JIPMER-2006

Ans. (a) :

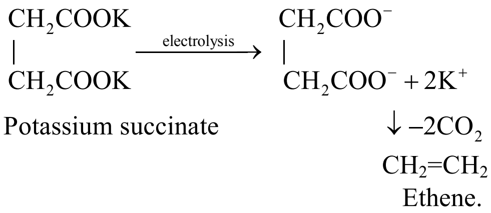


This reaction is known as anti markvaniff rule.

430. What is obtained, when potassium succinate solution is electrolysed?
(a) Ethane
(b) Ethene
(c) Ethyne
(d) All of these

JIPMER-2004

Ans. (b) : Ethene (ethylene) is obtained on electrolysis of potassium succinate this reaction is an example of kolbe's electrolysis.



$$\begin{matrix}CH_2COOK\\|\\CH_2COOK\end{matrix}\xrightarrow{\text{electrolysis}}\begin{matrix}CH_2COO^-\\|\\CH_2COO^-\end{matrix}+2K^+$$

Potassium succinate

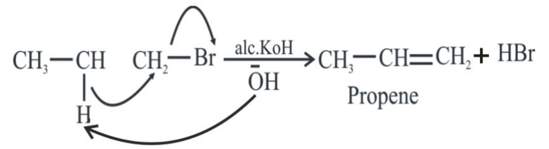
$\downarrow -2CO_2$
$CH_2{=}CH_2$
Ethene.

431. $CH_3 - CH_2 - CH_2 - Br \xrightarrow{Alc.KOH}$ Final product is
(a) propene
(b) propanol
(c) cyclopropane
(d) propane-1, 2-diol

JIPMER-2019

@apna_pdf

Ans. (a) :

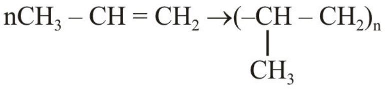


432. Polypropylene can be obtained by polymerization of

(a) $CH_2 = CH–CH_2–Cl$ (b) $CH_2 = CH–Cl$
(c) $CH_3–CH = CH_2$ (d) $CH_3–CHCl_2$

JIPMER-2016

Ans. (c) :



$$nCH_3 - CH = CH_2 \rightarrow (\underset{\underset{CH_3}{|}}{-CH} - CH_2)_n$$

Polypropylene is produced by the chaingrowth polymerization of propene.

433. Ziegler-Natta catalyst is used to prepare

(a) low-density polythene
(b) teflon
(c) high density polythene
(d) nylon-6

Karnataka-CET-2018
Kerala CEE-2011

Ans. (c) : Ziegler–natta catalyst is a mixture of two compound named as triethyl aluminium and titanium tetrachloride. This catalyst is used in the preparation of high density polyethylene and polythenes The molecular formula of Ziegler- Natta catalyst is - $(C_2H_5)_3$ Al and $TiCl_4$.

High density polythene is a polymer made from the monomer in ethylene. It is a very high strength. It is widely used in bottle caps, bottles, printing flaments etc.

434. n-propyl bromide on treating with alcoholic KOH produces

(a) propane (b) propene
(c) propyne (d) propanol

Karnataka-CET, 2008

Ans.(b): Alcoholic KOH is a dehydrohalogenating reagent, so when n-propyl bromide is treated with alcoholic KOH, propene is obtained.

$$\underset{n-propyl\,bromide}{CH_3CH_2CH_2Br} \xrightarrow{alc.KOH} \underset{Propene}{CH_3CH = CH_2} + HBr$$

435. Peroxide effect is observed with the addition of HBr but not with the addition of HI to unsymmetrical alkene because

(a) H-I bond is stronger that H-Br and is not cleaved by the free radical
(b) H-I bond is weaker than H-Br bond so that Iodine free radicals combine to form iodine molecules
(c) Bond strength of HI and HBr are same but free radicals are formed in HBr
(d) All of these

Kerala-CEE-29.08.2021
Karnataka CET-2021

Ans.(b): Due to free radial mechanical (secondary free radial), peroxide effect is observed with the addition of HBr but not with the addition of HI to unsymmetrical alkene because the H-I bond (297 $kJmol^{-1}$) is weaker than it HBr bond and undergoes homolysis readily form iodine free radical. But iodine free radical have greater tendency to combine amongst themselves to form iodine molecules.

$$H - I \xrightarrow[peroxide]{Organic} \dot{H} + \underset{Iodine\,free\,radical}{\dot{I}}$$

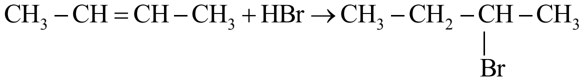
$$\dot{I} + \dot{I} \rightarrow \underset{Iodine\,molecule}{I_2}$$

436. The alkene that will give the same product with HBr in the absence as well as in the presence of peroxide is

(a) 2-butene (b) 1-butene
(c) propene (d) 1-hexene
(e) 2-methylpropene

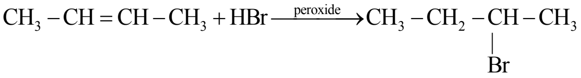
Kerala-CEE-2010

Ans. (a) :



$$CH_3 - CH = CH - CH_3 + HBr \rightarrow CH_3 - CH_2 - \underset{\underset{Br}{|}}{CH} - CH_3$$

This reaction is an example of markwnikoff rule.



$$CH_3 - CH = CH - CH_3 + HBr \xrightarrow{peroxide} CH_3 - CH_2 - \underset{\underset{Br}{|}}{CH} - CH_3$$

This reaction is an example of satyzeff rule.

437. Pick out the correct statements from the following and choose the correct answer from the codes given below

1. Hexa-1, 5-diene is a conjugated diene
2. Prop-1, 2-diene is conjugated diene
3. Hexa-1, 3-diene is a conjugated diene
4. Buta-1, 3 diene is an isolated diene
5. Prop-1, 2 diene is a cumulative diene

(a) 1, 2 (b) 2, 3
(c) 4, 5 (d) 2, 5
(e) 3, 5

Kerala-CEE-2009
UPTU/UPSEE-2013

Ans. (e) :

(i) $\underset{hexa\quad 1,5-diene}{CH_2 = CH - CH_2 - CH_2 - CH = CH_2}$

It is an isolated diene.

(ii) CH_2= C= CH_2 It is cumulative diene
prop-1,2 - diene

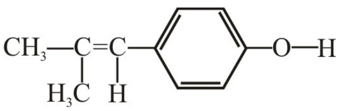
(iii) $\underset{hexa-1,3-diene}{\overset{2}{CH_2} = \overset{2}{CH} - \overset{3}{CH} = \overset{4}{CH} - \overset{5}{CH_2} - \overset{6}{CH_3}}$ It is a conjugated diene

(iv) $\underset{But-1,3,diene}{CH_2 = CH - CH = CH_2}$ It is conjugated diene.

(v) $\underset{Prop-1,2diene}{CH_2 = C = CH_2}$ It is a cumulative diene

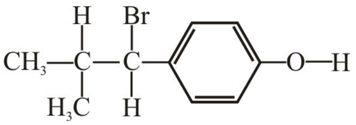
@apna_pdf

438. The reaction of

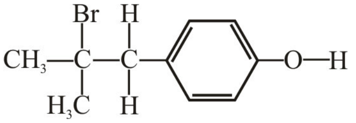


with HBr give predominantly

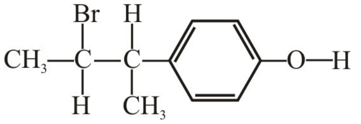
(a)



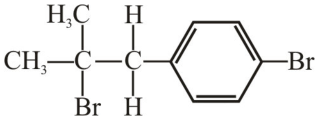
(b)



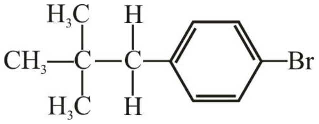
(c)



(d)

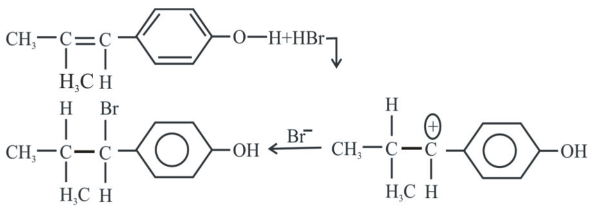


(e)



Kerala-CEE-2008

Ans. (a):

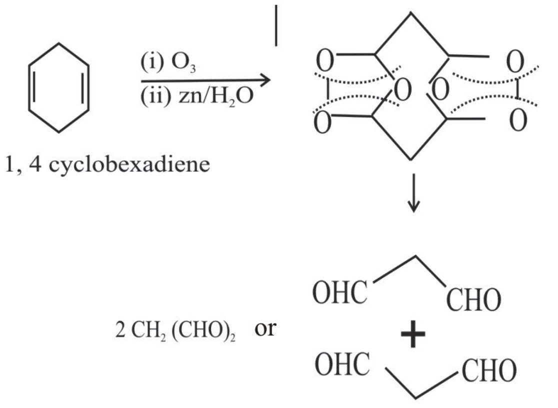


439. An alkene on reductive ozonolysis gives 2-molecules of $CH_2(CHO)_2$. The alkene is:

(a) 2, 4-hexadiene
(b) 1, 3 -cyclohexadiene
(c) 1 , 4-cyclohexadiene
(d) 1- methyl-1, 3-cyclopentadiene
(e) 1, 2-dimethyl cyclopropene

Kerala-CEE-2006

Ans. (c) :



440. The Markownikoff's rule is the best applicable to the reaction between :

(a) $C_2H_4 + HCl$
(b) $C_3H_6 + Br_2$
(c) $C_3H_6 + HBr$
(d) $C_3H_8 + Cl_2$
(e) $C_2H_4 + I_2$

Kerala-CEE-2006
J & K CET-2014
UPTU/UPSEE-2018

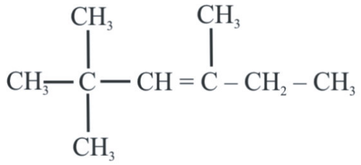
Ans. (c) : Morkownikofl's rule is best applicable to the reaction C_3H_6 +HBr. This rule is used as a guidance for electrophlic addition in those cases where an as a symmetrical reagent is added to an asyunmetrical alkene. i.e. unsymmetrical alkene with HBr. Markovnikov's rule is applicable to predict the regioselectivity of elctrophilic addition reaction of alkenes and alkynes.

441. An alkene having the molecular formula C_9H_{18} on ozonolysis gives 2, 2-dimethyl propanal and 2-butanone. The alkene is :

(A) 2, 2, 2-trimethyl-3-hexene
(B) 2, 2, 6-trimethyl-3-hexene
(C) 2, 3, 4- trimethyl-2-hexene
(D) 2, 2, 4- trimethyl-3-hexene
(E) 2, 2-dimethyl-1-3 heptene

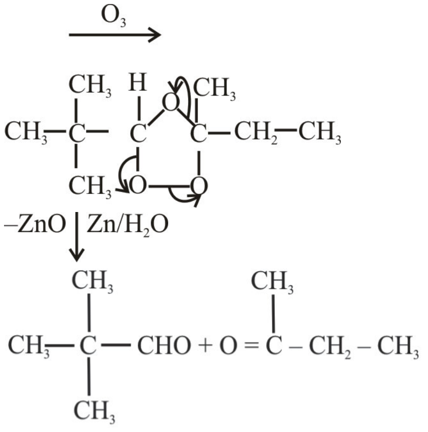
Kerala-CEE-2005
VITEEE-2019

Ans. (d) : The alkene is 2,2,4-trimethyl 3-hexene. On ozonolysis of this alkene gives 2,2,-dimethyl propanol and 2-butanone.



$$CH_3-C(CH_3)_2-CH=C(CH_3)-CH_2-CH_3$$

2, 2, 4 - trimethyl– 3 – hexene.



2,2,dimethyl propanal 2-butanone

442. The presence of Ag^+ ion increases the solubility of alkenes due to the formation of:

(a) dπ-dσ bonding
(b) pσ-pπ bonding
(c) pπ-dπ bonding
(d) pπ-dσ bonding
(e) non of the above

Kerala-CEE-2004

@apna_pdf

Ans. (c) Ag^+ forms complex with the alkene by pπ-dπ bonding giving anion and the solubility is increase.

443. Identify the correct statement from below, concerning the structure of $CH_2= C= CH_2$:

(a) The molecule is planer
(b) One of the three carbon atoms is in an-sp^3 hybridized state
(c) The molecule is non-planar with the two –CH_2 groups being in planes perpendicular to each other
(d) All the carbon atoms are sp-hybridized
(e) The molecule is bent with the –C–C–C– angle being 120 degrees.

Kerala-CEE-2004

Ans. (c) : The structure is given as –

$$\underset{sp^2}{CH_2} = \underset{sp}{C} = \underset{sp^2}{CH_2}$$

The molecule is a non-planar with the two –CH_2 groups being in planes perpendicular to each other

444. When 3-phenylpropene reacts with HBr in the presence of peroxide, the major product formed is

(a) 2-bromo 1-phenylpropane
(b) 1, 2-dibromo 3-phenylpropane
(c) 3-(o-bromophenyl) propene
(d) 1-bromo 3-phenylpropane
(e) 3 (p-bromophenyl) propene

Kerala-CEE-2011

Ans. (d) :

$$\underset{\text{3- phenylpropene}}{C_6H_5-CH_2-CH=CH_2} + HBr \xrightarrow{\text{Peroxide}} \underset{\text{1 - bromo - 3- phenyl propane}}{C_6H_5-CH_2-CH_2-CH_2Br}$$

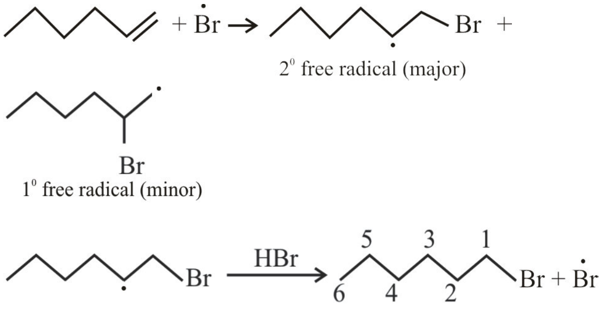
When 3-phenypropene reacts with HBr in the presence of peroxide then reaction is known as Antimarkonikoff or peroxide effect.

445. When HBr adds on hex-1-ene in the presence of benzoyl peroxide, the product is

(a) 2-bromohexane (b) 2, 3-dibromohexane
(c) 1, 2-dibromohexane (d) 2, 4-dibromohexane
(e) 1-bromohexane

Kerala-CEE-2012

Ans. (e) : HBr + benzoyl peroxide → $\dot{Br}$



+ Br•
Br +
2° free radical (major)
Br
1° free radical (minor)
Br
HBr
5
3

6
4
2
Br + Br•

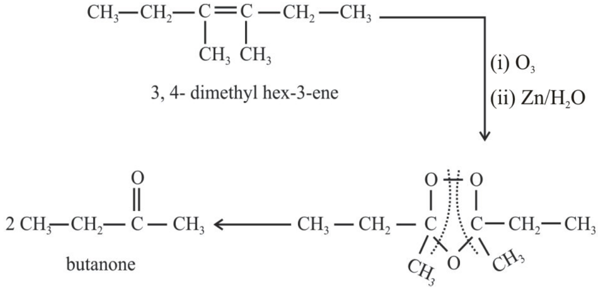
1-brom hexane

446. One mole of alkene on ozonolysis gives 2 moles of butanone. The alkene is

(a) 3,4-dimethylhex-2-ene
(b) 2,3-dimethylhex-3-ene
(c) 3,4-dimethylhex-3-ene
(d) 2,3-dimethylhex-2-ene
(e) 2,5-dimethylhex-3-ene

Kerala-CEE-2013

Ans. (c) :



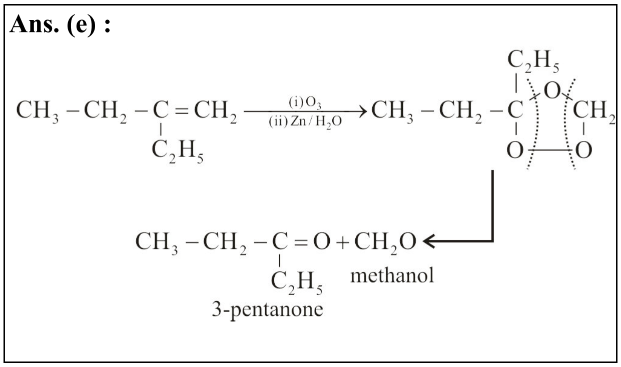
CH₃—CH₂—C=C—CH₂—CH₃
CH₃ CH₃
3, 4- dimethyl hex-3-ene
(i) O₃
(ii) Zn/H₂O
2 CH₃—CH₂—C—CH₃
O
butanone
CH₃—CH₂—C—C—CH₂—CH₃
O O O
CH₃ CH₃

447. The products obtained by the ozonolysis of 2-ethylbut-1-ene are

(a) propanone and ethanol
(b) ethanol and 3-pentanone
(c) butanal and ethanal
(d) methanol and 2-pentanone
(e) methanal and 3-pentanone

Kerala-CEE-2014

Ans. (e) :



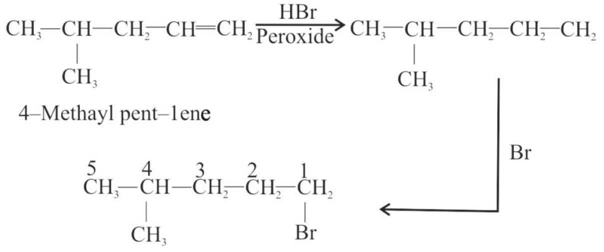
CH₃–CH₂–C=CH₂
C₂H₅
(i) O₃
(ii) Zn/H₂O
CH₃–CH₂–C
C₂H₅
O
CH₂
O O
CH₃–CH₂–C=O + CH₂O
C₂H₅
methanol
3-pentanone

448. The major product obtained by the addition reaction of HBr to 4-methylpent-1-ene in the presence of peroxide is

(a) 1-bromo-4-methylpentane
(b) 4-bromo-2-methylpentane
(c) 2-bromo-4-methylpentane
(d) 3-bromo-2-methylpentane
(e) 2-bromo-2-methylpentane

Kerala-CEE-2016

Ans. (a) :



CH₃—CH—CH₂—CH=CH₂
CH₃
HBr
Peroxide
CH₃—CH—CH₂—CH₂—CH₂
CH₃
4–Methayl pent–1ene

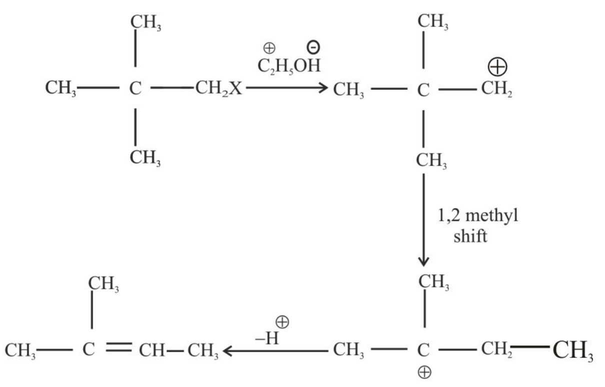
1-Bromo-4methylpentane

@apna_pdf

449. The neopentyl halide in ethanol yields alkenes by E1 mechanism due to
(a) low concentration of solvent
(b) absence of base
(c) it is a primary halide
(d) steric factor which prevents E2 mechanism
(e) salvation effect

Kerala-CEE-2019

Ans. (d) :



The neopentyl halide in ethanol yields alkenes by E_1 mechanism due to steric factor which prevent E_2 Mechanism.

450. Propylene on treatment with HBr/H_2O_2 provides
(a) 1-bromopropane
(b) 2-bromopropane
(c) 1,2-dibromopropane
(d) 1-bromopropan-2-ol
(e) 2-bromopropan-1-ol

Kerala-CEE-2019

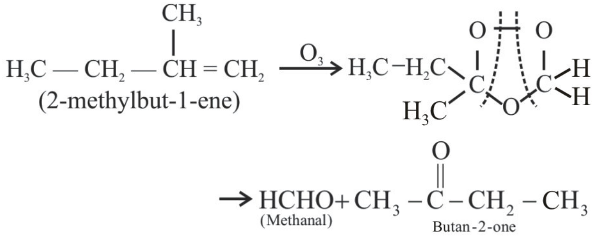
Ans. (a) : Propylene react HBr/H_2O_2 the product is 1-bromoprpane.

$$\underset{\text{Propylene}}{CH_3-CH=CH_2} \xrightarrow[H_2O_2]{HBr} \underset{\text{1-bromopropane}}{CH_3-CH_2-CH_2-Br}$$

451. The products obtained by the ozonolysis of 2-methylbut-1-ene are
(a) propanone and ethanol
(b) propanone and methanol
(c) butanone and methanol
(d) ethanal and propanal
(e) butanone and methanal

Kerala-CEE-2020

Ans.(e): The ozonolysis of 2-methylbut-1-ene given



452. The catalyst used in the Wacker process of oxidation of ethyne to ethanol is
(a) Silver
(b) Nickel
(c) $PdCl_2$
(d) V_2O_5
(e) Ziegler catalyst

Kerala-CEE-2020

Ans.(c): The Wacker process or the Hoechst-Wacker process refers to the oxidation of ethylene to acetaldehyde in the presence of palladium (11) chloride as the catalyst.

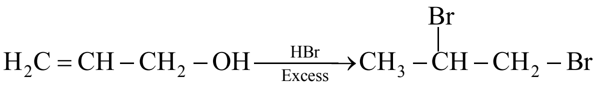
453. The major product of the following reaction is

$$CH_2=CH-CH_2-OH \xrightarrow[\text{excess}]{HBr} \textbf{product}$$

(a) $CH_3-CHBr-CH_2Br$
(b) $CH_2=CH-CH_2Br$
(c) $CH_3-CHBr-CH_2-OH$
(d) $CH_3-CHOH-CH_2OH$

Kerala-CEE-29.08.2021

Ans. (a) :



$$H_2C=CH-CH_2-OH \xrightarrow[\text{Excess}]{HBr} CH_3-\overset{\overset{\large Br}{|}}{C}H-CH_2-Br$$

In above reaction the alkene reacts with an excess of hydrogen bromide to give the final product. In this double bond is removed & Br is added to its place. Also, –OH is removed for –Br group. It follows Markownikov's Rule for the formation of the product.

454. For the reaction,

$$\mathbf{CH_3-CH=CH_2+HOCl \rightarrow A}$$

The product A is :
(a) $CH_3-CHCl-CH_2OH$

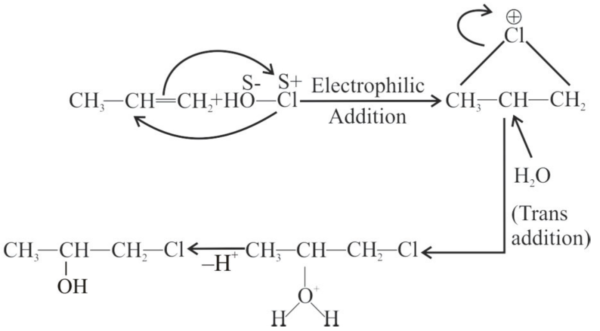
(b) 
$$CH_3-\underset{\underset{\large OH}{|}}{CH}-CH_2-Cl$$

(c) $CH_3-CH_2-CH_2-COCl$

(b) 
$$CH_3-\underset{\underset{\large OH}{|}}{\overset{\overset{\large Cl}{|}}{C}}-CH_3$$

Manipal-2019

Ans. (b) :



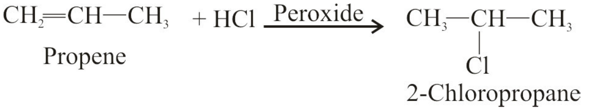
@apna_pdf

455. When propene reacts with HCl in presence of peroxide, the product is

(a) 1-chloro propane
(b) 1, 1-dichloro propane
(c) 2-chloro propane
(d) 1, 2-dichloro propane

MHT CET-02.05.2019, SHIFT-III

Ans. (c) :



$$\underset{\text{Propene}}{CH_2{=}CH-CH_3} + HCl \xrightarrow{\text{Peroxide}} \underset{\text{2-Chloropropane}}{CH_3-\underset{\substack{|\\Cl}}{CH}-CH_3}$$

When propane reacts with HCl in presence of peroxide, the product is 2-Chloropropane.

456. α - butylene when subjected to hydroboration oxidation reaction, yields

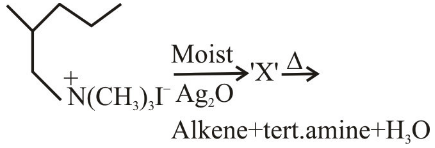
(a) iso-butyl alcohol
(b) sec-butyl alcohol
(c) n-butyl alcohol
(d) tert-butyl alcohol

MHT CET-02.05.2019, SHIFT-III

Ans.(c): α- butylenes when subject to hydroboration-oxidation on reaction, yields n-butyl alcohol.

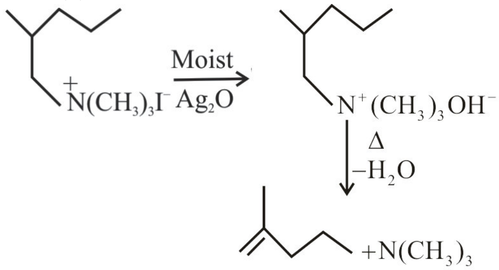
$$\underset{\alpha-\text{butylene}(1-\text{butene})}{CH_3=CH_2-CH_2-CH_3} \xrightarrow[H_2O_2]{BH_3} \underset{n-\text{butyl alcohol}}{CH_3-CH_2-CH_2-CH_2-OH}$$

457. Identify the alkene that is produced in the following series of reactions



(a) 
(b) 
(c) 
(d) 
MHT CET-2014

Ans. (a) :

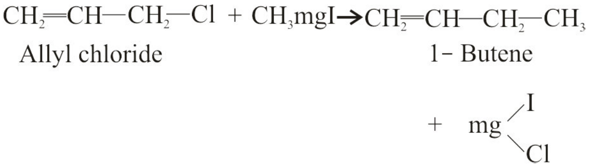


458. For synthesis of 1-butene, CH_3MgI should be treated with

(a) propene
(b) 2-chloropropene
(c) allyl chloride
(d) ethyl chloride

MHT CET-2007

Ans. (c) :



$$\underset{\text{Allyl chloride}}{CH_2{=}CH-CH_2-Cl} + CH_3mgI \rightarrow \underset{\text{1- Butene}}{CH_2{=}CH-CH_2-CH_3} + mg\begin{smallmatrix}I\\Cl\end{smallmatrix}$$

459. Select the true statement about benzene amongst the following

(a) because of unstauration benzene easily undergoes addition
(b) there are two types of C–C bonds in benzene molecule
(c) there is cyclic delocalisation of π-electrons in benzene
(d) monosubstitution of benzene gives three isomeric products.

NEET-1992

Ans. (c) :

Benzene has large resonance energy due to the six conjugated carbon of benzene. The delocalization of P-orbital's carbon on the sp^2 hybridized is give the aromaticity

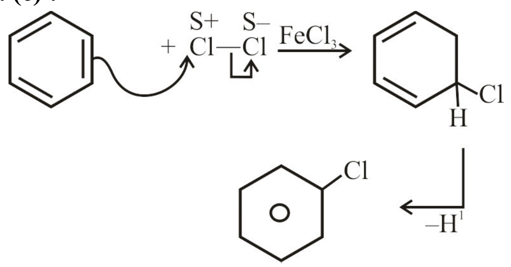
- Benzene is a planer molecule containing a ring of six carbon atoms each with a hydrogen atom attached
- The six carbon atom forms a perfectly regular hexagon. All of the carbon carbon-carbon bond has exactly the same length.
- There are delocalized electron above and below the plane of the ring which make benzene particularly stable
- Benzene resists addition reaction because those reactions would involve breaking the delocalization and losing stability.

460. Electrophile in the case of chlorination of benzene in the presence of $FeCl_3$ is

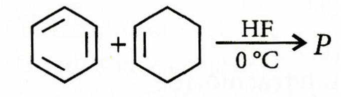
(a) Cl
(b) $FeCl_3$
(c) Cl^+
(d) Cl^-

NEET-1996

Ans. (c) :



461. In the given reaction

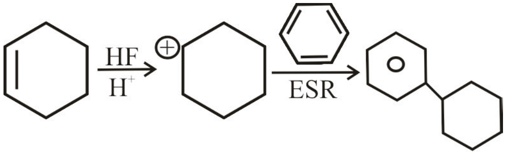


the product P is

@apna_pdf

(a) 
(b) 
(c) 
(d) 
NEET-II 2016

Ans. (c) :



462. In which of the following molecules, all atoms are coplanar?

(a) 
(b) 
(c) 
$$(CH_3)_2C=C(CN)_2$$

(d) 
NEET-II 2016

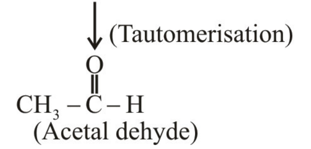
Ans. (a) : Coplanar means atoms a groups of atom that lie on the same plane. Biphenyl has both Benzene rings on the same plane. When all atoms of a compound are in the same plane are called coplanar compound coplanarity in organic compounds is seen in unsaturated molecues.

463. When acetylene is passed through dil, H_2SO_4 in the presence of $HgSO_4$, the compound formed is

(a) acetic acid
(b) ketone
(c) ether
(d) acetaldehyde

NEET-1999

Ans. (d) : Acetylene add a ater molecule when treated with dil H_2SO_4 in the presence of $HgSO_4$ to form acetal dehyde (ethanal).



$$CH\equiv CH+H_2O\rightarrow CH_2=CH-OH \text{ (Unstable Alcohol)} \xrightarrow{\text{(Tautomerisation)}} CH_3-\overset{\overset{O}{\|}}{C}-H$$

(Acetal dehyde)

464. Base strength of

$$\underset{(i)}{H_3C\overline{C}H_2}, \underset{(ii)}{H_2C=\overline{C}H} \text{ and } \underset{(iii)}{H-C\equiv\overline{C}}$$ **is in the order of**

(a) (i) > (iii) > (ii)
(b) (i) > (ii) > (iii)
(c) (ii) > (i) > (iii)
(d) (iii) > (ii) > (i)

NEET-2008

Ans. (b) : Basic strength are directly proportional to the least acidic. So alkane is least acidic and alkane is more basic. Hence the order is–

$$CH_3-\overset{\ominus}{C}H_2 > CH_2=\overset{\ominus}{C}H > H-C\equiv\overset{\ominus}{C}$$

465. The restricted rotation about carbon carbon double bond in 2-butene is due to

(a) overlap of one s and sp^2-hybridized orbitals
(b) overlap of two sp^2-hybridized orbitals
(c) overlap of one p and one sp^2-hybridized orbitals
(d) sideways overlap of two p-orbitals

NEET-1993, 2000

Ans. (d) : Restricted rotation about carbon-Carbon double bond in 2-butene is due to sideways overlap of 2p-orbital's π-bond gives rigidity to molecule, the rotation around the double bond is prevented. The restriction in free rotation makes the position of groups attached to sp^2 hybrid.

466. The reaction,

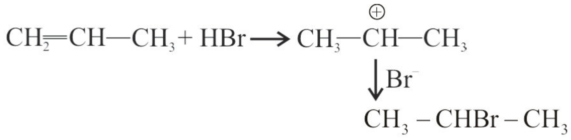
$$CH_2=CH-CH_3+HBr\longrightarrow CH_3CHBr-CH_3$$

is

(a) electrophilic substitution
(b) free radical addition
(c) nucleophilic addition
(d) electrophilic addition

NEET-1996

Ans. (d) : : In this reaction HBr undergoes heterolytic fission. This reaction is known or electrophilic addition reaction



$$CH_2=CH-CH_3+HBr\longrightarrow CH_3-\overset{\oplus}{C}H-CH_3 \xrightarrow{Br^-} CH_3-CHBr-CH_3$$

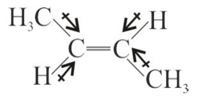
467. Which of the following has zero dipole moment?

(a) 1-Butene
(b) 2- Methyl-1-propane
(c) cis-2-Butene
(d) trans-2-Butene

NEET-1996

Ans. (d) : Trans 2-butene has zero dipole moment became dipole moment of two alkyl group and two hydrogen atom are opposed and cancel

trans-2butene



μ = 0

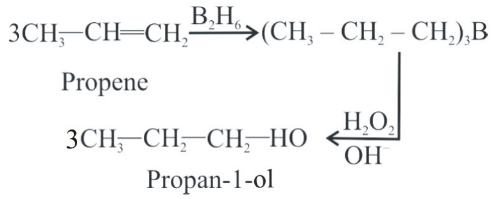
468. Which reagent converts propene to 1-propanol?

(a) H_2O, H_2SO_4
(b) B_2H_6, H_2O_2, OH^-
(c) $Hg(OAc)_2$, $NaBH_4/H_2O$
(d) Aq.KOH

NEET-2000

@apna_pdf

Ans. (b) :



469. Which is maximum stable?

(a) I-Butene

(b) cis-2-Butene

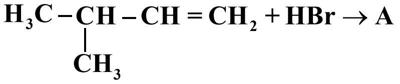
(c) trans-2-Butene

(d) All have same stability

NEET-2000

Ans. (c) : Trans-2-butene is much more stable isomer. The reason is that in the cis from the methyl group satirically interact and destabilize it relative to the trans form This is most stable as the repulsion between two methyl group is least.

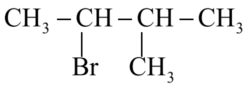
470.



$$H_3C-\underset{\displaystyle CH_3}{\underset{|}{CH}}-CH=CH_2+HBr\rightarrow A$$

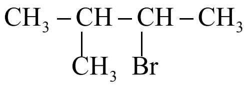
A (predominantly) is

(a)



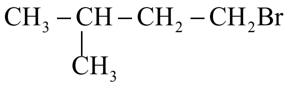
$$CH_3-\underset{Br}{\underset{|}{CH}}-\underset{CH_3}{\underset{|}{CH}}-CH_3$$

(b)



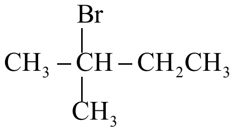
$$CH_3-\underset{CH_3}{\underset{|}{CH}}-\underset{Br}{\underset{|}{CH}}-CH_3$$

(c)



$$CH_3-\underset{CH_3}{\underset{|}{CH}}-CH_2-CH_2Br$$

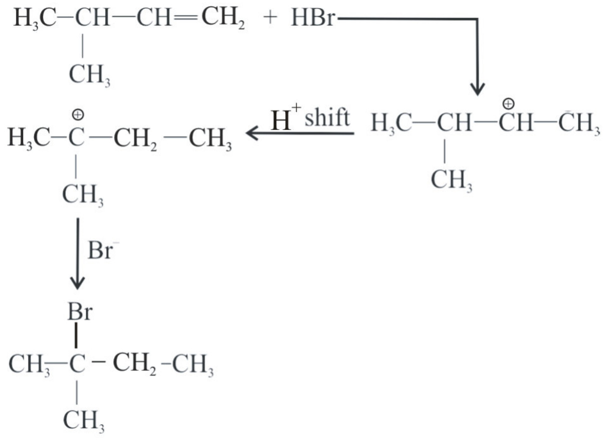
(d)



$$CH_3-\overset{Br}{\overset{|}{\underset{CH_3}{\underset{|}{C}}}}H-CH_2CH_3$$

NEET-2008

Ans. (d) :



471. Which of the compound with molecular formula C_5H_{10} yields acetone on ozonolysis?

(a) 3-Methyl-1-butene

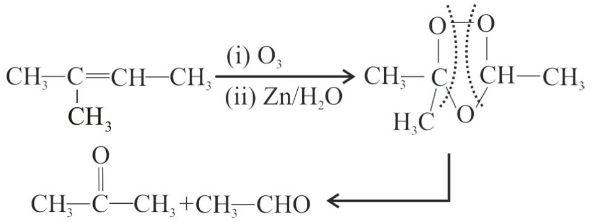
(b) Cyclopentane

(c) 2-Methyl-1-butene

(d) 2-Methyl-2-butene

NEET-2007

Ans. (d) :



472. Reaction of HBr with propene in the presence of peroxide gives

(a) isopropyl bromide

(b) 3-bromopropane

(c) allyl bromide

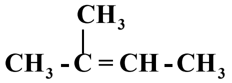
(d) n-propyl bromide

NEET-2004

Ans. (d) : Reaction of HBr with propene in the presence of peroxide gives n-propyl bromide.

$$CH_3-CH=CH_2+HBr\xrightarrow{\text{Peroxide}}\underset{\text{n-propyl bromide}}{CH_3-CH_2-CH_2-Br}$$

473. The compound,



$$CH_3-\overset{CH_3}{\overset{|}{C}}=CH-CH_3$$

on reaction with $NaIO_4$ in the presence of $KMnO_4$ gives

(a) CH_3COCH_3

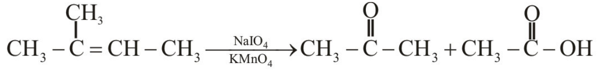
(b) $CH_3COCH_3+CH_3COOH$

(c) $CH_3COCH_3+CH_3CHO$

(d) $CH_3CHO+CO_2$

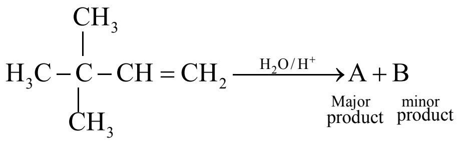
NEET-2003

Ans. (b) :



$$CH_3-\overset{CH_3}{\overset{|}{C}}=CH-CH_3\xrightarrow[KMnO_4]{NaIO_4}CH_3-\overset{O}{\overset{\|}{C}}-CH_3+CH_3-\overset{O}{\overset{\|}{C}}-OH$$

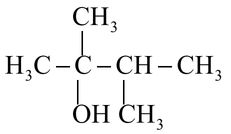
474. In the following reaction



$$H_3C-\overset{CH_3}{\overset{|}{\underset{CH_3}{\underset{|}{C}}}}-CH=CH_2\xrightarrow{H_2O/H^+}\underset{\text{Major product}}{A}+\underset{\text{minor product}}{B}$$

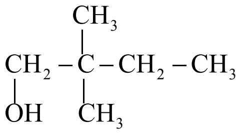
The major product is

(a)



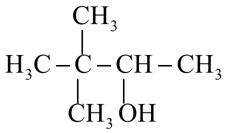
$$H_3C-\overset{CH_3}{\overset{|}{\underset{OH}{\underset{|}{C}}}}-\underset{CH_3}{\underset{|}{CH}}-CH_3$$

(b)



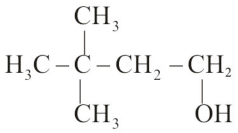
$$\underset{OH}{\underset{|}{CH_2}}-\overset{CH_3}{\overset{|}{\underset{CH_3}{\underset{|}{C}}}}-CH_2-CH_3$$

(c)



$$H_3C-\overset{CH_3}{\overset{|}{\underset{CH_3}{\underset{|}{C}}}}-\underset{OH}{\underset{|}{CH}}-CH_3$$

(d)

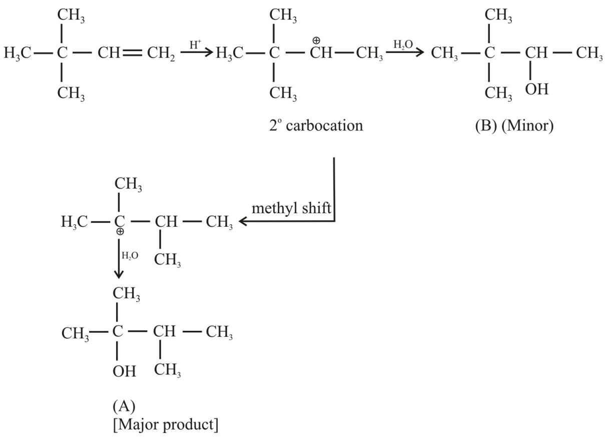


$$H_3C-\overset{CH_3}{\overset{|}{\underset{CH_3}{\underset{|}{C}}}}-CH_2-\underset{OH}{\underset{|}{CH_2}}$$

NEET-2012

@apna_pdf

Ans. (a) :



475. **In the reaction with HCl, an alkene reacts in accordance with the Markovnikov's rule to give a prodct 1-chloro-1-methyl-cyclohexane. The possible alkene is**

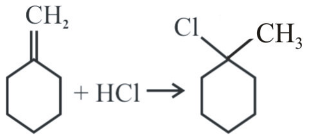
(a)  (A)

(b)  (B)

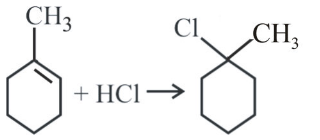
(c) (A) and (B)

(d) 
NEET-2015

Ans. (c) :



1-Chloro-1-methyl cyclohexane



1-Chloro-1-methyl cyclohexane

476. **Which of the following compounds shall not produce propene by reaction with HBr followed by elimination or direct only elimination reaction?**

(a) 
(b) $H_3C-\overset{H_2}{C}-CH_2OH$

(c) $H_2C=C=O$

(d) $H_3C-\overset{H_2}{C}-CH_2Br$

NEET-II 2016

Ans. (c) :

(i) 
(ii) $CH_3-CH_2-CH_2-OH \xrightarrow{HBr} \underset{Br}{\underset{|}{CH_3-CH-CH_3}} \xrightarrow{-HBr} CH_3-CH=CH_2$

(iii) 
(v) $CH_3-CH_2-CH_2-Br \xrightarrow{-HBr} CH_3-CH=CH_2$

477. **The major product of the following chemical reaction is**

$$\begin{matrix}CH_3\\CH_3\end{matrix}\!\!>CH-CH=CH_2+HBr\xrightarrow{(C_6H_5CO)_2O_2}$$

(a) $\begin{matrix}CH_3\\CH_3\end{matrix}\!\!>CBr-CH_2-CH_3$

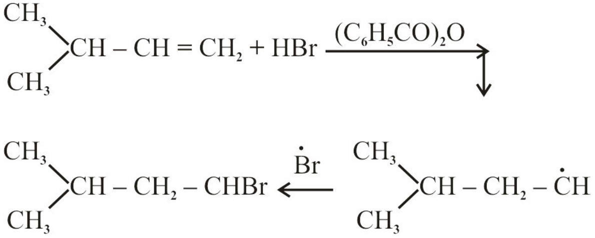
(b) $\begin{matrix}CH_3\\CH_3\end{matrix}\!\!>CH-CH_2-CH_2-Br$

(c) $\begin{matrix}CH_3\\CH_3\end{matrix}\!\!>CH-CH_2-CH_2-O-COC_6H_5$

(d) $\begin{matrix}CH_3\\CH_3\end{matrix}\!\!>CH-\underset{Br}{\underset{|}{CH}}-CH_3$

NEET-2021

Ans. (b) :

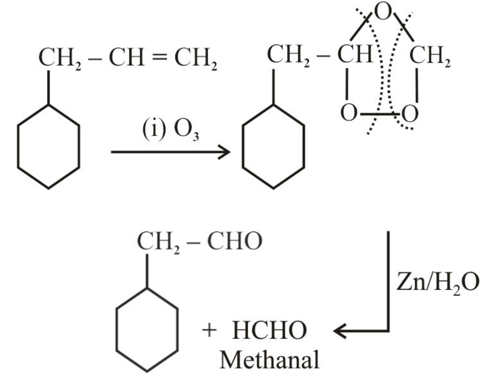


478. **An alkene on ozonolysis gives methanal as one of the product. Its structure is**

(a) 
(b) 
(c) 
(d) 
NEET-2020

@apna_pdf

Ans. (c)



479. An alkene A on reaction with O_3 and Zn–H_2O gives propanone and ethanal in equimolar ratio. Addition of HCl to alkene A gives B as the major product. The structure of product B is

(a) $H_3C-\underset{Cl}{\underset{|}{CH}}-\overset{CH_3}{\overset{|}{\underset{CH_3}{\underset{|}{CH}}}}$

(b) $Cl-CH_2-CH_2-\overset{CH_3}{\overset{|}{\underset{CH_3}{\underset{|}{CH}}}}$

(c) $H_3C-CH_2-\overset{CH_2Cl}{\overset{|}{CH}}-CH_3$

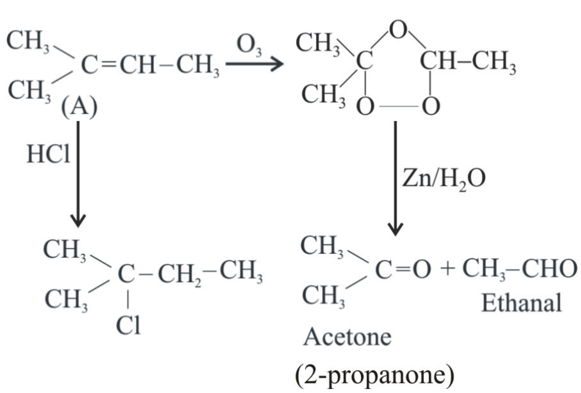
(d) $H_3C-CH_2-\overset{CH_3}{\overset{|}{\underset{Cl}{\underset{|}{C}}}}-CH_3$

NEET-2019

Ans. (d) :



480. Write the final product of the following reaction:

$$CH_3-CH=CH_2+H_2O\xrightarrow[50°C]{PdCl_2/CuCl_2}$$

(a) CH_3CH_2CHO (b) $CH_3CH_2CH_2-OH$

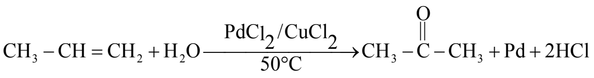
(c) $CH_3-\overset{O}{\overset{\|}{C}}-CH_3$

(d) $CHO-CH=CH_2$

Tripura JEE-2022

Ans. (c) :



$CH_3-CH=CH_2+H_2O\xrightarrow[50°C]{PdCl_2/CuCl_2}CH_3-\overset{O}{\overset{\|}{C}}-CH_3+Pd+2HCl$

This reaction is known as wacker synthesis.

481. When $CH_2=CH-COOH$ is reduced with $LiAlH_4$, the compound obtained will be

(a) CH_3-CH_2-COOH
(b) $CH_2=CH-CH_2OH$
(c) $CH_3-CH_2-CH_2\ OH$
(d) CH_3-CH_2-CHO

UPTU/UPSEE-2007

Ans. (b) :

$$CH_2=CH-COOH\xrightarrow{LiAlH_4}CH_2=CH-CH_2OH$$

$LiAlH_4$ is a reducing agent to reduce ^-COOH group to CH_2OH group but cannot reduce double bond.

482. Mark out the correct decreasing order of ease of addition of halogen.

(a) $CH_2=CH_2 > CH_3-CH=CH-CH_3 > CH_3-\underset{CH_3}{\underset{|}{C}}=CH_2 > (CH_3)_2C=C(CH_3)_2$

(b) $(CH_3)_2C=C(CH_3)_2 > CH_3-\underset{CH_3}{\underset{|}{C}}=CH_2 > CH_3-CH=CH-CH_3 > CH_2=H_2$

(c) $(CH_3)_2C=C(CH_3)_2 > CH_3-CH=CHCH_3 > CH_3-\underset{CH_3}{\underset{|}{C}}=CH_2 > CH_2=CH_2$

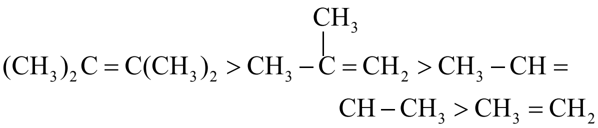
(d) $CH_2=CH_2 > CH_3-\underset{CH_3}{\underset{|}{C}}=CH_2 > CH_3-CH=CH-CH_3 > (CH_3)_2C=C(CH_3)_2$

UPTU/UPSEE-2012

Ans. (b) : As stability of alkene increases then the stability of addition of halogen in alkene increases.

Stability of alkene ∝ No. of ∝- hydrogen

Hence, the order of decreasing are –



$(CH_3)_2C=C(CH_3)_2 > CH_3-\overset{CH_3}{\overset{|}{C}}=CH_2 > CH_3-CH=CH-CH_3 > CH_3=CH_2$

483. Wacker process is an industrial process of the oxidation of terminal alkenes. Which of the following represents a true statement about the product?

(a) The product is an aldehyde with same number of carbon atoms as in the alkene
(b) The product is a ketone with same number of carbon atoms as in the alkene

@apna_pdf

(c) The product is an oxirane with same number of carbon atoms as in the alkene

(d) The product is a terminal alcohol as the net reaction is hydration of an alkene

UPTU/UPSEE-2011

Ans. (a,b) : Wacker process is an industrial process of oxidation of terminal alkene –

- The product is an aldehyele with same number of carbon atom as in the alkene.
- The product is a ketone with same number of carbon atoms as in the alkene.

484. An alkene having molecular formula, C_6H_{10}, gives OHC $(CH_2)_4$CHO, on ozonolysis, The alkene is

(a) hexane -1

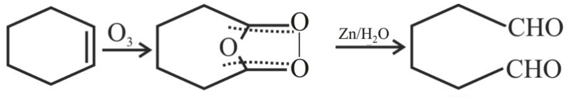
(b) hexane -2

(c) cyclohexene

(d) 1- methylcyclohexene -1

UPTU/UPSEE-2010

Ans. (c) :



O₃
O
O
O
Zn/H₂O
CHO
CHO

or

$OHC-(CH_2)_4-CHO$

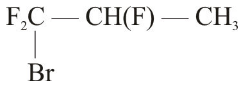
An alkene having molecular formula, C_6H_{10} gives $OHC(CH_2)_4$ CHO on ozonolysis. The alkene is cyclohexene.

485. The major product of the following reaction is

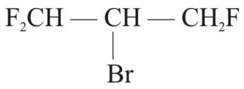
$$F_3C-CH=CH_2+HBr\longrightarrow$$

(a) $F_3C-CH_2-CH_2Br$

(b) $F_3C-CH(Br)-CH_3$

(c)


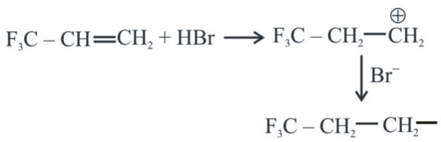
$F_2\underset{\substack{|\\Br}}{C}-CH(F)-CH_3$

(d)


$F_2CH-\underset{\substack{|\\Br}}{CH}-CH_2F$

WB-JEE-30.04.2022
JEE Main – 2019

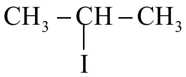
Ans. (a) :



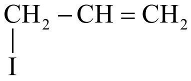
F₃C – CH=CH₂ + HBr ⟶ F₃C – CH₂–C⊕H₂
Br⁻
F₃C – CH₂– CH₂– Br

486. The major product *p* in the following reaction is $CH_3-CH=CH_2\xrightarrow[\text{Peroxide}]{\text{HI}}P$

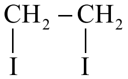
(a) $CH_3CH_2CH_2I$

(b)


$CH_3-\underset{\substack{|\\I}}{CH}-CH_3$

(c)


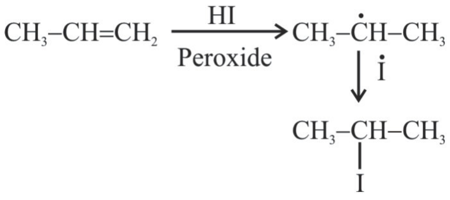
$\underset{\substack{|\\I}}{CH_2}-CH=CH_2$

(d)


$\underset{\substack{|\\I}}{CH_2}-\underset{\substack{|\\I}}{CH_2}$

WB-JEE-2008

Ans. (b) :



CH₃–CH=CH₂
HI
Peroxide
CH₃–ĊH–CH₃
İ
CH₃–CH–CH₃
I

The product formed is markvoniff rule.

487. The addition of HBr to 2- pentene gives

(a) 2- bromopentane only

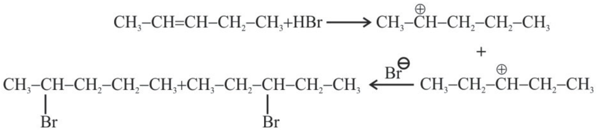
(b) 3- bromopentane only

(c) 2- bromopentane and 3-bromopentane

(d) 1- bromopentane and 3- bromopentane

WB-JEE-2009

Ans. (c) :



CH₃–CH=CH–CH₂–CH₃+HBr ⟶ CH₃–C⊕H–CH₂–CH₂–CH₃
+
CH₃–CH–CH₂–CH₂–CH₃+CH₃–CH₂–CH–CH₂–CH₃ ⟵ Br⊖ CH₃–CH₂–C⊕H–CH₂–CH₃
Br
Br

488. Among the alkenes which one produces tertiary butyl alcohol on acid hydration?

(a) $CH_3-CH_2-CH=CH_2$

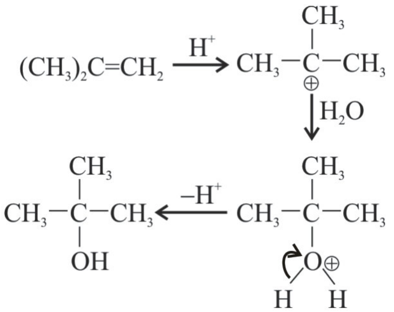
(b) $CH_3-CH=CH-CH_3$

(c) $(CH_3)_2C=CH_2$

(d) $CH_3-CH=CH_2$

WB-JEE-2011

Ans. (c) :



(CH₃)₂C=CH₂
H⁺
CH₃–C⊕–CH₃ (CH₃)
H₂O
CH₃–C(CH₃)–CH₃ O⊕ H H
–H⁺
CH₃–C(CH₃)–CH₃ OH

t–butylalcohol.

489. In 2-butene, which one of the following statements is true?

(a) C_1-C_2 bond is a $sp^3-sp^3-\sigma$-bond

(b) C_2-C_3 bond is a $sp^3-sp^2-\sigma$-bond

(c) C_1-C_2 bond is a $sp^3-sp^2-\sigma$-bond

(d) C_1-C_2 bond is a $sp^2-sp^2-\sigma$-bond

WB-JEE-2012

@apna_pdf

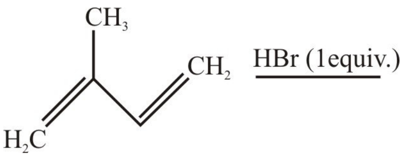
Ans. (c) : The structure of 2–butane is–

$$\overset{1}{CH_3}-\overset{2}{CH}=\overset{3}{CH}-\overset{4}{CH_3}$$

$sp^3 \quad sp^2 \quad sp^2 \quad sp^3$

In 2–butane, C_1–C_2 bond is a sp^3–sp^2–σ bond and C_3–C_4 bond is a sp^2–sp^3 –σ bond.

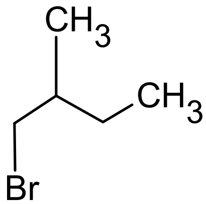
490.



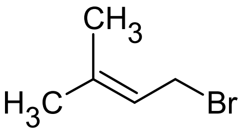
CH3
CH2
H2C
HBr (1equiv.)

The major product of the above reaction is

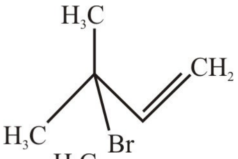
(a)



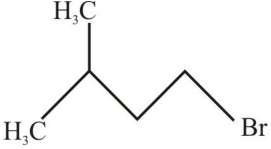
(b)



(c)

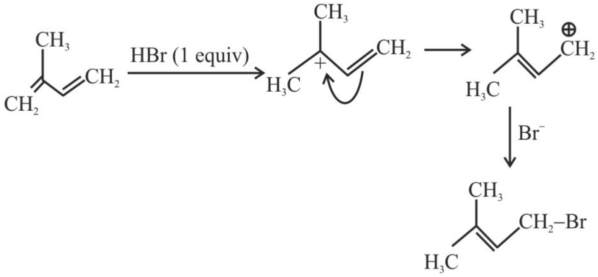


(d)



WB-JEE-2015

Ans. (b) :



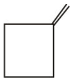
CH3
CH2
CH2
HBr (1 equiv)
CH3
H3C
+
CH2
CH3
⊕
CH2
H3C
Br⁻
CH3
CH2–Br
H3C

491. Ozonolysis of an alkene produces only one dicabonyl compound. The structure of the alkene is

(a) $H_3C-CH=CH-CH_3$

(b)

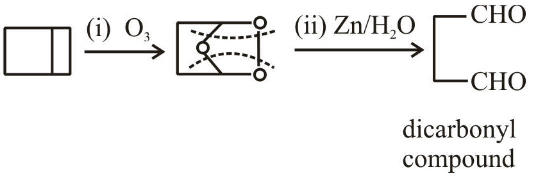
(c)



(d) $CH_3-CH=CH-CH-CH_2$

WB-JEE-2016

Ans. (b) : Ozonolysis of an cyclobutene produces only one dicarbonyl compound.



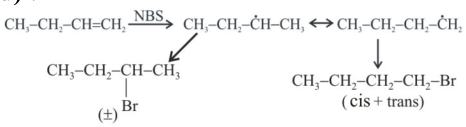
(i) O3
(ii) Zn/H2O
CHO
CHO
dicarbonyl compound

492. The number of possible organobromine compounds which can be obtained in the allylic bromination of 1-butene with N-bromosuccinimide is

(a) 1
(b) 2
(c) 3
(d) 4

WB-JEE-2018

Ans. (d) :



CH3–CH2–CH=CH2
NBS
CH3–CH2–ĊH–CH3
CH3–CH2–CH2–ĊH2
CH3–CH2–CH–CH3
Br
(±)
CH3–CH2–CH2–CH2–Br
(cis + trans)

The allylic bromination of 1–butane with N–bromosuccinimide, the possible number of organobromine is 4.

493. The correct order of the addition reaction rates of halogen acids with ethylene is

(a) hydrogen chloride> hydrogen bromide > hydrogen iodide
(b) hydrogen iodide > hydrogen bromide > hydrogen chloride
(c) hydrogen bromide > hydrogen chloride > hydrogen iodide
(d) hydrogen iodide > hydrogen chloride > hydrogen bromide

WB-JEE-2019

Ans. (b) : The stability of hydrogen halides decreases down the group due to decrease in bond (H–X) dissociation energy. Hence, the addition of hydrogen halide with alkene will be HI>HBr>HCl>HF.

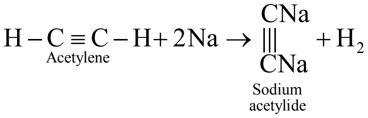
3. Alkynes

494. Which of the following compounds liberates hydrogen gas on reacting with sodium metal?

(a) C_6H_6
(b) C_2H_2
(c) C_2H_4
(d) C_2H_6

AP-EAMCET (Med.)-1999

Ans. (b) : The sodium reacts with acetylene to evolve H_2 gas.

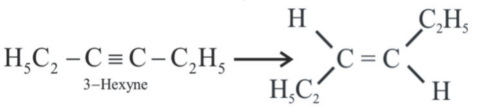


$$\underset{\text{Acetylene}}{H-C\equiv C-H}+2Na \rightarrow \underset{\text{Sodium acetylide}}{\begin{matrix}CNa\\ |||\\ CNa\end{matrix}}+H_2$$

Na has basic characteristics so, it reacts with acidic compounds. In the given compounds C_2H_2 has acidic nature because H attached with triple bonded carbon has acidic character.

@apna_pdf

495. Consider the following transformation :



trans-3-hexene
as major product

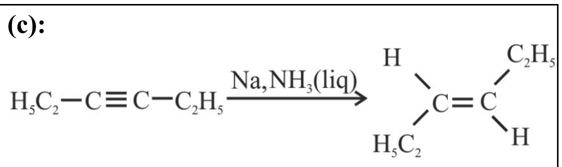
Which one of the following reagents is suitable for the above transformation?

(a) H_2 Lindlar catalyst (b) $LiAlH_4$
(c) Na, NH_3(liq) (d) Zn-Hg/HCl

SCRA-2015

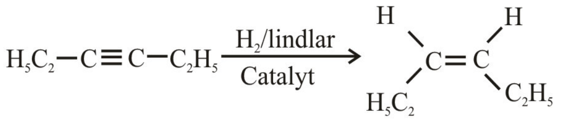
Ans. (c):

(a)



Trans-alkene

(b)



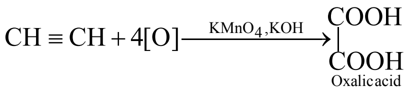
cis-alkene

496. Dilute $KMnO_4$ oxidises acetylene to

(a) acetic acid (b) carbon dioxide
(c) oxalic acid (d) acetaldehyde

A.P.EAMCET-1992

Ans. (c) : Acetylene react with dilute $KMnO_4$ to give oxalic acid.



$$CH\equiv CH+4[O]\xrightarrow{KMnO_4,KOH}\underset{\text{Oxalic acid}}{\begin{matrix}COOH\\|\\COOH\end{matrix}}$$

497. The hybridisation involved in acetylene is

(a) sp (b) sp^2
(c) sp^3 (d) dsp^2

A.P.EAMCET-1993

Ans. (a) : Acetylene (C_2H_2), the hybridisation involve in acetylene is sp because it has triple bonded compound. The structure of acetylene is–

$HC\equiv CH$

498. In the following reaction sequence,

$$CaC_2\xrightarrow{H_2O}P\xrightarrow{\text{Hot iron}}Q\xrightarrow[AlCl_3]{CH_3Cl}R$$

the product R is

(a) benzene
(b) toluene
(c) ethylbenzene
(d) n-propyl benzene

A.P.EAMCET-1995

Ans. (b) :

$$CaC_2\xrightarrow{H_2O}\underset{\underset{(P)}{\text{Acetylene}}}{HC\equiv CH}\xrightarrow[\text{tube}]{\text{Hot iron}}\underset{\underset{(Q)}{\text{Benzene}}}{C_6H_6}\xrightarrow[AlCl_3]{CH_3Cl}\underset{\underset{(R)}{\text{Toluene}}}{C_6H_5CH_3}$$

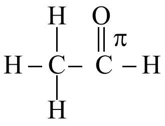
499. The number of π bonds in the product formed by passing acetylene through dil. H_2SO_4 containing mercuric sulphate is

(a) zero (b) one
(c) two (d) three

A.P.EAMCET-1997

Ans. (b) : $\underset{\text{Acetylene}}{CH\equiv CH}+H_2O\xrightarrow{\text{dil.}H_2SO_4/HgSO_4}\underset{\text{Acetaldehyde}}{CH_3CHO}$

The product is -



In acetaldehyde only one π– bond present

500. The homologue of ethyne is

(a) C_2H_4 (b) C_2H_6
(c) C_3H_8 (d) C_3H_4

JIPMER-2009
UP CPMT-2008
AP-EAMCET (Medical)-2006, 1998

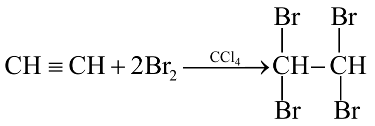
Ans. (d) : A homologue is a compound belonging to series of compounds differing from each other by a repeating unit, such as a methylene bridge-CH_2 group. For ethyne C_2H_2 homologue will be C_3H_4.

501. A gas decolourises Br_2 in CCl_4 and forms a precipitate with ammonical silver nitrate. The gas is

(a) C_2H_2 (b) C_2H_4
(c) C_2H_6 (d) CH_4

A.P.EAMCET-1998

Ans. (a) :



$$CH\equiv CH+2Br_2\xrightarrow{CCl_4}\begin{matrix}Br & Br\\|&|\\CH-&CH\\|&|\\Br&Br\end{matrix}$$

$$CH\equiv CH+2NH_4OH+2AgNO_3\longrightarrow$$
$$H_2O+2NH_4NO_4+\underset{\underset{\text{(White ppt)}}{\text{Silver acetylide}}}{Ag-C\equiv C-Ag}$$

If the compound decolourises Br_2/CCl_4, it must be unsaturated and it gives a white ppt with $AgNO_3/NH_4OH$, the surety of a compound is alkyne (C_2H_2)

502. The number of C – C sigma bonds present in 1–butyne is

(a) 2 (b) 3
(c) 4 (d) 5

A.P.EAMCET-1999

Ans. (b) : $\underset{\text{1-butyne}}{\overset{1}{C}H\equiv\overset{2}{C}-\overset{3}{C}H_2-\overset{4}{C}H_3}$

Hence, the number of three C–C sigma bond present in 1-butyne.

@apna_pdf

503. The number of acetylene molecules required to form one molecule of benzene is

(a) 1 (b) 2
(c) 3 (d) 4

A.P.EAMCET-1999

Ans. (c) : $\underset{\text{Acetylene}}{3C_2H_2} \xrightarrow[\text{Polymerisation}]{\text{Red hot iron tube}} \underset{\text{Benzene}}{C_6H_6}$

When the number of 3 moles of acetylene molecules required to form one molecule of benzene.

504. Which of the following hydrocarbons has least carbon-carbon bond length?

(a) C_2H_6 (b) C_2H_4
(c) C_6H_6 (d) C_2H_2

A.P.EAMCET-2000

Ans. (d) : C_2H_2 has least C – C bond length i.e. 1.20 Å.

- C_2H_4 has least C–C bond length is 1.33 Å.
- C_2H_6 has least C–C bond length is 1.54 Å.

505. Which of the following reacts with ammonical cuprous chloride?

(a) CH_4 (b) C_2H_2
(c) C_2H_6 (d) C_6H_6

A.P.EAMCET-2000

Ans. (b) : Acetylene (C_2H_2) reacts with ammonical cuprous chloride

$$\underset{\text{Acetylene}}{HC \equiv CH} \xrightarrow[NH_4OH]{Cu_2Cl_2} \underset{\text{Cuprous acetalide}}{Cu-C\equiv C-Cu}$$

506. The reagent used for converting acetylene to oxalic acid is

(a) $HgSO_4$/aqueous H_2SO_4
(b) $HgSO_4/CH_3COOH$
(c) $KMnO_4$/KOH, 25^0C
(d) Cr_2O_3/H_2SO_4

A.P.EAMCET-2002

Ans. (c) : The reagent KMnO4/KOH, 25^0C is used for converting acetylene to oxalic acid

$$\underset{\text{Acetylene}}{CH \equiv CH} + 4[O] \xrightarrow[KOH, 25^\circ C]{KMnO_4} \underset{\text{oxalic acid}}{HOOC-COOH}$$

507. When acetylene is passed through red hot iron tube, compound X is formed. Which one of the following reactions will yield X as the major product?

(a) $C_6H_5OH + Zn \xrightarrow{\text{Distillation}}$
(b) $C_6H_5SO_3H + NaHCO_3 \rightarrow$
(c) $C_6H_{12} + 3H_2 \xrightarrow{Ni}$
(d) $C_6H_5Cl + H_2O \xrightarrow{\Delta}$

A.P.EAMCET-2003

Ans. (a) : When acetylene iron tube, benzene is formed

$$\underset{\text{Acetylene}}{3C_2H_2} \xrightarrow{\text{Red hot tube}} \underset{(\times)}{C_6H_6}$$

$$C_6H_5OH + Zn \xrightarrow{\text{distillation}} C_6H_6 + ZnO$$

508. The following reaction is an example of ....reaction.

$C_2H_4Br_2 \xrightarrow{\text{Alc.KOH}} C_2H_2$

(a) addition
(b) dehydrobromination
(c) substitution
(d) debromination

A.P.EAMCET-2004

Ans. (b) :

$$\underset{\substack{\text{Ethylene}\\\text{dibromide}}}{C_2H_4Br_2} + \underset{\text{Alc.}}{2KOH} \xrightarrow{\Delta} \underset{\text{Acetylene}}{CH \equiv CH} + 2KBr + 2H_2O$$

This reaction is dehydrohalogenation reaction.

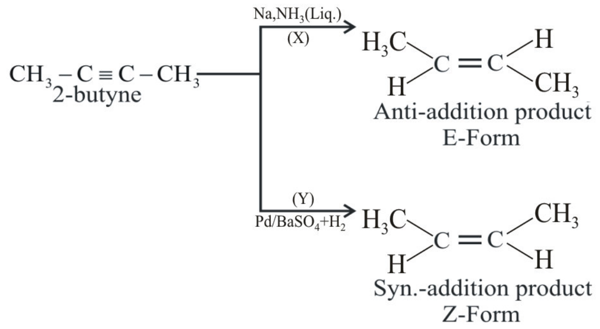
509. What are X and Y respectively in the following reaction?

$Z-\text{product} \xrightarrow{y} 2-\text{butyne} \xrightarrow{x} E-\text{product}$

(a) Na/NH_3(liq.) and $Pd/BaSO_4 + H_2$
(b) Ni/140^0 C and $Pd/BaSO_4 + H_2$
(c) Ni/140^0C and Na/NH_3 (liq.)
(d) $Pd/BaSO_4 + H_2$ and Na/NH_3 (liq.)

A.P.EAMCET-2008

Ans. (a) :



510. Which of the following compounds reacts with an aqueous solution of $Ag(NH_3)_2OH$?

(a) Ethane (b) Ethene
(c) 1 – Butyne (d) 2 – Butyne

MPPET - 2012

Ans. (c) : Terminal alkyne (1-butyne)
$H_3C - H_2C - C \equiv CH$ posses acidic hydrogen. Hence it reacts with $Ag(NH_3)_2OH$ to form a ppt. of silver salt.

511. Action of zinc dust on tetrabromo ethane gives

(a) CH_2OH (b) $CH \equiv CH$
(c) $\begin{matrix} CH = CH_2 \\ | \\ CH_2OH \end{matrix}$ (d) $CH_3 — CH_3$

A.P. EAMCET-1996

Ans. (b) :

$$\underset{\text{Tetrabromo ethane}}{C_2H_2Br_4} + 2Zn \xrightarrow[\text{reaction}]{\text{elimination}} \underset{\text{Acetylene}}{C_2H_2} + 2ZnBr_2$$

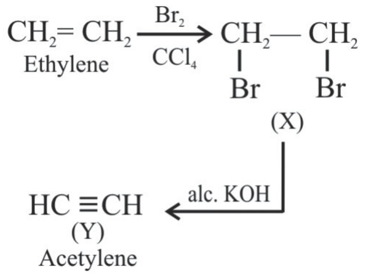
512. Ethylene reacted with bromine in CCl_4 to form X. X is treated with alcoholic KOH to give Y. X and Y are respectively

@apna_pdf

(a) $BrCH_2—CH_2Br$ and C_2H_2
(b) C_2H_5Br and C_2H_4
(c) C_2H_5Br and C_6H_6
(d) $C_2H_5Br_3$ and C_2H_4

A.P. EAMCET-2000

Ans. (a) :



$CH_2=CH_2$
Ethylene
Br_2
CCl_4
$CH_2—CH_2$
Br
Br
(X)
alc. KOH
$HC\equiv CH$
(Y)
Acetylene

513. Ethyne is treate with 30% H_2SO_4 in the presence of 1% mercuric sulphate at 70°C. What is the product formed?
(a) Ethene
(b) Ethanol
(c) Ethanal
(d) Ethylene glycol

A.P.EAMCET/1999

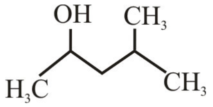
Ans. (c) :

$$\underset{\text{Acetylene}}{CH\equiv CH}+H_2O\xrightarrow[70^0C]{1\%\,HgSO_4}\underset{\substack{\text{Ethanal}\\ \text{or}\\ \text{Acetaldehyde}}}{CH_3CHO}$$

514. The major product form the following reaction sequence is

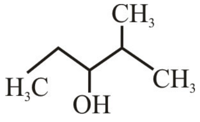
$$\text{Propyne}\xrightarrow[\substack{\text{iii)}\Delta\\ \text{iv)}Pd,H_2\\ \text{v)}NaBH_4}]{\substack{\text{i)}Hg^{2*}/H^+,333K\\ \text{ii)}NaOH}}$$

(a)



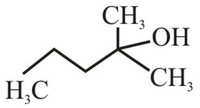
OH
CH_3
H_3C
CH_3

(b)



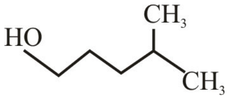
CH_3
H_3C
OH
CH_3

(c)



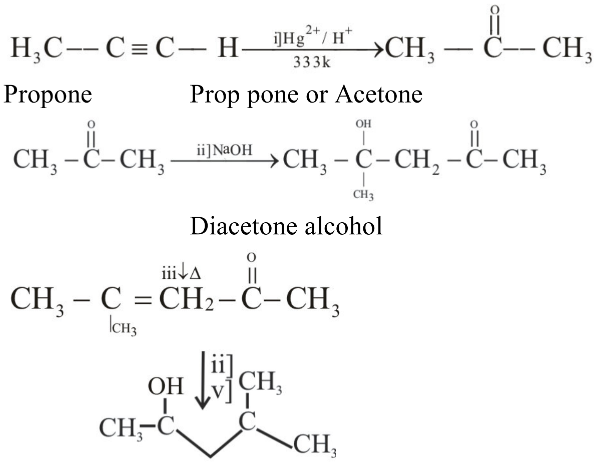
CH_3
OH
H_3C
CH_3

(d)



TS EAMCET 10.08.2021, Shift-I

Ans. (a) :



$H_3C—C\equiv C—H$
i]Hg^{2+}/H^+
333k
$CH_3—\overset{O}{\overset{||}{C}}—CH_3$
Propone
Prop pone or Acetone
ii]NaOH
Diacetone alcohol
iii↓Δ
ii]
v]
OH
CH_3
CH_3

515. Ammonicla cuprous chloride will give red precipitate with which one of the following
(a) $CH_3-C\ \ C\equiv C-CH_3$
(b) $CH_3-CH=CH_2$
(c) $CH_3-C\equiv CH$
(d) $CH_3-CH=CH-CH_3$

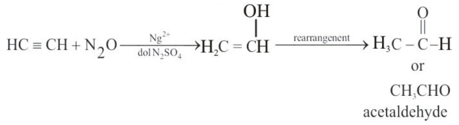
MPPET-2008

Ans. (c) : The compound which reacts with ammonicla cuprous chloride which produces a red precipitate is ethyne (acetylene)- The option (c) is correct.

516. Reaction of acetylene with water in the presence of H_2SO_4 and $HgSO_4$ gives :
(a) Acetone
(b) Acetablehyde
(c) Acetic acid
(d) Formaldehyde

SCRA - 2009

Ans. (b) : Acetylene reacts with water in the presence of dill sulphuric acid and mercuric sulphate to form unstable product which under goes rearrangement to give acetaldehyde.



$HC\equiv CH+N_2O$
Ng^{2+}
dol N_2SO_4
$H_2C=\overset{OH}{CH}$
rearrangenent
$H_3C-\overset{O}{\overset{||}{C}}-H$
or
CH_3CHO
acetaldehyde

517. Identify the alkyne in the following sequence of reactions,

$$\text{Alkyne}\xrightarrow[\text{Lindlar's catalyst}]{H_2}A\xrightarrow{\text{Ozonolysis}}\underset{\text{only}}{B}$$

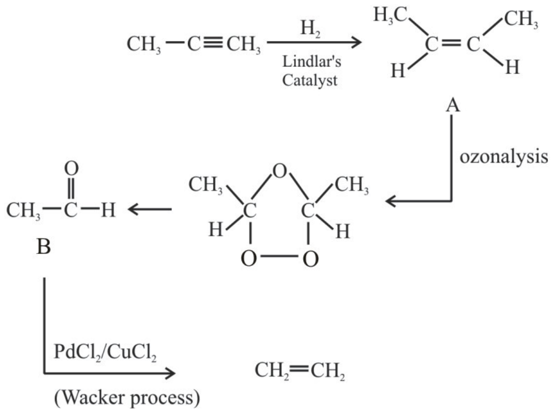
$$\xrightarrow[\text{process}]{\text{Wacker}}CH_2=CH_2$$

(a) $H_3C—C\equiv C—CH_3$
(b) $H_3C—CH_2—C\equiv CH$
(c) $H_2C=CH—C\equiv CH$
(d) $HC\equiv C=CH_2—CH_3$

AP EAMCET (Engg.)-2009
BITSAT – 2009

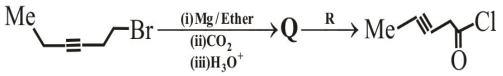
@apna_pdf

Ans. (a)



CH₃—C≡CH₃
H₂
Lindlar's Catalyst
H₃C
CH₃
C=C
H
H
A
ozonalysis
O
CH₃—C—H
B
PdCl₂/CuCl₂
(Wacker process)
CH₂=CH₂

518. In the following reaction sequence Identify product 'Q' and reagent 'R'



Me
Br
(i)Mg/Ether
(ii)CO₂
(iii)H₃O⁺
Q
R
Me
Cl
O

(a)  and $SOCl_2$

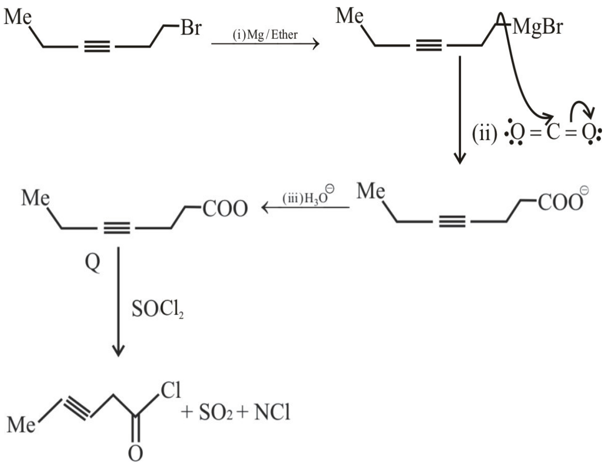
(b)  and SO_2Cl_2

(c)  and $SOCl_2$

(d)  and $CH_3SO_2Cl_2$

AP EAPCET 19-08-2021 Shift-I

Ans. (c) :



Me
Br
(i)Mg/Ether
Me
MgBr
(ii) O=C=O
Me
COO
(iii)H₃O
Me
COO⁻
Q
SOCl₂
Me
Cl
O
+ SO₂ + NCl

519. In the following reaction:

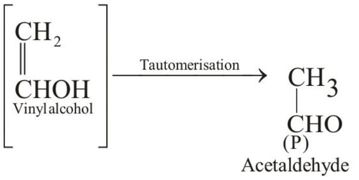
$$HC\equiv CH\xrightarrow[Hg^{2+}]{H_2SO_4}\text{'P'}$$

Product 'P' will not give

(a) Tollen's reagent test
(b) Brady's reagent test
(c) Victor Meyer test
(d) Iodoform test.

KARNATAKA NEET 2013

Ans. (c) : $HC\equiv CH\xrightarrow[Hg^{2+}]{H_2SO_4}$



CH₂
CHOH
Vinylalcohol
Tautomerisation
CH₃
CHO
(P)
Acetaldehyde

Acetaldehyde does not give Victor Meyer test.

520. The number of sigma and pi bonds in pent-2-yne is

(a) 12 and 2
(b) 11 and 2
(c) 13 and 2
(d) 12 and 3

COMEDK 2012

Ans. (a):

$$CH_3-C\equiv C-CH_2-CH_3$$

Pent-2-yne

Total number of π bonds = 2

Total number of σ bonds = 12

521. Ethylene can be separated from acetylene by passing the mixture through

(a) fuming h_2SO_4
(b) pyrogallol
(c) ammoniacal Cu_2CI_2
(d) charcoal powder

WB-JEE-2009

Ans. (c) : Ethylene can be separated from acetylene by passing the mixture through ammonical Cu_2Cl_2.

$$CH\equiv CH+CuCl_2(\text{ammonical})\rightarrow \underset{\substack{\text{Copper acetylide}\\\text{(red ppt.)}}}{CuC\equiv CC_4}$$

$$CH_2=CH_2+CuCl_2(\text{ammonical})\rightarrow \text{No reaction}$$

522. Acetylene and HCHO react in presence of copper acetylide catalyst to form:

(a) 1-butyne-1, 4-diol
(b) 2-butyne-1, 2-diol
(c) 2-butyne-1, 4-diol
(d) none of these

AP-EAMCET (Medical), 2006

Ans. (c) : When acetylene and HCHO react in presence of copper acetylene catalyst to formed the 2-butync-1,4-diol.

$$\underset{\text{Acetylene}}{H-C\equiv C-H}+\underset{\text{Formaldehyde}}{2HCHO}\rightarrow \underset{\text{2-butyne-1,4-diol}}{HOH_2C-C\equiv C-CH_2OH}$$

523. Identify C in the following reaction

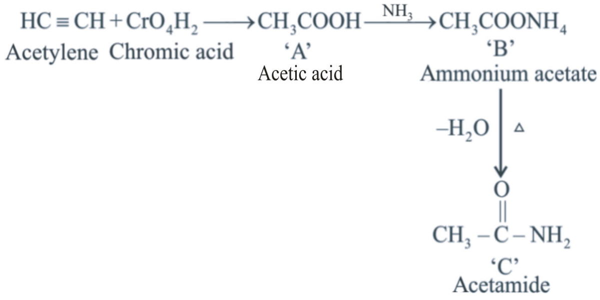
$$C_2H_2\xrightarrow[\text{acid}]{\text{Chromic}}A\xrightarrow{NH_3}B\xrightarrow[-H_2O]{\Delta}C$$

(a) $CH_3-CH_2-NH_2$
(b) CH_3-CN
(c) $CH_3-CH_2-NH-CH_3$
(d)  $CH_3-\overset{\overset{O}{\|}}{C}-NH_2$

AP-EAMCET (Medical), 2008

@apna_pdf

Ans. (d) : When chromic acid (CrO_4H_2) treated with acetylene then acetic acid is formed. Further acetic acid reacted with ammonia to formed the ammonium acetate. When heat supplied on ammonium acetate then acetamide is formed



524. In the following reaction

$$C_2H_2 \xrightarrow[HgSO_4/H_2SO_4]{H_2O\ 60^0 C} X \rightleftharpoons CH_3CHO$$

What is X?

(a) CH_3CH_2OH (b) CH_3OCH_3
(c) CH_3CH_2CHO (d) $H_2C{=}CHOH$

AP-EAMCET (Medical), 2001

Ans. (d) : Acetylene (C_2H_2) treated with water or dil. H_2SO_4 in presence of Hg^{2+} or $HgSO_4$, vinyl alcohol is obtained which undergoes rearrangement to form acetaldehyde (CH_3–CHO).

$$\underset{\text{Acetylene}}{HC\equiv CH} + H_2O \xrightarrow{H_2SO_4/HgSO_4} \underset{\text{Vinylalcohol}}{H_2C=CH-OH} \xrightleftharpoons{\text{Rearrangement}} \underset{\text{Acetaldehyde}}{CH_3-CHO}$$

525. When acetylene gas is passed through .... solution, a white precipitate is formed :

(a) Aqueous silver nitrate
(b) Ammoniacal cuprous chloride
(c) Ammoniacal silver nitrate
(d) Aqueous potassium permanganate

AP-EAMCET (Medical), 2002

Ans. (c) : When acetylene (C_2H_2) gas is passed through ammoniacal silver nitrate ($AgNO_3$) solution, a white precipitate is formed. The reaction is given below –

$$\underset{\text{Acetylene}}{H-C\equiv C-H} + \underset{\text{Silver nitrate}}{2AgNO_3} + \underset{\text{Ammonium hydroxide}}{2NH_4OH} \longrightarrow$$

$$\underset{\text{Silver acetylide}}{Ag^{2+}\cdot\bar{C}\equiv\bar{C}} + \underset{\text{Ammonium nitrate}}{2NH_4NO_3} + 2H_2O$$

526. In the following reaction, X and Y are respectively :

$$C_2H_2 \xrightarrow{X} C_6H_6 \xrightarrow{Y} C_6H_5SO_3$$

(a) iron tube/heating, Na_2SO_4
(b) Zn, conc. H_2SO_4
(c) red hot iron tube, fuming H_2SO_4
(d) H_2/Pd —$BaSO_4$, dil/H_2SO_4

AP-EAMCET (Medical), 2002

Ans. (c) : When 3 moles of ethyne is passed through red hot iron tube at 873K. It undergoes cyclic polymerization to form benzene. When benzene reacts with fuming H_2SO_4 undergo sulphonation and forms benzene sulphonic acid.

$$\underset{\text{Ethyne}}{3H_2C_2} \xrightarrow[\text{iron tube}]{\text{Red hot}} \underset{\text{Benzene}}{C_6H_6}$$

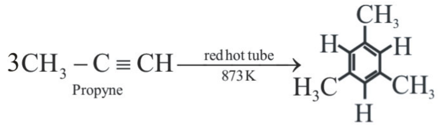
$$\underset{\text{Benzene}}{C_6H_6} + \underset{\text{Sulfuric acid}}{H_2SO_4} \longrightarrow \underset{\text{Benzene sulphonic acid}}{C_6H_5SO_3H} + H_2O$$

527. When propyne is passed through a red hot iron tube at 873K, the reaction gives product having molecular formula of

(a) C_7H_8 (b) C_9H_{12}
(c) C_8H_{10} (d) C_6H_6

TS EAMCET 04.08.2021, Shift-I

Ans. (b) :



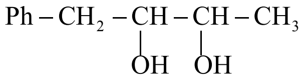
1,3,5 trimethyl benzene (mesitylene)

Hence, the molecular formula of 1,3,5 trimethyl benzene is C_9H_{12}.

528. $Ph-CH_2-CH=CH-CH_3 \xrightarrow[\text{(ii)Alc.KOH}]{\text{(i)}Br_2}$

(a) $Ph - CH = CH - CH = CH_2$

(b)

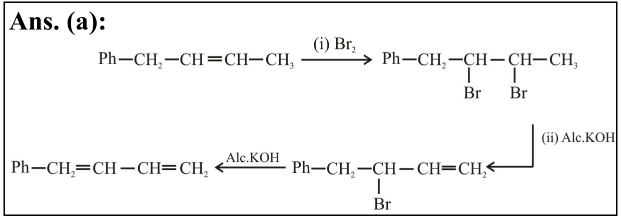


$Ph-CH_2-\underset{OH}{CH}-\underset{OH}{CH}-CH_3$

(c) $Ph - CH_2 - C = C \equiv CH_3$
(d) $Ph - C \equiv C - CH_2 - CH_3$

AIIMS 25 May 2019 (Evening)

Ans. (a):

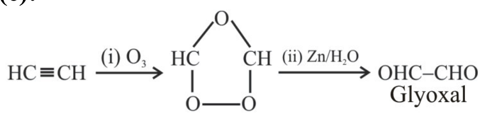


529. Ozonolysis of acetylene gives

(a) HCHO (b) CH_3CHO
(c) CHO-CHO (d) none of these

AIIMS-1996

Ans. (c):



530. The end product (C) in the following sequence of reactions

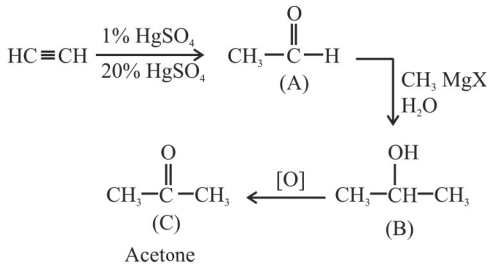
$$HC\equiv CH \xrightarrow[20\%\ H_2SO_4]{1\%HgSO_4} A \xrightarrow[H_2O]{CH_3MgX} B \xrightarrow{[O]} (C)$$

(a) acetic acid (b) isopropyl alcohal
(c) acetone (d) ethanol

AIIMS-2017, 1997
CG PET-2004

@apna_pdf

Ans. (c):



531. Which is the most suitable reagent among the following to distinguish compound (3) from rest of the compounds?

1. $CH_3-C\equiv C-CH_3$
2. $CH_3-CH_2-CH_2-CH_3$
3. $CH_3-CH_2C\equiv CH$
4. $CH_3-CH=CH_2$

(a) Bromine in carbon tetrachloride
(b) Bromine in acetic acid
(c) Alk $KMnO_4$
(d) Ammoniacal silver nitrate

[AIIMS-2015]

Ans. (d): : Only terminal allcyne react with ammonical solution of silver nitrate. ($AgNO_3$)

$$CH_3-CH_2-C\equiv CH+2[Ag(NH_3)_2]NO_3\rightarrow \underset{\text{White ppt.}}{CH_3-CH_2-C\equiv \overset{\ominus}{C}\overset{\oplus}{Ag}}$$

Rest other campaind donot react with ammonical solution of silver nitrate.

(i) $CH_3-C\equiv C-CH_3+2[Ag(NH_3)_2]NO_3\rightarrow$No reaction
(ii)$CH_3-CH_2-CH_2-CH_3+2[Ag(NH_3)_2]NO_3\rightarrow$No reaction
(iii) $CH_3-CH=CH_2+2[Ag(NH_3)_2]NO_3\rightarrow$No reaction

532. Predict the nature of P in the following reaction

$$CH_3C\equiv CCH_3\xrightarrow[\text{heat}]{NaNH_2/\text{inert solvent}}P$$

(a) $CH_2\equiv CHCH=CH_2$
(b) $CH_2=C=CH-CH_3$
(c) $CH_3CH_2C\equiv CH$
(d) No reaction

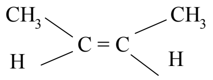
[AIIMS-2014]

Ans. (c):
We know that when alkynes are heated with $NaNH_2$ in an inert solvent, the triple bond moves towards end of the chain.

$$CH_3-C\equiv C-CH_3+NaNH_2\xrightarrow[\text{heat}]{\text{inert solvent}}CH_3-CH_2-C\equiv C^-Na^+\downarrow H_2O$$
$$CH_3-CH_2-C\equiv CH$$

533. Which of the following has the lowest dipole moment ?

(a)



(b) $CH_3C\equiv CCH_3$
(c) $CH_3CH_3C\equiv CH$
(d) $CH_3=CH-C\equiv CH$

[AIIMS-2013]

Ans. (b): In but-2-yne has two methyl group have dipolar direction to each other Hence, the resultant dipole moment is zero.

$$CH_3-C\equiv C\rightarrow CH_3$$
$$\mu=O$$

534. 1-Butyne can be distinguished most easily from 2-butyne by

(a) bromine water
(b) ozonmolysis
(c) Tollen's reagent
(d) $KMnO_4$ solution

AIIMS-2011
NEET Mains-2012
BCECE-2003]
JIPMER-2005

Ans. (c): The hydrogen atom that are attached to triply bonded carbon are weakly acidic in nature. The two alkyne. The reaction with tollen's reagent. Tollen's reagent is a chemical reagent which consist of a solution of silver nitrate, ammonia and some sodium hydroxide. Due to acidic nature of the hydrogen atoms attached to the triply bonded carbon, terminal alkynes react with heavy metallic salts like silver nitrate. Hence, 1–butyne is a terminal alkyne, it will react with Tollen's reagent while 2-butyne will not react as it as internal alkyne.

535. Which of the following gives propyne on hydrolysis?

(a) Al_4C_3
(b) Mg_2C_3
(c) B_4C
(d) La_4C_3

[AIIMS-2005]

Ans. (b): Mg_2C_3 (Magnesium carbide) on hydrolysis to give propyne.

$$Mg_2C_3+4H_2O\rightarrow \underset{\text{Propyne}}{CH_3-C\equiv CH}+2Mg(OH)_2$$

$$Al_4C_3+12H_2O\rightarrow \underset{\text{Methane}}{3CH_4}+4Al(OH)_3$$

536. With ammoniacal cuprous chloride solution, a reddish brown precipitate is obtained on treating with:

(a) CH_4
(b) C_2H_4
(c) C_2H_2
(d) C_3H_6

[AIIMS-2001]

Ans.(c): Acetylene on reaction with ammonical cuprous chloride solution gives a reddish brown precipitate of copper acetylide.

$$H-C\equiv C-H\xrightarrow[NH_4OH]{CuCl_2}\underset{\substack{\text{Copper}\\\text{acetylide}\\\text{Red}\\\text{Ppt}}}{Cu-C\equiv C-Cu}$$

IN the above reaction $2NH_3Cl+2H_2O$ are also formed in the products side.

537. Alkynes usually show which type of reaction?

(a) Substitution
(b) Elimination
(c) Addition
(d) Replacement

AIIMS-1999

@apna_pdf

Ans. (c): Alkyne undergo addition reaction due to the presence of loosely held π–electrons. Due to the presence of a triple bond in alkynes, halogen, water etc. Can be added to them by the process of the addition reaction. The addition reaction of unsaturated compound are added by a group of atoms or molecule to form a saturated compound. An addition occur when two or more compounds combine to form a single product.

538. 1-Butyne and cold alkaline [$KMnO_4$] react to produce:

(a) $CH_3\ CH_2\ COOH$
(b) $CH_3CH_2COOH + CO_2$
(c) $CH_3CH_2COOH + HCOOH$
(d) $CH_3\ CH_2CH_2COOH$

[AIIMS-1997]

Ans. (b):

$$CH_3-CH_2-C\equiv CH \xrightarrow[\text{alkaline}\,KMnO_4]{\text{Cold}} CH_3-CH_2-COOH+CO_2$$

539. Chloroform when heated with silver powder gives.

(a) CH_4
(b) H_3C-CH_3
(c) $CH\equiv CH$
(d) $CH_2=CH_2$

AP- EAMCET(Medical) -2010

Ans. (c): When two mole of chloroform heated with six moles of solid silver powder gives the acetylene.

$$2CHCl_3 + 6Ag(s) \longrightarrow CH\equiv CH + 6AgCl$$

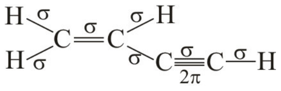
Chloroform Silver powder acetylene

540. The number of σ and π bonds present in 1-butene-3-yne is

(a) 7 and 3
(b) 5 and 5
(c) 7 and 2
(d) 6 and 4

AP - EAMCET(MEDICAL) - 2009

Ans. (a) : The structure of 1-butene-3-yene is given as–



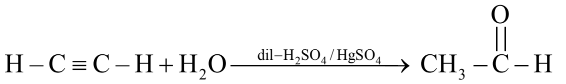
Number of σ-bond = 7
Number of π-bond = 3

541. The number of π -bonds in the product formed by passing acetylene through dil. H_2SO_4 containing mercuric sulphate is:

(a) zero
(b) one
(c) two
(d) three

AP – EAMCET - (Medical)-1997

Ans. (b) : When acetylene passes through the dilute H_2SO_4 in the presence of mercuric sulphate then acetaldehyde is formed.



$$\underset{\text{Alkyne}}{H-C\equiv C-H}+H_2O \xrightarrow{\text{dil}-H_2SO_4/HgSO_4} \underset{\text{Acetaldehyde}}{CH_3-\overset{\overset{\displaystyle O}{||}}{C}-H}$$

As we know, acetaldehyde contains the one π-bonds

542. When acetylene is passed into methanol at 160-200°C on the presence of a small amount of potassium methoxide under pressure, the following is formed –

(a) Polyvinyl alcohol
(b) Divinyl ether
(c) Dimethyl ether
(d) Methyl vinyl ether

VITEEE-2019

Ans. (d) : When acetylene is passed into methanol at 160-200°C in the presence of a small amount (1-2%) of potassium methoxide and under pressure just high enough to prevent boiling, methyl vinyl ether is formed.

$$HC\equiv CH+CH_3O^- \longrightarrow C^-H=CHOCH_3$$
$$\xrightarrow{CH_3OH} \underset{\text{Methyl vinyl ether}}{CH_2=CHOCH_3}+CH_3O^-$$

543. Identify Z in the following reaction sequence

$$CH_3CH_2CH_2OH \xrightarrow[160-180°C]{\text{Conc.}H_2SO_4} X$$
$$\downarrow$$
$$Y \xrightarrow[\text{(ii)}NaNH_2]{Br_2+CCl_4}$$

(a) $CH_3-CH(NH_2)-CN_2NH_2$
(b) $CH_3-CHOH-CH_2OH$
(c) $CH_3-C(OH)=CH_2$
(d) $CH_3-C\equiv CH$

VITEEE-2015

Ans. (d) :

$$CH_3CH_2CH_2OH \xrightarrow[160°-180°C]{\text{Conc.}H_2SO_4} \underset{(X)}{CH_3CH=CH_2}$$

$$\xrightarrow{Br_2}\xrightarrow{\text{alc.KOH}} \underset{(Y)}{CH_3CHBr-CH_2Br}$$

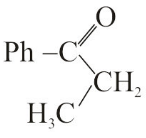
$$[CH_3C(Br)=CH_2+CH_3CH=CHBr]$$

$$\xrightarrow[-HBr]{NaNH_2} \underset{(Z)}{CH_3C\equiv CH}$$

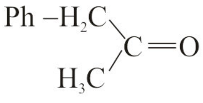
Alcoholic KOH brings about dehydrobromination of Y and give a mixture of vinyl bromide. While $NaNH_2$ is a strong base to give propyne.

544. $Ph-C\equiv C-CH_3 \xrightarrow{Hg^{2+}/H^+}$ A.

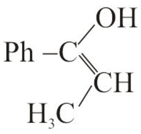
(a)



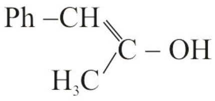
(b)



(c)



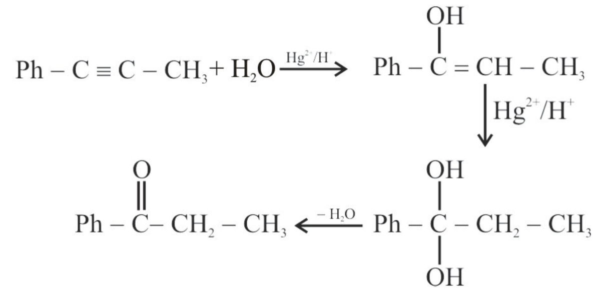
(d)



VITEEE-2014

@apna_pdf

Ans. (a) :



$$Ph-C\equiv C-CH_3+H_2O\xrightarrow{Hg^{2+}/H^+}Ph-\overset{OH}{\overset{|}{C}}=CH-CH_3 \xrightarrow{Hg^{2+}/H^+} Ph-\underset{OH}{\underset{|}{\overset{OH}{\overset{|}{C}}}}-CH_2-CH_3 \xrightarrow{-H_2O} Ph-\overset{O}{\overset{\|}{C}}-CH_2-CH_3$$

545. Consider following reaction ,

$$HC\equiv CH\xrightarrow[H_2SO_4]{Hg^{2+}/HgSO_4}X\xrightarrow{CH_3MgBr}Y\xrightarrow{H_3C^+}Z$$

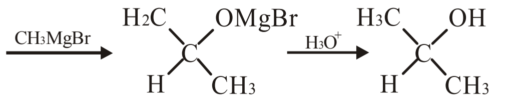
The compound 'Z' is

(a) 1–propanol (b) 2– Propanol

(c) Propanol (d) Propan–2–one

AMU–2006

Ans. (b) : $HC\equiv CH\xrightarrow[H_2SO_4]{Hg^{2+}/HgSO_4}CH_3CHO$



546. In the reaction sequence

$$HC\equiv CH\xrightarrow[ether]{NaNH_3}'A'\xrightarrow[ether]{CH_3CH_2CH_2Br}'B'$$

the product 'B' is

(a) 1- butyne (b) 1-pentyne

(c) 2-butyne (d) 2-pentyne

AMU-2004

Ans. (b) : $HC\equiv CH\xrightarrow[ether]{NaNH_2}HC\equiv CNa$

$HC\equiv CNa+CH_3CH_2CH_2Br\rightarrow$

$\underset{\text{1–Pentyne}}{HC\equiv C-CH_2CH_2CH_3}+NaBr$

547. The correct description of bonds in acetylene molecule is

(a) $3\sigma, 1\pi$

(b) $3\sigma, 2\pi$

(c) $4\sigma, 2\pi$

(d) $4\sigma, 1\pi$

Assam CEE-2020

Ans. (b) : Acetylene moleculas formula = C_2H_2

$$H\overset{\sigma}{—}C\overset{\sigma\,\pi\pi}{\equiv}C\overset{\sigma}{—}H$$

in 1 bond 1σ only and in triple bond 1σ and 2π bond so, total bond = $3\sigma, 2\pi$

548. Which of the following will react with hex-2-yne to produce trans-hex-2-ene?

(a) $LiAlH_4$

(b) Pt/H_2

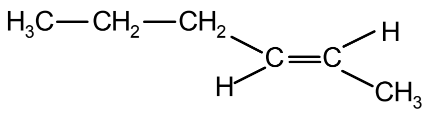
(c) Li/NH_3

(d) $Pd/BaSO_4$

Assam CEE-2021

Ans.(a): $CH_3-C\equiv C-CH_2-CH_2-CH_3$

$\downarrow LiAlH_4$



549. $CH_3C\equiv CH\xrightarrow[+Hg^{2+},60^0C]{H_2SO_4}?$

(a) CH_3CHO (b) CH_3COOH

(c) CH_3COCH_3 (d) CH_3CH_2COOH

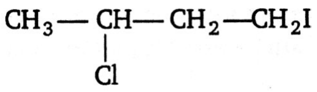
BCECE-2009

Ans. (c) : $\underset{\text{Propyne}}{CH_3-C\equiv CH}\xrightarrow[+Hg_2+,60^\circ C]{H_2SO_4}\underset{\text{Acetone}}{CH_3-\overset{O}{\overset{\|}{C}}-CH_3}$

550. Predict the product 'C' obtained in the following reaction of butyne–1

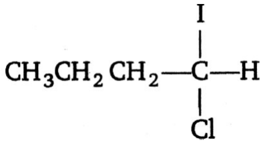
$$CH_3CH_2-C\equiv CH+HCl\longrightarrow B\xrightarrow{HI}C$$

(a)



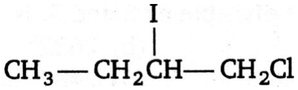
$CH_3-\underset{Cl}{\underset{|}{CH}}-CH_2-CH_2I$

(b)



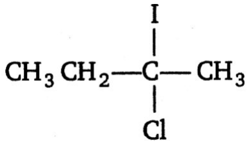
$CH_3CH_2CH_2-\underset{Cl}{\underset{|}{\overset{I}{\overset{|}{C}}}}-H$

(c)



$CH_3-CH_2\overset{I}{\overset{|}{CH}}-CH_2Cl$

(d)

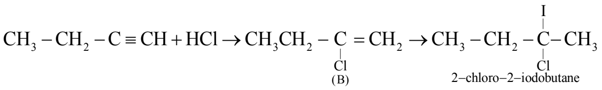


$CH_3CH_2-\underset{Cl}{\underset{|}{\overset{I}{\overset{|}{C}}}}-CH_3$

BCECE-2012

NEET-2007

Ans. (d) :



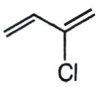
$$CH_3-CH_2-C\equiv CH+HCl\rightarrow \underset{(B)}{CH_3CH_2-\underset{Cl}{\underset{|}{C}}=CH_2}\rightarrow \underset{\text{2–chloro–2–iodobutane}}{CH_3-CH_2-\underset{Cl}{\underset{|}{\overset{I}{\overset{|}{C}}}}-CH_3}$$

551. $2HC\equiv CH\xrightarrow[+NH_4Cl]{CH_2Cl_2}A\xrightarrow[HCl]{1mol}B$

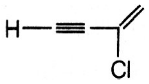
Indentify the compounds A and B.

A **B**

(a)



(b)

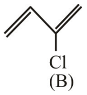


@apna_pdf

(c) 
(d) 
BCECE-2015

Ans. (a) :

$$2HC\equiv CH\xrightarrow[+NH_4Cl]{CH_2Cl_2}\underset{(A)}{CH_2=CH-C\equiv CH}\xrightarrow[HCl]{1\,mol}$$



(B)

552. Consider the following reaction sequence of alkene

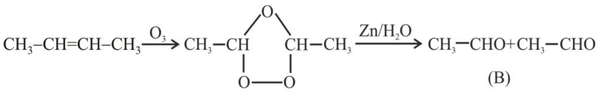
$$CH_3CH=CHCH_3\xrightarrow{O_3}A\xrightarrow[Zn]{H_2O}B$$

The product B is–

(a) $CH_3CH_2COCH_3$ (b) CH_3COCH_3
(c) CH_3CHO (d) CH_3CH_2CHO

BCECE-2015

Ans. (c) :



A

553. When propyne is treated with H_2SO_4 (aq) in presence

(a) propanal
(b) n-propyl hydrogen sulphate
(c) acetone (d) propanol

BCECE-2017
IIT JEE-1983

Ans. (c) :

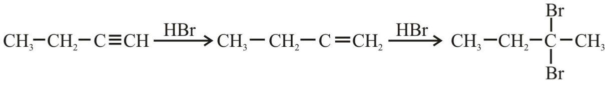
When propyne is treated with H_2SO_4(aq) in presence to give acetone.

554. Which of the following product is obtained when 1-butyne reacts with excess of HBr?

(a) 2, 2-dibromobutane (b) 2-bromobutane
(c) 1,1,2,2-tetra bromobutane
(d) 1,2-dibromo butane

BCECE-2018

Ans. (a) :



$$CH_3-CH_2-C\equiv CH\xrightarrow{HBr}CH_3-CH_2-C=CH_2\xrightarrow{HBr}CH_3-CH_2-\underset{Br}{\overset{Br}{C}}-CH_3$$

2, 2–dibromobutane

2,2–dibromobutane is obtained when 1-butyne reacts with excess of HBr.

555. The most suitable catalyst for the hydrogenation of

2 – Hexyne ⟶ 2 – cis-Hexene is

(a) Pd-$BaSO_4$ (b) $(Ph_3P)_3RhCl$
(c) 10% Pd – C (d) Raney Ni

[BITSAT – 2007]

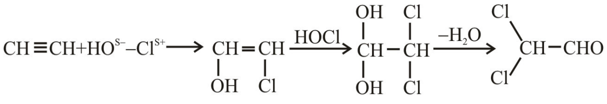
Ans. (a) : A palladium catalyst ($Pd/BaSO_4$) is deliberately poisoned with lead/sulphur compound. This reagent is known as Lindlar's catalyst. They give a cis product. Reduction of 2–hexyne in $Pd/BaSO_4$ to give a ci & –2–hexane.

556. What will be the main product when acetylene reacts with hypochlorous acid?

(a) Trichloroacetaldehyde
(b) Acetaldehyde
(c) Dichloroacetaldehyde
(d) Chloro acetaldehyde

[BITSAT – 2013]

Ans. (c) :



$$CH\equiv CH+HO^{S-}-Cl^{S+}\longrightarrow \underset{OH}{CH}=\underset{Cl}{CH}\xrightarrow{HOCl}\underset{OH}{\overset{OH}{CH}}-\underset{Cl}{\overset{Cl}{CH}}\xrightarrow{-H_2O}(Cl)_2CH-CHO$$

dichlaroacetaldehyele

557. The degree of unsaturation of C_6H_5 and butyne-2 respectively are

(a) 6 and 3
(b) 6 and 2
(c) 2 and 6
(d) 4 and 2

CG PET- 2016

Ans. (d) :

Every ring or π–bond in a compound is said to represent the degree of unsaturaltion.

$$\text{Degree of aunsaturation}=\frac{2C+2+N-X-H}{2}$$

Where, C=Number of carbons
N=No. of nitrogen
X=No. of halogen (F, Cl, Br, I)
H=No, of hydrogen.

$$\text{For } C_6H_5\text{, DoU}=\frac{2\times 6+2-5}{2}=\frac{9}{2}=4.5$$

$$\text{For 2–butyne, DoU }=\frac{2\times 4+2-6}{2}=\frac{4}{2}=2$$

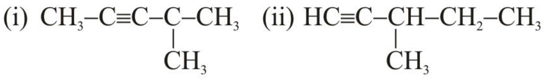
558. One of the isomer of the 5th member of alkyne series is optically active, it is

(a) 4– methyl pent–2–yne
(b) 3– methyl pent–1–yne
(c) 4– methyl pent–1– yne
(d) 3,3–dimethyl but–1– yne

CG PET- 2013

Ans. (b) :

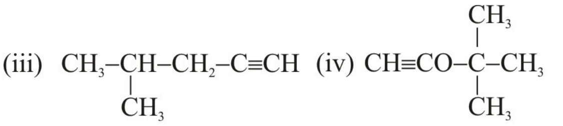
The 5th member of alkyne is C_5H_8.



(i) $CH_3-C\equiv C-\underset{CH_3}{C}-CH_3$ (ii) $HC\equiv C-\underset{CH_3}{CH}-CH_2-CH_3$

4–methyl pent–2–yne 3–methyl pent–1–yne

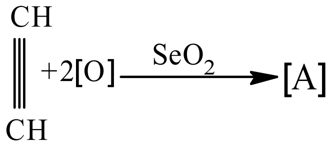
@apna_pdf



(iii) $CH_3-\underset{CH_3}{CH}-CH_2-C\equiv CH$ (iv) $CH\equiv CO-\overset{CH_3}{\underset{CH_3}{C}}-CH_3$

4–methyl–pent–1–yne 3,3–dimethyl but–1–yne

559. Consider the following reaction



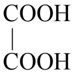
$$CH\equiv CH + 2[O] \xrightarrow{SeO_2} [A]$$

The product [A] is

(a) HCOOH (formic acid)

(b) CH_3COOH (acetic Acid)

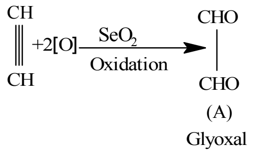
(c) $\begin{matrix}CHO\\|\\CHO\end{matrix}$ (glyoxal)



(d) $\begin{matrix}COOH\\|\\COOH\end{matrix}$ (oxalic acid)

CG PET -2017

Ans. (c) : On treatment of acetylene with SeO_2, we get glyoxal (on oxidation) is obtained.



CH
CH
+2[O]
SeO₂
Oxidation
CHO
CHO
(A)
Glyoxal

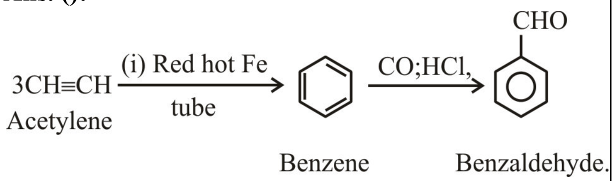
560. Consider the following chemical reaction.

$$CH\equiv CH \xrightarrow[\text{(2) CO, HCl, AlCl}_3]{\text{(1) Red hot Fe tube, 873K}}$$

Product the number of sp^2 hybridised carbon atom(s) present in the product is ....

[JEE Main-2021, 25 Feb Shift-I]

Ans. ():



3CH≡CH
Acetylene
(i) Red hot Fe
tube
CO;HCl,
CHO
Benzene
Benzaldehyde.

In benzaldehyde, total number of sp^2 c–atom is 7.

561. The hydrocarbon which can react with sodium in liquid ammonia is:

(a) $CH_3CH_2CH_2C\equiv CCH_2CH_2CH_3$

(b) $CH_3CH_2C\equiv CH$

(c) $CH_3CH=CHCH_3$

(d) $CH_3CH_2C\equiv CCH_2CH_3$

[AIEEE 2008]

Ans. (b) :

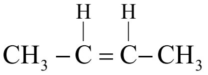
$$CH_3-CH_2-C\equiv CH \xrightarrow{Na/Liq.NH_3} CH_3-CH_2-C\equiv CNa+H_2$$

Alkynes having terminal $C\equiv C$–H react with Na in liquid NH_3 to yield H_2. Terminal alkynes hydrogen are acidic.

562. The treatment of CH_3MgX with $CH_3C\equiv C–H$ produces

(a) $CH_3–CH=CH_2$

(b) $CH_3C\equiv C-CH_3$

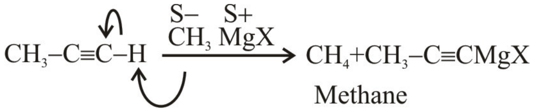


(c) $CH_3-\overset{H}{C}=\overset{H}{C}-CH_3$

(d) CH_4

[AIEEE 2008]

Ans. (d) : Grignard reagent (RMgx) abstracts the acidic proton as it acts as base when an acidic hydrogen is present. The terminal alkyne hydrogen is acidic.



CH₃–C≡C–H
S–
S+
CH₃ MgX
CH₄+CH₃–C≡CMgX
Methane

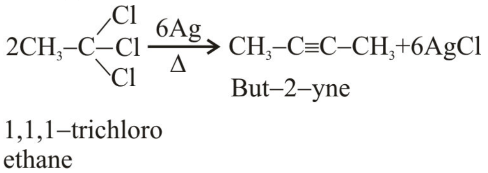
563. The major organic compound formed by the reaction of 1,1,1-trichloroethane with silver powder is :

(a) Acetylene (b) Ethene

(c) 2–butyne (d) 2–butene

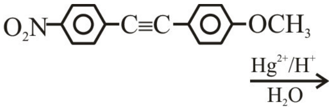
[JEE Main 2014]

Ans. (c) :



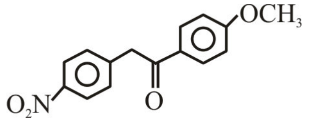
2CH₃–C–Cl
Cl
Cl
6Ag
Δ
CH₃–C≡C–CH₃+6AgCl
But–2–yne
1,1,1–trichloro
ethane

564. The major product obtained from the following reaction is :

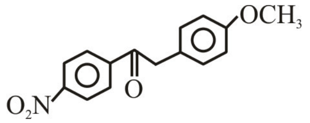


O₂N
C≡C
OCH₃
Hg²⁺/H⁺
H₂O

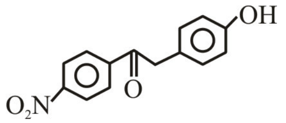
(a)



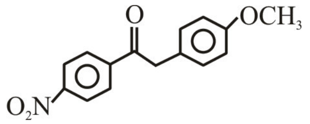
(b)



(c)

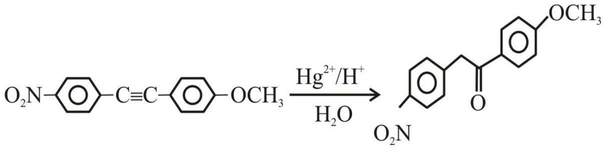


(d)



[JEE Main-2020, 6 Sep Shift-I]

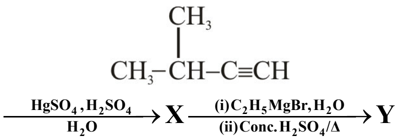
Ans. (a) :



O₂N
C≡C
OCH₃
Hg²⁺/H⁺
H₂O
OCH₃
O
O₂N

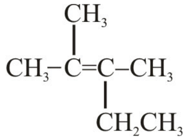
@apna_pdf

565. **The major product (Y) in the following reaction is:**

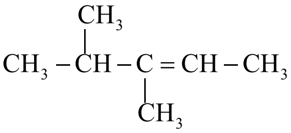


HgSO₄, H₂SO₄
H₂O
X
(i) C₂H₅MgBr, H₂O
(ii) Conc. H₂SO₄/Δ
Y

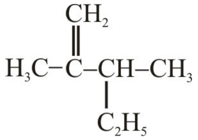
$$CH_3-CH(CH_3)-C\equiv CH \xrightarrow[H_2O]{HgSO_4,\,H_2SO_4} X \xrightarrow[\text{(ii) Conc. } H_2SO_4/\Delta]{\text{(i) } C_2H_5MgBr,\,H_2O} Y$$

(a)


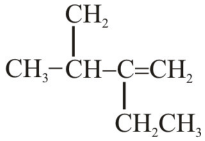
$CH_3-C(CH_3)=C(CH_2CH_3)-CH_3$

(b)


$CH_3-CH(CH_3)-C(CH_3)=CH-CH_3$

(c)


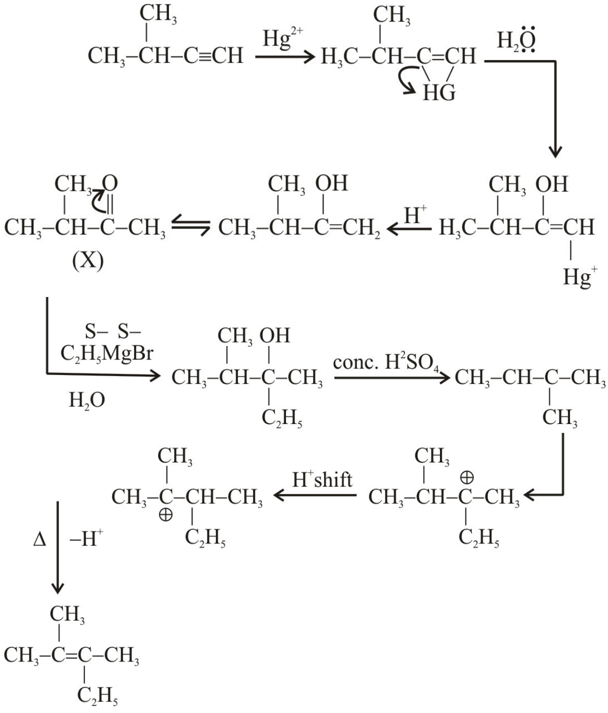
$H_3C-C(=CH_2)-CH(C_2H_5)-CH_3$

(d)


$CH_3-CH(CH_2)-C(CH_2CH_3)=CH_2$

[JEE Main-2020, 9 Jan Shift-I]

Ans. (a) :



Hg²⁺
HG
H₂Ö
H⁺
Hg⁺
(X)
S– S–
C₂H₅MgBr
H₂O
conc. H²SO₄
H⁺shift
Δ
–H⁺

566. **The major product of the following reaction is:**

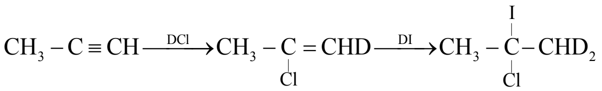
$CH_3C\equiv CH \xrightarrow[\text{(ii) DI}]{\text{(i) DCl(1equiv.)}}$

(a) $CH_3CD(Cl)CHD(I)$ (b) $CH_3CD_2CH(Cl)(I)$

(c) $CH_3CD(I)CHD(Cl)$ (d) $CH_3C(I)(Cl)CHD_2$

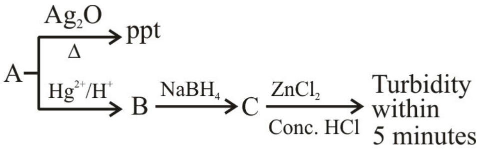
[JEE Main-2019, 9 April Shift-I]

Ans. (d) :



$$CH_3-C\equiv CH \xrightarrow{DCl} CH_3-C(Cl)=CHD \xrightarrow{DI} CH_3-C(I)(Cl)-CHD_2$$

567. **Consider the following reactions,**



Ag₂O
Δ
ppt
A
Hg²⁺/H⁺
B
NaBH₄
C
ZnCl₂
Conc. HCl
Turbidity within 5 minutes

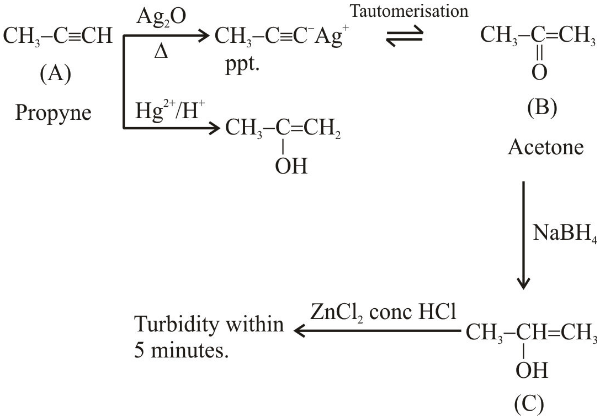
A is

(a) $CH\equiv CH$ (b) $CH_3C\equiv C\,CH_3$

(c) $CH_3-C\equiv CH$ (d) $CH_2=CH_2$

[JEE Main-2019, 12 April Shift-II]

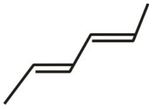
Ans. (c) :



CH₃–C≡CH
(A)
Propyne
Ag₂O
Δ
CH₃–C≡C⁻Ag⁺
ppt.
Tautomerisation
CH₃–C=CH₃
O
(B)
Acetone
Hg²⁺/H⁺
CH₃–C=CH₂
OH
NaBH₄
ZnCl₂ conc HCl
Turbidity within 5 minutes.
CH₃–CH=CH₃
OH
(C)

568. **The correct order of heat of combustion for following alkadienes is :**

(A)



(B)

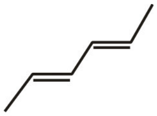
(C)

(a) (B) < (C) < (A) (b) (A) < (B) < (C)

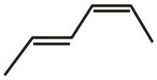
(c) (A) < (C) < (B) (d) (C) < (B) < (A)

[JEE Main-2020, 9 Jan Shift-I]

Ans. (b):

(i)


(Trans, trans)

(ii)


(Trans, Cis)

(iii)
(Cis, Cis)

Heat of combustion $\propto \dfrac{1}{\text{Stability}}$

We know that, trans is more stable than cis form, so the order is A>B>C Hence, the order of heat of combustion is C>B>A.

@apna_pdf

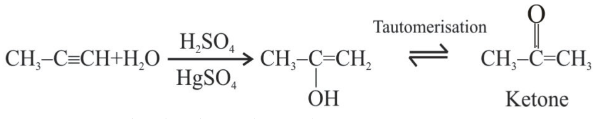
569. Hydration of which one of the following yields a ketone?

(a) Propyne (b) Ethene

(c) Propene (d) Ethyne

J & K CET-2009, 2002

Ans. (a) :



$CH_3-C\equiv CH+H_2O \xrightarrow[HgSO_4]{H_2SO_4} CH_3-\underset{OH}{C}=CH_2 \overset{\text{Tautomerisation}}{\rightleftharpoons} CH_3-\overset{O}{\overset{\|}{C}}-CH_3$ Ketone

Propyne on hydration give a ketones.

570. 1- Butyne on hydration gives:

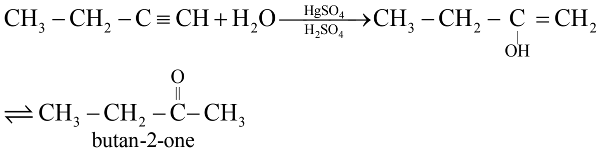
(a) butane-1, 2-diol (b) butan-1-ol

(c) butan-2-ol (d) butan-2-one

J & K CET-(2008)

Ans. (d) :

1–butybne on hydration give a butan–2–ane



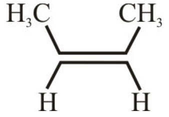
$CH_3-CH_2-C\equiv CH+H_2O \xrightarrow[H_2SO_4]{HgSO_4} CH_3-CH_2-\underset{OH}{C}=CH_2$

$\rightleftharpoons CH_3-CH_2-\overset{O}{\overset{\|}{C}}-CH_3$

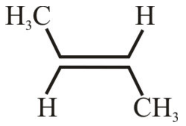
butan-2-one

571. The major product in the reaction of 2-butyne with Li/Liq. NH_3 is

(a)



(b)

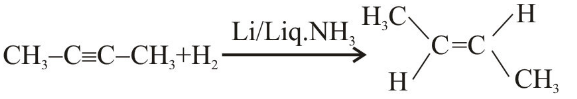


(c) $CH_3CH_2CH_2CH_3$

(d) $H_2C = CH – CH_2 – CH_3$

J & K CET-(2006)

Ans. (b) :



$CH_3–C\equiv C–CH_3+H_2 \xrightarrow{Li/Liq.NH_3}$ $H_3C(H)C=C(H)CH_3$

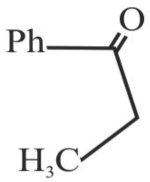
trans–but–2–ene

Reaction of 2–butyne of non–terminal alkyne with a solution of an alkali metal (Na/Li or K) in liquid ammonia give a trans alkene.

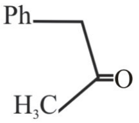
572. $Ph - C \equiv C - CH_3 \xrightarrow{Hg^{2+}/H^+} A$

the product A is

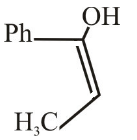
(a)



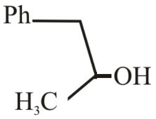
(b)



(c)

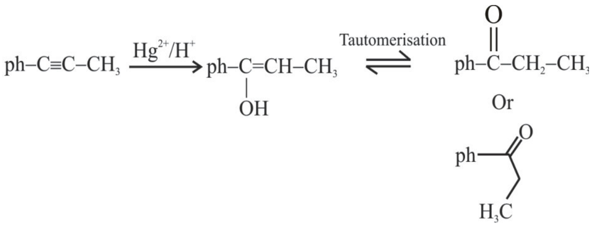


(d)



J & K CET-(2004)

Ans.(a):



$ph–C\equiv C–CH_3 \xrightarrow{Hg^{2+}/H^+} ph–\underset{OH}{C}=CH–CH_3 \overset{\text{Tautomerisation}}{\rightleftharpoons} ph–\overset{O}{\overset{\|}{C}}–CH_2–CH_3$

Or

573. The number of sigma and Pi-bonds in but-l-en-3-yne are

(a) 5 sigma and 5 pi

(b) 7 sigma and 3 pi

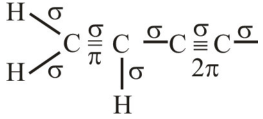
(c) 8 sigma and 2 pi

(d) 7 sigma and 2 pi

JEE Main -2014

Ans. (b) :

The structure of but –1–en–3–yne



In but–1–en–3–yne, the number of sigma bond is 7 and π–bonds is 3.

574. Products of the following reaction are :

$$CH_3C\equiv CCH_2CH_3 \xrightarrow[\text{(ii) hydrolysis}]{\text{(i) } O_3}$$

(a) $CH_3COOH + CO_2$

(b) $CH_3COOH + HOOC\ CH_2CH_3$

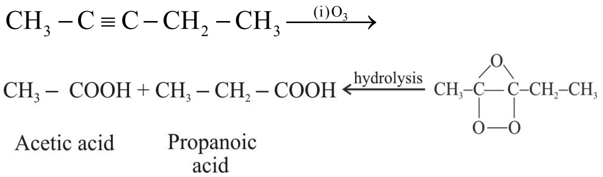
(c) $CH_3CHO+CH_3CH_2CHO$

(d) $CH_3COOH + CH_3COCH_3$

J & K CET-1999

NEET-2005

Ans. (b) :



$CH_3-C\equiv C-CH_2-CH_3 \xrightarrow{(i) O_3}$

$CH_3-COOH+CH_3-CH_2-COOH \xleftarrow{\text{hydrolysis}}$ ozonide

Acetic acid Propanoic acid

@apna_pdf

575. Calcium carbide reacts with H_2O to produce

(a) ethane (b) methane

(c) ethylene (d) acetylene

JCECE - 2007

JIPMER-2010

Ans. (d) :
Calcium carbide is a solid element and chemical formula CaC_2. When calcium carbide react with water to give a acetylene.

$$CaC_2(S)+2H_2O(l)\rightarrow \underset{\text{Acetylene}}{C_2H_2(g)}+Ca(OH)_2(g)$$

This reaction is also termed as ethine formally known as acetylene. Acetylene is commonly used as welding or cutting. Acetylene is basically a colorless gas.

576. Alkynes occur in nature in

(a) free state

(b) partially free state

(c) not in free state

(d) None of these

JCECE - 2013

Ans. (c) : Alkynes are unsaturated compound, therefore, not found in free state in nature.

577. $$CH_3—C\equiv CH \xrightarrow[1\%\ HgSO_4]{40\%\ H_2SO_4} A \xrightarrow{\text{Isomerisation}} CH_3COCH_3$$

Structure of A and the type of isomerism in the above reaction are respectively.

(a) prop-1-en-2-ol, metamerism

(b) prop-1-en-1-ol, tautomerism

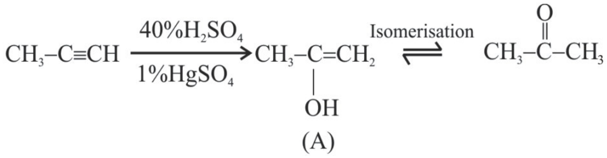
(c) prop-2-en-2-ol, c/s and trans isomerism

(d) prop-2-en-1-ol, tautomerism

JCECE - 2013

NEET-2017

Ans. (b) :



$$CH_3–C\equiv CH \xrightarrow[1\%HgSO_4]{40\%H_2SO_4} \underset{(A)}{CH_3–\underset{\substack{|\\OH}}{C}=CH_2} \overset{\text{Isomerisation}}{\rightleftharpoons} CH_3–\overset{\substack{O\\||}}{C}–CH_3$$

Hence, the structure of A is prop–1–en–1ol and the type of isomerism is tautomerism.

578. What is the best way to carry out the following transformation?

1- pentyne → pentanal

(a) $HgSO_4/H_2SO_4$

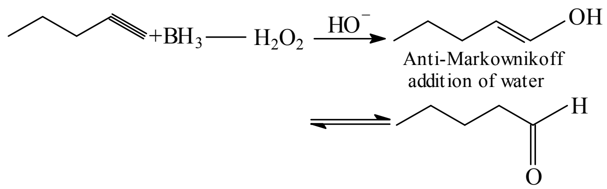
(b) H_2/Lindlar's catalyst; O_3; $Zn-H_2O$

(c) HIO_4/H_2O

(d) $BH_3;H_2O_2/NaOH$

JCECE - 2014

Ans. (d) :



579. Choose the correct alkyne which gives alkanal on hydroboration and hydrolysis.

(a) $CH_3 — C \equiv C — CH_3$

(b) $CH_3 — CH_2 — CH = CH — C \equiv CH$

(c) $CH_3 — C \equiv CH$

(d) $CH_3 — CH_2 — C \equiv CH — CH_3$

JCECE - 2016

Ans. (c) : 1-alkyne gives aldehyde on hydroboration and hydrolysis.

580. The hydrocarbon which can react with sodium in liquid ammonia is

(a) styrene

(b) acetylene

(c) propylene

(d) pentane

JCECE - 2017

Ans. (b) : Reaction of acetylene with sodium in liquid ammonia proceeds as

$$H—C\equiv C—H+2Na \xrightarrow{\text{Liq.}NH_3} CH_2=CH_2+2NaNH_2$$

581. When 2-butyne is treated with pd-$BaSO_4$; the product formed will be

(a) 1-butene

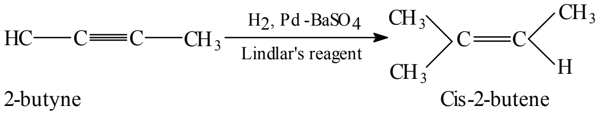
(b) trans-2-butene

(c) cis-2-butene

(d) 2-hydroxy butane

JCECE - 2017

Ans. (c) : The reaction proceeds as



582. On warming with silver powder, chloroform is converted into

(a) acetylene

(b) hexachloroethane

(c) 1,1,2,2-tetrachlolroethane

(d) ethylene

JIPMER-2012

Ans. (a) : For making acetylene from chloroform ($CHCl_3$). We have to heat is with silver powder. We have to heat it with silver powder and the reaction is–

$$2CHCl_3+6Ag\rightarrow C_2H_2+6AgCl$$

Ag (Silver powder) behave as a reducing agent in this reaction. Ag itself oxidized from. O to +1 oxidation state and reduce to carbon from +2 to –1 oxidation state. Hence, chloroform is heated with silver powder, acetylene is produced.

583. Propyne on passing through red hot copper tube forms

(a) benzene (b) toluene

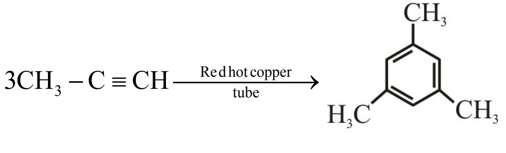
(c) mesitylene (d) None of these

JIPMER-2012

Kerala CEE-2004

@apna_pdf

Ans. (c) : Propyne on passing through red hot copper tube forms a mesitylene.



Meistylene

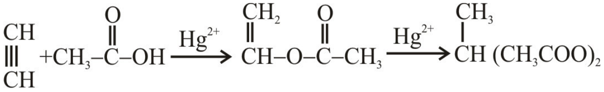
584. $\begin{array}{c}\text{CH}\\|||\\\text{CH}\end{array}$ **reacts with acetic acid in presence of** Hg^{2+} **to give:**

(a) $\begin{array}{l}CH_3\\|\\CH(CH_3COO)_2\end{array}$ (b) $\begin{array}{l}CH(CH_3COO)_2\\|\\CH(CH_3COO)_2\end{array}$

(c) $\begin{array}{l}CH_3\\|\\CH_2(CH_3COO)\end{array}$ (d) None of these

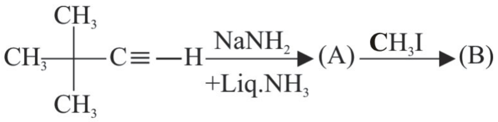
JIPMER-2006

Ans. (a) :
When acetylene react with acetic acid in presence of Hg^{2+} to give a $CH_3–CH(CH_3COO)_2$



$$\begin{array}{c}\text{CH}\\|||\\\text{CH}\end{array} + CH_3-\overset{\overset{O}{\|}}{C}-OH \xrightarrow{Hg^{2+}} \overset{\overset{CH_2}{\|}}{CH}-O-\overset{\overset{O}{\|}}{C}-CH_3 \xrightarrow{Hg^{2+}} \overset{\overset{CH_3}{|}}{CH}\,(CH_3COO)_2$$

585. In the reaction.



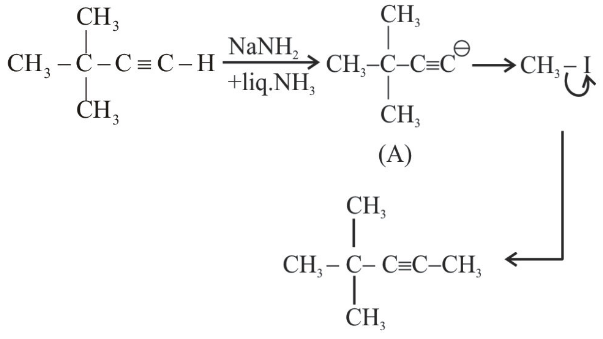
$$CH_3-\underset{\underset{CH_3}{|}}{\overset{\overset{CH_3}{|}}{C}}-C\equiv-H \xrightarrow[+Liq.NH_3]{NaNH_2} (A) \xrightarrow{CH_3I} (B)$$

How many electron donating groups are attached with the carbon atom of unsaturated part of the product 'B'?

(a) Two (b) Three
(c) Four (d) None of these

JIPMER-2016

Ans. (a) :



$$CH_3-\underset{\underset{CH_3}{|}}{\overset{\overset{CH_3}{|}}{C}}-C\equiv C-H \xrightarrow[+liq.NH_3]{NaNH_2} CH_3-\underset{\underset{CH_3}{|}}{\overset{\overset{CH_3}{|}}{C}}-C\equiv C^{\ominus} \longrightarrow CH_3-I$$
$$(A)$$
$$CH_3-\underset{\underset{CH_3}{|}}{\overset{\overset{CH_3}{|}}{C}}-C\equiv C-CH_3$$

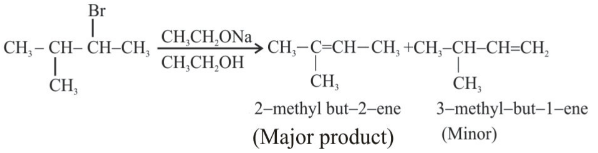
Two electron donating group are attached with the carbon atom of unsaturated part of the product 'B'.

586. When 2-methyl 3-bromo butane is treated with sodium ethoxide in ethanol, what will be the major product?

(a) 2-methyl but-2-ene
(b) 3-methyl but-1-ene
(c) 2-methyl but-1-ene
(d) 2-methyl sodium-butoxide

JIPMER-2016

Ans. (a) : When 2–emthyl 3–bromo butane is treated with sodium ethoxide in ethanol, two alkene are possible. The more substituted alkene are 2–methyl but–2–ene is the major product.



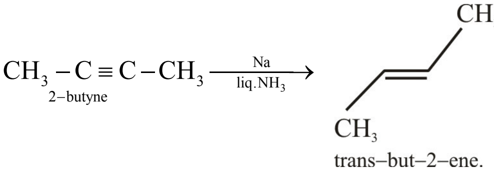
$$CH_3-\underset{\underset{CH_3}{|}}{CH}-\overset{\overset{Br}{|}}{CH}-CH_3 \xrightarrow[CH_3CH_2OH]{CH_3CH_2ONa} CH_3-\underset{\underset{CH_3}{|}}{C}=CH-CH_3 + CH_3-\underset{\underset{CH_3}{|}}{CH}-CH=CH_2$$

587. 2-butyne is reduced to trans-but-2-ene using

(a) $H_2|Ni$ (b) Na in liq.NH_3
(c) $H_2|Pd-C$ (d) Zn in dil. HCl

Karnataka-CET-2019
Kerala CEE-2014
NEET-1993

Ans. (b) :
When 2–butyne is reduced to trans but–2ene this reaction is known as Birch reduction reaction.



588. n-propyl chloride reacts with sodium metal in dry ether to give

(a) $CH_3–CH_2–CH_2–CH_2–CH_2–CH_3$
(b) $CH_3–CH_2–CH_3$
(c) $CH_3–CH_2–CH_2–CH_3$
(d) $CH_3–CH_2–CH_2–CH_2–CH_2–CH_2–CH_3$

Karnataka-CET-2018

Ans. (a) :

$$\underset{\text{n-propylchloride}}{2CH_3-CH_2-CH_2-Cl} + 2Na \xrightarrow{\text{dry ether}} CH_3-CH_2-CH_2-CH_2-CH_2-CH_3$$

589. Number of possible alkynes with formula C_5H_8 is

(a) 2 (b) 3
(c) 4 (d) 5

Karnataka-CET-2015
UPTU/UPSEE-2008, 2014

Ans. (b) :
The number of possible alkyne with formula C_5H_8 is three. The structure of different isomer of C_5H_8 are–

(i) $\underset{\text{1–Pentyne}}{CH_3-CH_2-CH_2-C\equiv CH}$

(ii) $\underset{\text{2–Pentyne}}{CH_3-CH_2-C\equiv C-CH_3}$

(iii) $CH_3-\underset{\underset{CH_3}{|}}{CH}-C\equiv CH$

3methyl -1-butyne

590. In acetylene molecule, between the carbon atoms there are

(a) three pi bonds
(b) one sigma and two pi bonds

@apna_pdf

(c) two sigma and one pi bonds
(d) three sigma bonds

Karnataka-CET-2007

Ans. (b) : The structure of acetylene is

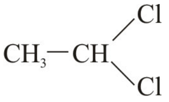
$$H - \overset{1s}{\underset{2p}{C \equiv C}} - H$$

Hence, in acetylene molecule, there are one σ and two π bonds are present between carbon atoms.

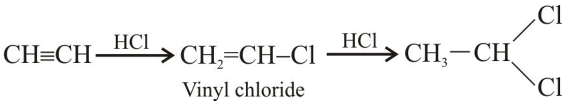
591. Ethylidene dichloride is obtained by the reaction of excess of HCl with
(a) ethylene
(b) acetylene
(c) propene
(d) methane

MHT CET-2009

Ans. (b) : Ethylidiene dichloride is also called as gem dihalide. Gem halogen mean the halogen atom present on the same carbon atom in the molecule.
The structure of ethylidene dichloride is–



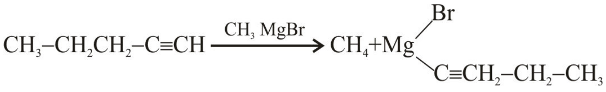
Acetylene reacts with on excess amount of HCl and form ethylidene dichloride as the product.



592. Which one of the following compounds will react with methyl magnesium iodide?
(a) $CH_3CH_2CH_2CH_2CH_3$
(b) $CH_3CH = CH - CH = CH_2$
(c) $CH_3 - C \equiv C - CH_2CH_3$
(d) $CH_3CH_2CH_2C \equiv CH$

MHT CET-2008

Ans. (d) : Methyl magnexium iodide react with terminal alkyne due to presence of acidic hydrogen.



593. Acetylenic hydrogen are acidic because
(a) sigma electron density of C–H bond in acetylene is nearer to carbon, which has 50% s-character
(b) acetylene has only open hydrogen in each carbon
(c) acetylene contains least number of hydrogens among the possible hydrocarbons having two carbons.
(d) acetylene belongs to the class of alkynes with molecular formula, C_nH_{2n-2}.

NEET-1989

Ans. (a) :
In acetylene has two acidic hydrogen atom and triple bond shared between two atoms of carbon which means there are three electron between the carbon atom. The C–H bond in acetylene involves sp–hybridized carbon atom. Since, s–electron are closer to the nucleus than p–electron sp hybrid orbital are more electronegative so, the hydrogen atom present or carbon atom can be easily removed.

594. A compound is treated with $NaNH_2$ to give sodium salt. Identify the compound.

(a) C_2H_2	(b) C_6H_6
(c) C_2H_6	(d) C_2H_4

NEET-1993

Ans. (a) : A compound is treated with $NaNH_2$ to give a sodium salt, the compound is acetylene.

$$CH \equiv CH \xrightarrow{NaNH_2} HC \equiv C^- Na^+$$

595. The cylindrical shape of an alkyne is due to
(a) two sigma C–C and one π C–C bonds
(b) one sigma C – C and two π C–C bonds
(c) three sigma C – C bonds
(d) three π C–C bonds

NEET-1997

Ans. (b) : In alkyne, two carbon atom constitutions the triple bond are sp–hybridized carbon undergoes sp–hybridization to form two sp–hybrid orbitals. The two 2p–orbital remain unhybridised. Hybrid orbitals form one sigma bond while two–bond are formed by unhybridised orbitals.

596. In the following reaction,

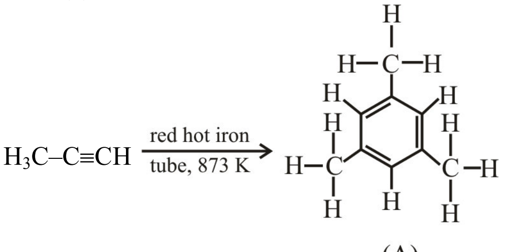
$$H_3C - C \equiv CH \xrightarrow[873\text{ K}]{\text{red hot iron tube}} A,$$

the number of sigms (σ) bonds present in the product A, is

(a) 21	(b) 9
(c) 24	(d) 18

Odisha NEET 2019

Ans. (a) :



(A)

The number of σ bond present in meistylene is 21.

597. Which one is the correct order of acidity?

(a) $CH \equiv CH > CH_3 - C \equiv CH > CH_2 = CH_2 > CH_3 - CH_3$

(b) $CH \equiv CH > CH_2 = CH_2 > CH_3 - C \equiv CH > CH_3 - CH_3$

(c) $CH_3 - CH_3 > CH_2 = CH_2 > CH_3 - C \equiv CH > CH - CH$

@apna_pdf

(d) $CH_2 \equiv CH_2 > CH_3-CH=CH_2 > CH_3-C\equiv CH > CH\equiv CH$

NEET-2017

Ans. (a) :
The s–character of these compounds depends upon their saturation and hybridization and acidic character more for more s–character increasing the s–character the acidic strength increases.

$$\underset{sp}{CH}\equiv\underset{sp}{CH} > CH_3-\underset{sp}{C}\equiv\underset{sp}{C} > \underset{sp^2}{CH_2}=\underset{sp^2}{CH_2} > \underset{sp^3}{CH_3}-\underset{sp^3}{CH_3}$$

50% s–character   33.3% s–character   25% s–character

598. The pair of electrons in the given carbanion, $CH_3C\equiv C^-$, is present in which of the following orbitals?

(a) sp^2 (b) sp

(c) 2p (d) sp^3

NEET-I 2016

Ans. (b) : In carbanion $CH_3-C\equiv C^-$, the pair of electrons represent as the negative charge is present in sp-hybridised orbital $CH_3-\underset{sp}{C}\equiv \underset{sp}{C^-}$

599. In the reaction

$$H-C\equiv CH \xrightarrow[\text{(ii)}CH_3CH_2Br]{\text{(i)}NaNH_2/\text{liq.}NH_3} X \xrightarrow[\text{(ii)}CH_3CH_2Br]{\text{(i)}NaNH_2/\text{liq.}NH_3} Y.$$

X and Y are

(a) X = 2-butyne, Y = 2-hexyne

(b) X = 1-butyne, Y = 2-hexyne

(c) X = 1-butyne, Y = 3-hexyne

(d) X = 2-butyne, Y = 3-hexyne

NEET-I 2016

Ans. (c) :

$$\begin{tikzcd}
H-C\equiv C-H \arrow[r, "\text{(i)}NaNH_2", "\text{liq.}NH_3"'] & HC\equiv CNa \arrow[d, "\text{(ii)}CH_3CH_2Br", "-NaBr"'] \\
CH_3-CH_2-C\equiv CNa \arrow[d, "\text{(ii)}CH_3CH_2Br"'] & CH\equiv C-CH_2-CH_3\ (X) \arrow[l, "\text{(i)}NaNH_2"', "\text{liq.}NH_3"] \\
CH_3-CH_2-C\equiv C-CH_2-CH_3 &
\end{tikzcd}$$

3 – hexyne
(Y)

600. Which of the following organic compounds has same hybridization as the combustion product (CO_2)?

(a) Ethane (b) Ethyne

(c) Ethene (d) Ethanol

NEET-2014

Ans. (b) : The hybridization of combustion product CO_2 is-

$$O=\underset{sp}{C}=O$$

(i) $\underset{sp^3}{CH_3}-\underset{sp^3}{CH_3}$ Ethane   (ii) $\underset{sp}{CH}\equiv\underset{sp}{CH}$ Ethyne

(iii) $\underset{sp^2}{CH_2}=\underset{sp^2}{CH_2}$ Ethene   (iv) $\underset{sp^3}{CH_3}-\underset{sp^3}{CH_2}-OH$ Ethanol

Hence, Ethyne is same hybridization as the combustion product of CO_2.

601. In the following reaction :

$$HC\equiv CH \xrightarrow[Hg^{2+}]{H_2SO_4} \text{'p'}$$

product 'p' will not give

(a) Tollens' reagent test

(b) Brady's reagent test

(c) Vichor Meyer test

(d) Iodoform test

Karnataka NEET 2013

Ans. (c) :

$$HC\equiv CH \xrightarrow[Hg^{2+}]{H_2SO_4} CH_2=CH-OH \overset{\text{Tautomerisation}}{\rightleftharpoons} CH_3-CHO$$

Acetaldehyde

Acetaldehyde does not give victor Meyer test.

Note- Victor Meyer tesst is a chemical test that is done to different between the alcohols as primary, secondary and tertiary alcohols. The primary alcohol give red, the secondary alcohol give blue and the tertiary alcohol give colorless.

602. Considering the state of hybridization of carbon atoms, find out the molecule among the following which is linear?

(a) $CH_3-CH=CH-CH_3$

(b) $CH_3-C\equiv C-CH_3$

(c) $CH_2=CH-CH_2-C\equiv CH$

(d) $CH_3-CH_2-CH_2-CH_3$

NEET-2011

Ans. (b) : In molecule $CH_3-\underset{sp}{C}\equiv\underset{sp}{C}-CH_3$ has a linear due to sp hybridized carbon and bond angle is 180°.

603. The compound that will react more readily with gaseous bromine has the formula

(a) C_3H_6 (b) C_2H_2

(c) C_4H_{10} (d) C_2H_4

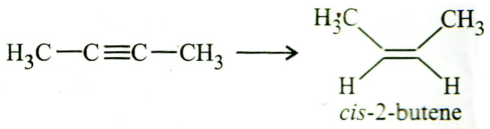
NEET-II 2016

Ans. (a) : Bromine gas reacts with alkene to give allylic substituted product by free radical mechanism. It mean reaction take place higher temperature so mechanism with Br_2 should be free radical substitution, which can take place in propene. Reaction of free radical depends upon stability of free radical, which will be stabilized by the conjugation with π-bond.

$$CH_3-CH=CH_2 \xrightarrow{Br_2\,(gas)} \underset{\displaystyle Br}{\underset{|}{CH_2}}-CH=CH_2$$

@apna_pdf

604. The most suitable reagent for the following conversion is

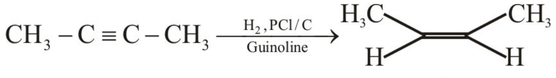


$H_3C-C\equiv C-CH_3$
H_3C
CH_3
H
H
cis-2-butene

(a) Hg^{2+}/H^+, H_2O (b) Na/liquid NH_3
(c) H_2, Pd/C, quionline (d) Zn/HCl

NEET-2019

Ans. (c) :



$CH_3-C\equiv C-CH_3$
H_2, PCl/C
Guinoline
H_3C
CH_3
H
H

cis-2-butene

605. The bond length between hybridised carbon atom and other carbon atom is minimum in

(a) propene (b) propyne
(c) propane (d) butane

NEET-1996

Ans. (b) :

In C – C bond length is 1.54 Å

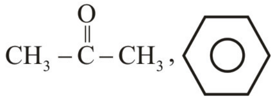
In C = C bond length is 1.34 Å and C ≡ C bond length is 1.20 Å.

Hence, propyne has a triple bond, therefore it has a minimum bond length.

606. Identify the products (I) and (III) observing the following sequence of reactions:

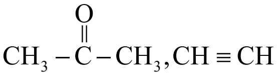
$$CH_3-C\equiv C-H \xrightarrow[1\%HgSO_4,60°C]{20\%H_2SO_4} (I) \xrightarrow[(Colored\ Solid)]{NaOH/I_2(excess)} (II) \xrightarrow[\Delta]{Ag\ particle} (III)$$

(a) CH_3CH_2CHO, $CH\equiv CH$

(b)


$CH_3-\overset{O}{\overset{\|}{C}}-CH_3$,

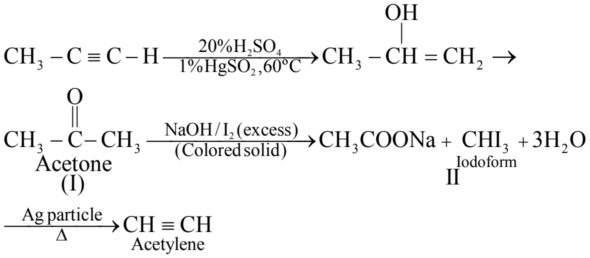
(c) CH_3CH_2CHO, $CH_3-C\equiv CH$

(d)


$CH_3-\overset{O}{\overset{\|}{C}}-CH_3, CH\equiv CH$

Tripura JEE-2022

Ans. (d):



OH
$CH_3-C\equiv C-H$
20%H_2SO_4
1%$HgSO_2$,60°C
$CH_3-CH=CH_2$
O
CH_3-C-CH_3
Acetone
(I)
NaOH/I_2(excess)
(Colored solid)
$CH_3COONa+CHI_3+3H_2O$
Iodoform
II
Ag particle
Δ
$CH\equiv CH$
Acetylene

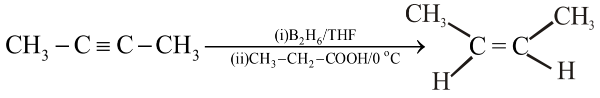
607. $CH_3-C\equiv C-CH_3 \xrightarrow[(ii)CH_3CH_2COOH,0°C]{(i)B_2H_6/THF} Y$

Compound Y will be

(a) 1-butyne (b) 2-butanol
(c) cis-2-butene (d) trans-2-butene

Tripura JEE-2019

Ans. (c) :



$CH_3-C\equiv C-CH_3$
(i)B_2H_6/THF
(ii)CH_3-CH_2-COOH/0 °C
CH_3
CH_3
H
H

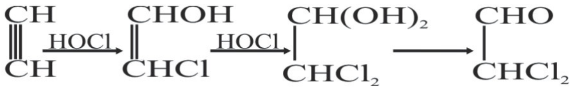
(cis-2-butene)

608. What is the product formed when acetylene reacts with hypochlorous acid?

(a) CH_3COCl (b) $ClCH_2CHO$
(c) Cl_2CH CHO (d) $ClCH_2COOH$

UP CPMT-2012

Ans. (c) :



CH
CH
HOCl
CHOH
CHCl
HOCl
$CH(OH)_2$
$CHCl_2$
CHO
$CHCl_2$

609. C_2H_2 molecule is

(a) linear (b) angular
(c) trigonal planar (d) pyramidal

UP CPMT-2012

Ans. (a) : C_2H_2(H–C=C–H) is linear in shape.

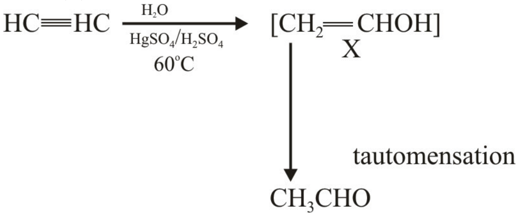
610. In the following reaction

$C_2H_2 \xrightarrow[HgSO_4/H_2SO_4]{H_2O} X$ CH_3CHO, What is X?

(a) CH_3CH_2OH (b) CH_3-O-CH_3
(c) CH_3CH_2CHO (d) $CH_2=CHOH$

UP CPMT-2006

Ans. (d) :



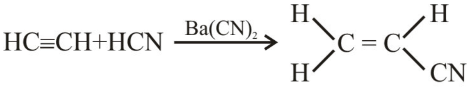
HC≡HC
H_2O
$HgSO_4/H_2SO_4$
60°C
[CH_2=CHOH]
X
tautomensation
CH_3CHO

611. Acetylene reacts with HCN in the presence of Ba $(CN)_2$ to yield:

(a) 1, 1-dicyanoethane (b) 1, 2-dicyanoethane
(c) Vinyl cyanide (d) None of the above

UPTU/UPSEE-2004

Ans. (c) :



HC≡CH+HCN
$Ba(CN)_2$
H
H
H
CN

Vinyl Cyanide

Acetylene react with HCN in the presence of $Ba(CN)_2$ to yield a vinyl cyanide.

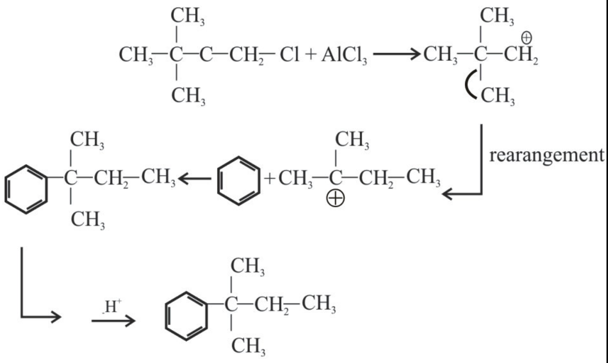
612. Which one of the following represents the major product of the reaction of benzene with 2, 2-dimethylpropyl chloride in presence of anhydrous aluminium chloride?

(a) 2, 2-dimethylpropylbenzene
(b) 1, 1-dimethylpropylbenzene
(c) 1, 2- dimethylpropylbenzene
(d) 1, 2-dimethyl-1-propenylbenzene

UPTU/UPSEE-2011

@apna_pdf

Ans. (b) :



613. Lewisite, a chemical used in chemical warfare, is obtained from

(a) phosphene (b) acetylene

(c) ethylene (d) zinc phosphate

UPTU/UPSEE-2010

Ans. (b) :
Lewisite is a dichloro (2-chlorovinyle) arsine, a liquid whose vapour is highly toxic when inhaled or when in direct contact with the skin. Lewisite has been used only as a chemical warfare agent.

$$CH \equiv CH + ASCl_3 \xrightarrow{\text{Anh.}AlCl_3} \underset{\text{Lewisite}}{ClCH = CH{\cdot}ASCl_2}$$

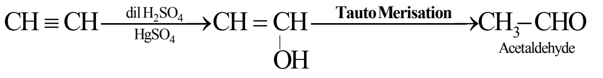
614. When acetylene is passed through dil H_2SO_4 in presence of $HgSO_4$, the compound formed is

(a) ether (b) acetaldehyde

(c) acetic acid (d) ketone

UPTU/UPSEE-2009

Ans.(b):



$$CH \equiv CH \xrightarrow[HgSO_4]{dil\,H_2SO_4} \underset{\displaystyle OH}{CH = CH} \xrightarrow{\textbf{Tauto Merisation}} \underset{\text{Acetaldehyde}}{CH_3{-}CHO}$$

When acetylene is passed through dil.H_2SO_4 in presence of $HgSO_4$, the compound formed is acetaldehyde (CH_3–CHO).

615. Ammoniacal silver nitrate form a white precipitate easily with

(a) $CH_3C{\equiv}CH$

(b) $CH_3C{\equiv}C\text{-}CH_3$

(c) $CH_3CH{=}CH_2$

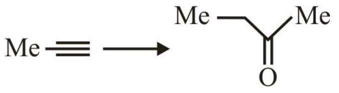
(d) $CH_2{=}CH_2$

UPTU/UPSEE-2008

Ans. (a) : Ammonical silver nitrate is also known as Tollen reagent. In terminal alkyne has acidic hydrogen to replace by ammonical silver nitrate form a white precipitate easily.

$$CH_3 - C \equiv C - H \xrightarrow{[Ag(NH4)_2]NO_3} \underset{\text{White ppt}}{CH_3 - C \equiv CAg}$$

616. The reagents to carry out the following conversion are



(a) $HgSO_4$/dil.H_2SO_4

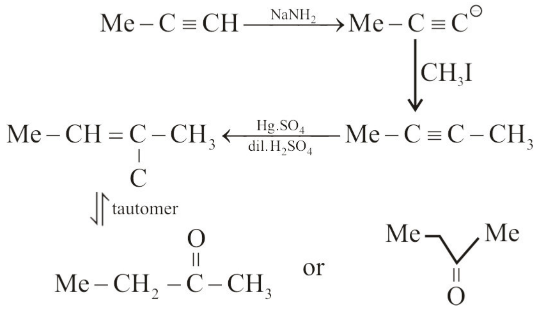
(b) BH_3;H_2O_2/NaOH

(c) OsO_4;HIO_4

(d) $NaNH_2$/CH_3I;$HgSO_4$/dil.H_2SO_4

WB-JEE-2014

Ans. (d) :



617. $CH_3–C{\equiv}C$ MgBr can be prepared by the reaction of

(a) $CH_3 - C \equiv C$ –Br with $MgBr_2$

(b) $CH_3 - C \equiv CH$ with $MgBr_2$

(c) $CH_3 - C \equiv CH$ with KBr and Mg metal

(d) $CH_3 - C \equiv CH$ with CH_3MgBr

WB-JEE-2018

Ans. (d) :
$CH_3 - C \equiv C$ MgBr can be prepared by the reaction of $CH_3 - C \equiv CH$ with CH_3MgBr.

$$CH_3 - C \equiv CH + CH_3MgBr \rightarrow CH_3 - C \equiv CMgBr + CH_4$$

4. Hybridisation

618. Allyl cyanide molecule contains

(a) 9 sigma bonds, 4 pi bonds and no lone pair

(b) 9 sigma bonds, 3 pi bonds and one lone pair

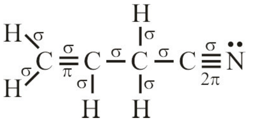
(c) 8 sigma bonds, 5 pi bonds and one lone pair

(d) 8 sigma bonds, 3 pi bonds and two lone pairs

(e) 6 sigma bonds, 2 pi bonds and four lone pairs

Kerala-CEE-2013

Ans. (b) : The structure of allyl cyanide is –



In allyl cyanide molecule contain 9 sigma bonds, 3□-bond and one lone pair respectively.

619. In dehydrolysing reaction,

$$CH_3CONH_2 \xrightarrow{P_2O_5} CH_3CN + H_2O$$

the hybridisation state of carbon is changed from

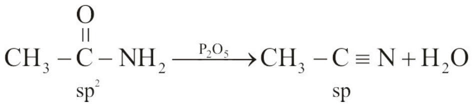
(a) sp^3 to sp^2 (b) sp to sp^2

(c) sp^2 to sp (d) sp to sp^3

CG PET -2008

@apna_pdf

Ans. (c) : The given dehydrolysing reaction –



$$\underset{sp^2}{CH_3-\overset{\overset{O}{||}}{C}-NH_2} \xrightarrow{P_2O_5} \underset{sp}{CH_3-C\equiv N}+H_2O$$

The hybridisation state of carbon is changed from sp^2 to sp.

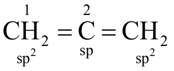
620. Hybridization of 1 and 2 carbon atom in $\overset{1}{C}H_2=\overset{2}{C}=CH_2$ are

(a) sp, sp (b) sp^2, sp^2

(c) sp^2, sp (d) sp^3, sp^2

JIPMER-2005

Ans. (c) :



$$\underset{sp^2}{\overset{1}{CH_2}}=\underset{sp}{\overset{2}{C}}=\underset{sp^2}{CH_2}$$

The hybridisation of 1 and 2 carbon atom are sp^2 and sp respectively.

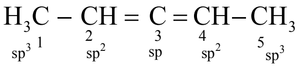
621. Hybridization of C_2 and C_3 of H_3C-CH =C=CH-CH_3 are

(a) sp, sp^3 (b) sp^2, sp

(c) sp^2, sp^2 (d) sp, sp

WB-JEE-2011

Ans. (b) : The hybridissation of C_2 and C_3 of



$$\underset{sp^3\ 1}{H_3C}-\underset{sp^2}{\overset{}{\underset{2}{CH}}}=\underset{sp}{\underset{3}{C}}=\underset{sp^2}{\underset{4}{CH}}-\underset{sp^3}{\underset{5}{CH_3}}$$

So C_2 and C_3 hybridization is sp^2 and sp.

622. The hybridization of carbon atoms in C – C single bond of HC$\equiv$ C – CH = CH_2 is

(a) sp^3-sp^3 (b) sp^2-sp^2

(c) sp-sp^2 (d) sp^3-sp

J & K CET-(2003)

Ans. (c) :

$$\underset{sp}{CH}\equiv\underset{sp}{C}-\underset{sp^2}{CH}=\underset{sp^2}{CH_2}$$

In the hybridization of carbon atom in C–C single bond of $HC\equiv C-CH=CH_2$ is sp – sp^2.

623. The compound in which carbon atom uses sp^3 hybrid orbitals for bond formation?

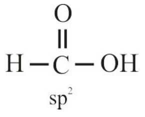
(a) HCOOH (b) NH_2CONH_2

(c) $(CH_3)_3COH$ (d) CH_3CHO

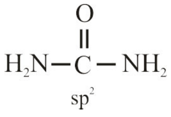
J & K CET-(2003)

Ans. (c) : The hybridisation of the following compound are –

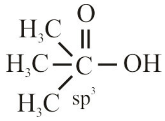
(i)



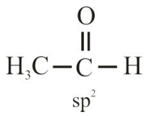
(ii)



(iii)



(iv)



In $(CH_3)_3COH$ has sp3 hybrid orbitals.

624. Which one of the following does not have sp^2 hybridised carbon?

(a) Acetone (b) Acetic acid

(c) Acetonitrile (d) Acetamide

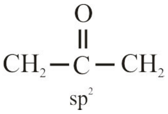
AIEEE-2004

JCECE-2008

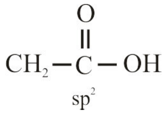
UPTU/UPSEE-2007

Ans. (c) : The hybridisation of carbon of the following are –

(i)

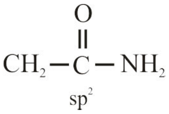


(ii)



(iii) $CH_3-\underset{sp}{C}\equiv N$

(iv)



Hence, the acetonitrile does not have sp^2 hybridised carbon.

625. The hybridization state of carbon atoms in the product formed by the reaction of ethyl chloride with aqueous KOH, is

(a) sp (b) sp^2

(c) sp^3 (d) sp^3d

A.P. EAMCET-1997

Ans. (c) :

$$\underset{\text{Ethyl chloride}}{CH_3CH_2Cl}+\underset{aq.}{KOH}\longrightarrow KCl+\underset{sp^3\text{hybridisation}}{CH_3-CH_2-OH}$$

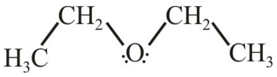
626. Hybridisation of oxygen in diethyl ether is

(a) sp (b) sp^2

(c) sp^3 (d) sp^3d

A.P.EAMCET/2007

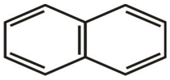
Ans. (c) :



The hybridisation of diethyl ether in oxygen is sp^3 hybridisation.

627. Which one of the following molecules is non-planar?

(a)



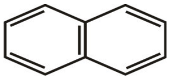
(b) $CH_2 = C = CH_2$

(c) $CH_2 = CH - CH = CH_2$

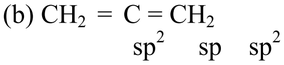
(d) $CH_2 = CH - CH_2 - C \equiv CH$

SCRA-2010

Ans. (d) : (a)



(b)



$$CH_2=\underset{sp^2\quad sp\quad sp^2}{C=CH_2}$$

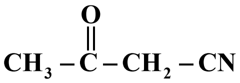
(c) $H_2C = CH - CH = CH_2$

(d) $CH_2 = CH - CH_2 - C \equiv CH$

In the option (d) is not planar because one C has sp^3 hybridised.

@apna_pdf

628. The hybridisation of each carbon in the following compound respectively is



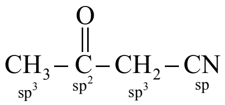
$CH_3-\overset{\overset{O}{\|}}{C}-CH_2-CN$

(a) sp^3, sp^2, sp^3, sp (b) sp^3, sp^3, sp^2, sp

(c) sp^3, sp, sp^3, sp^2 (d) sp^3, sp^2, sp, sp^3

TS-EAMCET-2016

Ans. (a) :



$\underset{sp^3}{CH_3}-\underset{sp^2}{\overset{\overset{O}{\|}}{C}}-\underset{sp^3}{CH_2}-\underset{sp}{CN}$

Hence, the option (a) is correct.

629. The hybridization involved in the six carbon atoms of benzene is:

(a) three sp^3 and three sp^2

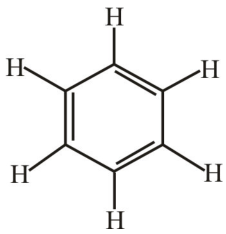
(b) three sp^3 and three sp

(c) all six sp

(d) all six sp^2

AP EAMCET (Medical) -1998

Ans. (d): The molecular formula of benzene is C_6H_6.



All six carbon has sp^2 hybridization and the usual valency angle among the sp^2 hybrid orbitals is 120º.

630. Match List-I with List-II. Select the correct answer using the codes given below the list:

List-I (Molecule/ion)	**List-II (Type of hybridization)**
(a) NH_4^+	1. sp^3d^3
(b) PCl_5	2. sp^3d
(c) CF_6	3. sp^3
(d) IF_7	4. sp^3d^2

Answer code:

	A	**B**	**C**	**D**
(a)	3	2	4	1
(b)	1	2	3	4
(c)	2	3	1	4
(d)	4	1	2	3

MPPET-2008

Ans. (a) :

Molecule	**Hybridisation**
NH_4^+	sp^3
PCl_5	sp^3d
CF_6	sp^3d^2
IF_7	sp^3d^3

631. Which of the following groups does not have sp^3d hybridization

(a) ClF_3, IF_3, XeF_3^+

(b) ICl_2^-, ClF_2^-, I_3^-

(c) ClF, BrF, IF

(d) PCl_3, $AsCl_3$, PF_5

MPPET-2008

Ans. (c,d) : ClF_3 – sp^3d
IF_3 – sp^3d
XeF_3^+ – sp^3d
ICl_2^- – sp^3d
ClF_2^- – sp^3d
I_3^- – sp^3d
ClF – sp^3
BrF – sp^3
IF – sp^3
PCl_3 – sp^3
$AsCl_3$ – sp^3
PF_5 – sp^3d

632. The correct order of electronegativity of carbon in various hybridization states:

(a) $sp < sp^2 < sp^3$ (b) $sp > sp^2 > sp^3$

(c) $sp > sp^2 < sp^3$ (d) $sp = sp^2 < sp^3$

AP EAPCET 20.08.2021 Shift-I

Ans. (b) : Electronegativity of hybridisation depend on the % s character. As % s character

Increase electronegativity increase.

In sp, % s character is 50%

In sp^2, % s character is 33.3 %

In sp^3, % s character is 25%

633. Hybridisation of oxygen in diethyl ether is

(a) sp (b) sp^2

(c) sp^3 (d) sp^3d

AP EAMCET (Engg.) -2007

Ans. (c) :

The Hybridisation of oxygen in diethyl ether is sp^3.

$CH_3-CH_2-\underset{sp^3}{\ddot{O}}-CH_2-CH_3$

634. The carbon atoms in ethane are

(a) sp^2 hybridised

(b) sp^3 hybridised

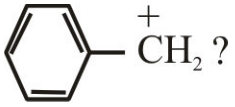
(c) sp hybridised

(d) dsp^2 hybridised.

COMEDK 2011

Ans. (b) : The structure of ethane is CH_3-CH_3 and the carbon atoms in ethane is sp^3 hybridised.

635. What is the hybridization state of benzyl carbonium ion

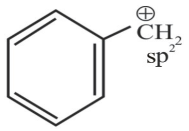


@apna_pdf

(a) sp^2 (b) spd^2
(c) sp^{2}d (d) sp^3

KARNATAKA NEET 2013

Ans. (a) :



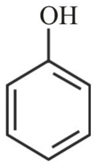
Benzyl carbonium ion

636. Hybridization shown by Carbon and Oxygen of –OH group in Phenol are respectively ....

(a) sp^2, sp^2 (b) sp^3, sp^2
(c) sp, sp^2 (d) sp^2, sp^3

GUJCET-2011

Ans. (d) :



Phenol

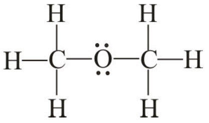
In phenol, carbon show hybridization is sp^2
and oxygen show hybridization is sp^3.

637. What is the hybridisation of Carbon and Oxygen in electronic structure of Ether?

(a) sp^2 and sp^2 (b) sp and sp
(c) sp^3 and sp^3 (d) sp^3 and sp^2

GUJCET-2008

Ans. (c) : The functional group of an ether is an oxygen atom bonded to two carbon atoms i.e. dimethylether.



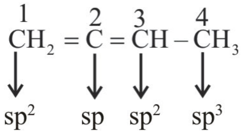
The hybridisation of carbon and oxygen in electronic structure of dimethylether is sp^3.

638. In $\overset{1}{C}H_2 = \overset{2}{C} = \overset{3}{C}H - \overset{4}{C}H_3$ molecule, the hybridization of carbon 1, 2, 3 and 4 respectively,

(a) sp^2, sp^2, sp^2, sp^3 (b) sp^3, sp, sp^3, sp^3
(c) sp^2, sp, sp^2, sp^3 (d) sp^2, sp^3, sp^2, sp^3

JEE Main 26.02.2021,Shift-II

Ans. (c) :



$$\underset{sp^2}{\overset{1}{CH_2}} = \underset{sp}{\overset{2}{C}} = \underset{sp^2}{\overset{3}{CH}} - \underset{sp^3}{\overset{4}{CH_3}}$$

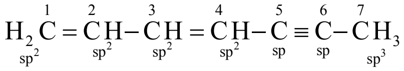
Carbon	Hybridization	Bonds
C_1	sp^2	3σ, 1π
C_2	sp	2σ, 2π
C_3	sp^2	3σ, 1π
C_4	sp^3	4σ, 0π

639. The number of sp and sp^2 carbon in Hepta-1, 3-dien-5-yne, respectively, are

(a) 2, 4 (b) 4, 3
(c) 2, 2 (d) 2, 5

TS EAMCET 04.08.2021, Shift-I

Ans. (a) :



$$\underset{sp^2}{H_2\overset{1}{C}} = \underset{sp^2}{\overset{2}{C}H} - \underset{sp^2}{\overset{3}{C}H} = \underset{sp^2}{\overset{4}{C}H} - \underset{sp}{\overset{5}{C}} \equiv \underset{sp}{\overset{6}{C}} - \underset{sp^3}{\overset{7}{C}H_3}$$

Hence, the number of 2sp and 4sp^2 carbon in Hepta-1, 3-dien-5-yne, respectively, are 2, 4.

640. Assertion : Energy of resonance hybrid is equal to the average of energies of all canonical forms.

Reason: Resonance hybrid cannot be presented by a single structure.

(a) If both Assertion and Reason are correct and the reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

[AIIMS-2016]

Ans. (d): The energy of the resonance hybrid is equal to the sum of the energies of the various canonical structures in proportion of their contribution towards the resonance hybrid. Resonance hybrid can be represented by the single structure.

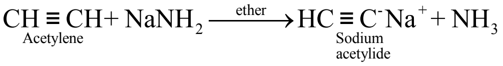
641. Assertion: Acetylene on reacting with sodamide gives sodium acetylide and ammonia.

Reason: sp hybridized carbon atoms of acetylene are considerably electronegative.

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

[AIIMS-2007]

Ans. (a): Acetylene on reacting with sodamide gives sodium acetylide and ammonia.



$$\underset{\text{Acetylene}}{CH \equiv CH} + NaNH_2 \xrightarrow{\text{ether}} \underset{\substack{\text{Sodium}\\\text{acetylide}}}{HC \equiv C^-Na^+} + NH_3$$

The C – H bond is strongly polar due to the high electro negativity of carbon atom.

Hence, it gives H$^+$ ion on reacting with a base or acetylene behaves as acid,

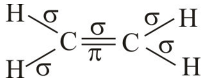
@apna_pdf

642. The number of σ and π bonds present in ethene is:

(a) 6σ (b) 3σ
(c) 4σ, 2π (d) 5σ, 1π

[AIIMS-1997]

Ans. (d):
The structure of ethene is –



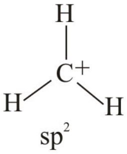
In ethene, number of σ bond is 5 and π-bond is 1.
Hence, ethane has 5σ and 1π bond.

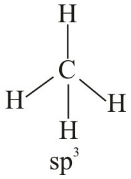
643. Hybridisation states of C in CH_3^+ and CH_4 are

(a) sp^2 and sp^3 (b) sp^3 and sp^2
(c) sp^2 and sp^2 (d) sp^3 and sp^3

(AIIMS-2017)

Ans. (a):





The hybridisation state of C in CH_3^+ and CH_4 are sp^2 and sp^3 respectively.

644. Which of the following represents the given mode of hybridization sp^2–sp^2–sp from left to right?

(a) $H_2C = CH–C \equiv N$ (b) $CH \equiv C–C \equiv CH$
(c) $H_2C = C = CH_2$ (d)

(AIIMS-2015)

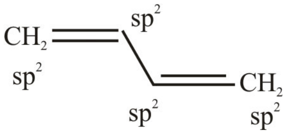
Ans. (a):
The given compound are –

(i) $\underset{sp^2}{CH_2} = \underset{sp^2}{CH} - \underset{sp}{C} \equiv N$

(ii) $\underset{sp}{HC} \equiv \underset{sp}{CH},$

(iii) $\underset{sp^2}{CH_2} = \underset{sp}{C} = \underset{sp^2}{CH_2}$

(iv)



Hence, the given mode of hybridisation $sp^2 - sp^2 - sp$ form left to right is

$CH_2 = CH - C \equiv N$

645. In the hydrocarbon $CH_3 \equiv C - CH_3$, hybridisation of carbon atoms in the molecule from left to right are respectively

(a) sp^3, sp^2, sp^2 and sp^3
(b) sp^3, sp, sp and sp^3
(c) sp^2, sp^2, sp^2 and sp^3
(d) sp, sp^2, sp and sp^2

SRMJEEE – 2013

Ans. (b) :

$$\underset{sp^3}{CH_3} - \underset{sp}{C} \equiv \underset{sp}{C} - \underset{sp^3}{CH_3}$$

Hence, hybridisation is sp^3, sp, sp, sp^3.

646. What is the hybridisation state(s) of the atoms in X formed in the following reaction?

$$\underset{(vapour)}{C_2H_5OH} \xrightarrow[260°C]{Al_2O_3} X$$

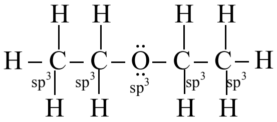
(a) sp^3 only (b) sp^2 and sp^3
(c) sp^2 only (d) sp only

AP - EAMCET(MEDICAL) - 2009

Ans. (a) : The vapour form of ethyl alcohol react with Al_2O_3 at 260°C then ether will be formed if temperature is increased by 360°C then ethene is formed.

$$\underset{(vapour)}{C_2H_5OH} \xrightarrow[260°C]{Al_2O_3} \underset{\substack{'X'\\(ether)}}{C_2H_5 - O - C_2H_5}$$

The structure of X is shown below–



So, hydridizaiton is sp^3 only.

647. The hydridization state of carbon atoms in the product formed by the reaction of ethyl chloride with aqueous KOH is:

(a) sp (b) sp^2
(c) sp^3 (d) sp^3d

AP – EAMCET - (Medical)-1997

Ans. (c) : When ethyl chloride react with aqueous KOH then alcohol is formed.

$$\underset{\text{Ethyl chloride}}{CH_3 - CH_2 - Cl} \xrightarrow{aqueous-KOH} \underset{\text{Ethyl alcohol}}{CH_3 - CH_2 - OH} + KCl$$

In ethyl alcohol all the four valencies of carbon are single bonded. So, the hybridization of carbon atom in $C_2H_5 - OH$ is sp^3.

648. 1, 2-dibromoethane reacts with alcoholic KOH to yield a product X. The hybridisation state of the carbons present in X-respectively are:

(a) sp, sp (b) sp^3, sp^3
(c) sp^2, sp^2 (d) sp^3, sp^2

AP-EAMCET (Engg.)-2005

Ans. (a) : 1, 2- dibromoethane reacts with alcoholic KOH to yield a product acetylene.

$$\underset{\text{1, 2- dibromoethane}}{Br—CH_2—CH_2—Br} \xrightarrow[\Delta]{alc.KOH} \underset{\text{Acetylene}}{\underset{sp}{CH} \equiv \underset{sp}{CH}}$$

Hence, both carbon has sp hybridization.

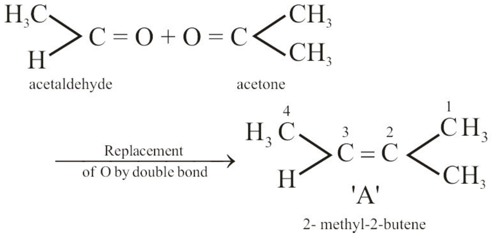
649. One mole of alkene X on ozonolysis gave one mole of acetaldehyde and one mole of acetone. The IUPAC name of X is

(a) 2-methyl-2-butene
(b) 2-methyl-1-butene
(c) 2-butene
(d) 1-butene

VITEEE- 2009

@apna_pdf

Ans. (a) : To determine the structure of alkene that undergoes ozonolysis, add the products and replace O by double (=) bond. Thus,



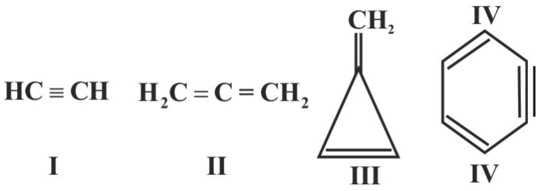
650. What is the hybridization of oxygen atom in an alcohol molecule?

(a) sp^3
(b) sp
(c) sp^2
(d) sp^2d

VITEEE- 2006

Ans. (a) : Oxygen atom in alcohol molecule is sp^3 hybridised.

651. Which of the following structure contains sp-hydridized carbon atom/s?



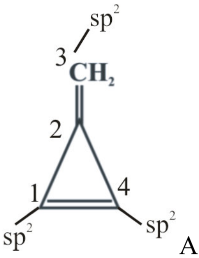
(a) I, II and III
(b) I, III and IV
(c) II, III and IV
(d) I, II and IV

AMU-2018

Ans. (d) : From I:- $\underset{sp}{HC}\equiv\underset{sp}{CH}$, Carbons are sp hybridised

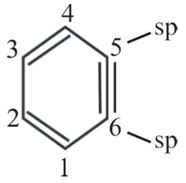
From II:- $H_2C=\underset{sp}{C}=CH_2$ middle carbon is sp hybridised.

From III :-



All carbon sp^2 hybridised.

From IV :-



Carbon 5, 6 are sp hybridised.

Hence by above explanation I, II and IV are sp-hybridised.

652. Which of the d-orbital is used in sp^3d hybridization?

(a) d_{xy}
(b) $d_{x^2-y^2}$
(c) d_{z^2}
(d) d_{yz}

AMU-2011

Ans. (c) : Hybridisation is defined as concept of mixing two atomic orbital's having the same energy levels to give a new degenerate orbital's. In sp^3d hybridisation five orbitals are degenerate that is their energies are the same but configurations are different. In this sp^3d hybridisation there are a total 5 orbital's which are s, px, py, pz and dz^2 orbital take part in hybridisation.

653. In the compound $CH_2=CH-CH_2-CH_2-C\equiv CH$, the pair of hybridized which involved in the formation of C_2-C_3 bond is

(a) $sp-sp^2$
(b) $sp-sp^3$
(c) sp^2-sp^3
(d) sp^3-sp^3

Assam CEE-2020

Ans. (c) : $CH_3=CH-CH_2-CH_2-C\equiv CH$
Hybridisation at $C_2 = sp^2$ and $C_3 = sp^3$

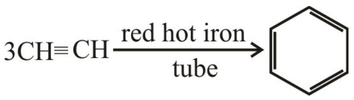
654. During polymerization of acetylene to benzene, the state of hybridization of carbon changes from

(a) sp^2 to sp
(b) sp^3 to sp
(c) sp to sp^3
(d) sp to sp^2

BCECE-2011

Ans. (d) : In acetylene is C_2H_2 has triple bond between the two carbon atoms and one hydrogen atom attached to each of the carbon,

When acetylene is passed through a red not iron tube to give a benzene.



In acetylene hybridisation of carbon is sp and hybridisation of benzene is sp^2.

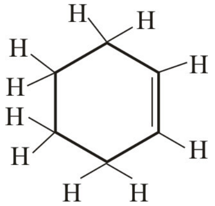
Therefore, the polymerisation of acetylene to benzene changes hybridisation form sp to sp^2.

655. The number of sp^3- hybridised carbon atoms in cyclohexene are

(a) 2
(b) 3
(c) 4
(d) 6

CG PET -2004

Ans. (c) : The structure of cyclohexene is –



In cyclohexene, the number of sp^3- hybridized carbon atom is 4 and sp^2-hybridised carbon atom is 2.

@apna_pdf

656. The number of sp^2-hybrid orbitals in a molecule of benzene is:

(a) 24 (b) 12

(c) 18 (d) 6

[JEE Main-2020, 9 Jan Shift-II]

Ans. (c) : Benzene (C_6H_6) has a $6sp^2$ hybridised carbons. Each carbon has 3 σ bond and 1 π bond. 3 bond means for each carbon.

Hence, the total number of sp^2 hybrid orbital's is 18.

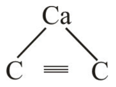
657. The number and type of bonds between two carbon atoms in calcium carbide are

(a) two sigma, two pi (b) two sigma, one pi

(c) one sigma, two pi (d) one sigma, one pi

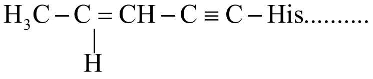
AIEEE 2005

Ans. (c) : The structure of calcium carbide is –



In calcium carbide, type of bonds between two carbon atom in calcium carbide are one sigma and two π – bond.

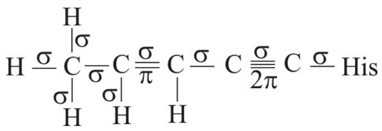
658. The number of sigma bonds in



$H_3C-\underset{\underset{H}{|}}{C}=CH-C\equiv C-H$ is..........

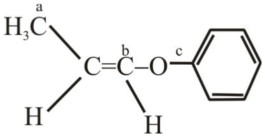
[JEE Main 2021, 25 July Shift-I]

Ans. (10) : The number of sigma bonds in given structure



No. of σ bond is 10 and 3π bonds.

659. In the following molecules,



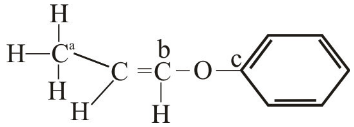
hybridization of carbon a, b and c respectively are

(a) sp^3, sp, sp (b) sp^3, sp^2, sp

(c) sp^3, sp^2, sp^2 (d) sp^3, sp, sp^2

[JEE Main 2021, 18 March Shift-II]

Ans. (c) : Given the molecules

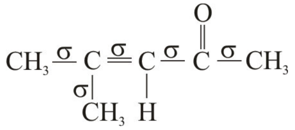


The hybridisation of carbon in a, b and c are sp^3, sp^2 and sp^2 respectively.

660. The total number of C–C sigma bond/s in mesityl oxide ($C_6H_{10}O$) is .... (Round off to the nearest integer).

[JEE Main 2021, 17 March Shift-II]

Ans. (5) : The structure of mesityl oxide ($C_6H_{10}O$) is –

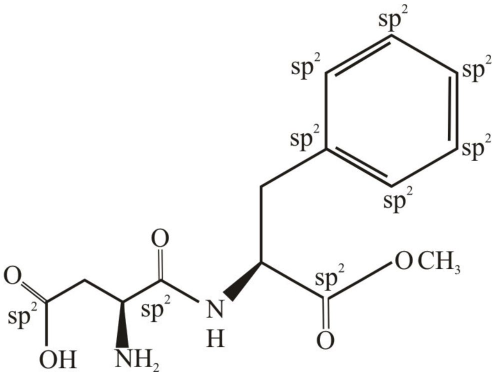


Hence, the total number of C – C sigma bonds in mesityl oxide ($C_6H_{10}O$) is 5.

661. The number of sp^2 – hybridised carbons present in "aspartame" is ....

JEE Main 2020, 7 Jan Shift-II

Ans. (9) : The structure of aspartame is –



In aspartame, the sp^2-hybridised carbon is 9.

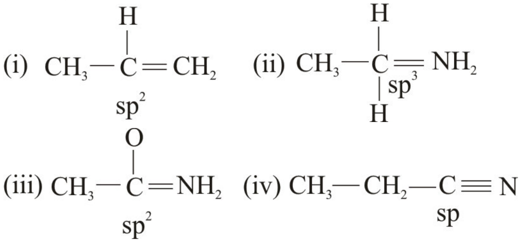
662. Underlined carbon is sp^3 hybridised in

(a) $CH_3\underline{C}H=CH_2$ (b) $CH_3\underline{C}H_2NH_2$

(c) $CH_3\underline{C}ONH_2$ (d) $CH_3CH_2\underline{C}N$

(AIEEE-2002)

Ans. (b) :



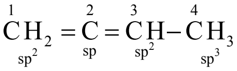
663. In $\overset{1}{C}H_2=\overset{2}{C}=\overset{3}{C}H-\overset{4}{C}H_3$ molecule, the hybridisation of carbon 1, 2, 3 and 4 respectively are

(a) sp^3, sp, sp^3, sp^3 (b) sp^2, sp^2, sp^2, sp^3

(c) sp^2, sp, sp^2, sp^3 (d) sp^2, sp^3, sp^2, sp^3

(JEE Main 2021, 26 Feb Shift-II)

Ans. (c) : The given molecule are –



$\underset{sp^2}{\overset{1}{C}H_2}=\underset{sp}{\overset{2}{C}}=\underset{sp^2}{\overset{3}{C}H}-\underset{sp^3}{\overset{4}{C}H_3}$

The hybridisation of carbon 1, 2, 3 and 4 are sp^2, sp, sp and sp^3 respectively.

664. What is the type of hybridisation found in methane?

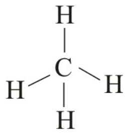
(a) sp^3 (b) sp^2

(c) sp^1 (d) None of these.

J & K CET-(2014)

@apna_pdf

Ans. (a) : The structure of methane is –



sp^3

In methane hybridisation found is sp^3.

665. The hybridization of carbon atoms in C–C single bond of $HC\equiv C–CH=CH_2$ is

(a) $sp^3 – sp^2$ (b) $sp^2 – sp^3$
(c) $sp – sp^2$ (d) $sp^3 – sp^3$

J & K CET-(2013)

Ans. (c): The given molecule are –

$HC\equiv \underset{sp}{C}-\underset{sp^2}{CH}-CH_2$

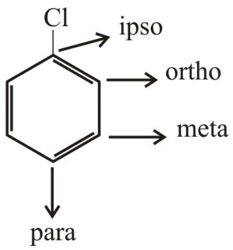
The hybridisation of carbon atom in C – C bond is sp – sp^2.

666. The hybridization of the ipso carbon in chlorobenzene is

(a) sp hybridisation (b) sp^2 hybridisation
(c) sp^2d hybridisation (d) sp^3 hybridisation

J & K CET-(2007)

Ans. (b) : The structure of chloro benzene is –



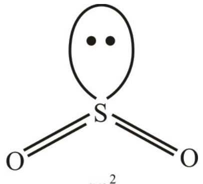
The hybridisation of ipso carbon in chlorobenzene is sp^2 hybridisation.

667. Which hybridization has sulphur is SO_2?

(a) sp^2 (b) sp^3d^2
(c) sp^3 (d) sp

JCECE - 2004

Ans. (a) : The structure of SO_2 is –



sp^2

The hybridisation of sulphur in SO_2 is SO_2.

668. Which of the following has a bond formed by overlap of sp-sp^3 hybrid orbitals?

(a) $CH_3 – C\equiv C – H$
(b) $CH_3 – CH = CH – CH_3$
(c) $CH_2 = CH– CH = CH_2$
(d) $HC\equiv CH$

JIPMER-2010

Ans. (a): The bond formed by overlap of sp – sp^3 hybrid orbital is –

$\underset{sp^3}{CH_3}-\underset{sp}{C}\equiv C-H$

669. Which of the following pair of compounds will have three sp^2 -hybrid orbitals?

(a) SO_2, CH_4
(b) SO_3, C_2H_4
(c) BF_3, SF_4
(d) I_3^- , SF_4

JIPMER-2016

Ans. (b) :

Molecule	Hybrid orbital
SO_2	sp^2
CH_4	sp^3
SO_3	sp^2
C_2H_4	sp^2
BF_3	sp^2
SF_4	sp^3d
I_3	sp^3d

670. All carbon atoms are sp^2-hybridised in

(a) 1, 3-butadiene
(b) $CH_2=C=CH_2$
(c) cyclohexane
(d) 2-butene
(e) $CH\equiv C-C\equiv CH$

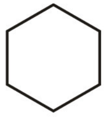
Kerala-CEE-2010

Ans. (a) : The hybridisation of given compound

(i) 1, 3 butadiene
$\underset{sp^2}{CH_2}=\underset{sp^2}{CH}-\underset{sp^2}{CH}=\underset{sp^2}{CH_2}$

(ii) $\underset{sp^2}{CH_2}=\underset{sp}{C}-\underset{sp^2}{CH_2}$

(iii)



sp^3 all carbon

(iv) 2– butene
$\underset{sp^3}{CH_3}-\underset{sp^2}{CH}=\underset{sp^2}{CH}-\underset{sp^3}{CH_3}$

(v) $\underset{sp}{CH}=\underset{sp}{C}-\underset{sp}{C}\equiv\underset{sp}{CH}$

671. In which of the following species, all the three types of hybrid carbons are present?

(a) $CH_2=C=CH_2$
(b) $CH_3-CH=CH-CH^+_2$
(c) $CH_3-C\equiv C-CH^+_2$
(d) $CH_3-CH=CH-CH^-_2$
(e) $CH_2=CH-CH=CH_2$

Kerala-CEE-2009

Ans. (c) :

(i) $\underset{sp^2}{CH_2}=\underset{sp}{C}=\underset{sp^2}{CH_2}$

(ii) $\underset{sp^3}{CH_3}-\underset{sp^2}{CH}=\underset{sp^2}{CH}-\underset{sp^2}{CH_2^+}$

(iii) $\underset{sp^3}{CH_3}-\underset{sp}{C}\equiv\underset{sp}{C}-\underset{sp^2}{CH_2^+}$

(iv) $\underset{sp^3}{CH_3}-\underset{sp^2}{CH}=\underset{sp^2}{CH_2}-\underset{sp^2}{CH_2^+}$

(v) $\underset{sp^2}{CH_2}=\underset{sp^2}{CH}-\underset{sp^2}{CH}-\underset{sp^2}{CH_2}$

@apna_pdf

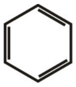
672. Consider the following compounds:
(i) chloroethene (ii) benzene
(iii) 1, 3-butadiene (iv) 1, 3, 5 -hexatriene
All the carbon atoms are sp^2 hybridised in:

(a) (i), (iii), (iv) only
(b) (i), (ii) only
(c) (ii), (iii), (iv) only
(d) (iii), (iv) only
(e) (i), (ii), (iii) and (iv)

Kerala-CEE-2006

Ans. (e) :

(i) $\underset{sp^2}{CH_2}=\underset{sp^2}{CHCl}$ (ii)



all sp^2 carbon atom

(iii) $\underset{sp^2}{CH_2}=\underset{sp^2}{CH}-\underset{sp^2}{CH}=\underset{sp^2}{CH_2}$

(iv) $\underset{sp^2}{CH_2}=\underset{sp^2}{CH}-\underset{sp^2}{CH}=\underset{sp^2}{CH}-\underset{sp^2}{CH}=\underset{sp^2}{CH_2}$

673. The molecule that contains only sp^2 hybrid carbon atoms is

(a) isoprene
(b) acrylonitrile
(c) but-1-ene
(d) 1, 3-butadiene
(e) isobutene

Kerala-CEE-2012

Ans. (d) : In structure of 1, 3 –butadiene

$$\underset{sp^2}{CH_2}=\underset{sp^2}{CH}-\underset{sp^2}{CH}=\underset{sp^2}{CH_2}$$

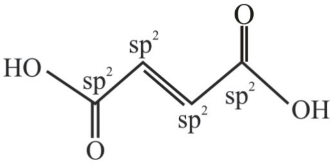
In 1, 3 -butadiene has all carbon atom is sp^2 hybridised.

674. The hybridization state of C atom in butendioic acid is

(a) sp^2
(b) sp^3
(c) Both (a) and (b)
(d) sp

MHT CET-2012

Ans. (a) : The structure of butendioic acid is –



In butendioic acid all the carbon is sp^2 hybridised.

675. Which of the following molecules represents the order of hybridisation sp^2, sp^2, sp, sp from left to right atoms?

(a) $HC\equiv C-C\equiv CH$
(b) $CH_2=CH-C\equiv CH$
(c) $CH_2=CH-CH=CH_2$
(d) $CH_3-CH=CH-CH_3$

NEET-2018

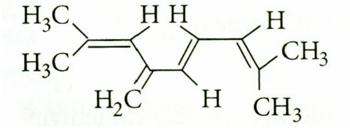
Ans. (b) :

(i) $\underset{sp}{CH_2}=\underset{sp}{C}-\underset{sp}{C}\equiv\underset{sp}{CH}$ (ii) $\underset{sp^2}{CH_2}=\underset{sp^2}{CH}-\underset{sp}{C}\equiv\underset{sp}{CH}$

(iii) $\underset{sp^2}{CH_2}=\underset{sp^2}{CH}-\underset{sp^2}{C}=\underset{sp^2}{CH_2}$ (iv) $\underset{sp^3}{CH_3}-\underset{sp^2}{CH}-\underset{sp^2}{CH}=\underset{sp^3}{CH_3}$

Hence, option (b) is sp^2, sp^2, sp, sp hybridised from left to right.

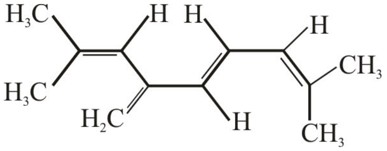
676. The total number of π-bond electrons in the following structure is



(a) 12
(b) 16
(c) 4
(d) 8

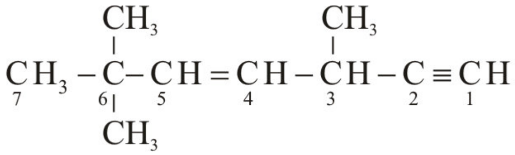
NEET-2015, cancelled

Ans. (d) : In the given structure –



The total number of π – bond is 4 and π-bond electron is 8.

677. The state of hybridization of C_2, C_3, C_5 and C_6 of the hydrocarbon,



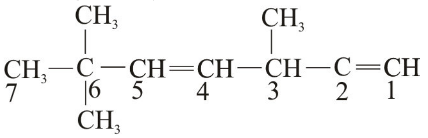
$$\underset{7}{CH_3}-\underset{\underset{CH_3}{|}}{\overset{\overset{CH_3}{|}}{\underset{6}{C}}}-\underset{5}{CH}=\underset{4}{CH}-\overset{\overset{CH_3}{|}}{\underset{3}{CH}}-\underset{2}{C}\equiv\underset{1}{CH}$$

is in the following sequence

(a) sp^3, sp^2, sp^2 and sp
(b) sp, sp^2, sp^2 and sp^3
(c) sp, sp^2, sp^3 and sp^2
(d) sp, sp^3, sp^2 and sp^3

NEET-2009

Ans. (d) : The given hydrocarbon is –



$$\underset{7}{CH_3}-\underset{\underset{CH_3}{|}}{\overset{\overset{CH_3}{|}}{\underset{6}{C}}}-\underset{5}{CH}=\underset{4}{CH}-\overset{\overset{CH_3}{|}}{\underset{3}{CH}}-\underset{2}{C}=\underset{1}{CH}$$

The hybridisation of C_2, C_3, C_5 and C_6 are sp, sp^3, sp^2 and sp^3.

678. In the hydrocarbon,

$$\underset{6}{CH_3}-\underset{5}{CH}=\underset{4}{CH}-\underset{3}{CH_2}-\underset{2}{C}\equiv\underset{1}{CH}$$

The state of hybridization of carbons 1, 3 and 5 are in the following sequence

(a) sp, sp^2, sp^3
(b) sp^3, sp^2, sp
(c) sp^2, sp, sp^3
(d) sp, sp^3, sp^2

NEET-2008

@apna_pdf

Ans. (d) : The given hydrocarbon is –

$$\underset{6}{CH_3} - \underset{5}{CH} = \underset{4}{CH} - \underset{3}{CH_2} - \underset{2}{C} \equiv \underset{1}{CH}$$

The hybridisation state of carbon 1, 3 and 5 are sp, sp^3 and sp^2.

679. In which of the following compounds there is more than one kind of hybridization (sp, sp^2, sp^3) for carbon?

(a) $CH_2 = CH - CH = CH_2$

(b) $H - C \equiv C - H$

(c) $CH_3CH_2CH_2CH_3$

(d) $CH_3 - CH = CH - CH_3$

NEET-1995

Ans. (d) :

(i) $\underset{sp^2}{CH_2} = \underset{sp^2}{CH} - \underset{sp^2}{CH} = \underset{sp^2}{CH_2}$ (ii) $H - \underset{sp}{C} \equiv \underset{sp}{C} - H$

(iii) $\underset{sp^3}{CH_3} - \underset{sp^3}{CH_2} - \underset{sp^3}{CH_2} - \underset{sp^3}{CH_3}$

(iv) $\underset{sp^3}{CH_3} - \underset{sp^2}{CH} = \underset{sp^2}{CH} - \underset{sp^3}{CH_3}$

680. A straight chain hydrocarbon has the molecular formula C_8H_{10}. The hybridization of the carbon atoms from one end of the chain to the other are respectively sp^3, sp^2, sp^2, sp^3, sp and sp. The structural formula of the hydrocarbon would be

(a) $CH_3C \equiv CCH_2 - CH = CHCH = CH_2$

(b) $CH_3CH_2 - CH = CHCH = CHC \equiv CH$

(c) $CH_3CH \equiv CHCH_2 - C \equiv CCH = CH_2$

(d) $CH_3CH \equiv CHCH_2 - CH = CHC \equiv CH$

NEET-1991

Ans. (d) : The given structural formula of the hydrocarbon is –

$$\underset{sp^3}{CH_3} - \underset{sp^2}{CH} = \underset{sp^2}{CH} - \underset{sp^3}{CH_2} - \underset{sp^2}{CH} = \underset{sp^2}{CH} - \underset{sp}{C} \equiv \underset{sp}{CH}$$

681. Which of the following possesses a sp-carbon in its structure?

(a) $CH_2 = CCl - CH = CH_2$

(b) $CCl_2 = CCl_2$

(c) $CH_2 = C = CH_2$

(d) $CH_2 = CH - CH = CH_2$

NEET-1989

Ans. (c) : The given species are –

(i) $\underset{sp^2}{CH_2} = \underset{sp^2}{CCl} - \underset{sp^2}{CH} = \underset{sp^2}{CH_2}$ (ii) $\underset{sp^2}{CCl_2} = \underset{sp^2}{CCl_2}$

(iii) $\underset{sp^2}{CH_2} = \underset{sp}{C} = \underset{sp^2}{CH_2}$ (iv) $\underset{sp^2}{CH_2} = \underset{sp^2}{CH} - \underset{sp^2}{CH} = \underset{sp^2}{CH_2}$

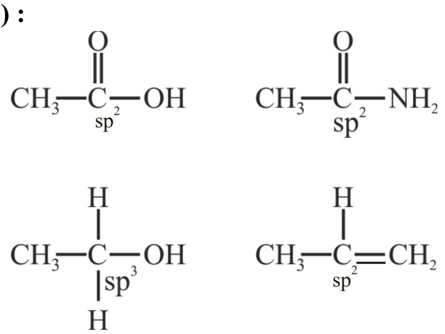
682. The compound in which underlined carbon uses only its sp^3 hybrid for bond formation is:

(a) $CH_3\underline{C}OOH$ (b) $CH_3\underline{C}ONH_2$

(c) $CH_3\underline{C}H_2OH$ (d) $CH_3\underline{C}H = CH_2$

UP CPMT-2006

Ans. (c) :



683. The correct sequence of hybridization of methane, ethene and acetylene is

(a) sp, sp^2, sp^3

(b) sp^2, sp^3, sp

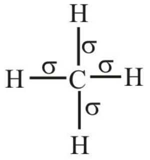
(c) sp^3, sp^2, sp

(d) sp^3, sp, sp^2

UP CPMT-2003

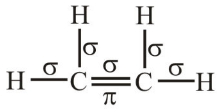
Ans. (c) : The first bond between any two atoms is sigma and rest are pi bonds.

Pi bond is formed by sideways overlapping of unhybridised p-orbital.



4 σ bonds

∴ sp^3 hybridisation



3 σ and 1 π bond

∴ sp^2 hybridisation

2 σ and 2 π bond

∴ sp hybridisation

684. $\overset{\ominus}{\underset{\cdot\cdot}{C}}H_3$ $H_2\overset{\ominus}{\underset{\cdot\cdot}{C}} - CH_2OCH_3$

(I) **(II)**

Hybridisation of the negative carbons in (I) and (II) are

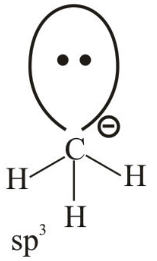
(a) sp^2 and sp^3 (b) sp^3 and sp^2

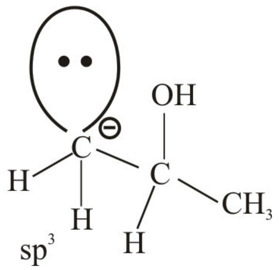
(c) both sp^2 (d) both sp^3

WB-JEE-30.04.2022

Ans. (d) :

(i) $\overset{\ominus}{\underset{\cdot\cdot}{C}}H_3$ (ii) $H_2\overset{\ominus}{C} - CHOCH_3$





@apna_pdf

685. **In the compound** 
$HC\equiv C-\overset{CH_3}{\overset{|}{C}}=CH_2$

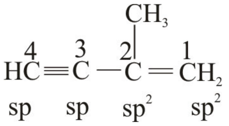
the hybridization of C-2 and C-3 carbons are respectively

(a) sp^3 and sp^3 (b) sp^2 and sp^3

(c) sp^2 and sp (d) sp^3 and sp

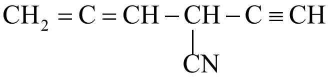
WB-JEE-2009

Ans. (c) : The given compound are –



The hybridisation of C – 2 and C – 3 carbon are sp^2, sp respectively.

686. **In the following compound, the number of sp-hybridised carbons are**



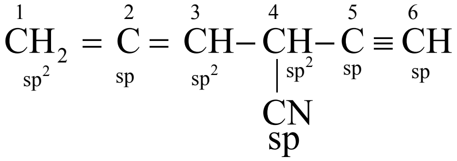
$CH_2=C=CH-\underset{CN}{\underset{|}{CH}}-C\equiv CH$

(a) 2 (b) 3

(c) 4 (d) 5

WB-JEE-2015

Ans. (c) : The given compound are –



Hence, the number of sp –hybridised carbon are 4.

5. Structure of Benzene

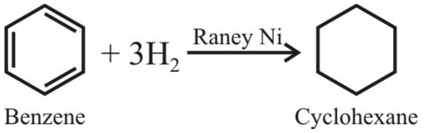
687. **Benzene reacts with H_2 at 150°C at 30 atm pressure in the presence of Ni catalyst to give–**

(a) Cyclohexene (b) Cyclohexane

(c) n – hexane (d) No reaction occur

CG PET-22.05.2022

Ans. (b) : Benzene treated with H_2 in the presence of Ni catalyst of 150°C and 30 atm then cyclo hexane is formed. This is the example of addition reaction.



688. **In benzene, the triple bond consists of**

(a) one sp-sp sigma bond and two p-p pi bonds

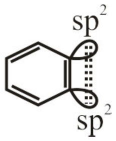
(b) two sp-sp sigma bonds and one p-p pi bond

(c) one sp^2-sp^2 sigma bond, one p-p pi bond

(d) one sp^2-sp^2 sigma bond, one sp^2-$sp^{2.}$ pi bond and one p-p pi bond

VITEEE-2021

Ans. (d)



Benzene is also know as 1,2-dehydrobenzeile of an aryne. It is a neutral and highly reactive reaction intermediate. It one sp^2 – sp^2 σ-bond, one sp^2 – sp^2, π-bond and one p–p–π bond.

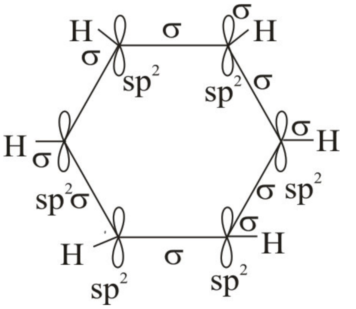
689. **The overlapping of orbitals in benzene is of the type**

(a) sp-sp (b) p-p

(c) sp^2 – sp^2 (d) sp^3 – sp^3

Karnataka-CET, 2008

Ans. (c) : The molecular orbital picture of benzene shows that in it all the six carbon atoms are sp^2 hybridised. Out of these three sp^2 hybrid orbitals of each C atom, two orbitals overlap with sp^2 hybrid orbitals of adjacent C atoms to form six C–C single bonds. The remaining sp^2 orbital of each C atom overlaps with s-orbital of each hydrogen atom to form six C – H single sigma bonds. Each C atom is now left with one unhybridised p-orbital perpendicular to the plane of the ring.



690. **How many litres of oxygen (at STP) are required for complete combustion of 39 g of liquid benzene?**

(atomic weights : C =12, O =16, H=1)

(a) 84 (b) 22.4

(c) 42 (d) 11.2

A.P.EAMCET-2001

Ans. (a)

$$C_6H_6(l)+\frac{15}{2}O_2(g)\rightarrow 6CO_2(g)+3H_2O(g)$$

Molar mass of C_6H_6 = 78 g/mol

39 gms of $C_6H_6(l)=\frac{39}{78}$ moles = 0.5 moles

For 2 moles, we require 15 moles of O_2, for 0.5 moles we will require–

$$\Rightarrow \frac{0.5}{2}\times 15=\frac{15}{4}\text{moles of } O_2$$

$$=\frac{15}{4}\times 22.4\,\text{litres}=84\,\text{litres}$$

@apna_pdf

13.

Environmental Chemistry

1. Water Pollution

1. Sulphur dioxide is one of the components of polluted air. SO_2 is also a major contributor to acid rain. The correct and complete reaction to represent acid and caused by SO_2 is

(a) $2SO_2 + O_2 \longrightarrow 2SO_3$

(b) $SO_2 + O_3 \longrightarrow SO_3 + O_2$

(c) $SO_2 + H_2O_2 \longrightarrow H_2SO_4$

(d) $2SO_2 + O_2 + 2H_2O \longrightarrow 2H_2SO_4$

JEE Main-29.06.2022, Shift-II

Ans. (d) : Sulphur dioxide is a air pollutant which is very harmful to plants and people both. It produced sulphuric acid, when it reacts with oxygen and water and cause acid rain.

The reaction is-

$$2SO_2 + O_2 + 2H_2O \longrightarrow 2H_2SO_4$$

2. Which one of the following statements is not true?

(a) Clean water would have a BOD value of 5 ppm.

(b) Fluoride deficiency in drinking water is harmful. Soluble fluoride is often used to bring its concentration upto 1 ppm.

(c) When the pH of rain water is higher than 6.5, it is called acid rain.

(d) Dissolved Oxygen (DO) in cold water can reach a concentration upto 10 ppm.

(JEE Main 2021, 25 Feb shift-2)
Karnataka-CET, 2013

Ans. (c): Rainwater with a pH less than 5.6 is called acid rain. Normal, clean rain has a pH value of between 5.0 and 5.5, which is slightly acidic. When Sulphur dioxide and nitrogen oxides are released into the air, they react with water and oxygen and produces sulphuric and nitric acids. Thus it forms acid rain.

3. When rain is accompanied by a thunderstorm the collected rain water will have a pH value

(a) Slightly lower than that of rain water without thunderstorm

(b) Slightly higher than that when the thunderstorm is not there

(c) Uninfluenced by occurrence of thunderstorm

(d) Which depends upon the amount of dust in air

[BITSAT – 2014]
AIEEE-2003

Ans. (a) : When rain is accompanied by a thunderstorm the collected rain water will have a pH value slightly lower than that of rain water without thunderstorm.

- During thunderstorm, acidic oxides are formed. They dissolve in rainwater to form acids. This increases the acidity of rain water and decreases the pH.

$$N_2 + O_2 \longrightarrow NO \xrightarrow{O_2} NO_2 \longrightarrow N_2O_5 \xrightarrow{H_2O} HNO_3 (pH < 7)$$

4. The substance having the largest concentration in acid rain?

(a) H_2CO_3 (b) HNO_3

(c) HCl (d) H_2SO_4

WB-JEE-2018
[BITSAT-2007]

Ans. (d) : Sulphuric acid (H_2SO_4) is present in a larger concentration in acid rain. Acid rain is formed due to the presence of oxides of sulphur & nitrogen in the atmosphere. Acid rain contains in order–

$$H_2SO_4 > HNO_3 > HCl > H_2CO_3$$

5. The reagent used in the determination of the chemical oxygen demand (COD) of water sample is

(a) Potassium permanganate

(b) Sulphuric acid

(c) Acidified Potassium dichromate

(d) Potassium dichromate

TS-EAMCET (Engg.), 07.08.2021 Shift-II

Ans. (c):

The most general COD determination uses potassium dichromate ($K_2Cr_2O_7$) in excess in an acidic medium with the aid of silver sulfate (Ag_2SO_4) as a catalyst, and mercuric sulfate ($HgSO_4$) added to remove interference of chlorides.

- COD is widely used as a measure of the susceptibility to oxidation of the organic and inorganic materials present in water bodies and in the municipal and industrial wastes.

6. The correct statement/ option about acid rain is

(a) The acid rain would not affect the fertility of the soil

(b) The acid rain contains HCl

(c) SO_2 and NO_2 are contributors to acid rain

(d) Acetic acid is the component of acid rain

TS EAMCET-10.08.2021, Shift-II

Ans. (c): Acid rain results when sulfur dioxide (SO_2) and nitrogen dioxides (NO_2) are emitted into the atmosphere and transported by wind and air currents.

$$SO_2 + \frac{1}{2}O_2 \rightarrow SO_3$$

$$SO_3 + H_2O \rightarrow \underset{\text{Sulphuric acid}}{H_2SO_4}$$

$$NO_2 + H_2O \rightarrow \underset{\text{Nitric acid}}{HNO_3}$$

@apna_pdf

7. **Given below are two statements.**

Statement I the pH of rain water is normally ~ 5.6.

Statement II if the pH of rain water drops below 5.6., it is called acid rain.

In the light of the above

Statements, choose the correct answer from the options given below.

(a) Both statements I and II are true
(b) Both statements I and II are false
(c) Statement I is true but statement II is false
(d) Statement I is false but statement II is true

[JEE Main-2021, 25 Feb Shift-II]

Ans. (a) : Normally rain water has pH of 5.6 due to the presence of H^+ ion formed by the reaction of rain water with carbon dioxide present in the atmosphere.

8. **Given below are two statements :**

Statements-I Chlorofluoro carbons break down by radiation in the visible energy region and release chlorine gas in the atmosphere which then reacts with stratospheric ozone.

Statement-II Atmospheric ozone reacts with nitric oxide to give nitrogen and oxygen gases, which add to the atmosphere.

For the above statements choose the correct answer from the options given below :

(a) Statement-I is incorrect but statement-II is true
(b) Both statement-I and II are false
(c) Statement-I is correct but statement-II is false
(d) Both statement-I and II are correct

[JEE Main-2021, 25 July Shift-II]

Ans. (b) : Statement I: Chlorofluoro Carbons (CFCs) are broken by powerful UV radiation and releases chlorine free radical which reacts with Ozone & state chain reaction.

$$CF_2Cl_2(g) \xrightarrow{UV} \dot{C}l(g) + CF_2Cl(g)$$

$$\dot{C}l(g) + O_3(g) \longrightarrow \dot{C}lO(g) + O_2(g)$$

$$\dot{C}l(g) + O_3(g) \longrightarrow \dot{C}l(g) + O_2(g)$$

Statement II: Atmospheric Ozone reacts with nitric oxide to produce nitrogen dioxide & oxygen.

$$NO(g) + O_3 \longrightarrow NO_2(g) + O_2(g)$$

9. **Biochemical oxygen demand (BOD) value can be a measure of water pollution caused by the organic matter. Which of the following statements is correct?**

(a) Polluted water has BOD value higher than 10 ppm
(b) Aerobic bacteria decreases the BOD value
(c) Anaerobic bacteria increases the BOD value
(d) Clean water has BOD value higher than 10 ppm

[BITSAT-2021]

Ans. (a) : Clean water has BOD less than 5 ppm whereas highly polluted water have BOD value of 17 ppm or more because the more organic matter there is (e.g, in sewage and polluted bodies of water), the greater the BOD; the lower the amount of dissolved oxygen available for higher animals such as fishes.

- The BOD is therefore a reliable gauge of the organic pollution of a body of water.

10. **Thermal power plants can lead to**

(a) acid rain
(b) blue baby syndorme
(c) ozone layer depletion
(d) eutrophication

[JEE Main-2020 3 Sep Shift-I]

Ans. (a) : Thermal power plants can lead to acid rain as it emits CO_2 that combines with moisture of atmosphere and forms H_2CO_3 (Carbonic acid).

- The thermal power plant has serious impacts on land, soil, air & various social impacts. These plants also emit large amount of mercury & generate large quantity of fly ash with destroys the surrounding environment.

11. **The incorrect statement(s) among (A)-(D) regarding acid rain is (are) :**

(A) It can corrode water pipes.
(B) It can damage structures made up of stone
(C) It cannot cause respiratory ailments in animals.
(D) It is not harmful for trees.

(a) (C) and (D)
(b) (A), (C) and (D)
(c) (C) only
(d) (A), (B) and (D)

[JEE Main-2020, 3 Sep Shift-II]

Ans. (a) : Effects of Acid rain:

- Acid rain damages the leaves of trees and plants, thus limiting their growth and exposing them to the metals in the air from the toxic rain.
- Acid rain increases the acidity of lakes and rivers that kills fish, bacteria & algae & the aquatic ecosystem collapses into sterility leaving a crystal clear but ultimately a dead lake.
- It affects both materials & organism. It attacks building materials principally sandstone, limestone, marble, steel and nickel.

12. **Level of Biochemical oxygen Demand indicates**

(a) Soil pollution
(b) Water pollution
(c) Air pollution
(d) Pollution by photochemical smog

Assam CEE-2019

Ans. (b) : Biochemical oxygen demand represent the amount of oxygen consumed by bacteria and other microorganisms while they decompose organic matter under aerobic conditions at a specified temperature.

13. **The maximum prescribed concentration of copper in drinking water is**

(a) 5 ppm
(b) 0.5 ppm
(c) 0.05 ppm
(d) 3 ppm

[JEE Main-2019, 8 April Shift-II]

@apna_pdf

Ans. (d) : Maximum prescribed concentration of copper metal in drinking water is 3ppm. Above this concentration water become toxic.

14. The concentration of dissolved oxygen (DO) in cold water can go upto

(a) 14 ppm (b) 10 ppm
(c) 8 ppm (d) 16 ppm

[JEE Main-2019, 11 Jan Shift-I]

Ans. (b) : The concentration range of dissolved oxygen (DO) in cold water reaches upto 10 ppm, but that in normal water (at room temperature) is within 5 ppm.

15. Taj Mahal is being slowly disfigured and discoloured. This is primarily due to

(a) water pollution (b) soil pollution
(c) global warming (d) acid rain

[JEE Main-2019, 11 Jan Shift-II]

Ans. (d) : Acid rain reacts with marble, $CaCO_3$ of Taj Mahal causing damage to monument and monument is being slowly disfigured the marble is getting discolored and lusterless.

$$CaCO_3 + H_2SO_4 \rightarrow CaSO_4 + H_2O + CO_2$$

16. Which cleaning agent gets precipitated in hard water?

(a) Sodium lauryl sulphate
(b) Sodium stearate
(c) Cetyl trimethyl ammonium bromide
(d) Sodium dodeyle benzene sulphonate

Karnataka-CET-2019

Ans. (b) : Sodium stearate is the cleaning agent that gets precipitated in hard water.

$$\underset{\text{Sodium Stearate}}{2C_{17}H_{35}COONa} + CaCl_2 \longrightarrow 2NaCl + \underset{\text{insoluble calcium stearate (soap)}}{(C_{17}H_{35}COO)_2Ca}$$

- Sodium stearate is a versatile, material used as an emulsifier, dispersant, gelling agent.

Stabilizer, binder, viscosity modifier and more. It is a major component of many soaps, cosmetics and food additives.

17. The process of 'eutrophication' is due to :

(a) increase in concentration of radioactive substances in water
(b) the reduction in concentration of the dissolved oxygen in water due to phosphate pollution in water
(c) increase in concentration of fluoride ion in water
(d) increase in concentration of insecticide in water

Manipal-2016

Ans. (b) : The process of eutrophication is due to the reduction in the concentration of dissolved oxygen in water due to phosphate pollution in water.

- Harmful algal blooms, dead zones & fish kills are the results of a process called eutrophication which occurs when the environment becomes enriched with nutrients, increasing the amount of plant and algae, increasing the amount of plant and algae growth to estuaries and coastal waters.

18. The wrong statement among the following is

(a) acid rain is mostly because of oxides nitrogen and sulphur
(b) green house effect is responsible for global warming
(c) ozone layer does not permit infrared radiation from the sun to reach earth
(d) chlorofluorocarbons are responsible for ozone layer depletion.

J & K CET-(2015)

Ans. (c) : Ozone layer acts as a shield and does not allow ultraviolet radiation from sun to reach earth. It does not prevent infra-red radiation from sun to reach earth.

All the energy from the sun that reaches the Earth arrives as solar radiation, part of a large collection of energy called the electromagnetic radiation spectrum. Solar radiation includes visible light, ultraviolet light, infrared, radio waves, X-rays, and gamma rays. Radiation is one way to transfer heat.

19. BOD is a measure of

(a) ozone depletion in the stratosphere due to too many free radicals
(b) suspended particulate matter in the air causing lung problems
(c) pesticides which are non-biodegradable in the soil and water
(d) organic material present in water needing dissolved oxygen to break them down depleting oxygen content in water.

COMEDK-2015

Ans. (d): Biochemical oxygen demand (BOD) is the amount of dissolved oxygen needed by aerobic biological organisms to break down organic material present in a given water sample at certain in a given water sample at certain temperature over a specific time period.

- A low BOD is an indicator of good quality water, while a high BOD indicates polluted water.

20. Rain water is called acid rain when its pH

(a) falls below zero
(b) falls below 5.6
(c) is above 5.6 but less then 10
(d) is above 10.

COMEDK-2014

Ans. (b): With a pH range of 5 to 6, natural rain water is mildly acidic. It becomes acid rain when the pH level of rainwater falls below this range. Therefore, the pH of acid rain is approximately 4 to 5.

21. Match the following

List I	**List II**
(A) pH of unpolluted rain water	(I) $H_2C{=}CH{-}CHO$
(B) Acid rain	(II) 5.6
(C) Acrolein	(III) NO_2, CO_2
(D) Freon	(IV) CF_2Cl_2
	(V) $CaOCl_2$

	(A)	**(B)**	**(C)**	**(D)**
(a)	(II)	(I)	(III)	(IV)
(b)	(I)	(II)	(III)	(IV)
(c)	(III)	(II)	(IV)	(I)
(d)	(II)	(III)	(I)	(IV)

AP EAMCET (Medical)-2013

@apna_pdf

Ans. (d): The pH of unpolluted rain water is 5.6. Thus, it is slightly acidic in nature.

- Acid rain is due to the presence of NO_2 and CO_2. It follows the following reaction.

$$2NO + O_2 \longrightarrow 2NO_2$$

$$2NO + H_2O \longrightarrow HNO_3 + HNO_2$$

$$\text{(Nitric acid)}$$

And $$2SO_2 + O_2 \longrightarrow 2SO_3$$

- The chemical formula of acrolein is $H_2C = CH - CHO$.

→ Acrolein is a colorless or yellow liquid with a disagreable odour. It dissolves in water very easily and quickly changes to a vapor when heated.

→ Acrolein is a simplest unsaturated aldehyde and is highly flammable, very reactive, is fatal when swallowed, and causes burns to skin and eye. It is simplest unsaturated aldehyde, also known as propanal

- Freon's are colorless, odorless, nonflammable, and noncorrosive gases or liquids belonging to the class of chlorofluorocarbons (CFCs). Due to their low boiling points and low viscosity, they are mainly used as refrigerants in refrigerators and air-conditioning systems. It is also known as chlorofluorocarbon.

22. Which one of the following statement is not true?

(a) pH of drinking water should be between 5.5-9.5.

(b) Concentration of DO below 6 ppm is good for the growth of fish

(c) Clean water would have a BOD value of less than 5 ppm

(d) Oxides of sulphur, nitrogen and carbon, are the most widespread air pollutant

NEET-2011

Ans. (b) : Concentration of DO below 6 ppm is not good for the growth of fished because the growth of fishes get hindered if the concentration of DO is below 6 ppm. The ideal value of DO for growth of fishes 8 mg/I.

DO = Dissolved oxygen

Hence, statement B is not true.

23. Most abundant water pollutant is

(a) detergents (b) industrial wastes

(c) pesticides (d) oil spills

BCECE-2011

Ans. (b) : Industrial wastes are the most abundant water pollutant.

- The waste from industries containing poisonous chemicals enter the ponds, lakes, rivers, and seas and degrade the oxygen level in the water, blocking the sunlight affecting the growth of aquatic species.

24. Minamata disease is due to pollution of

(a) aresenic into the atmosphere

(b) organic waste into drinking water

(c) oil spill in water

(d) industrial waster mercury into fishing water

[BITSAT-2010]

Ans. (d) : The minamata disease is a kind of organic mercury poisoning induced by the intake of polluted fish & shellfish caught in Minamata Bay. It is a neurological disease caused by the release of mercury/methyl mercury from the industries into the fresh water bodies and the subsequent consumption of the water.

25. Phosphate pollution is caused by:

(a) Sewage and agricultural fertilizers

(b) Weathering of phosphate rocks only

(c) Agricultural fertilizers only

(d) Phosphate rocks and sewage

[BITSAT-2010]

Ans. (a) : Phosphate pollution in the water is directly related to the release of the untreated sewage and agriculture fertilizers into the water body. This result in excessive algal bloom that forms a thick layer on the surface of the water and prevent the sunlight and oxygen from getting into the water.

26. The water pollutants mainly responsible for eutrophication are

(a) Cd, Pb and Hg present in industrial waste

(b) heavy metals present in mining waste

(c) detergents and fertilizers containing phosphate anion

(d) polychlorinated biphenyls

AMU-2005

Ans. (c) : Detergents and fertilizers containing phosphate anion are the water pollutants mainly responsible for eutrophication. The addition of phosphorous water in the form of phosphate ion. encourages the formation of algae, which reduce of DO of water. This process known as eutrophication.

- Eutrophication is the gradual increase in the concentration of phosphoros, nitrogen, and other plants nutrients in an aging aquatic ecosystem such as a lake.

27. Water is considered to be polluted if the dissolved oxygen (DO) content is less than….ppm.

(a) 5 (b) 10

(c) 15 (d) 100

AP EAMCET-2003

Ans. (b): Water is considered to be polluted if the dissolved oxygen (DO) content is less than 10 ppm.

- Water pollution is the contamination of water sources by substances which make the water unusable for drinking, cooking, clearing, swimming, and other activities.

28. Amongest

$\mathbf{NO_3^-, AsO_3^{3-}, CO_3^{2-}, ClO_3^-, SO_3^{2-}}$ **and** $\mathbf{BO_3^{3-}}$

the non-planar species are

(a) CO_3^{2-}, SO_3^{2-}, and BO_3^{2-}

(b) AsO_3^{3-}, ClO_3^-, and SO_3^{2-}

(c) NO_3^-, CO_3^{2-}, and BO_3^{3-}

(d) SO_3^{2-}, NO_3^-, and BO_3^{3-}

VITEEE, 2017

Ans.(b): AsO_3^{3-}, ClO_3^- and SO_3^{2-} undergoes sp^3 hybridisation and its geometry is pyramidal with one lone pair and hence, are non-planer species while NO_3^-, CO_3^{2-} and BO_3^{3-} have sp^2 hybridisation and its geometry is trigonal planer, with no lone pair.

@apna_pdf

2. Air Pollution

29. The pollution due to oxides of sulphur gets enhanced due to the presence of:

(I) particulate matter (II) ozone
(III) hydrocarbons (IV) hydrogen peroxide

Choose the most appropriate answer from the options given below

(a) (II), (III), (IV) only (b) (I), (III) (IV) only
(c) (I), (IV) only (d) (I), (II), (IV) only

NEET-17.07.2022

Ans. (d) : Particulate matter, O_3, H_2O_2 enhance oxidation process.

(i) $2SO_2(g) + O_2(g) \rightarrow 2SO_3(g)$

(ii) $SO_2(g) + O_3(g) \rightarrow SO_3(g) + O_2(g)$

(iii) $SO_2(g) + H_2O_2(l) \rightarrow H_2SO_4(aq)$

30. The smog is essentially caused by the presence of

(a) O_2 and O_3
(b) O_2 and N_3
(c) Oxides of sulphur and nitrogen
(d) O_3 and N_2

JCECE - 2008
UPTU/UPSEE-2007, AIEEE 2004

Ans. (c) : Smog is a type of air pollution. Smog is going to form by the mixture of smoke and fog in the air.

- Due to the photochemical reaction between volatile organic compounds (fuels), oxides of sulphur, and oxides of nitrogen, a large amount of ozone and fine particles are released into the air.
- The fuels, oxides of sulphur and oxides of nitrogen are called precursors because they are reasonable for the formation of the smog.

31. Which one of the following is not a common component of photo-chemical smog?

(a) Ozone
(b) Acrolein
(c) Peroxy acetyl nitrate
(d) Chlorofluorocarbons

Karnataka-CET-2017
NEET-2014

Ans. (d): Chlorofluorocarbons (CFCs) is not a common component of photo-chemical smog.

- The major components of photochemical smog are nitrogen dioxide (NO_2), Ozone (O_3), PAN (peroxyacetylinitrate), and chemical compounds that contain the CHO group (aldehydes).

32. Identify the incorrect statement from the following

(a) Oxides of nitrogen in the atmosphere can cause the depletion of ozone layer
(b) Ozone absorbs the intense ultaviolet radiations of the sun
(c) Depletion of ozone layer is because of its chemical reactions with chlorofluoro alkanes
(d) Ozone absorbs infrared radiations

[BITSAT-2018]
AIEEE-2011

Ans. (d) : The ozone layer, existing between 20 to 35km above the earth's surface, shield the earth from the harmful ultraviolet radiations from the sun.

33. Which of the following is not an air pollutant?

(a) N_2 (b) N_2O
(c) NO (d) CO

AP - EAMCET (Medical)-2007
AP EAMCET-2005

Ans. (a) : Nitrogen is not an air pollutant as the atmospheric composition contains 78% nitrogen and 21% oxygen by proportion. Oxides of nitrogen from external sources and carbon monoxide are various exhaust gases from vehicles which are air pollutants causing damage to the atmosphere.

- The six major air pollutants are particulate matter, Ground level zone, carbon Monoxide, Sulfur oxides, Nitrogen oxides and lead.

34. Which of the following is not involved in the formation of photochemical smog?

(a) Hydrocarbon (b) NO
(c) SO_2 (d) O_3

[BITSAT-2017, 2005]

Ans. (c) : SO_2 is not involved in the formation of photochemical smog.

- Photochemical smog, also called 'Los Angeles smog', is brown in colour and observed in sunny and densely populated cities.

35. Which of the following acts as a sink for CO?

(a) Plants
(b) Haemoglobin
(c) Microorganisms present in the soil
(d) Oceans

NEET-2017
[BITSAT-2008]

Ans. (c) : Since, soil also acts as a sink for Carbon monoxide and is a natural medium. Microorganism present in soil also act as a sink for carbon monoxide (CO).

- Don't mix up with plant and soil. Plants act as sink for carbon dioxide and soil act as sink for carbon monoxide.

36. Eutrophication causes reduction in

(a) Dissolved oxygen (b) Nutrients
(c) Dissolved salts (d) All the above

Karnataka-CET-2019
[BITSAT-2010]

Ans. (a) : Eutrophication is the process of enriching water bodies with phosphates like nutrient. It support the abnormal growth of algae & the lakes and ponds become marshy. As the algae increases, it consumes more dissolve oxygen and therefore level of dissolve oxygen decreases.

37. Air pollution that occurs in sunlight is:

(a) Reducing smog (b) Acid rain
(c) Oxidizing smog (d) Fog

AIIMS 25 May 2019 (Morning)
JEE Main-10.04.2019, Shift-II

@apna_pdf

Ans. (c): Oxidizing smog is the air pollution that occurs in sunlight.

• Photochemical smog form when primary pollutants are transformed through photo chemical reactions into secondary pollutants, the most important which are the strong oxidant gases, ozone and peroxyacetyl nitrate (PAN).

• $\text{Hydrocarbons} + O_2 + NO_2 \xrightarrow{\text{Sunlight}} \underset{\text{PAN}}{CH_3COONO_2}$

38. Decomposition of ozone can be caused by
(a) atomic helium (b) water vapour
(c) dust particles (d) atomic chlorine

SRMJEEE-2013, 2012

Ans. (d) : Decomposition of ozone can be caused by atomic chlorine which leads to depletion of ozone layer in the stratosphere.

• The thinning of the ozone layer, is mainly due to the action of the chlorine cycle during which, the presence of one chlorine atom in the stratosphere can cause the decomposition of 100000 ozone molecules.

39. Given below are two statements:

Statement I An allotrope of oxygen is an important intermediate in the formation of reducing smog.

Statement II Gases such as oxides of nitrogen and sulphur present in troposphere contribute to the formation of photochemical smog.

In the light of the above statements, choose the correct answer from the options given below.
(a) Both statement I and statement II are true
(b) Both statement I and statement II are false
(c) Statement I is true but statement II is false
(d) Statement I is false but statement II is true

[JEE Main-2021, 25 Feb Shift-I]

Ans. (b) : Reducing smog is a mixture of smoke, fog and Sulphur dioxide.
Troposphere contribute to the formation of chemical smog due to presence of Sulphur dioxide and carbon particles. Troposphere pollutants such as hydrocarbon and nitrogen oxide contribute to the formation of photochemical smog.

40. The gas released during anaerobic degradation of vegetation may lead to
(a) acid rain
(b) global warming and cancer
(c) corrosion of metals
(d) ozone hole

[JEE Main-2021, 24 Feb Shift-I]

Ans. (b): Anaerobic degradation means the breakdown in the absence of oxygen. During anaerobic degradation of vegetation, CH_4 is produced, which is responsible for global warming as it absorbs sun's heat. It is also known to cause cancer.

41. The statements that are true.
(A) Methane leads to both global warming and photochemical smog.
(B) Methane is generated from paddy fields
(C) Methane is a stronger global warming gas than CO_2
(D) Methane is a part of reducing smog

Choose the most appropriate answer from the options given below
(a) (A), (B), (C) only (b) (A) and (B) only
(c) (B), (C), (D) only (d) (A), (B), (D) only

[JEE Main-2021, 18 March Shift-I]

Ans. (a) The statements (A), (B) & (C) are true regarding to methane.

• Contribution of global warming gas

$CO_2 > CH_4 > CFCs > O_3 > N_2O > H_2O$

But CH_4 is 40 times stronger greenhouse gases than CO_2. It has more heating effects.

• Methane is not a part of reducing smog.

42. Reducing smog is mixture of
(a) smoke, fog and O_3
(b) smoke, fog and SO_2
(c) smoke, fog and $CH_2 = CH - CHO$
(d) smoke, fog and N_2O_3

[JEE Main-2021, 17 march Shift-I]

Ans. (b): Reducing smog is mixture of smoke, fog and SO_2.

43. Which of the following statement (s) is/are incorrect?
(a) A sink of SO_2 pollutant is O_3 in the atmosphere
(b) FGD is a process of removing NO_2 from atmosphere
(c) NO_x in fuel gases can be removed by alkaline scrubbing
(d) The catalyst to convert CCl_4 to CF_4 by HF is SbF_5

WB-JEE-2020

Ans. (b & c): Statements (b and c) are incorrect whereas statement (a & d) is correct. The corrected form as follows:–

- FGD is a set of technologies used to remove SO_2 from exhaust flue gasses of fossil fuel power plant and from the emission of other SO_2 emitting.
- NOx in fuel gases can be removed by pyrolusite slowly.

44. Which of the following is a greenhouse gas?
(a) Methane (b) Ethane
(c) Hydrogen sulphide (d) Acetylene
(e) Ethylene

Kerala-CEE-2020

Ans. (a): Green house gases are gases that cause a green house effect. They absorb and emit infrared radiation. Water vapour, carbon dioxide, methane, nitrous oxide, and ozone are green house gases.

45. The condition that indicates a polluted environment is
(a) pH of rain water to be 5.6
(b) eutrophication
(c) BOD value of 5 ppm
(d) 0.03% of CO_2 in the atmosphere

[JEE Main-2020, 5 Jan Shift-II]

Ans. (b) : Eutrophication is the condition that indicates a polluted environment.

• Eutrophication is the condition in which excessive richness of nutrients in a lake or water body, which causes dense growth of plant life and BOD increases.

@apna_pdf

46. The molecule that has minimum/no role in the formation of photochemical smog, is

(a) N_2 (b) $CH_2 = O$

(c) NO (d) O_3

[JEE Main-2019, 12 Jan Shift-I]

Ans. (a) : NO_2, O_3 and hydrocarbon is main resource for the build-up smog.

And other compound which are responsible for photochemical smog is HCHO, O_3 and NO.

So, N_2 has no role in the formation of photochemical smog.

47. The correct set of species responsible for the photochemical smog is

(a) N_2, NO_2 and hydrocarbons

(b) CO_2, NO_2, SO_2 and hydrocarbons

(c) NO, NO_2, O_3 and hydrocarbons

(d) N_2, O_2, O_3 and hydrocarbons

[JEE Main-2019, 12 April Shift-I]

Ans. (c) : Photochemical smog is mixture of pollutants that are formed when nitrogen oxides and volatile organic compounds (VOCs) react to sunlight, creating a brown haze above cities.

Photochemical smog is an oxidizing smog and occurs in warm atmospheric condition.

Common component of photochemical smog are ozone nitric oxide acrolein PAN.

48. The primary pollutant that leads to photochemical smog is

(a) acrolein (b) nitrogen oxides

(c) ozone (d) sulphur dioxide

[JEE Main-2019, 12 April Shift-II]

Ans. (b) : Nitrogen oxide is the primary pollutant. Again if we observe the reaction mentioned above we can observe the reaction mentioned above we can observe that the whole set reaction information of photochemical smog revolves around nitrogen oxide without the presence of higher concentration of nitrogen oxide in one place, the formation of photochemical smog is impossible.

49. Assertion (A) Ozone is destroyed by CFCs in the upper stratosphere.

Reason (R) Ozone holes increase the amount of UV radiation reaching the earth

(a) Assertion and Reason are incorrect

(b) Assertion and Reason are both correct and the Reason is the correct explanation for the Assertion.

(c) Assertion and Reason are correct, but the Reason is not the explanation for the Assertion.

(d) Assertion is false, but the Reason is correct

[JEE Main-2019, 8 April Shift-I]

Ans. (c) : Ozone is present in the atmosphere in the upper part of the atmosphere called the stratosphere.

Ozone (O_3) which protect us from harmful ultraviolet (UV) radiations coming from the sun.

And CFCs when react with ozone (O_3) it breaks the molecules of ozone resulting in ozone layer depletion.

50. Which one of the following is the major constituent of biogas?

(a) Carbon dioxide (b) Nitrous oxide

(c) Methane (d) Oxygen

NDA (II)-2019

Ans : (c) Biogas is the mixture of gases produced by the breakdown of organic matter in the absence of oxygen. The main component of biogas is 'methane' (CH_4) about 75%.

51. Carbon monoxide is a pollutant as it

(a) inactivates nerves

(b) inhibits glycolysis

(c) combines with oxygen

(d) combines with haemoglobin

Assam CEE-2018

Ans. (d) : Carbon monoxide (CO) - a colourless, orderless, tasteless, and toxic air pollutant-is produced in the incomplete combustion of carbon-containing fuels, such as gasoline natural gas, oil, Coal and wood.

CO affects human health by impairing the ability of the blood to bring O_2 to body tissue, when CO is in fated, it rapidly crosses the alveolar epithelium to such the blood, where it binds to haemoglobin to Carboxyhemoglobin (COHb), a useful maker for predicting the health effects of CO. CO has an affinity for haemoglobin more than 200 times greater than O_2, the present of CO in the lung will displace O_2 from the heamoglobin.

52. Which oxide of nitrogen is not a common pollutant introduced into the atmosphere both due to natural and human activity?

(a) N_2O_5 (b) NO_2

(c) N_2O (d) NO

NEET-2018

Ans. (a) : Dinitrogen Pentaoxide (N_2O_5) is an oxide of Nitrogen which is not a common pollutent. It is an unstable and dangerous oxides, which have only nitrogen and oxygen. This is not a common pollutant introduced into the atmosphere both due to natural and human activity.

53. SO_2 is considered as airpollutant because

(a) Its concentration increases with temperature increase of atmosphere

(b) It is used as insecticide, which is airpollutant

(c) It reacts with O_2 and H_2O to produce acid rain

(d) It is a strong oxidant and oxidised other components of atmosphere

UPTU/UPSEE-2018

Ans. (c): SO_2 is considered as air pollutant because it reacts with O_2 and H_2O to produce acid rain.

- Acid rain is caused by a chemical reaction that begins when compounds like sulfur dioxide and nitrogen oxide (are released into air). These substances can rise very high into the atmosphere, where they mix and react with water, oxygen and other chemicals to form more acidic pollutants known as acidic rain.

54. The photochemical smog is

(a) formed due to oxidation of hydrocarbons trapped in flowing air in the presence of sunlight

@apna_pdf

(b) formed due to oxidation of smoke trapped in stagnant air mass in the presence of sunlight
(c) formed due to heterogeneous combination of smoke and fog in air in the presence of sunlight
(d) formed due to oxidation of hydrocarbons trapped in stagnant air mass in the presence of sunlight.

AMU-2017

Ans. (d) : Photochemical smog is a brownish-gray haze caused by the action of solar ultra radiation on atmosphere polluted with hydrocarbons and oxides of nitrogen.

- It contains anthropogenic air pollutants, mainly Ozone, nitric acid, and organic compounds, which are trapped near the ground by temperature inversion.
- Photochemical smog formation reaction is as follows

$$\underset{\substack{\text{(Voltile organic}\\\text{compound)}}}{\text{VOCs}} + \text{NO} \xrightarrow{\text{Sunlight}} O_3 + HNO_3 + \text{Organics}$$

55. In environmental chemistry, the medium which is affected by a pollutant is called as the ....
(a) sink (b) slag
(c) solvent (d) receptor

TS-EAMCET-2016

Ans. (d) : In environmental chemistry a receptor is any organism or object affected by the pollution of the environment around the organism.

- **Receptor:** The medium which is effected by the pollutant is called receptor. Eg: Our eyes become red with burning sensation due to the smike released from automobiles.

56. Freon 12 is manufactured from CCl_4 by
(a) Wurtz reaction
(b) Swarts reaction
(c) Fittig reaction
(d) Wurtz-Fittig reaction
(e) Sandmeyer reaction

Kerala-CEE-2016

Ans. (b): Freon-12 is manufactured from CCl_4 by Swarts reaction.

$$3CCl_4 + 2SbF_3 \longrightarrow \underset{\text{(Freon-12)}}{3CCl_2F_2} + 2SbCl_3$$

57. Which of the following statement(s) is not correct?
(a) Suspended particulate matter is an important pollutant released by diesel vehicles
(b) Soot particles (size<5μ) cause fibrosis of the lung living
(c) H_2SO_4 particulates have size of 500–1000nm
(d) Photochemical smog is formed by oxides of sulphur, smoke and dust particles

JIPMER-2016

Ans. (d): Statement (d) is not correct.

- Photochemical smog is produced when sunlight reacts with nitrogen oxides and at least one volatile organic compound (VOC) in the atmosphere.
- Nitrogen oxides come from vehicle exhaust, cool power plants, and factory emissions.
- VOCs are released from gasoline, paints, and many cleaning solvents.

58. Which of the following oxides of nitrogen is not an air pollutant?
(a) NO_2 (b) N_2O
(c) N_2O_5 (d) NO

AMU-2015

Ans. (c) : N_2O_5 is not a common pollutant introduced into the atmosphere both due to natural and human activity.

N_2O, NO and NO_2 are common pollutants introduced into the atmosphere both due to natural and human activity.

59. Assertion (A) Nitrogen and oxygen are the main components in the atmosphere but these do not react to form oxides of nitrogen.
Reason (R) The reaction between nitrogen and oxygen requires high temperature
(a) Both Assertion and Reason are correct and the reason is the correct explanation for the Assertion.
(b) Both Assertion and Reason are correct but the reason is not the correct explanation for the Assertion.
(c) The Assertion is incorrect but reason is correct.
(d) Both the Assertion and reason are incorrect.

JEE Main-2015

Ans. (a) : Nitrogen and Oxygen are the main components in the atmosphere but these do not react to form oxides of nitrogen.

This is because the reaction between nitrogen and oxygen requires high temperature to overcome the activation energy barrier.

Thus both Assertion and reason as correct and reason is the correct explanation of Assertion.

60. Which of the following pollutants is main product of automobiles exhaust?
(a) CO (b) CO_2
(c) NO (d) Hydrocarbons

[BITSAT-2015]

Ans. (c) : Nitric oxide (NO) pollutant is the main product of automobiles exhaust Nitrogen dioxide (NO_2) pollutant is also the product of aoutomobiles exhaust. These oxides destroy ozone layer.

- Pollutants produced by vehicle exhaust include carbon monoxide, hydrocarbons, nitrogen oxides, particles, volatile organic compounds and sulfur dioxide.

61. The disease caused the high concentration of hydrocarbon pollutants in atmosphere is / are
(a) silicosis (b) TB
(c) Cancer (d) asthma

[BITSAT-2015]

Ans. (c) : The high concentration of hydrocarbon pollutants in atmosphere causes cancer. In plants, hydrocarbons cause ageing, shading of leaves, flowers and twigs. Hydrocarbons are produced due to incomplete combustion of fuel used in automobiles.

- Hydrocarbons are majorly used as the source of combustible fuel source. They are also beneficial in production of many consumer products used to manufacture plastics, synthetic rubbers, synthetic fibres, fertilizers. etc.

@apna_pdf

62. In an atmosphere with industrial smog, copper corrodes to

I. $Cu_2(OH)_2SO_4$ **II. $Cu_2(OH)_2CO_3$**
III. $CuSO_4$ **IV. $CuCO_3$**
(a) I and III (b) II and IV
(c) I and IV (d) I and II

BCECE-2013

Ans. (d) : Corrosion of Copper gives $Cu_2(OH)_2SO_4$ & $Cu_2(OH)_2CO_3$.

$2Cu + H_2O + SO_3 + O_2 \rightarrow Cu_2(OH)_2\ SO_4$

$2Cu + H_2O + CO_2 + O_2 \rightarrow Cu_2(OH)_2\ CO_3$

- Copper corrodes to a mixture of carbonate & sulphate compounds in various amounts, depending upon environmental conditions such as sulphur containing acid rain.

63. Freon used as refrigerant is

(a) $CF_2 = CF_2$ (b) CH_2F_2
(c) CCl_2F_2 (d) CF_4

JCECE-2012

Ans. (c) : Freon used as refrigerant is CCl_2F_2.

$$CCl_4 + 2HF \xrightarrow{Sb_2F_5} \underset{freon}{CF_2Cl_2} + 2HCl$$

64. The gas emitted by supersonic jet planes that slowly depletes the concentration of ozone layer is

(a) CO (b) NO
(c) SO_2 (d) O_2
(e) HF

Kerala-CEE-2012

Ans. (b): The gas released into upper atmosphere from engine of supersonic jet plane is nitric oxide (NO). It reaches into the stratosphere, reacts with ozone and cause its depletion.

$$NO + O_3 \longrightarrow NO_2 + O_2$$

$$O_2 \xrightarrow{UV} [\dot{O}] + [\dot{O}]$$

$$NO_2 + [\dot{O}] \longrightarrow NO + O_2$$

65. Which one of the following statements regarding photochemical smog is not correct?

(a) Carbon monoxide does not play any role in photochemical smog formation.
(b) Photochemical smog is an oxidizing agent in character.
(c) Photochemical smog is formed through photochemical reaction involving solar energy
(d) Photochemical smog does not cause irritation in eyes and throat

NEET-2012

Ans. (d): Photochemical smog is the chemical reaction of sunlight, nitrogen oxides and volatile organic compounds in the atmosphere. Which leaves airborne particles and ground level ozone.

Being an irritant of the eyes, nose throat, and lungs, ozone is known to particularly affect asthmatics and people with respiratory problems.

66. CCl_4 and freons

(a) are green compounds because they are green coloured
(b) depletes ozone concentration
(c) causes increase in ozone concentration
(d) have no effect on ozone concentration.

J & K CET-(2012)

Ans. (b): CCl_4 and freons depletes ozone concentration. freon-12 (dichlorodiflooro-methane, CF_2Cl_2) is commonly known as CFC. It is used as a refrigerant in refrigerators and air conditioners.

It is also used in aerosol spray propellants such as body sprays, hair sprays etc.

CFCS & CCl_4 released to atmosphere -Ozone layer depletion takes place which prevent us from UV rays.

UV rays-released to atmosphere - skin cancer and eye infection or other diseases.

67. CO_2 goes to air, causes green house effect and gets dissolved in water. What will be the effect on soil fertility and pH of the water?

(a) Increases (b) Decreases
(c) Remain same (d) None of these

[BITSAT-2012]

Ans. (b) : Carbon dioxide dissolves in water to form carbonic acid

$$H_2O + CO_2 \rightarrow H_2CO_3$$

Due to this pH of the water will decrease (it will become more acidic and soil fertility will decrease).

68. Which one of the following statements about ozone and ozone layer is true?

(a) Ozone layer is beneficial to us because ozone cuts out the ultraviolet radiation of the sun.
(b) The conversion of ozone to oxygen is an endothermic reaction
(c) Ozone has a triatomic linear molecule
(d) None of the above

[BITSAT-2011]

Ans. (a) : The ozone layer protects the Earth against most UV ray coming from the sun. It is always important to protect oneself against UV radiation, even in the absence of Ozone depletion, by wearing heat, sunglasses, and sunscreen. However, these precautions will become more important as ozone depletion worsens.

- It helps in polar ice shifting.
- Help to reduce temperature.

69. Producer gas is the mixture of

(a) $CO + N_2$ (b) $CO + H_2$
(c) CO + water vapour (d) $N_2 + CH_4$

JCECE-2010

Ans. (a): Producer gas is combustible mixture of nitrogen (N_2), carbon monoxide (CO) and Hydrogen (H_2).

Uses :

- Producer gas is utilised as a fuel in a variety of sectors, including iron producing industries.
- To remove the carbon dioxide gas from the fuel cells, producer gas is used.
- Producer gas is used in the production of fuel gas.

@apna_pdf

70. The statements which is not correct about control of particulate pollution is:
(a) In electrostatic precipitator, the particulates are mode to acquire positive charge which are then attracted by the negative electrode and removed
(b) Gravity settling chamber removes larger particles from the air
(c) Cyclone collector removes fine particls in the diameter range 5-20 microns
(d) Wet scrubbers are used to wash away all types of particulates

[BITSAT-2009]

Ans. (a) : In electrostatic precipitation, the particulates are mode to acquire negative charge which are them attracted by the positive electrode & removed.

Hence, the option (a) is not correct.

71. Chief source of soil and water pollution is:
(a) Mining (b) Agro industry
(c) Thermal power plant (d) All of the above

[BITSAT-2009]

Ans. (d) : Mining, Agro industry, Thermal power plant all are the chief source of soil & water pollution.

• Soil pollution is often caused by the uncontrolled disposal of sewage and other liquid wastes resulting from domestic uses of water, industrial wastes containing a variety of pollutants, agricultural and drainage of irrigation water.

72. The false statement among the followings:
(a) The average residence time of NO is one month
(b) Limestone acts as a sink for SO_x.
(c) SO_x can be removed from flue gases by passing through a solution of citrate ions.
(d) Ammonia acts as a sink for NO_x.

[BITSAT-2008]

Ans. (a) : Residence time means the lifetime amount of chemicals in the atmosphere divided by the rate at which the chemicals are eliminated from the atmosphere. The average residence time of NO is 0.5 to 2 days.

Hence, average residence time of NO is one Months it is false statements.

• Nitrous oxide (NO_2) has a long residence time in the atmosphere and average of about 120 years.

73. Sewage mostly constitutes:
(a) Non-biodegradable pollutants
(b) Biodegradable pollutants
(c) Effluents
(d) Air pollutants

[BITSAT-2008]

Ans. (c) : Sewage mostly constitutes Effluents Effluent is sewage that has been treated in a septic tank or sewage treatment plant. It is also referred to as "trade effluent" or "wastewater". Effluent is waste other than waste from kitchens or toilets, surface water or domestic sewage. It can be produced and discharged by an industrial or commercial premises.

74. BOD is connected with:
(a) Microbes and organic matter
(b) Organic matter
(c) Microbes
(d) None of the above

[BITSAT-2008]

Ans. (a) : Biological oxygen demand measures the amount of oxygen consumed by microorganism as they break down organic matter within small water samples, which are analyzed in a Laboratory. The BOD of non-polluted water is above 17 ppm.

• When the BOD is high, the dissolved oxygen (DO) content of the water may become too low to support life in water.

75. The type of pollution caused by spraying of DDT
(a) Air and soil (b) Air and water
(c) Air (d) Air, water and soil

[BITSAT-2007]

Ans. (d) : Spraying of DDT chemicals reacts to the pollution of the air, soil and water soil is the main polluting part when DDT is sprayed to the crops.

• DDT or dichlorodiphenyltrichloroethane, is a chemical compound with the formula $C_{14}H_9Cl_5$.

• DDT and other agrochemicals are release greenhouse gasses to the environment which causes ozone depletion.

• Water may also get polluted by this which destroy all aquatic organisms in the water.

76. Presence of which fuel gas in the exhaust fumes shows incomplete combustion of fuel
(a) Sulphur dioxide
(b) Carbon monoxide and water vapour
(c) Carbon monoxide
(d) Nitrogen dioxide

[BITSAT-2007]

Ans. (c) : Carbon monoxide is formed when carbon reacts with oxygen in limited supply of air i.e. when its incomplete combustion occurs.

• Carbon monoxide (CO) is slightly less dense, colorless, odorless, and tasteless gas than oxygen.

• This gas affects the oxygen capacity of Red Blood Cells.

77. Bhopal gas tragedy of 1984 was caused by
(a) Carbon monoxide (b) Phosgene
(c) Methyl cyanate (d) Methyl isocyanate

AP EAMCET-2007

Ans. (d) : On the night of December 2, 1984, chemical, methyl isocyanate (MIC) split out from Union carbide India Ltd's (UCIL's) pesticide factory turned the city of Bhopal into a colossal gas chamber. It was India's first major industrial disaster.

• When MIC and water mixed, an exothermic chemical reaction started, which produced a lot of heat. As a result, the safety valve of the tank burst because of the increase in pressure.

78. $CFCl_3$ is responsible for the decomposition of ozone to oxygen. Which of the following reacts with ozone to form oxygen?

@apna_pdf

(a) Cl_2 (b) Cl^-

(c) F^- (d) Cl^*

AP-EAMCET-2006

Ans. (d) : According to the question

$$CFCl_3 \xrightarrow{hv} \dot{C}l + \dot{C}FCl_2$$

Hence, $\dot{C}$ reacts with O_3 through a chain reaction as follows-

$$\dot{C}l + O_3 \longrightarrow Cl\dot{O} + O_2$$

$$\dot{C}l + O \longrightarrow \dot{C}l + O_2$$

Hence, option (d) is correct.

79. Which of the following is not a consequence of greenhouse effect?

(a) Climatic conditions will be changed

(b) Plants in warmer climates with adequate rainfall would grow faster

(c) The incidence of infectious diseases is likely to increase

(d) Malaria will be controlled as the mosquitoes will not survive

[BITSAT-2006]

Ans. (d) : Malaria will be controlled as the mosquitoes will not survive. It is not consequence of green house effect.

Consequence of green house effect is-

- Causes global warming which result in making holes in the ozone layer.
- Climatic condition will be changed.

80. Pick up the correct statement :

(a) CO which is major pollutant resulting from the combustion of fuels in automobiles plays a major role in photochemical smog

(b) Classical smog has an oxidizing character while the photochemical smog is reducing in character

(c) Photochemical smog occurs in day time whereas the classical smog occurs in early morning hours

(d) During formation of smog the level of ozone in the atmosphere goes down

(e) Classical smog is good for health but not photochemical smog

Kerala-CEE-2005

Ans. (c): Classical smog occurs in cold and humid climate photochemical smog occurs in warm dry and sunny climate. Photochemical smog is an oxidizing smog whereas classical smog is an reducing smog.

81. Poisonous gas present in the exhaust fumes of an automobile is

(a) C_2H_6 (b) CO_2

(c) CO (d) CH_4

AP-EAMCET-1996

Ans. (c) : Carbon monoxide (CO) is a poisonous gas that is emitted from the exhaust system of a combustible engine of an automobile that uses petrol or diesel as a fuel. It is an odourless, colourless, tasteless, non-irritating and poisonous gas.

3. Types of Pollution and Pollutants

82. Give below ate two statements:

Statement I: Classical smog occurs in cool humid climate. It is a reducing mixture of smoke, fog and sulphur dioxide

Statement II: Photochemical smog has components, ozone, nitric oxide, acrolein, formaldehyde, PAN etc.

In the light of the above statements, choose the most appropriate answer form the options given below.

(a) Both statement I and statement II are correct

(b) Both statement I and statement II are incorrect

(c) Statement is correct but statement II is incorrect

(d) Statement I is incorrect but statement II is correct

JEE Main-27.06.2022, Shift-I

Ans. (a) : Both the given statements about classical smog and photochemical somog are correct.

So, the correct option is (a).

83. Match the Column I and II and pick the correct matching from the codes given below.

Column I		**Columan II**	
A	Polycylic aromatic hydrocarbons	**1**	Global warming
B	Dioxins	**2**	Photochemical
C	IR active molecules	**3**	Carcinogens
D	Peroxy acetyl nitrate	**4**	Waste incineration

	A	**B**	**C**	**D**
(a)	3	4	1	2
(b)	4	3	2	1
(c)	3	4	2	1
(d)	1	2	3	4

Manipal-2016, BCECE-2014

Ans. (a)

Colum-I	**Colum-II**
Polycyclic aromatic hydrocarbons	Carcinogens
Dioxins	Waste incineration
IR active molecules	Global warming
Peroxy acetyl nitrate	Photochemical

84. Which one of the following gases is reported to retard photosynthesis?

(a) CO (b) CFCs

(c) CO_2 (d) NO_2

[JEE Main-2021, 20 July Shift-II]

Ans. (d) : NO_2 gas is reported to retard photosynthesis as its higher concentrating damage the leaves of plants and retard the rate of photosynthesis:

- NO_2 is a lung irritant that can lead to an acute respiratory disease in children.
- It is also toxic to living tissues.
- Also, it is harmful to various textile fibres and metals.

@apna_pdf

85. The gas 'A' is having very low reactivity reaches to stratosphere. It is non-toxic and non-flammable but dissociated by UV-radiations in stratosphere. The intermediates formed initially from the gas 'A' are

(a) $Cl\dot{O}+\dot{C}CF_2Cl$ (b) $Cl\dot{O}+C\dot{H}_3$

(c) $\dot{C}H_3+C\dot{F}_2Cl$ (d) $\dot{C}l+C\dot{F}_2Cl$

[JEE Main-2021, 27 Aug Shift-I]

Ans. (d) : In stratosphere, CFCs get broken down by powerful UV radiation releasing $\dot{C}l$,

$$CF_2Cl_2(g)\xrightarrow{UV}\dot{C}l(g)+CF_2\dot{C}l(g)$$

86. Match List I with List - II

	List-I (Compound)		**List II (Effect/affected species)**
A.	Carbon monoxide	1.	Carcinogenic
B.	Sulphur dioxide	2.	Metabolised by pyrus plants
C.	Polychlorinated biphenyls	3.	Haemoglobin
D.	Oxides of nitrogen	4.	Stiffness of flower buds

Choose the correct answer from the options given below :

	A	**B**	**C**	**D**
(a)	III	IV	I	II
(b)	IV	I	III	II
(c)	I	II	III	IV
(d)	III	IV	II	I

[JEE Main-2021, 27 July Shift -II]

Ans. (a):

List-I	**List-II**
Carbon monoxide	Hemoglobin
Sulphur dioxide	Stiffness of flower buds
Polychlorinated biphenyls	Carcinogenic
Oxides of nitrogen	Metabolised by pyrus plants.

87. Given below are two statements. One is labelled as Assertion (A) and the other is labelled as Reason (R).

Assertion (A) Photochemical smog causes cracking of rubber.

Reason (R) Presence of ozone, nitric oxide, acrolein,

formaldehyde and peroxyacetyl nitrate in photochemical smog makes it oxidizing.

Choose the most appropriate answer from the options given below.

(a) Both (A) and (R) are true but (R) is not the correct explanation of (A)

(b) Both (A) and (R) are true and (R) is the correct explanation of (A)

(c) (A) is false but (R) is true

(d) (A) is true but (R) is false

[JEE Main-2021, 26 Aug Shift-II]

Ans. (b) : Photochemical smog causes cracking of rubber, the common component of photochemical smog are ozone, nitric oxide, acrolein, form aldehyde and peroxyacetyl nitrate (PAN).

88. Water sample is called cleanest on the basis of which one of the BOD values given below

(a) 11 ppm (b) 15 ppm

(c) 3 ppm (d) 21 ppm

[JEE Main-2021, 1 Sep Shift-II]

Ans. (c): Biological Oxygen Demand (BOD) is difined as the amount of dissolved oxygen required by aerobic microrganisms to breakdown the organic materials.

Note- Clean water could have BOD value of less than 5 ppm while highly polluted water have BOD value of 17 pmm or more

89. BOD values (in ppm) for clean water (A) and polluted water (B) are expected respectively

(a) $A > 50, B < 27$ (b) $A > 25, B < 17$

(c) $A < 5, B > 17$ (d) $A > 15, B > 47$

[JEE Main-2021, 31 Aug Shift-I]

Ans. (c): BOD value of clean water (A) is less than 5.

It means $A < 5$.

And, BOD values of polluted waste water (B) is greater than 17 ppm.

It means– $B > 17$

90. Which one of the following statements is not correct?

(a) Eutrophication indicates that water body is polluted

(b) The dissolved oxygen concentration below 6 ppm inhibits fish growth

(c) Eutrophication leads to increase in the oxygen level in water

(d) Eutrophication leads to anaerobic conditions

[JEE Main-2021, 27 July Shift-I]

Ans. (c): Eutrophication is when the environment becomes enriched with nutrients. This can be problem in marine because habitats such as lakes can cause algal blooms. Some algae even produce toxins that harmful to higher forms of life. This can cause a decrease of oxygen levels in the lake or pond which can cause problems along the food chain and affect any animal that feeds on them.

Statement (c) in context of Eutrophication is not correct.

91. Given below are two statements

Statements-I Non-biodegradable wastes are generated by the thermal power plants.

Statement-II Bio-degradable detergents leads to eutorphication. In the light of the above statements, choose the most appropriate answer from the option given below

(a) Both statements I and II are false.

(b) Statement I is true but statement II is false

(c) Statement I is false but statement II is true

(d) Both statements I and II are true

[JEE Main-2021, 18 March Shift-II]

@apna_pdf

Ans. (d): Both statements I & II are true.

- Non-biodegradable waste are generated by thermal power plants that is fly ash. Fly ash is a waste byproduct material generated from thermal power plants by the combustion of polarized coal.
- Detergents which are bio-degradable leads to eutrophication that kills animal life by deprieving it of oxygen

92. Which of the following statement(s) is (are) incorrect reason for eutrophication?

A. Excess usage of fertilisers

B. Excess usage of detergents

C. Dense plant population in water bodies.

D. Lack of nutrients in water bodies that prevent plant growth

Choose the most appropriate answer from the options given below.

(a) Only A (b) Only C

(c) B and D (d) Only D

[JEE Main-2021, 17 March Shift-II]

Ans. (d): Lack of nutrients in water bodies that prevent plant growth is incorrect reason for eutrophication.

The process in which nutrient enriched water bodies support a dense plant population. Which kills animal life by depriving oxygen and results in subsequent loss of biodiversity is known as eutrophication.

93. Given below are two statements.

Statement-I The value of the parametere 'Biochemical Oxygen Demand (BOD)' is important for survival of aquatic life.

Statement-II The optimum value of BOD is 6.5 ppm. In the light of the above statements, choose the most appropriate answer from the options given below.

(a) Statement I is false but statement II is true

(b) Both statements are true

(c) Statement I is true but statement II is false

(d) Both statements are false

[JEE Main-2021, 24 Feb Shift-II]

Ans. (c): Clean water would have BOD value of less than 5ppm whereas highly polluted water could have a BOD value of 17ppm or more.

Hence, the value of parameter 'BOD' is important for survival of aquatic life but optimum value of BOD is 17ppm or more.

So, statement II is incorrect.

94. Identify the structure of the compound responsible for Bhopal disaster:

(a) $H_3C-C\equiv N$ (b) $H_3C-N=C=O$

(c) $N\equiv C-O-CH_3$ (d) $H_3C-N^+\equiv C^-$

AP-EAPCET 23-08-2021 Shift-I

Ans. (b) : For Bhopal disaster more than 40 tons of methyl isocyanate gas leaked from a pesticide plant.

The structure of methyl isocyanate is-

$H_3C-N=C=O$

95. The type of pollution that gets increased during the day time and in the presence of O_3 is:

(a) Reducing smog (b) Oxidizing smog

(c) Acid rain (d) Global warming

JEE Main-16.03.2021, Shift-I

Ans. (b): The following reaction takes place-

$$\underset{\text{Nitric oxide}}{NO}+\frac{1}{2}O_2\longrightarrow NO_2$$

$$NO+\underset{\text{Ozone}}{O_3}\longrightarrow NO_2+O_2$$

$$\underset{\text{Nitrogen dioxide}}{NO_2}\xrightarrow{hv}NO+[O]$$

$$O+O_2\longrightarrow O_3$$

In presence of ozone (O_3), oxidizing smog gets increased during the day time because automobile and factories produce main components and factories produce main components of the photochemical smog (oxidizing smog) result from the action of sunlight on unsaturated hydrocarbon and nitrogen oxide.

96. The gas released during anaerobic degradation of vegetation may lead to :

(a) Acid rain

(b) Global warming and cancer

(c) Corrosion of metals

(d) Ozone hole

JEE Main-24.02.2021, Shift-I

Ans. (b): During the anaerobic degradation of vegetation, CH_4 gas is evolved which is responsible for global warming and cancer.

97. Which among the following has the highest concentration of PAN?

(a) Acid Rain (b) Photochemical Smog

(c) Reducing Smog (d) Ozone

AP-EAPCET 19-08-2021, Shift-II

Ans. (b) : The main component of photochemical smog is peroxyacetyl nitrate (PAN). The other component are ozone. nitric oxide, acrolein and formaldehyde.

98. Match following :

Pollutants	**Effects**
(a) Chloro fluro carbon	(i) BOD level of water increases
(b) Methane in air	(ii) Acid rain
(c) Synthetic detergents in water	(iii) Global warming
(d) Nitrogen oxides in air	(iv) Depletion of ozone layer

(a) (a – iii), (b – iv), (c – i), (d – ii)

(b) (a – iv), (b – iii), (c – i), (d – ii)

(c) (a – iv), (b – ii), (c – i), (d – iii)

(d) (a – iii), (b – ii), (c – i), (d – iv)

AP- EAPCET- 07-09-2021, Shift-I

Ans. (b) :

(a) Chlorofluorocarbon depletion of ozone (O_3) layer

(b) Methane in air cause global warming

(c) Synthetic detergents in water effect BOD level of water increases

(d) Nitrogen oxides in air causes acid rain

@apna_pdf

99. Match List-I with List-II

	List I		List- II
(A)	$2SO_{2(g)} + O_{2(g)} \rightarrow 2SO_{3(g)}$	(i)	Acid rain
(B)	$HOCl_{(g)} \xrightarrow{hv} OH + Cl$	(ii)	Smog
(C)	$CaCO_3 + H_2SO_4 \longrightarrow CaSO_4 + H_2O + CO_2$	(iii)	Ozone depletion
(D)	$NO_{2(g)} \xrightarrow{hv} NO_{(g)} + O_{(g)}$	(iv)	Tropospheric pollution

Choose the correct answer from the options given below :

(a) (A)-(iii), (B)-(ii), (C)- (iv), (D)- (i)
(b) (A)-(i), (B)-(ii), (C)- (iii), (D)- (iv)
(c) (A)-(ii), (B)-(iii), (C)- (iv), (D)- (i)
(d) (A)-(iv), (B)-(iii), (C)- (i), (D)- (ii)

NEET-2021

Ans. (d):

List-I	List-II
$2SO_2(g) + O_2(g) \rightarrow 2SO_3\ (g)$	Troposphoric pollution
$HOCl\ (g) \xrightarrow{hv} \dot{O}H + \dot{C}l$	Ozone depletion
$CaCO_3H_2SO_4 \rightarrow CaSO_4 + H_2O + CO$	Acid rain
$NO_2\ (g) \xrightarrow{hv} \dot{N}O(g) + \dot{O}(g)$	Smog

100. Which of the following is not correct about carbon monoxide?

(a) It forms carboxyhaemoglobin
(b) It reduces oxygen carrying ability of blood
(c) The carboxyhaemoglobin (haemoglobin boud to CO) is less stable than oxyhaemoglobin
(d) It is produced due to incomplete combustion

NEET-2020

Ans. (c)

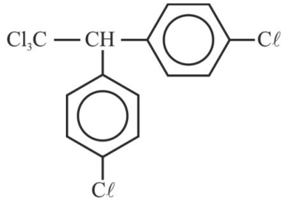
- When Co (Carbonmonoxide) combine with hemoglobin it produced carboxyhaemoglobin.
- Carboxyhaemoglobin reduce the oxygen carrying ability of blood.
- Oxyhaemoglobin is 300 times less stable then carboxyhaemoglobin.
- Carbonmonoxide produce due to incomplete combustion.

101. The insecticide DDT is considered as ....

(a) greenhouse gas
(b) biodegradable pollutant
(c) non-biodegradable pollutant
(d) a fertiliser

AP EAMCET (Engg.) 17.09.2020 Shift-I

Ans. (c) : The insecticide, DDT is consider as non-biodegradable pollutant.



DDT

DDT, plastic, polythene, bags, insecticides, pesticides, mercury, lead, arsenic, metal articles like aluminium cans, synthetic fibers, glass objects, iron products, and silver foils are non biodegradable pollutants.

102. Biochemical oxygen demand (BOD) is the amount of oxygen required (in ppm)

(a) for the photochemical breakdown of waste present in 1 m^3 volume of a water body.
(b) for sustaining life in a water body.
(c) by anaerobic bacteria to breakdown inorganic waste present in a water body.
(d) by bacteria to breakdown organic waste in a certain volume of a water sample

[JEE Main-2020 Jan Shift-II]

Ans. (d): Biochemical Oxygen Demand (BOD) is the amount of oxygen required (in ppm) by bacteria to breakdown organic waste in a certain volume of a water sample.

103. Among the gases (A)-(E), the gases that cause greenhouse effect are :

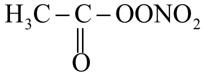
(A) CO_2 **(B) H_2O**
(C) CFCs **(D) O_2**
(E) O_3

(a) (A), (B), (C) and (D)
(b) (A) and (D)
(c) (A), (B), (C) and (E)
(d) (A), (C), (D) and (E)

[JEE Main-2020, 8 Jan Shift-I]

Ans. (c) : $CO_2, H_2O, CFCs, O_3$ are the gases that cause green house effect.
O_2 is not green out gases hence it is not causes green house effects.

104. The compound that is not a common component of photochemical smog is

(a) CF_2Cl_2 (b)


$H_3C-\underset{\underset{O}{\|}}{C}-OONO_2$

(c) $CH_2 = CHCHO$ (d) O_3

[JEE Main-2019, 12 Jan Shift-II]

Ans. (a): Among the given chlorofluorocarbons (CF_2Cl_2) are the compounds that are responsible for ozone depletion which degrades ozone into molecular oxygen. It is not a components of photochemical smog.

105. Which is wrong with respect to our responsibility as a human being to protect our environment?

(a) Restricting the use of vehicles
(b) Avoiding the use of floodlighted facilities
(c) Setting up compost tin in gardens
(d) Using plastic bags

[JEE Main-2019, 8 April Shift-I]

Ans. (d): Using plastic bags, a non-biodegradable pollutant, is wrong w.r.t. our responsibility as a human being to protect our environment.

- As a residents of planet of Earth, humans have a responsibility to take care of the natural environment.
- Our Cognitive ability & understanding of nature obliges us to maintain the integrity of the environment.

@apna_pdf

106. A water sample has ppm level concentration of the following metals: Fe = 0.2; Mn = 5.0; Cu = 3.0; Zn = 5.0. The metal that makes the water sample unsuitable for drinking is

(a) Cu (b) Fe
(c) Mn (d) Zn

[JEE Main-2019, 9 Jan Shift-I]

Ans. (c): According to the question, Mn with concentration 5 ppm makes the water sample unsuitable for drinking as it must be 0.05 ppm.

Permissible concentration of following Metals in Drinking water:-

Metal		**Maximum Concentration (ppm)**
Zn	....	5·0
Fe	....	0·2
Mn	**.......**	**0·05**
Cu	....	3·0
Al	....	0·2
Cd	....	0·005

107. The condition for methemoglobinemia by drinking water is

(a) > 50 ppm nitrate (b) > 50 ppm chloride
(c) > 50 ppm lead (d) > 100 ppm sulphate

[JEE Main-2019, 9 Jan Shift-II]

Ans. (a): The concentration of nitrate > 50 ppm in drinking water caused methemoglobinemia which is blood disordes in which an abnormal amount of methemoglobin is produced.

108. Water filled in two glasses A and B have BOD values of 10 and 20, respectively. The correct statement regarding them, is

(a) A is more polluted than B
(b) A is suitable for drinking, whereas B is not
(c) Both A and B are suitable for drinking
(d) B is more polluted than A

[JEE Main-2019, 10 Jan Shift-I]

Ans. (d): The glasses 'A' & 'B' have BOD values '10' & '20', respectively.

Hence 'glass 'B' is more polluted than glass 'A'.

As we learnt in BOD:–
3–5 ppm is clean
6–19 ppm is polluted

109. Peroxyacetyl nitrate (PAN), an eye irritant is produced by

(a) organic waste (b) acid rain
(c) classical smog (d) photochemical smog

[JEE Main-2019, 11 Jan Shift-I]

Ans. (d): Peroxyacetyl nitrate (PAN), an eye irritant is produced by the photochemical smog.

- In photochemical smog, photo means light & smog are a mixture of smoke & fog.
- In the morning hours, the NO & hydrocarbon level increases followed by an increase in the nitrogen dioxide.

110. Water samples with BOD values of 4 ppm and 18 ppm, respectively, are

(a) clean and clean
(b) highly polluted and clean
(c) highly polluted and highly polluted
(d) clean and highly polluted

[JEE Main-2019, 12 Jan Shift-I]

Ans. (d): Water samples with BOD values of 4ppm & 18 ppm are clean and highly polluted respectively.

- The amount of oxygen required by bacteria to break down the organic matter present in a certain value of x sample of water is called chemical oxygen demand (BOD).

111. Match column-I with column-II and select the correct option.

Column-I (Pollutant)	**Column-II (Source)**
(A) Microorganisms	**1.Chemical Fertilizers**
(B) Plant nutrients	**2. Abandoned Coal mines**
(C) Sediments	**3. Domestic Sewage**
(D) Mineral acids mining	**4. Erosion of soil by strip**

(a) A-3, B-1,C-4,D-2 (b) A-2,B-4,C-3,D-1
(c) A-1,B-3,C-2,D-4 (d) A-4,B-2,C-1,D-3

COMEDK-2017

Ans. (a):

Column-I (pollutant)	**Column-II (Source)**
Microorganism	Domestic sewage
Plant nutrients	Chemical fertilizers
Sediments	Erosion of soil by strip
Mineral acids mining	Abandoned coal mines.

112. A water sample has ppm level concentration of following anions :

$$F^- = 10,\ SO_4^{2-} = 100,\ NO_3^- = 50$$

The anion/anions that make/makes the water sample unsuitable for drinking is/are

(a) Only NO_3^- (b) Both SO_4^{2-} and NO_3^-
(c) Only F^- (d) Only SO_4^{2-}

JEE Main-2017

Ans. (c): The permissible limit of F^- in drinking water is up to 1ppm. Hence, excess of concentration of F^- in the given sample of water makes it unsuitable for drinking.

- Excess concentration of $F^- >$ 1ppm causes decay of bones.

113. DDT is

(a) 2,2-di(p-chlorophenyl)-1, 1,1-trichloroethane
(b) 2,2-di(m-chlorophenyl)-1,1,1-trichloroethane
(c) 2,2-di(o-chlorophenyl)- 1,1,1-trichloroethane
(d) 2,2-di(p-chlorophenyl)- 1,1,1-trichloroethane

AMU-2016

Ans. (a): The IUPAC name of DDT is 2,2-di(p-chlorophenyl)-1, 1,1-trichloroethane

- DDT or dichlordiphenyl trichloerothane, is a chemical compund with formula $C_{14}H_9Cl_5$.
- Under STP, the chemical compound exists as a colour less & tasteless crytalline solid.

@apna_pdf

114. The concentration of fluoride, lead nitrate and iron in a water sample from an underground lake was found to be 1000 ppb, 40 ppb, 100 ppm and 0.2 ppm, respectively. This water is unsuitable for drinking due to high concentration of

(a) lead
(b) nitrate
(c) iron
(d) fluoride

JEE Main-2016

Ans. (b):

Concentration of Fluoride $=1000\text{ppb}=\frac{1000}{1000}=1\text{ppm}$

Concentration of Lead = 40ppb$=\frac{40}{1000}\text{ppm}=0\cdot04\text{ppm}.$

Concentration of Nitrate = 100 ppm.

We can see that concentration of nitrate is maximum.

- Concentration of nitrate > 40 ppm gives blue body syndrome disease.

Hence, this water is unsuitable for drinking due to the high concentration of nitrate.

115. Match the Column I and Column II and pick the correct matching from the codes given below.

Column-I	Column-II
A. Peroxy acetyl nitrate	1. Waste incineration
B. Polycyclic aromatic	2. Global warming
C. Dioxins	3. Photochemical smog
D. Indigo	4. Carcinogens
E. IR active molecules	5. Vat dye

	A	B	C	D	E
(a)	3	4	1	5	2
(b)	1	2	3	4	5
(c)	3	5	1	2	4
(d)	5	3	1	2	4

Manipal-2016

Ans. (a) : Photochemical Smog–Photochemical smog consist of primary and secondary pollution's. Secondary pollutants consist of PAN and ozone.

Carcinogenicity–Aromatic hydrocarbons containing two or more fused ring are called polycyclic aromatic hydrocarbons. Methoxy in these compounds give rise to carcinogenicity.

Dioxins–Dioxins are a group of chlorinated organic compounds that are formed in waster incineration.

Indigo–Indigo is a vat dye. Dyeing with indigation was carried out in the wooden vats in the form of water soluble indigotin white.

IR Active–IR active molecules such as HCl, CO and NO absorb the radiation from the infrared region and causes global warming.

116. Assertion: Suspended particulate matter (SPM) is an important pollutant released by diesel vehicles.

Reason: Catalytic converters greatly reduce pollution caused by automobiles.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

[AIIMS-2015]

Ans. (b): Suspended particular matter (SPM) is an important pollutant released by diesel vehicles. It have particles with a diameter below 10μm. SPM is generated from natural sources such as volcanoes or dust stroms and human activities such as vehicles, industrial plants etc. Catalystic converter is filters in the vehicle which convert nitrogen oxides (NO_x) to nitrogen and reduce potential hazards of nitrogen oxides.

117. When heat rays are reflected from Earth, gases like Carbon dioxide, Nitrous oxide do not allow them to escape back to the space causing our planet to heat up. These gases are known as:

(a) Noble gas
(b) Green-house gas
(c) Hot gas
(d) Blue gas

NDA (I)-2015

Ans : (b) : Green house gases allow the incoming sunlight to pass through the atmosphere, but the heat of sunlight get trapped due to these green house gases such as carbon dioxide, nitrous oxide etc.

118. Which of the following statements are correct?

(A) Ocean is sink for CO_2.
(B) Greenhouse effect causes lowering of temperature of earth's surface.
(C) To control CO emission by automobiles usually catalytic convertor are fitted into exhaust pipes.
(D) H_2SO_4, herbicides and insecticides form mist.

(a) C and D
(b) A and B
(c) B and D
(d) A and D

AP-EAMCET (Engg.) 2015

Ans. (d) : Ocean is sink for CO_2 because the microscopic marine algae and bacteria play a huge role in the world's. H_2SO_4, herbicides and insecticides form mist.

119. The gas leaked from a storage tank of the Union Carbide plant in Bhopal gas tragedy was

(a) Methylisocyanate
(b) Methylamine
(c) Ammonia
(d) Phosgene

JEE Main-2013

Ans. (a): Methyl isocyanate ($CH_3–N = C = O$) gas was leaked from the storage tank of the union carbide plant in Bhopal gas tragedy.

120. Freon, culprits in depletion of ozone layer are industrially produced from

(a) CF_4
(b) CH_2Cl_2
(c) Hexachlorobenzene
(d) $CHCl_3$ and CCl_4

SCRA-2012

Ans. (b) : The chlorofluorocarbons is also known by Freon- The Freon are product by chloroform and carbon tetrachloride which is given as:

@apna_pdf

$$\underset{\text{Chloroform}}{CHCl_3} + 2HF \rightarrow \underset{\text{Chlorodifluoromethane}}{CHCl_2F_2} + 2HCl$$

Freon-1, 2, CCl_2F_2 is prepared from CCl_4 by reaction with HF.

$$\underset{\text{Carbontetrachloride}}{CCl_4} + 2HF \rightarrow \underset{\text{Dichlorodifluoromethane}}{CCl_2F_2} + 2HCl$$

121. What is DDT among the following?

(a) Green house gas

(b) A fertilizer

(c) Biodegradable pollutant

(d) Non-biodegradable pollutant

AIEEE-2012

Ans. (d): DDT (Dichlorodiphenyltrichloroethane) is a non-biodegradable pollutant.

Ex:- DDT, plastics, polythene, bags, insecticide, pesticides, mercury, lead, arsenic etc.

122. Which of the following oxides finally dissolve in water to cause acid rain?

(a) NO, NO_2 (b) NO_2, SO_2

(c) NO_3, SO_3 (d) N_2O_5, SO_3

AP - EAMCET(MEDICAL) - 2009

Ans. (b) : The following reaction occur during the process–

$$\underset{\substack{\text{nitrogen}\\\text{dioxide}}}{NO_2} + H_2O \longrightarrow \underset{\text{nitric acid}}{HNO_3} + \underset{\text{nitrous acid}}{HNO_2}$$

And,

$$\underset{\substack{\text{sulphur}\\\text{dioxide}}}{SO_2} + H_2O \longrightarrow \underset{\text{sulfuric acid}}{H_2SO_4}$$

123. Which of the following is secondary pollutant?

(a) CO_2 (b) N_2O

(c) PAN (d) SO_2

JIPMER-2006

Ans. (c) : Secondary pollutants are type of pollutant that is farmed in the atmosphere from the combustion of primary pollutants.

Here, PAN (Peroxyacetyl nitrate) is secondary pollutant.

124. The substance which is not regarded as a pollutant?

(a) NO_2 (b) CO_2

(c) O_3 (d) Hydrocarbons

[BITSAT-2005]

Ans. (b): CO_2 is generally not regarded as pollutant.

- A pollutant is a substance that is present in concentrations that may harm orgnisms or exceed an environmental quality standard.
- These can be both naturally forming or anthropognic in origin.

4. Layer of Atmosphere

125. Which of the following is responsible for depletion of the ozone layer in the upper strata of the atmosphere?

(a) Polyhalogens (b) Ferrocenes

(c) Fullerenes (d) Freons

JCECE - 2008

NEET-2004

UPTU/UPSEE-2007

Ans. (d): Freons are chlorofluorocarbons and are responsible for depletion of ozone layer in the upper strata of the atmosphere.

126. Identify the wrong statements in the following

(a) Chlorofluorocarbons are responsible for ozone layer depletion

(b) Green house effect is responsible for global warming

(c) Ozone layer does not permit infrared radiation from the sun to reach the earth

(d) Acid rain is mostly because of oxides of nitrogen and sulphur

[BITSAT-2014]

AIEEE-2008

Ans. (c) : Ozone layer permit infrared radiation from the sun to reach the earth. It absorbs Ultra voilet (UV) radiation.

127. In stratosphere most of the ozone formation is assisted by

(a) cosmic rays (b) γ-rays

(c) ultaviolet radiations (d) visible radiations

[JEE Main-2021, 27 Aug Sbift-II]

Ans. (c) : Ozone in stratosphere is a product of UV radiations acting on dioxygen (O_2) molecules.

$$O_2(g) \xrightarrow{UV} \dot{O}(g) + \dot{O}(g)$$

$$O(g) + O_2(g) \overset{UV}{\rightleftharpoons} \underset{\text{(Ozone)}}{O_3(g)}$$

128. In winter season of Antarctica, the depletion of ozone layer by the radical species ClO is mainly due to the formation of

(a) Polar troposphere clouds

(b) Polar stratospheric clouds

(c) Polar mesospheric clouds

(d) Methane

TS EAMCET-10.08.2021, Shift-I

Ans. (b) : The severe depletion of the Antarctic ozone layer known as the "ozone hole" occurs because of the special atmospheric and chemical conditions that exist there and nowhere else on the globe. The very low winter temperatures in the Antarctic stratosphere cause polar stratospheric clouds (PSCs) to form.

- The clouds are responsible for chemical changes that promote production of chemically active chlorine and bromine. This chlorine and bromine activation then leads to rapid ozone loss when sunlight returns to Antarctica in September and October of each year, which then result in the Antarctic ozone hole.

129. The statement that is not true about ozone is

(a) In the stratosphere, CFCs release chlorine free radicals (Cl), which reacts with O_3 to give chlorine dioxide radicals

(b) In the atmosphere, it is depleted by CFCs

(c) In the stratosphere, it forms a protective shield against UV radiation.

(d) It is a toxic gas and its reaction with NO gives NO_2

[JEE Main-2020, 2 Sep Shift-I]

@apna_pdf

Ans. (a): In the stratosphere, CFCs release chlorine radical ($\dot{Cl}$)

$$CF_2Cl_2(g)\xrightarrow{UV}\dot{Cl}(g)+\dot{C}F_2Cl(g)$$

which react with O_3 to give chlorine oxide (ClO) radical not chlorine dioxide (ClO_2) radical.

$$Cl(g)+O_3(g)\longrightarrow \dot{Cl}O(g)+O_2(g)$$

130. Ozone in stratosphere is depleted by

(a) CF_2Cl_2 (b) C_7F_{16}

(c) $C_6H_6Cl_6$ (d) C_6F_6.

COMEDK-2019

Ans. (a) : Ozone in stratosphere is depleted by CF_2Cl_2 . They are used as coolants in refrigerators, coolers etc. The CFCs cause the breaking of the ozone molecule which forms the oxygen radical and O_2. The depletion of the ozone layer results in the penetration of the harmful UV radiations from the sun into the Earth's atmosphere.

131. The reaction that is not involved in the ozone layer depletion mechanism in the stratosphere is

(a) $CH_4 + 2O_3 \rightarrow 3CH_2 = O + 3H_2O$

(b) $Cl\dot{O}(g)+O(g)\longrightarrow\dot{Cl}(g)+O_2(g)$

(c) $HOCl(g)\xrightarrow{hn}\dot{O}H(g)+\dot{Cl}(g)$

(d) $CF_2Cl_2(g)\xrightarrow{hn}\dot{Cl}(g)+\dot{C}F_2Cl(g)$

[JEE Main-2019, 10 Jan Shift-II]

Ans. (a) : Reactions involved in the ozone layer depletion mechanism is as follows:-

$$O_2\xrightarrow{UV}O(g)+O(g)$$

$$O_2(g)+O(g)\longleftrightarrow O_3(g)$$

$$CF_2Cl_2(g)\xrightarrow{UV}Cl(g)+CF_2Cl(g)$$

$$Cl(g)+O_3(g)\longrightarrow ClO(g)+O_2(g)$$

$$ClO(g)+O(g)\longrightarrow Cl(g)+O_2(g)$$

Therefore it is clear to the above reaction CH_4 is not responsible for ozone layer depletion.

132. The layer of atmosphere between 10 km to 50 km above the sea level is called as

(a) stratosphere (b) mesosphere

(c) thermosphere (d) troposphere

[JEE Main-2019, 9 April, Shift-II]

Ans. (a) : The layer of atmosphere between 10 km to 50 km above the sea level is called as stratosphere.

- Ozone lays lies in the stratosphere.
- Stratasphere holds 19% of atmosphere's gases.

133. The regions of the atmosphere, where clouds form and where we live, respectively, are

(a) stratosphere and stratosphere

(b) troposphere and troposphere

(c) troposphere and stratosphere

(d) stratosphere and troposphere

[JEE Main-2019, 10 April, Shift-I]

Ans. (b) Troposphere is the lowest layer of our atmosphere. It extends upward from the ground to about 10 km above the sea level.

- Clouds formation & all whether of occurs hands humans live in this layer.

134. The upper stratosphere consisting of the ozone layer protects us from the sun's radiation that falls in the wavelength region of

(a) 600-750 nm (b) 400-550 nm

(c) 0.8-1.5 nm (d) 200-315 nm

[JEE Main-2019, 12 Jan Shift-II]

Ans. (d) : The ozone layer absorbs 97 to 99% of sun's medium frequencies ultraviolet light (from 200-315 nm wavelength).

135. Excessive release of CO_2 into the atmosphere results in

(a) formation of smog (b) depletion of ozone

(c) polar vortex (d) global warming

[JEE Main-2019, 9 April Shift-I]

Ans. (d) : Global warming is caused by the emission of greenhouse gases. 72% of the totally emitted greenhouse gases is CO_2. Therefore, excessive release of CO_2 is the main cause of global warming.

- CO_2 absorbs and emits infrared radiation at wavelengths of 4.26μm and 14.99 μm and consequently is a greenhouse gas that plays a significant role in influencing Earths surface temperature through the greenhouse effect.

136. Ozone layer of stratosphere requires protection from indiscriminate use of

(a) pesticides

(b) atomic explosions

(c) aerosols and high flying jets

(d) balloons

JCECE-2015

Ans. (c): Ozone layer of stratosphere requires protection from indiscriminate use of aerosols and high flying jets because aerosols and high flying jets release nitric oxide into the upper atmosphere which leads to the distruction of ozone layer.

137. Formation of ozone in the upper atmosphere from oxygen takes place by the action of

(a) Nitrogen oxides (b) Ultraviolet rays

(c) Cosmic rays (d) Free radicals

[BITSAT-2012]

Ans. (b) : Ozone is formed in the upper atmosphere from oxygen by the action of ultraviolet rays. Ozone can absorb UV light to reform oxygen. Thus, the ozone layer acts as a screen and prevents then harmful UV radiations from reaching the surface of earth.

- The "Ozone layer", approximately 6 to 30 miles above the Earth's surface.

138. The ozone layer forms naturally by

(a) The interaction of CFC with oxygen

(b) The interaction UV radiation with oxygen

(c) The interaction of IR radiation with oxygen

(d) The interaction of oxygen and water vapour

WB-JEE-2011

@apna_pdf

Ans. (b): Stratospheric ozone is formed naturally through the interaction of solar ultraviolet (UV) radiation with molecular oxygen (O_2). The "ozone layer" approximately 6 to 30 miles above the Earth's surface. It reduces the amount of harmful UV radiation reaching the Earth's surface.

139. Which of the following statements about polar stratosphere clouds (PSCs) is not correct?

(a) PSCs do not react with chlorine nitrate and HCl

(b) Type I clouds are formed at about – 77°C and contain solid $HNO_3.3H_2O$

(c) Type II clouds are formed at about – 85°C and contain some ice

(d) A tight whirlpool of wind called Polar Vortex is formed which surrounds Antarctica

[BITSAT-2011]

Ans. (a) : Polar stratospheric clouds (PSCs) play a central role in the formation of the ozone hole in the Antarctic and Arctic. PSCs provide surfaces upon which heterogenous chemical reaction take place. PSCs react with chlorine nitrate and HCl to give HOCl and Cl_2.

140. Among the following compounds, which one is not responsible for depletion of ozone layer?

(a) CH_4 (b) $CFCl_3$

(c) NO (d) Cl_2

AP EAMCET-2008

Ans. (a) : In stratosphere, the following reaction take place which are responsible for depletion of ozone layers.

(i) $CF_2Cl_2 \xrightarrow{hv} \dot{C}F_2Cl + \dot{C}l$

$CFCl_3 \xrightarrow{hv} \dot{C}FCl_2 + \dot{C}l$

(ii) $\dot{C}l + O_3 \longrightarrow \dot{C}lO + O_2$

$\dot{C}lO + \dot{O} \longrightarrow \dot{C}l + O_2$

(iii) $\dot{N}O + O_3 \longrightarrow NO_2 + O_2$

Therefore, CH_4 is not responsible for ozone layer depletion.

141. In Antarctica ozone depletion is due to the formation of following compound:

(a) acrolein (b) peroxyacetyl nitrate

(c) SO_2 and SO_3 (d) chlorine nitrate

(e) formaldehyde

Kerala-CEE-2005

Ans. (d): CFCs is caused the depletion of ozone layer. Chlorine nitrate, which is found in the stratosphere in the reason of antarctica causes break down of the ozone layer.

In Antarctica ozone depletion is caused due to the formation of chlorine nitrate.

142. Identify the correct decreasing order of the following with respect to altitude from atmosphere.

I.Troposphere
II. Mesosphere
III. Thermosphere

(a) II, III, I (b) III, II, I

(c) I, II, III (d) I, III, II

AP EAMCET-2004

Ans. (b) : Atmosphere is divided into four category
(i) Troposphere (0 – 10 km)
(ii) Stratosphere (10 – 50 km)
(iii) Mesosphere (50 – 85 km)
(iv) Thermosphere (85----- km)
(v) Exosphere (700-10000 km)
Therefore, the order is
III > II > I

143. Which one of the following regions atmosphere contains ozone?

(a) Troposphere (b) Thermosphere

(c) Mesosphere (d) Stratosphere

AP-EAMCET (Medical), 2001

Ans. (d) : Most atmospheric ozone is concentrated in a stratosphere layer about 9 to 18 miles (10 to 50 km) above the Earth's surface. Ozone is a molecule that contains three oxygen atoms.

- Ozone layer protects us from the harmful ultraviolet ray.

144. Which one of the following is mainly responsible for depletion of ozone layer?

(a) Methane (b) Cabon dioxide

(c) Water (d) Chlorofluoro carbons

AP EAMCET (Engg.) 2001

Ans. (d) : CFCs (Chlorofluoro carbons) is responsible for the depletion of ozone layers. Gaseous CFCs can deplete the ozone layer when they slowly rise into the stratosphere, are broken down by strong ultraviolet radiation, release chlorine atoms, and then react with ozone molecules.

145. About 20 km above the earth, there is an ozone layer. Which one of the following statements about ozone and ozone layer is true?

(a) It is beneficial to us as it stops UV radiation.

(b) Conversion of O_3 to O_2 is an endothermic reaction

(c) Ozone is a triatomic molecule

(d) It is harmful as it stops useful radiation

NEET-1995

Ans. (a) : Ozone is an allotropic form of oxygen. It is present in the upper atmosphere (about 20 km above the surface of the earth). It is believed to be formed in the upper atmosphere by the action of UV-rays on oxygen as–

$3O_2 + \text{UV-rays} \rightarrow 2O_3 \quad \Delta H = 142.7 \text{ kJ mol}^{-1}$

There for UV-rays, which are harmful to human being are absorbed by oxygen to form ozone.

5. Green Chemistry

146. The acid that is believed to be mainly responsible for the damage of Taj Mahal is:

(a) Sulfuric acid (b) hydrofluoric acid

(c) phosphoric acid (d) hydrochloric acid

JEE Main-29.06.2022, Shift-I

@apna_pdf

Ans. (a) : The acid that is believed to be mainly responsible for the damage of Taj Mahal is sulphuric acid. It is produced by sulphur dioxide which is a air pollutant. When SO_2 comes in contact of atmospheric oxygen and water it gives sulphuric acid, which is a component of acid rain.

147. The greenhouse effect is because of the

(a) presence of gases, which in general are strong inferred absorbers, in the atmosphere
(b) presence of CO_2 only in the atmosphere
(c) pressure of O_3 and CH_4 in the atmosphere
(d) N_2O and chlorofluorohydrocarbons in the atmosphere

[BITSAT-2020, 2013]

Ans. (a) : In Earth, greenhouse gases trap heat in the atmosphere and warm the planet. The main gases responsible for the greenhouse effect include carbon dioxide, methane, nitrous oxide, and water vapour (which all occur naturally), and fluorinated gases.

The major causes of the greenhouse effect are:

- Deforestation
- Industrial waste and Landfills
- Global warming
- Acidification of water Bodies

148. Which of the following is not a green house gas?

(a) CFC (b) CO_2
(c) O_2 (d) NO_2

Karnataka-CET-2020
Assam CEE-2020
WB-JEE-2014

Ans. (c): Oxygen (O_2) is not a green house gas while CFC, CO_2, NO_2, SO_2, are major green house gases.

149. Which gas among the following has the maximum global warming potential?

(a) CO_2 (b) SF_6
(c) CH_4 (d) N_2O

AP EAPCET 23-08-2021 Shift-I

Ans. (b) : The maximum global warming potential is SF_6. CO_2 is a primary green house gas is used as the base for all the calculation. The order of maximum global warming is-

$$SF_6 > N_2O > CH_4 > CO_2.$$

150. The greenhouse gas/es is (are)

(A) carbon dioxide (B) oxygen
(C) water vapour (D) methane

Choose the most appropriate answer from the options given below.

(a) Only (A) and (C) (b) Only (A)
(c) (A), (C) and (D) (d) Only (A) and (B)

[JEE Main-2021, 16 March Shift-II]

Ans. (c): A green house gas is a gas that absorbs and emits radiant energy with in the thermal infrared range, causing the greenhouse effect.

The greenhouse gas/es is (are) water vapour, carbon dioxide (CO_2), methane (CH_4).

151. Which among the following is not a greenhouse gas?

(a) Nitrous oxide (b) Water vapour
(c) Sulphur dioxide (d) Methane

AP EAPCET 20.08.2021 Shift-I

Ans. (c) : Green house gases are carbon dioxide (CO_2), methane (CH_4), Water vapour, nitrogen oxides (NOx), CFCs and ozone.

Hence, its is clear that sulphur dioxide is not a green house gas.

- Greenhouse gases caused green house effect.

152. Greenhouse gases show their activity by confining in the air-zone of

(a) mesosphere (b) stratosphere
(c) troposphere (d) thermosphere

Tripura JEE-2019

Ans. (c): Green house gases show their activity by confining in the air-zone of upper troposphere, and increased concentration will reduce the amount of heat radiated up into the upper atmosphere (and into space) until Earth heats up.

153. Among the following, the one that is not a greenhouse gas is

(a) sulphur dioxide **(b) nitrous oxide**
(c) methane **(d) ozone**

NEET-2019

Ans. (a): Sulphur dioxide (SO_2) is not a green house gas.

- The primary green house gases in earth's atmosphere are water vapour, CO_2, CH_4, nitrous oxide & ozone.

154. Which one of the following is not a green house gas?

(a) Methane (b) Ozone
(c) Carbon dioxide (d) Nitrogen

J & K CET-(2011)

Ans. (d): A greenhouse gas is a gas that absorbs and emit radiant energy within the thermal infrared range causing the greenhouse effect.

Greenhouse gas in earth's atmosphere are water vapor (H_2O), carbon dioxide (CO_2) methane (CH_4), nitrous oxide (N_2O) and ozone (O_3).

155. Green house effect is caused by

(a) NO_2 (b) CO
(c) NO (d) CO_2

JCECE-2010

Ans. (d) : Green house gases cause the green house effect on planets. The primary green house gases in earth's atmosphere are water vapor (H_2O), carbon dioxide (CO_2), methane (CH_4), nitrogen oxide (N_2O), ozone (O_3) and CFC's.

@apna_pdf

14.

The Solid State

1. Amorphous and Crystalline Solids

1. How many number of atoms are there in a cube based unit cell, having one atom on each corner and 2 atom on each body diagonal of cube ?

(a) 4 (b) 9

(c) 8 (d) 6

Karnataka CET-17.06.2022, Shift-II

Ans. (b) : Given,

One atom on each corner

two atom on each body diagonal

total = 4 × 2 = 8

At corner $= \frac{1}{8} \times 8 = 1$ atom.

total no. of atoms = 8 + 1 = 9

2. Which of the following is NOT true about the amorphous solids ?

(a) Amorphous solids can be moulded by heating

(b) They are anisotropic in nature

(c) On heating they may become crystalline at certain temperature

(d) They may become crystalline on keeping for long time.

Karnataka CET-17.06.2022, Shift-II

Ans. (b) : Amorphous solids are isotropic in nature because there is short range order and arrangement is irregular along all directions. The property remains the same in all direction. This property is known as isotropy.

3. Graphite is a

(a) molecular solid (b) covalent solid

(c) ionic solid (d) metallic solid

BITSAT-2015, JIPMER-2012

Ans. (b) : Graphite is a covalent solid. Each carbon atom is bonded into its layer with three strong covalent bonds. It is a good conductor of heat as well as good conductor of electricity.

4. Which is network solid from following?

(a) SiC (b) $I_2(s)$

(c) $CO_2(s)$ (d) $H_2O(s)$

GUJCET-2021

Ans. (a) : Any chemical compound in which covalent bonds bind the atoms in a continuous network extending throughout the material is called **network solid**, or **covalent network solid** or **atomic crystalline solid**. Silicon carbide (SiC) is a covalent network solid. The atoms of silicon are joined together with carbon atoms with the help of a covalent bond tetrahedral.

Note:- Silicon (Si), Boron nitride (BN), Quartz (SiO_2) Germanium (Ge) are other example of network solids.

5. If an element in group-2 formed a compound with an element in group 17 of the periodic table, the compound formed is likely to _____.

(a) Conduct electricity in the solid state

(b) have a low boiling point

(c) dissolve in non-polar solvents

(d) be a crystalline solid

AP-EAMCET 25-08-2021 Shift - I

Ans. (d) : Group-2 elements are metal and 17 group elements are nonmetal. Metal donates e^- form cation whereas non metal receives e^- form anion. So there are formation of ionic bond and ionic compound form a crystalline solid.

• Ionic compounds conduct electricity in molten state.

• Ionic compounds have high boiling point.

• Ionic compounds are soluble in polar solvent due to polar nature of the bond.

Ionic compounds come in classification of crystalline solid, so the compound formed is likely to be a crystalline solid.

6. Given below are two statements :

Statement I :

α and β forms of sulphur can change reversibly between themselves with slow heating or slow cooling.

Statement II :

At room temperature the stable crystalline form of sulphur is monoclinic sulphur.

In the light of the above statements, choose the correct answer from the options given below :

(a) Both Statement I and Statement II are true.

(b) Both Statement I and Statement II are false.

(c) Statement I is true but Statement II is false.

(d) Statement I is false but Statement II is true.

JEE Main 25.02.2021, Shift-II

Ans. (c) : α and β forms of sulphur can change reversibly between themselves with slow heating or slow cooling.

$$\alpha\text{-sulphur} \xrightleftharpoons[<369\text{ K}]{>369\text{ K}} \beta-\text{sulphur}$$

Monoclinic sulphur is also called β - sulphur or prismatic sulphur. It is stable only above 396K and changes into rhombic sulphur below this temperature.

Monoclinic sulphur is heated slowly in a evaporating dish till it melts.

The molten sulphur is then allowed to cool slowly. During the cooling process, a solid crust will be formed over the surface. As this crust is being formed, two holes are made in the crust. The molten sulphur is then poured out of these holes. The crust is then removed.

@apna_pdf

On the lower side of the crust, long needle-shaped crystals of monoclinic sulphur are formed.
The stable form of sulphur at room temperature is rhombic sulphur (α-sulphur).

7. Select the correct statements.
(A) Crystalline solids have long range order.
(B) Crystalline solids are isotropic.
(C) Amorphous solids are sometimes called pseudo solids.
(D) Amorphous solids soften over a range of temperatures.
(E) Amorphous solids have a definite heat of fusion.
Choose the most appropriate answer from the options given below.

(a) (A), (B), (E) only (b) (B), (D) only
(c) (C), (D) only (d) (A), (C), (D) only

[JEE Main 2021, 27 July Shift-II]

Ans. (d) :
(A) Crystalline solids have definite arrangement of constituents particles and have long range order. There is a regular pattern of arrangement of particals.
(C) Amorphous solid is also called pseudo solid.
(D) Different constituent particles of an amorphous solid have different bond strengths and soften over a range of temperatures.

8. Which of the following statements is true with regards to crystalline solids?

(a) Crystalline solids possess blunt melting points characteristic of absence of long range order.
(b) When cut or hammered gently, they break in an irregular manner.
(c) The mechanical properties depend upon the direction along which they are measured.
(d) They are isotropic in nature, having identical properties along all taxes.

J & K CET-(2019)

Ans. (c) : Properties of Crystalline solids.
(i) They have a definite shape and geometrical form.
(ii) They have sharp (definite) melting point.
(iii) They are rigid and incompressible.
(iv)They are anisotropic, i.e mechanical (physical) properties depend upon the direction along which they are measured. Rest all are not properties of crystalline solid.

9. Silicon carbide is example of

(a) molecular solid (b) metallic solid
(c) ionic crystal (d) covalent solid

JIPMER-2019

Ans. (d) : Silicon carbide (SiC) is covalent solid which is a subtype of crystalline solid. It is covalent solid since the atoms of silicon are connected with carbon through covalent bonds tetrahedrally.

10. Which among the following compounds in crystalline form is used for making Nicol's prism?

(a) $CaSO_4$ (b) Na_2AlF_6
(c) $CaCO_3$ (d) Al_2O_3

MHT CET-02.05.2019, SHIFT-III

Ans. (c) : A Nicol prism is a type of polarizer, an optical device made from calcite crystal used to produce and analyse plane polarized light. It is made in such a way that it eliminates one of the rays by total internal reflection.
Calcite crystal (i.e. calcium carbonate in crystalline form) is generally know as calc-spar and is used to produce and analyse plane polarised light.

11. Which among the following pairs of compounds is not isomorphous?

(a) $NaNO_3$ and $CaCO_3$
(b) K_2SO_4 and K_2SeO_4
(c) NaCl and KCl
(d) NaF and MgO

MHT CET-02.05.2019, SHIFT-III

Ans. (c) : Two crystal are said to be isomorphous-
• Both have the same space group and unit cell dimension.
• The type and position of atoms in both are the same NaCl and KCl have the same atomic ratio similar molecular formula and similar chemical properties.
But they have different crystal structure.

12. Which among the following solid is a non-polar solid?

(a) Hydrogen chloride
(b) Sulphur dioxide
(c) Water
(d) Carbon dioxide

MHT CET-2016

Ans. (d) : Non-polar solids have evenly distribution of electric charge across the molecule. Some example of non-polar solids are carbon dioxide, benzene, methane, diatomic gases (N_2, O_2, Cl_2) as we know non-polar compounds have symmetry that means all of the sides around the centre are identical. CO_2 is covalently bonded. Here carbon is the central atom and both sides around carbon atom is identical so it is a non-polar molecule.

13. Which one is not the property of crystalline solid?

(a) A definite and regular geometry
(b) High intermolecular forces
(c) Isotropic
(d) Sharp melting point

UPTU/UPSEE-2016

Ans. (c): We know that crystalline solids are solids that have closely packed atom and molecules. They are harder than amorphous solid and have a definite pattern. They show anisotropy and give more properties of solid than that by amorphous solids.

14. Consider the following for alumina:
1. In crystalline form, it exists in α and γ forms.
2. α form is the strongest and is known as corundum.
3. α form can be converted to γ form by heating at 1000°C.
Which of the above statements is/are correct?

(a) 1 only (b) 2 only
(c) 1 and 2 (d) 2 and 3

SCRA-2015

@apna_pdf

Ans. (c): Alumina (Al_2O_3) is a crystalline form and it exists in a α and γ form. α form is the strongest and is known as corundum.

15. Consider the following statements for $MgSO_4$
1. It crystallizes in a form with seven water molecules
2. Aqueous solution of $MgSO_4$ when treated with NaCl gives white precipitate.
Which of the above statement is/are correct?
(a) 1 only (b) 2 only
(c) Both 1 and 2 (d) Neither 1 nor 2

SCRA-2015

Ans. (c): (1) Magnesium sulfate heptahydrate, is a hydrous magnesium sulfate mineral with formula $MgSO_4.7H_2O$
(2) $MgSO_4$ is a crystalline solid in a form with seven water molecules. The colour of $MgSO_4$ is white crystalline solid, soluble in water.

16. Amorphous solids are characterized by property as
(a) isotropic (b) anisotropic
(c) sharp melting point (d) true solids

AMU-2015

Ans. (a) : Amorphous solids are isotropic i.e. they exhibit uniform properties in all directions. Amorphous solids have only short range order of arrangement. The structure of amorphous solids are similar to that of liquids. The thermal and electrical conductivity, coefficient of thermal expansion and refractive index of an amorphous solid have the same value in whatever direction.

17. Which one of the following has a different crystal lattice from those of the rest?
(a) Ag (b) V
(c) Cu (d) Pt
(e) Au

Kerala-CEE-2015

Ans. (b) : The crystal lattice is the symmetrical three-dimensional structural arrangements of atoms ions or molecules (constituent particle) inside a crystalline solid as points. So, Vanadium (V) crystallizes in BCC structures while silver (Ag), Copper (Cu), Platinum (Pt) and gold (Au) crystallize in CCP structures.

18. Which is the correct statement about solid?
(a) Very high compressibility
(b) Maximum intermolecular distance
(c) Definite mass but no definite volume
(d) Maximum intermolecular force of attraction

J & K CET-(2014)

Ans. (d) : Solid has maximum intermolecular force of attraction. In solid form, molecules are very tightly packed that there is very less intermolecular space and there is high intermolecular force of attraction. They have definite shape and volume and they are incompressible.

19. A crystalline solid X reacts with dil. HCl to liberate a gas Y. Y decolourises acidified $KMnO_4$. When a gas 'Z' is slowly passed into an aqueous solution of Y, colloidal sulphur is obtained X and Z could be respectively
(a) Na_2S, SO_3 (b) Na_2SO_4, H_2S
(c) Na_2SO_3, H_2S (d) Na_2SO_4, SO_2

Karnataka-CET-2014

Ans. (c) : X and Z could be Na_2SO_3, H_2S
Na_2SO_3 (Crystalline solid) reacts with dil. HCl to liberate SO_2.

$$\underset{X}{Na_2SO_3} + 2HCl(dil.) \rightarrow 2NaCl + SO_2\uparrow + H_2O$$

SO_2 decolourises acidified $KMnO_4$.

$$\underset{(Y)}{5SO_2} + 2KMnO_4 + 2H_2O \rightarrow K_2SO_4 + 2MnO_4 + 2H_2SO_4$$

When H_2S gas is slowly passed into an aqueous solution of SO_2 colloidal sulphur is obtained.

$$SO_2 + \underset{(Z)}{2H_2S} \rightarrow 2H_2O + 3S\downarrow$$

20. Which one of the following metals has a different lattice from those of the others?
(a) Fe (b) Co
(c) Ni (d) Cu
(e) Ag

Kerala-CEE-2013

Ans. (a) : Given metals in the option–
Co, Cu and Ag possess CCP (FCC) lattice at room temperature.
But Fe has BCC lattice at normal room temperature but it is changes into FCC lattice when temperature increases at 912°C.

21. Ionic solid are generally:
(a) good conductor of electricity
(b) soft
(c) volatile
(d) brittle

MPPET - 2012

Ans. (d) : Ionic solid are hard and brittle and have high melting and boiling point because ionic solid are composed of cations and anions by strong electrostatic forces. Ionic crystals having strong interaction between the ions (cation and anion)
It conducts electricity in molten state and aqueous form.

22. The property of crystalline solid is not
(a) anisotropic (b) isotropic
(c) hardness (d) denseness

CG PET- 2012

Ans. (b) : Crystalline solid shows anisotropic property not isotropic property.
Isotropic property are shown by amorphous solid, properties are same in all the direction.
Anisotropic property are shown by crystalline solid, properties are change in different directions.

23. Dry ice is
(a) Solid CO_2 (b) Solid camphor
(c) Solid SO_2 (d) Solid NO_2

JCECE - 2007

Ans. (a) : Dry ice is the common name of solid carbon dioxide (CO_2). It gets this name because it does not melt into a liquid when heated. Instead, it changes directly into a gas. It is used primary as cooling agent.

24. Which one of the following is amorphous?
(a) Polystyrene (b) Table salt
(c) Silica (d) Diamond

VITEEE- 2006

Ans. (a) : In Amorphous solid, constituent particle are not arranged in any regular fashion example –glass, rubber, quartz, polystyrene.

@apna_pdf

25. Crystalline form of silica is called:
(a) crystalline silicon (b) quartz
(c) rock (d) talc

UPTU/UPSEE-2006

Ans. (b) : Quartz is crystalline form of silica .It is most common form of crystalline silica and is the second most common mineral on the earth's surface.

26. Which one of the following allotropic forms of carbon is isomorphous with crystalline silicon?
(a) Graphite (b) Coal
(c) Coke (d) Diamond

AP-EAMCET (Medical), 2001

Ans. (d) : In crystalline silicon, all Si atom is bonded to four another Si atoms arranged tetrahedral as in diamond.

In crystallography, Crystals are described as isomorphous if they are closely similar in shape. Diamond and crystalline silicon are isomorphous because both have three dimensional tetrahedral structure.

Diamond and fullerence are pure forms of carbon.

27. Quartz is a crystalline variety of
(a) Sodium silicate (b) Silicon carbide
(c) Silicon (d) Silica

AP EAMCET- 1997

Ans. (d) : Quartz is a crystalline variety of silica. It is a covalent crystal having a framework of silicates or silica. It is a hard crystalline mineral composed of silica. It is a three-dimensional network where all the four oxygen atoms of each SiO_4 tetrahedron are shared.

28. For two ionic solids CaO and KI, identify the wrong statement among the following.
(a) CaO has high melting point.
(b) Lattice energy of CaO a much larger than that of KI.
(c) KI has high melting point.
(d) KI is soluble in benzene.

NEET-(1997)

Ans. (d) : (a) CaO has high melting point. It is true because the size of Ca is less than K.

(b) Lattice energy of CaO is much higher than that of KI. True because CaO is covalent in nature where as KI is ionic.

(c) KI has high melting point. It is true because lattice energy leads to high melting point.

(d) KI is insoluble in benzene. False because KI is ionic compound so it is not soluble in non polar solvent. (i.e. dipole moment (μ) for benzene = 0)

29. The Pure crystalline substance on being heated gradually first forms a turbid liquid at constant temperature and still at higher temperature turbidity completely disappears. The behaviour is a characteristic of substance forming
(a) Allotropic crystals
(b) Liquid crystals
(c) Isomeric crystals
(d) Isomorphous crystals

NEET-(1993)

Ans. (b) : Liquid crystals on heating firs become turbid and then on further heating turbidity completely disappears.

30. Glass a
(a) Liquid
(b) Solid
(c) Supercooled liquid
(d) Transparent organic polymer

NEET-(1991)

Ans. (c) : Glass is a supercooled liquid because glass is an amorphous solid have the tendency to flow but slowly.

31. Most crystals show good cleavage because their atoms, ions or molecules are
(a) weakly bonded together
(b) strongly bonded together
(c) spherically symmetrical
(d) arranged in planes.

NEET-(1991)

Ans. (d) : In crystals, the constituents are arranged in orderly pattern i.e. in plane. Thus they show good cleavage.

32. The ability of a substance to assume two or more crystalline structures is called
(a) Isomerism (b) polymorphism
(c) Isomorphism (d) amorphism

NEET-(1990)

Ans. (b) : The phenomenon of occurrence of a substance in two or more crystalline structure is called polymorphism. But the ability of two or more substance having the same crystal structure is called isomorphism.

2. Crystal Structure

33. Vacant space in body centered cubic lattice unit cell is about
(a) 23% (b) 46%
(c) 32% (d) 10%

Karnataka CET-17.06.2022, Shift-II

Ans. (c) : A body-centered unit cell structure consists of atoms arranged in a cube where each corner of the cube shares an atom and with one atom positioned at the center. If bcc structure efficiency is 68%. So, vacant space in body centered cubic lattice unit cell is about 32%.

34. A metal 'X' crystallises in a body centred cubic structure and its metallic radius is 346.4 pm. The length (in pm) of the unit cell is
(a) 200 (b) 800
(c) 600 (d) 500
(e) 400

Kerala CEE -03.07.2022

Ans. (b) : Given that,
Metal 'x' crystallizes is body centered cubic structure.
Radius (r) = 346.4 pm.
We know that –

$$\text{For bcc } = \frac{4r}{\sqrt{3}\,a}$$

$$a = \frac{4 \times 346.4}{\sqrt{3}}$$

$$= 799.076 = 800 \text{ pm.}$$

@apna_pdf

35. An element 'A' has face centred cubic structure with edge length of 361 pm. The radius of atom 'A' is:

(a) 127.6 pm (b) 180.5 pm
(c) 160.5 pm (d) 64 pm

CG PET-22.05.2022

Ans. (a) : Here, given element 'A' has face centred cubic structure.

Edge length = 361 pm

Then, for face centred cubic structure –

$$a\sqrt{2}=4r$$
$$361\sqrt{2}=4r$$
$$r=\frac{361\sqrt{2}}{4}=127.6\,\text{pm}$$

36. How many unit cells are present in a cubic shaped ideal crystal of NaCl of mass 1.0 g?

(a) 1.28×10^{21} unit cells
(b) 1.71×10^{21} unit cells
(c) 2.57×10^{21} unit cells
(d) 5.14×10^{21} unit cells

AP-EAPCET, 24.08.2021-Shift-I

CG PET -2019
UP CPMT-2013
JCECE - 2008
UPTU/UPSEE-2007
[AIEEE 2003]

Ans. (c) : NaCl has FCC structure, hence, n = 4 for NaCl.

Also number of atoms in 58.5g (1 mole) NaCl $= 6.023 \times 10^{23}$

∴ Number of unit cells present in 1 mol (58.5g)

$$\text{NaCl}=\frac{6.023\times10^{23}}{4}$$

and number of unit cells in 1g NaCl

$$=\frac{6.023\times10^{23}}{4\times58.5}$$

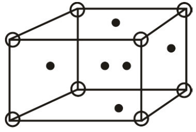
$= 2.57 \times 10^{21}$ unit cells

37. In FCC, the unit cell is shared equally by how many unity cells?

(a) 10 (b) 8
(c) 6 (d) 2

Karnataka-CET-2018, 2013
Manipal-2017
JIPMER-2007
NEET-2005

Ans. (c) : In a face–centered cubic lattice, consists of 6 faces so it is equally shared by 6 unit cell



38. Sodium atom crystallizes in bcc lattice with cell edge a=4.29Å, the radius of sodium atom is

(a) 18.6 Å (b) 1.86 Å
(c) 0.186 Å (d) 37.2 Å

AIIMS-2017
JEE MAIN-2015
Karnataka-CET-2015
CG PET- 2013

Ans. (b) : In a body – centered cubic lattice, atom touch along the body diagonal of cube Thus

$$4r=\sqrt{3}a$$
$$r=\frac{\sqrt{3}}{4}a$$

Edge length 'a' = 4.29 Å

$$r=\frac{\sqrt{3}\times4.29\,\text{Å}}{4}$$
$$r=\frac{1.732\times4.29\,\text{Å}}{4}$$
$$r=1.86\,\text{Å}$$

39. An ionic compound has a unit cell consisting of A ions at the corners of a cube and B ions the centres of the faces of the cube. The empirical formula for this compound would be

(a) AB (b) A_2B
(c) A_3B (d) AB_3

UP CPMT-2011
AIEEE-2005
(NEET-2000)

Ans. (d) : A atoms are at eight corners of the cube.

Therefore, the number of A atoms in a unit cell $=\frac{8}{8}=1$

B atoms are at the face centre of six faces.

Hence, its share in the unit cell $=\frac{6}{2}=3$.

Therefore, the formula of the compound is AB_3.

40. The number of atoms in a body centred cubic unit cell is

(a) 1 (b) 2
(c) 3 (d) 4

BITSAT-2017
UPTU/UPSEE-2016
AMU-2004

Ans. (b) : Since, the structure possesses 8 corner atoms and one body centre, the contribution will be

$=8\times\frac{1}{8}+1=2$ atoms per unit cell.

41. The metal that crystallises in simple cubic system is

(a) Po (b) Na
(c) Cu (d) Ag

MHT CET-2016
VITEEE- 2006

Ans. (a) : • Polonium (Po) is simple cubic structure.
• Sodium (Na) is Body centered cubic (bcc)
• Copper (Cu) and Silver (Ag) is face centered cubic (fcc) lattice.

@apna_pdf

42. A solid compound XY has NaCl structure. If the radius of the cation is 100 pm, the radius of the anion (Y^-) will be

(a) 275.1 pm (b) 322.5 pm
(c) 241.5 pm (d) 165.7 pm

VITEEE- 2012
NEET Mains-2011

Ans. (c) : Given:– radius of cation (r^+) = 100 pm

$$\text{Radius ratio} = \frac{\text{radius of cation }(r^+)}{\text{radius of anion }(r^-)}$$

We know that for NaCl like crystal

$$0.414 = \frac{100}{r^-}$$

$$\Rightarrow \quad r^- = 241.5 \text{ pm}$$

43. The number of atoms contained in a fcc unit cell of a monoatomic substance is

(a) 1 (b) 2
(c) 4 (d) 6

JIPMER-2012
(NEET-1993)

Ans. (c) : In the fcc or ccp arrangement. It has atoms at the corners as well as at the centre of each of the face. There is one atom at each of eight corners in this arrangement and each of them contributes one–eight to the unit cell, and one at each face centre of the cube and each of them contributed ½ to the unit cell.

The number of atoms present at corner $= \frac{1}{8} \times 8 = 1$

And the number of atoms present in face centre $= \frac{1}{2} \times 6 = 3$

∴ Total number of atoms in ccp or fcc arrangement = 1+3 = 4

So,

The number of atoms contained in one face–centred cubic unit cell of monoatomic substance is 4.

44. The ionic radii of A^+ and B^- ions are 0.98×10^{-10} m and 1.81×10^{-10} m. The coordination number of each ion in AB is

(a) 8 (b) 2
(c) 6 (d) 4

(NEET-I-2016)
J & K CET-2005

Ans. (c) : Given that —

Radius of A^+ (r_A^+) = 0.98×10^{-10}m

Radius of B^- (r_B^-) = 1.81×10^{-10}m

So,

The radius ratio

$$\frac{r_A^+}{r_B^-} = \frac{0.98\times10^{-10}\text{ m}}{1.81\times10^{-10}\text{ m}}$$

$$\frac{r_A^+}{r_B^-} = \frac{0.98}{1.81}\times10^{-10}\times10^{+10}$$

$$\frac{r_A^+}{r_B^-} = 0.54$$

This corresponds to octahedral coordination with coordination number 6.

For octahedral coordination, the radius ratio is in the range 0.414 to 0. 732.

45. Copper crystallises in FCC lattice with a unit cell edge of 361 pm. The radius of copper atom is

(a) 181 pm (b) 108 pm
(c) 128 pm (d) 157 pm

[AIEEE 2011, 2009]

Ans. (c) : The atoms on face diagonal will be touching each other. Let, the radius of the atom be r and edge length is 'a'.

Face diagonal of cube = $\sqrt{2}\,a$

$$\Rightarrow r + 2r + r = \sqrt{2}\,a$$

$$4r = \sqrt{2}\,a$$

$$r = \frac{\sqrt{2}}{4}a$$

Given that –

Edge length 'a' = 361 pm

So,

$$r = \frac{\sqrt{2}}{4}a$$

$$r = \frac{\sqrt{2}}{4}\times361\,\text{pm}$$

$$r = \frac{1.414\times361}{4}\text{pm}$$

$$r = 127.61\,\text{pm}$$

$$r \simeq 128\,\text{pm}$$

46. How many lattice points belong to a face centered cubic cell?

(a) 1 (b) 2
(c) 4 (d) 3

J&K CET-2012
VITEEE- 2006

Ans. (c) : In face centred cubic lattice, the atoms are present at eight corners of faces and one each at 6 faces.

∴ Lattice points belonging to face centred

cubic unit cell $= 8\times\frac{1}{8}+6\times\frac{1}{2} = 4$

47. Percentage of free space in bcc lattice is

(a) 24 (b) 32
(c) 48 (d) 52

COMEDK-2016
CG-PET-2015

Ans. (b) : We know that,

For bcc, number of atoms = 2

$$\text{Percentage packing fraction} = \frac{V_{\text{sphere}}}{V_{\text{unit cell}}}\times100$$

$$= \frac{2\times\frac{4}{3}\pi r^3}{\left(\frac{4}{\sqrt{3}}r\right)^3}\times100$$

@apna_pdf

$$= \frac{\frac{8}{3}\pi r^3}{\frac{64}{3\sqrt{3}}r^3}\times 100$$

$= 68\%$

∴ Fraction of free space in bcc = 100 – 68

= 32%

48. The dimensions of a unit cell of a crystal are a = 0.387, b = 0.387, c = 0.504 and $\alpha = \beta = 90°$, $\gamma = 120°$ the crystal system is

(a) cubic (b) hexagonal
(c) orthorhombic (d) rhombohedral

CG PET- 2013
AIIMS-2004

Ans. (b) : Given that –
a = 0. 387, b= 0.387 and c= 0.504
$\alpha = \beta = 90^0$, $\gamma = 120^0$.
For the crystal system –
$a = b \neq c$, $\alpha = \beta = 90^0$, $\gamma = 120^0$
These are the characteristic of hexagonal system.

49. The number of octahedral sites per sphere arranged in a face centered cubic structure, is

(a) 1 (b) 2
(c) 3 (d) 4

UPTU/UPSEE-2010
CG PET -2005

Ans. (b) : The octahedral sites will be equal to the number of spheres present in the unit cell. Hence, the total number of octahedral sites will be equal to the number of packing spheres. A fcc unit cell contains 4 atoms (sphere) per unit cell. Hence, the total number of octahedral sites per unit cell in fcc structure are 4.

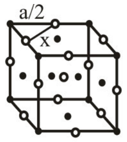
50. An element crystallises in a face-centered cubic (fcc) unit cell with cell edge a. The distance between the centers of two nearest octahedral voids in the crystal lattice is

(a) $\frac{a}{\sqrt{2}}$ (b) a
(c) $\sqrt{2a}$ (d) $\frac{a}{2}$

[JEE Main 2020, 5 Sep Shift-II]
WB-JEE, 2020

Ans. (a) : Distance between nearest octahedral voids (O.V)

$$= x = \sqrt{\left(\frac{a}{2}\right)^2 + \left(\frac{a}{2}\right)^2} = \frac{a}{\sqrt{2}}$$



x= Distance between to nearest octahedral voids
● = face-centered cubic
○ = octahedral voids

51. If a, b, c are the lengths of three edges of unit cell, α is the angle between side b and c, β is the angle between side a and c and γ is the angle between side a and b, what is the Bravais Lattice dimensions of a tetragonal crystal?

(a) $a = b = c$ and $\alpha = \beta = \gamma = 90°$
(b) $a = b \neq c$ and $\alpha = \beta = \gamma = 90°$
(c) $a = b = c$ and $\alpha = \beta = \gamma \neq 90°$
(d) $a \neq b \neq c$ and $\alpha = \beta = \gamma = 90°$

J & K CET-(2019, 1999)

Ans. (b) : In tetragonal Bravais lattices, the following relations are observed:
$a = b \neq c$ and $\alpha = \beta = \gamma = 90°$

52. Cell edge length in bcc, ccp and simple cubic unit cell is respectively as _____.

(a) $2r, \frac{4r}{\sqrt{3}}, 2\sqrt{2}r$ (b) $2r, 2\sqrt{2}r, \frac{4r}{\sqrt{3}}$
(c) $2\sqrt{2}r, \frac{4r}{\sqrt{3}}, 2r$ (d) $\frac{4r}{\sqrt{3}}, 2\sqrt{2}r, 2r$

GUJCET-2021, 2022

Ans. (d) : In bcc (body centered cubic), the atoms at the body diagonal touch each other.

So, $\sqrt{3}a = 4r$

$a = \frac{4}{\sqrt{3}}r$

In ccp or fcc the atoms at the face diagonals touch each other. If a is the edge length of cube and r is the radius of the atom.

So, $\sqrt{2}\,a = 4r$

$a = 2\sqrt{2}r$

In simple cubic the atoms at the corners touch each other.

So, $a = 2r$

Hence, $\frac{4r}{\sqrt{3}}, 2\sqrt{2}r, 2r$ are correct.

53. The number of atoms in body centred and face centred cubic unit cell respectively are

(a) 2 and 4 (b) 4 and 3
(c) 1 and 2 (d) 4 and 6

WB-JEE-30.04.2022

Ans. (a) : In bcc (body centred cubic) structure atoms present in corners and body centre. There are 8 corner and contribution of each corner is $\frac{1}{8}$ and body center has 1 atom.

So, number of atom in bcc = $\frac{1}{8} \times 8 + 1$

$= 1 + 1 = 2$

In the fcc (face centred-cubic) unit cell the atom present in corners and face centre. There are 8 corner and contribution of each corner is $\frac{1}{8}$ and 6 face centre and contribution of each face centre is $\frac{1}{2}$

So, Number of atom in fcc = $\frac{1}{8} \times 8 + \frac{1}{2} \times 6$

$= 1 + 3$

$= 4$

Hence, option (a) 2 and 4 are correct.

@apna_pdf

54. How many unit cells are present in a cube shaped ideal crystal of NaCl of mass 1 g?

(a) 5.14×10^{21} (b) 1.28×10^{24}

(c) 1.71×10^{21} (d) 2.5×10^{21}

AP EAPCET 24.08.2021, Shift-I

Ans. (d) : Given, M = 1g

Molecular weight of NaCl = 58.5

No. of moles in 1g NaCl = $\frac{1}{58.5}$

No. of crystal present in NaCl = $\frac{1}{58.5} \times 6.022 \times 10^{23}$

$= 0.1029 \times 10^{23}$

$= 1.029 \times 10^{22}$

Na^+ occupy the Octahedral site = 4 ion of Na^+

$\because$ 1 unit cell contain 4 molecules of NaCl.

$\therefore$ 1 molecule contain $\frac{1}{4}$ unit cell.

$\therefore$ 1.02×10^{22} crystal contains = $\frac{1.02 \times 10^{22}}{4}$ Unit cell

$= 0.255 \times 10^{22} = 2.5 \times 10^{21}$ unit cell.

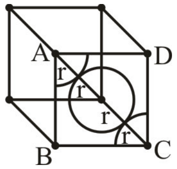
55. A metal crystallizes with a FCC-lattice, the edge of whose unit cell is x pm. The diameter of this metal atom would be _______ pm.

(a) 2x (b) $\frac{x}{\sqrt{2}}$

(c) $x\sqrt{2}$ (d) $\frac{\sqrt{2}}{x}$

AP EAPCET 20.08.2021 Shift-II

Ans. (b):



$\therefore$ Diameter = $\frac{AC}{2}$

$d = \frac{4r}{2}$

d = 2r ......(i)

Where r = radius

d = diameter

$\therefore$ we know that, when a = edge length

For FCC –

$4r = \sqrt{2}a$

$a = \frac{4r}{\sqrt{2}} \Rightarrow r = \frac{\sqrt{2}}{4}a = \frac{a}{2\sqrt{2}}$

putting these value in Eq^n. (i) we get

$d = 2r = \frac{a}{\sqrt{2}} = \frac{x}{\sqrt{2}}$

56. The number of octahedral voids per lattice site in a lattice is ______(Rounded off of the nearest integer)

JEE Main 26.02.2021,Shift-II

Ans.: 1

Assuming FCC

Number of lattice sites = 6 face-centre + 8 corners

= 14

Number of octahendral voids = 12 edge + 1 body centre

= 13

Per lattice site or ratio = $\frac{13}{14} = 0.92857 \simeq 1$

57. The number of translational degrees of freedom for NH_3 (g) is

(a) 4 (b) 5

(c) 3 (d) 9

TS-EAMCET 09.08.2021, Shift-I

Ans. (c) : Ammonia (NH_3) is a nonlinear molecule and has four atom i.e. N = 4.

$\therefore$ Translational degree of freedom for NH_3 = 3

- Rotational degree of freedom = 3
- Vibrational degree of freedom = 3N – 6

$= 3 \times 4 - 6 = 6$

Hence, The number of translational degrees of freedom for NH_3 is 3.

58. A certain element crystallises in a BCC lattice of unit cell edge length $27\overset{\circ}{A}$. If the same element under the same conditions crystallises in the FCC lattice, the edge length of the unit cell in $\overset{\circ}{A}$ will be___________. (Round off to the Nearest Integer).

[Assume each lattice point has a single atom]

$\left[\text{Assume}\sqrt{3} = 1.73, \sqrt{2} = 1.41\right]$

JEE Main 16.03.2021, Shift-I

Ans. 33 Å :

Given–

edge length $(a) = 27\overset{\circ}{A}(\text{For BCC})$

edge length $(a) = ?\ (\text{For FCC})$

Now,

relation between radius and edge length in BCC lattice–

For BCC unit cell,

$\sqrt{3}a = 4R$

$a = \frac{4R}{\sqrt{3}} = 27$

$R = 27\frac{\sqrt{3}}{4}$ Å

For FCC unit cell

$\sqrt{2}a = 4R$

$a = \frac{4}{\sqrt{2}}\left(27\frac{\sqrt{3}}{4}\right)$

$a = 27\frac{\sqrt{3}}{\sqrt{2}}$

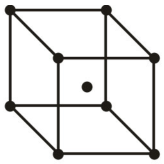
a = 33.12 ≈ 33Å

@apna_pdf

59. The coordination number of an atom in a body-centered cubic structure is ______.
[Assume that the lattice is made up of atoms]

JEE Main 24.02.2021, Shift-I

Ans. (8) : The body centred cubic (BCC) unit have one atoms at its body centre besides the ones that are at its corners. Each corner and body centre atom co-ordinated with the eight atom. Hence, the co-ordination number of BCC is 8.



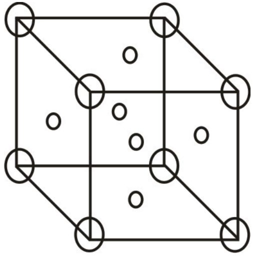
(BCC) Structure

60. The FCC - crystal contains how many atoms in each unit cell?

(a) 4 (b) 8
(c) 10 (d) 12

AP EAPCET 19-08-2021, Shift-II

Ans. (a) : Given - Face centred cubic (FCC)



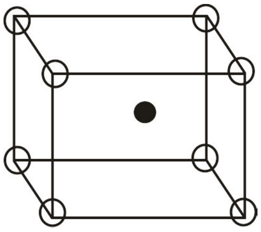
Total No. of atom in each unit cell =

$$= 8\times\frac{1}{8}+6\times\frac{1}{2}=1+3=4$$

61. The coordination number of an atom in a body centered cubic structure is.......
[Assume that the lattice is made up of atoms.]

[JEE Main 2021, 24 Feb Shift-I]

Ans. (8) :



The coordination number of number in a body centre cubic structure is 8.

62. Diamond has a three dimensional structure of C atoms formed by covalent bonds. The structure of diamond has face centred cubic lattice, where 50% of the tetrahedral voids are also occupied by carbon atoms. The number of carbon atoms present per unit cell of diamond is............

[JEE Main 2021, 20 July Shift-II]

Ans. (8) : Carbon atoms occupy FCC lattice paints as well as half of the tetrahedral voids therefore number of carbon atoms per unit cell = 8.

63. The parameters of the unit cell of a substance are a = 2.5, b = 3.0, c = 4.0, $\alpha = 90^0$, $\beta = 120^0$, $\gamma = 90^0$. The crystal system of the substance is

(a) hexagonal (b) orthorhombic
(c) monoclinic (d) triclinic

[JEE Main 2021, 27 July Shift-I]

Ans. (c) : Given that

a = 2.5, b=3.0 and c = 4.0,
$\alpha = 90^0$, $\beta = 120^0$, $\gamma = 90^0$.
When edge length $a \neq b \neq c$ and axial
Angle $\alpha = \gamma = 90^0$, $\beta = 120^0$ then
System is called monoclinic crystal system.

64. The empirical formula for a compound with a cubic close packed arrangement of anions and with cations occupying all the octahedral sites in A_xB. The value of x is.......(Integer answer)

[JEE Main 2021, 31 Aug Shift-II]

Ans. (1)
Anions forms CCP or FCC (A^-) = 4 A^- per unit cell.
cation occupy all octahedral void (B^+) = $4B^+$ per unit cell.
So, Empirical formula → $A_4\,B_4$
Empirical formula → AB → (x = 1)

65. The correct option for the number of body center unit cells in all 14 types of Bravais lattice unit cells is

(a) 3 (b) 7
(c) 5 (d) 2

(NEET-2021)

Ans. (a) : In the 14 type of Bravais lattices, body centred unit cell is present in cubic, tetragonal and orthorhombic crystal system. So in the body centred cubic possible variation in present in three crystal systems.

66. Iron exhibits BCC-structure at room temperature above 500°C, it transforms to FCC-structure. Find the ratio of the density of iron at room temperature to that at 500°C. (Assume the atomic radii and the molar mass of iron remain constant even with variation in temperature)

(a) $3\sqrt{3}:4\sqrt{2}$ (b) $\sqrt{3}:\sqrt{2}$
(c) $\sqrt{2}:\sqrt{3}$ (d) 10 : 92

AP EAPCET 23-08-2021 Shift-I

Ans. (a) :

$$\underset{\text{BCC}}{\text{Fe}} \xrightarrow[\text{500°C}]{\text{above}} \underset{\text{FCC}}{\text{Fe}}$$

(25°C)

Given, atomic radii and molar mass remain constant.

$$\therefore \text{ density } (\rho) = \frac{\text{No. of atom}\times\text{Molar mass}}{\text{Volume of unit cell}}$$

$$\rho = \frac{Z\times M}{a^3\,N_0}$$

For BCC, $4r = \sqrt{3}\,a \;\Rightarrow a = \dfrac{4r}{\sqrt{3}}$

@apna_pdf

and No. of atom (Z) = 2

and FCC, $4r = \sqrt{2}a \Rightarrow a = \dfrac{4r}{\sqrt{2}}$

and no. of atom (Z) = 4

$$\frac{\rho_{BCC}}{\rho_{FCC}} = \frac{2\times M}{\left(\frac{4r}{\sqrt{3}}\right)^3}\times\frac{\left(\frac{4r}{\sqrt{2}}\right)^3}{4M}$$

$$\frac{\rho_{BCC}}{\rho_{FCC}} = \frac{2}{\left(\sqrt{2}\right)^3}\times\frac{\left(\sqrt{3}\right)^3}{4}$$

$$\frac{\rho_{BCC}}{\rho_{FCC}} = \frac{3\sqrt{3}}{4\sqrt{2}}$$

So, ratio is $3\sqrt{3} : 4\sqrt{2}$

67. Which of the following is correct in the crystal lattice given below?

(a) Nearest neighbour distance in NaCl= $\dfrac{a}{\sqrt{2}}$

(b) Total volume of a unit cell in CCP= $\left(r\sqrt{2}\right)^3$

(c) Packing fraction of BCC is more than that of a FCC unit cell

(d) Nearest neighbour distance in CsCl= $a\dfrac{\sqrt{3}}{2}$

TS-EAMCET (Engg.), 07.08.2021 Shift-II

Ans. (d) : The nearest neighbours would be an atom at the corner and the one at the body center. The distance between them would be equal to half the length of the diagonal of the cube, that is $\sqrt{3}/2$ times the side length of the unit cell.

- Nearest neighbour distance in NaCl is a/2.
- Packing fraction of FCC is more than that of a BCC unit cell. They are respectively 0.74, 0.68.

68. In the face centered unit cell, the lattice points are present at —

(a) Only the corners of the unit cell

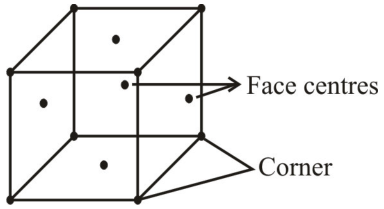
(b) The corners and the center of the unit cell

(c) The corners and the face centres of the unit cell

(d) Only the face centres of the unit cell

AP EAPCET 20.08.2021 Shift-I

Ans. (c) : In face centered unit cell atom/lattice point are present at corners and face centres of unit cell.



Unit cell of FCC

69. A compound crystallizes in a HCP arrangement. The total number of voids present in 0.5 mole of the crystal is

(a) 1.0 N
(b) 0.5 N
(c) 1.5 N
(d) 2.0 N

TS EAMCET 10.08.2021, Shift-II

Ans. (c) : In hexagonal close packed structure, there is 6 atom per unit cell.

Number of unit cell in HCP = $\dfrac{0.5}{6}\times 6.022\times 10^{23}$

(6 = Effective no. of HCP)

In one unit cell total void = 18 Octahedral, 12 Tetrahedral.

Total no. of void = $\dfrac{18\times 0.5\times 6.022\times 10^{23}}{6} = 9.033\times 10^{23}$

Total no. of voids in (N) = $\dfrac{9.003\times 10^{23}}{6.022\times 10^{23}} = 1.5\text{N}$

70. Calculate the coordination number of Na^+ in $NaC\ell$ crystal, given radius of Na^+ and $C\ell^-$ are 95 pm and 181 pm respectively.

(a) 8
(b) 4
(c) 6
(d) 12

AP EAMCET (Engg.) 18.09.2020, Shift-I

Ans. (c) : For $NaC\ell$ crystal

Radius ratio, $\dfrac{r_{Na^+}}{r_{C\ell^-}} = \dfrac{95}{181} = 0.5248$,

which is, in the range of 0.414 – 0.732.

So coordination number of Na^+ in $NaC\ell$ crystal = 6

71. In a monoclinic unit cell, the relation of sides and angles are respectively:

(a) $a = b \neq c$ and $\alpha = \beta = \gamma = 90^\circ$

(b) $a \neq b \neq c$ and $\alpha = \beta = \gamma = 90^\circ$

(c) $a \neq b \neq c$ and $\alpha = \gamma = 90^\circ \neq \beta$

(d) $a \neq b \neq c$ and $\alpha \neq \beta \neq \gamma \neq 90^\circ$

BITSAT-2020

Ans. (c) : Monoclinic crystal is one of the 7 crystal system. In monoclinic system, the crystal is described by vectors of unequal lengths,

So, we have. $a \neq b \neq c$ and $\alpha = \gamma = 90^\circ\ \beta = 120^\circ$

72. Which of the following statement is correct?

(a) Silicon doped with Arsenic impurity is a p-type semiconductor

(b) Amorphous solids are anisotropic in nature

(c) In the unit cell of rhombic sulphur, the axial distances are unequal and the value of each axial angle is 90°

(d) In MnO, all the domains are aligned in the same direction

GUJCET-2020

Ans. (c) : In the unit cell of rhombic sulphur, the axial distance are unequal and the value of each axial angle is 90^0 is correct.

Rhombic sulphur has a simple orthorhombic structure.

@apna_pdf

73. Which is mismatched for NaCl crystal?

(a) $\frac{r^+}{r^-} = 0.414$ to 0.732
(b) Coordination number = 6:6
(c) Edge of unit cell = $(r^+ + r^-)$
(d) Crystal structure = fcc **Manipal-2020**

Ans. (c) : Edge length of (NaCl) crystal unit cell

$$= 2\left(r^+_{Na^+} + r^-_{Cl^-}\right)$$

74. A match box exhibits

(a) cubic geometry
(b) monoclinic geometry
(c) orthorhombic geometry
(d) tetragonal geometry

CG PET -2019

Ans. (c) : A matchbox has the geometry as that of an orthorhombic lattice as the side a, b, c have different lengths and all of them have angles equal to 90°.

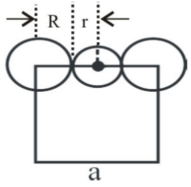
Orthorhombic geometry has $a \neq b \neq c$ and $\alpha = \beta = \gamma = 90^o$.

75. The radius of the largest sphere which fits properly at the centre of the edge of a body centred cubic unit cell is
(Edge length is represented by 'a')

(a) 0.134 a (b) 0.027 a
(c) 0.047 a (d) 0.067 a

[JEE Main 2019, 11 Jan Shift-II]

Ans. (d) :



From the figure –
a = 2 (R + r)
Properties at the centre of the edge of body centred cubic unit cell.
Now,

$$\frac{a}{2} = (R + r) \text{———}(1)$$

$$a\sqrt{3} = 4R \text{———}(2)$$

Using (1) and (2) we get –

$$\frac{a}{2} = \frac{a\sqrt{3}}{4} + r$$

$$a\left(\frac{2-\sqrt{3}}{4}\right) = r$$

r = 0.067a

76. 10 mL of 1 mM surfactant solution forms a monolayer covering 0.24 cm² on a polar substrate. If the polar head is approximated as a cube, what is its edge length?

(a) 2.0 pm (b) 0.1 nm
(c) 1.0 pm (d) 2.0 nm

[JEE Main 2019, 9 April Shift-II]

Ans. (a) : Milli moles = $10\times10^{-3} = 10^{-2}$

Moles = 10^{-5}

Number of molecules = $6\times10^{23}\times10^{-5}$

$= 6\times10^{23-5}$

$= 6\times10^{18}$

Surface area occupied by one molecule.

$$= \frac{0.24}{6\times10^{18}} = 0.04\times10^{-18}\,\text{cm}^2$$

$a^2 = 4\times10^{-20}$

$\therefore$ $a = 2\times10^{-10}$ cm

a = 2 pm

$1\text{pm} = 10^{-10}$ cm

77. An element has a face-centered cubic (FCC) structure with a cell edge of a. The distance between the centers of two nearest tetrahedral voids in the lattice is

(a) $\sqrt{2}a$ (b) a
(c) $\frac{a}{2}$ (d) $\frac{3}{2}a$

[JEE Main 2019, 12 April Shift-I]

Ans. (c) : The distance between the two nearest tetrahedral voids in FCC lattice is $\frac{a}{2}$. If a cube is divided into 8 minicubes one tetrahedral void is present at the centre of each minicube.

Distance between void at nearest distance is $= \frac{a}{4} + \frac{a}{4}$

$$= \frac{a+a}{4}$$

$$= \frac{2a}{4}$$

$$= \frac{a}{2}$$

78. The ratio of number of atoms present in a simple cubic, body centered cubic and face centered cubic structure are, respectively.

(a) 8: 1: 6 (b) 1: 2: 4
(c) 4: 2: 1 (d) 4: 2: 3

[JEE Main 2019, 12 April Shift-II]

Ans. (b) : Number of atom in simple cubic $= 8\times\frac{1}{8} = 1$

Number of atom in bcc $= 8\times\frac{1}{8} + 1$

$= 1 + 1$

$= 2$

Number of atom in FCC $= 8\times\frac{1}{8} + 6\times\frac{1}{2}$

$= 1 + 3$

$= 4$

Now

SC : BCC : FCC = 1 : 2 : 4 .

79. Which primitive unit cell has unequal edge lengths ($a \neq b \neq c$) and all axial angles different from 90°?

@apna_pdf

(a) Hexagonal (b) Monoclinic
(c) Tetragonal (d) Triclinic

[JEE Main 2019, 10 Jan Shift-I]

Ans. (d) : In triclinic cell –
Edge length $a \neq b \neq c$ and axial angle
$\alpha \neq \beta \neq \gamma \neq 90^0$.

80. How many total constituent particles are present in simple cubic unit cell ?
(a) 1 (b) 3
(c) 4 (d) 2

MHT CET-02.05.2019, SHIFT-II

Ans. (a) : In simple cubic structure atoms present in only corner. There are eight (8) corner present in simple cubic and contribution is 1/8

So, Number of effective atom $= \frac{1}{8} \times 8$
$= 1$ atom.

81. B^- ions form a close packed structure. If the radius of B^- ion is 200 pm then the cation (A^+) having radii 88 pm can fit into
(a) tetrahedral hole (b) octahedral hole
(c) both of these (d) none of these

AMU-2019

Ans. (b) : Radius ratio $= \frac{r^+}{r^-} = \frac{88}{200} = 0.44$
As it lies in the range 0.414 – 0.732, hence cation A^+ can be fit into the octahedral hole of the crystal A^+B^-

82. Which among the following is the most symmetrical crystal system?
(a) Hexagonal (b) Cubic
(c) Triclinic (d) Orthorhombic

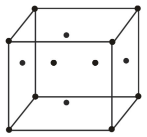
J & K CET-(2019)

Ans. (b) : Cubic is most symmetrical crystal system because their unit cell parameters as, $a = b = c$ and $\alpha = \beta = \gamma = 90$.

83. Consider a fcc lattice made of a metal cation (M^{6+}) and three oxide anions per unit cell. The resultant structure would have
(a) 3D network of edge shared Octahedra
(b) 3D network of corner shared Octahedra
(c) 2D network of edge shared Octahedra
(d) 2D network of corner shared Octahedra
(e) 3D network of face shared Octahedra

Kerala-CEE-2019

Ans. (b) :



Face centered cubic unit cell (FCC)
- cubic unit cell – 3D
- Face, $6 \times \frac{1}{2}$
- Corners, shared, $8 \times \frac{1}{8} = 1$

So, 3D network of corner shared octahedral.

84. The edge length of solid possessing cubic unit cell is $2\sqrt{2}r$ (structure I), based on hard sphere model, which upon subjecting to a phase transition, a new cubic structure (structure II) having an edge length of $\frac{4r}{\sqrt{3}}$ is obtained, where r is the radius of the hard sphere. Which of the following statements is true?
(a) Density of the structure II is the lower than structure I
(b) Density of structure II is higher than structure I
(c) The pore volume in structure I is 1.2 times higher than that of structure II
(d) The pore volume of both structures are equal
(e) The octahedral voids in structure I is transformed into tetrahedral voids in structure II

Kerala-CEE-2019

Ans. (a) : Structure I,
$a = 2\sqrt{2}r$ ...FCC
Structure II,
$a = \frac{4r}{\sqrt{3}} \Rightarrow$ BCC
So, FCC is denser than BCC and FCC has more porosity than BCC.
The number of atom in FCC is 4 and no. of atom in BCC is 2.

85. If a metal crystallises in bcc structure with edge length of unit cell 4.29×10^{-8} cm the radius of metal atom is
(a) 3.2×10^{-7} cm (b) 1.86×10^{-8} cm
(c) 1.07×10^{-7} cm (d) 1.07×10^{-8} cm

MHT CET-03.05.2019, SHIFT-I

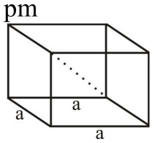
Ans. (b) : Given that–
Edge length (a) = 4.29×10^{-8} cm
In body centred cubic structure —

$$4r = \sqrt{3}a$$
$$r = \frac{\sqrt{3}}{4} \times a$$
$$r = \frac{\sqrt{3}}{4} \times 4.29 \times 10^{-8} \text{ cm}$$
$$r = \frac{1.73 \times 4.29 \times 10^{-8}}{4} \text{cm}$$
$$r = 1.86 \times 10^{-8} \text{ cm}$$

86. Edge length of a cube is 300 pm. Its body diagonal would be
(a) 600 pm (b) 423 pm
(c) 519.6 pm (d) 450.4 pm

Karnataka-CET-2018

Ans. (c) : Given that –
edge length 'a' = 300 pm



@apna_pdf

body diagonal $= \sqrt{a^2+a^2+a^2}$

$= \sqrt{3a^2}$

$= \sqrt{3}\,a$

$= \sqrt{3}\times 300\,\text{pm}$

$= 1{\cdot}732 \times 300$ PM

$= 519{\cdot}6$ pm

87. Which among the following metals crystallise as a simple cube?

(a) Polonium (b) Iron

(c) Copper (d) Gold

MHT CET-2018

Ans. (a) : Polonium crystallizes as simple cubic crystal structure while Iron crystallizes as BCC unit cell, copper and gold crystallizes as FCC unit cell.

88. Zn converts from its melted state to its solid state, it has HCP structure, then the number of nearest atoms will be

(a) 6 (b) 8

(c) 12 (d) 4

UPTU/UPSEE-2018

Ans. (c) : In Zn is HCP structure, the number of nearest neighbours is 12, six are in the plane, 3 above the plane and 3 below the plane, so hexagonal closed packing has the coordination number of 12.

89. Which colour is observed when ZnO is heated?

(a) Yellow (b) Violet

(c) Green (d) Blue

[AIIMS-26 May, 2018(M)]

Ans. (a) : Zinc oxide is white in colour at room temperature. When it heating it loses oxygen and turns yellow.

90. A metal crystallizes with face centred cubic lattice. The edge of the unit cell is 408 pm. The diameter of the metal atom is

(a) 288 pm (b) 408 pm

(c) 144 pm (d) 204 pm

Assam CEE-2018

Ans. (a) :

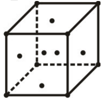
For FCC,

$$r = \frac{a}{2\sqrt{2}}$$

$$\because \text{ Diameter} = 2r = \frac{a}{\sqrt{2}}$$

$$\text{Diameter} = \frac{408}{1.414} = 288.5\text{pm}$$

91. The lattice point per unit cell in the figure



is

(a) 14 (b) $\frac{14}{6}$

(c) 4 (d) $\frac{8}{2}+\frac{6}{3}$

CG PET -2018

Ans. (c) : In given lattice is a FCC crystal lattice.

Number of atom per unit cell $= 8\times\frac{1}{8}+6\times\frac{1}{2}$

$= 1 + 3$

$= 4$

92. If the edge of a body centred unit cell is 400 pm, what will be the approximate radius of the atom present in it? (in pm)

(a) 200 (b) 141

(c) 173 (d) 924

GUJCET-2018

Ans. (c) : In the body centred unit cell , the radius (r) and edge length (a) are related by the expression —

$$4r = \sqrt{3}a$$

Given that —

edge length 'a' = 400 pm

$$r = \frac{\sqrt{3}}{4}a$$

$$r = \frac{\sqrt{3}}{4}\times 400\,\text{pm}$$

$$r = \frac{1.732\times 400}{4}\text{pm}$$

r = 173 pm

93. The limiting radius ratio for tetrahedral shape is

(a) 0.155 to 0.225 (b) 0 to 0.155

(c) 0.414 to 0.732 (d) 0.225 to 0.414

COMEDK-2018

Ans. (d) : The limiting radius of Tetrahedral shape is 0.225 to 0.414 due to three sphere touching one another and fourth sphere touches each other at one point only such that centre of the sphere are at the tetrahedral.

94. The crystal unit cell with parameter a = 3.1Å, b = 3.1Å, c = 5.2Å and $\alpha = \beta = \gamma = 90°$ belongs to–

(a) cubic crystal system

(b) triclinic crystal system

(c) monoclinic crystal system

(d) None of the above

BCECE-2018

Ans. (d) : The crystal unit cell with parameter

$a = 3.1\ \text{Å}, b = 3.1\ \text{Å}, c = 5.2\ \text{Å}$, and $\alpha = \beta = \gamma = 90^0$ belong to tetragonal crystal system and $a = b \neq c$ and $\alpha = \beta = \gamma = 90^0$. The bond parameter for other crystal system gives the other options as fallows.

(a) For cubic crystal system

$a = b = c,\ \alpha = \beta = \gamma = 90^o$

(b) For triclinic system

$a \neq b \neq c,\ \alpha \neq \beta \neq \gamma \neq 90^o$

(c) For monoclinic crystal system

$a \neq b \neq c,\ \alpha = \gamma = 90^o,\ \beta \neq 90^o$

95. The radius of sodium atom is 1.857 × 10^{-8} cm. If sodium crystal is a body centred, then the edge length of unit cell is

(a) 3.81 Å (b) 4.29 Å

(c) 2.37 Å (d) None of these

CG PET -2018

@apna_pdf

Ans. (b) : Given that –
Radius of sodium atom r = 1.857×10^{-8} cm.
In a body centered cubic unit cell

$$4r = \sqrt{3}\,a$$

Therefore

$$a = \frac{4r}{\sqrt{3}}$$

$$\Rightarrow 1.857\times 10^{-8} = \frac{\sqrt{3}}{4}a$$

$$\Rightarrow a = \frac{1.857\times10^{-8}\times4}{\sqrt{3}} \qquad \therefore \sqrt{3} = 1.732$$

$$a = 4.29 \times 10^{-8}\text{cm}$$

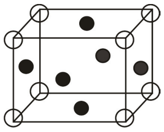
$$a = 4.29\ \overset{o}{A} \qquad \therefore 1\overset{o}{A} = 10^{-8}\,\text{cm}$$

96. A fcc crystal contains how many atoms in each unit cell?

(a) 4 (b) 6
(c) 2 (d) 5

HP CET-2018

Ans. (a) :



Number of atom in fcc crystal (at corners and face centres of cubic unit cell)

$$= 8\times\frac{1}{8}+6\times\frac{1}{2}$$

$$= 1 + 3$$

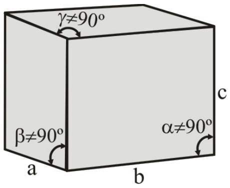
$$= 4$$

97. Crystal system of $CuSO_4$. $5H_2O$ is

(a) triclinic (b) trigonal
(c) cubic (d) tetragonal

JCECE - 2018

Ans. (a) : Crystal system of $CuSO_4\cdot5H_2O$ is triclinic. In the triclinic system, the crystal is described by vectors of unequal length. In addition, the angles between these vectors, must be different.



Triclinic system, Bravais lattice,

$$a \neq b \neq c \ \text{ and } \alpha \neq \beta \neq \gamma \neq 90°$$

98. If 'a' stands for the edge length of the cubic systems : simple cubic, body centred cubic and face centred cubic, then the ratio of radii of the spheres in these systems will be respectively,

(a) $\frac{1}{2}a:\frac{\sqrt{3}}{4}a:\frac{1}{2\sqrt{2}}a$ (b) $\frac{1}{2}a:\sqrt{3}a:\frac{1}{\sqrt{2}}a$

(c) $\frac{1}{2}a:\frac{\sqrt{3}}{2}a:\frac{\sqrt{3}}{2}a$ (d) $1a:\sqrt{3}a:\sqrt{2}a$

VITEEE-2017

Ans. (a) : Lattice arrangements in cubic cells between the edge length (a) of the cell and radius (r) of the sphere–

For simple cubic : $a = 2r$ or $r = \frac{1}{2}a$

For body centred cubic : $a = \frac{4}{\sqrt{3}}r$ or $r = \frac{\sqrt{3}}{4}a$

For face centred cubic : $a = 2\sqrt{2}\,r$ or $r = \frac{1}{2\sqrt{2}}a$

Thus, the ratio of radii of spheres for these will be–

$$\text{SC : BCC : FCC} = \frac{a}{2}:\frac{\sqrt{3}}{4}a:\frac{1}{2\sqrt{2}}a$$

99. A metal crystallises in a face centred cubic structure. If the edge length of its unit cell is 'a', the closest approach between two atoms in metallic crystal will be

(a) 2a (b) $2\sqrt{2}\,a$

(c) $\sqrt{2}\,a$ (d) $\frac{a}{\sqrt{2}}$

[JEE Main 2017]

Ans. (d) : For face centred cubic structure, the closest approach between two atom in metallic crystal will be equal to one half the length of the face diagonal. It will be

$$= \frac{1}{2}\times \text{ length of face diagonal} \text{———(1)}$$

But, length of face diagonal = $\sqrt{2}\,a$ ———(2)

Where, a is the edge of its unit cell.

From equation (1) and (2) ; the closest approach between two atom in metallic crystal will be –

$$=\frac{1}{2}\times\sqrt{2}\,a$$

$$=\frac{\sqrt{2}}{2}a$$

$$=\frac{\sqrt{2}}{\sqrt{2}\times\sqrt{2}}a$$

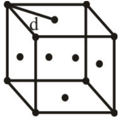
$$=\frac{a}{\sqrt{2}}$$

100. Cu crystallizes as face centered cubic lattice with edge length of 3.56Å. What will be the nearest distance between Cu atoms?

(a) 1.5Å (b) 2.5 Å
(c) 3.7Å (d) 4.8 Å

J & K CET-(2017)

Ans. (b) : Given that, edge length 'a' = 3.56 Å
For a face-centred cubic lattice, distance between nearest neighbour is given by:



d= nearest Cu atom distance

face diagonal length = $\sqrt{2}$a

@apna_pdf

then $d = \frac{\sqrt{2}a}{2} = \frac{a}{\sqrt{2}}$

$$d = \frac{a}{\sqrt{2}}$$

$$d = \frac{3.56\,\overset{o}{A}}{\sqrt{2}}$$

$$d = \frac{3.56\,\overset{o}{A}}{1.414}$$

$$d = 2.5\text{Å}$$

101. A cubic unit cell of a metal with molar mass of 63.55 g mol^{-1} has an edge length of 362 pm. Its density is 8.92 g cm^{-3}.The type of unit cell is

(a) primitive
(b) face centred
(c) end centred
(d) body centred

JIPMER-2017

Ans. (b) : Given that $d = 8.92 \text{ g cm}^{-3}$

$M = 63.55\text{g mol}^{-1}$
$a = 362 \text{ pm} = 362 \times 10^{-10} \text{ cm}$
$N_A = 6.023 \times 10^{23} \text{ mol}^{-1}$
$1 \text{ pm} = 10^{-10} \text{ cm}$

$$\text{Density (d)} = \frac{Z \times M}{a^3 \times N_A}$$

$$Z = \frac{d \times N_A \times a^3}{M}$$

$$Z = \frac{8\cdot92 \times 6\cdot023 \times 10^{23} \times (362 \times 10^{-10})^3}{63.55}$$

$$Z = 4$$

The face centered cubic (FCC) has 4 atoms per unit cell.
∴ The metal crystallizes in FCC.

102. Which of the following crystal has unit cell such that $a \neq b \neq c$ and $\alpha \neq \beta \neq \gamma \neq 90^o$?

(a) $NaNO_3$
(b) K_2SO_4
(c) KNO_3
(d) $K_2Cr_2O_7$

Karnataka-CET-2017

Ans. (d) : $K_2Cr_2O_7$ has triclinic system , Bravais lattic, unit cell such that $a \neq b \neq c$ and $\alpha \neq \beta \neq \gamma \neq 90°$

- $NaNO_3$ has two crystal structure-rhombohedral and trigonal.
- K_2SO_4 and KNO_3 are orthorhombic crystal structure.

103. If ionic radius of Cs^+ and Cl^- are 1.69 Å and 1.81 Å respectively, the edge length of unit cell is:

(a) 4.04 Å
(b) 3.50 Å
(c) 7.00 Å
(d) None of these

Manipal-2017

Ans. (a) : Given that –

Radius of cation $(r^+) = 1.69$ Å
Radius of anion $(r^-) = 1.81$ Å

So, $(r^+ + r^-) = \frac{\sqrt{3}}{2}a$

⇒ $a = \frac{2(r^+ + r^-)}{\sqrt{3}}$

$$a = \frac{2(1.69 + 1.81)}{\sqrt{3}}$$

$$a = \frac{7}{\sqrt{3}}$$

$$a = \frac{7}{1.732}$$

$$a = 4.04 \text{ Å}$$

104. Which of the following *fcc* structures contains cations in the alternate tetrahedral voids?

(a) Na_2O
(b) ZnS
(c) CaF_2
(d) CaO

AMU-2016

Ans. (b) : In ZnS, S^{-2} (sulphide ions) are present at FCC position giving four sulphide ions per unit cell.
To comply with 1:1 stoichiometry, four Zn^{2+} ions must be present in four alternate tetrahedral voids out of eight tetrahedral voids present.

105. If the distance between Na^+ and Cl^- ions in NaCl crystal is X-pm, the length of edge of the unit cells (in pm)

(a) $\frac{X}{2}$
(b) X
(c) 2X
(d) 4X

BCECE-2016

Ans. (c) : In the fcc unit cell of NaCl, along a given edge, chloride ions present at corner. Sodium ion present at edge centre which is touch to each other.
Hence, the edge length $a = 2r_{ce}– = 2\,(r_{Na^+} + r_{Cl^-})$

Here, $(r_{Na^+} + r_{Cl^-})$ is the distance between sodium and chloride ions.
The length of the edge of the unit cell is twice the distance between sodium and chloride ions in sodium chloride crystal. It is 2x.

106. Match List I with List II and select the correct answer using the given codes.

List I **(Crystal system)**	**List II** **(Examples)**
A. Cubic	1. TiO_2
B. Tetragonal	2. Graphite
C. Hexagonal	3. $K_2Cr_2O_7$
D. Triclinic	4. ZnS

Codes

	A	**B**	**C**	**D**
(a)	2	3	4	1
(b)	3	4	3	2
(c)	4	2	1	4
(d)	4	1	2	3

CG PET- 2016

Ans. (d) :

(A) → 4, Zns (Cubic)
(B) → 1, TiO_2 (Tetragonal)
(C) → 2, Graphite (hexagonal)
(D) → 3, $K_2Cr_2O_7$ (Triclinic)

@apna_pdf

107. The length of unit cell edge of a body- centred cubic metal crystal is 352 pm. The radius of metal atom is
(a) 162.4pm (b) 152.4 pm
(c) 142.4pm (d) 156.4 pm

CG PET- 2016

Ans. (b) : Edge length 'a' = 352 pm
In BCC unit cell.

$$\therefore \quad r=\frac{\sqrt{3}}{4}a$$
$$r=\frac{\sqrt{3}}{4}\times 352\text{pm}$$
$$r=\sqrt{3}\times 88\text{pm}$$
$$r = 152.4 \text{ pm}$$

108. The contribution of particle at the edge centre to a particular unit cell is
(a) $\frac{1}{2}$ (b) $\frac{1}{4}$
(c) 1 (d) $\frac{1}{8}$

Karnataka-CET-2016

Ans. (b) : The atom present at the edge centre of a unit cell is shared by a total of 4 unit cells.

So, the contribution of the edge centered atom = $\frac{1}{4}$.

109. In calcium fluoride having the fluorite structure, the coordination number for calcium ion (Ca^{2+}) and fluoride ion (F^-) are
(a) 4 and 2 (b) 6 and 6
(c) 8 and 4 (d) 4 and 8

(NEET-II-2016)

Ans. (c) : The fluorite structure, seen in calcium fluoride, has the calcium ions in a face centered cubic arrangement with the fluoride ions in all (8) of the tetrahedral holes. The fluoride ions have a coordination number of 4, and the calcium ions have a coordination number of 8.

110. Which statement is not true for metals?
(a) They form bcc structure
(b) They form hcp structure
(c) They form ccp structure
(d) They have low enthalpy of sublimation

CG PET- 2015

Ans. (d) : Enthalpy of sublimation is the enthalpy change when one mole of solid sublimes (i. e converts) directly into gaseous state at a temperature below it melting point.

$$\Delta_{sub}H = \Delta_{fus}H + \Delta_{vap}H$$

Metals have high enthalpy of sublimation.

111. A unit cell with edge length $a \neq b \neq c$ and axial angles $\alpha = \beta = \gamma = 90°$ is called
(a) cubic (b) tetragonal
(c) orthorhombic (d) hexagonal.

J & K CET-(2015)

Ans. (c) : The bravais lattices with orthorhombic systems obey the following equation –
- Edge length $a \neq b \neq c$ and axial angle $\alpha = \beta = \gamma = 90°$

112. The unit cell with crystallographic dimensions, $a \neq b \neq c$, $\alpha = \gamma = 90$ and $\beta \neq 90$ is
(a) triclinic (b) monoclinic
(c) orthorhombic (d) tetragonal

Karnataka-CET-2015

Ans. (b) : The unit cell with crystallographic dimensions
$a \neq b \neq c$, $\alpha = \gamma = 90°$ and $\beta \neq 90°$ is monoclinic.
- Triclinic unit cell has crystallographic dimensions $a \neq b \neq c$, $\alpha \neq \beta \neq \gamma \neq 90°$.
- Tetragonal unit cell has crystallographic dimensions. $a = b \neq c$, $\alpha = \beta = \gamma = 90°$.
- Orthorhombic unit cell has crystallographic dimensions $a \neq b \neq c$, $\alpha = \beta = \gamma = 90°$.

113. A binary solid has a primitive cubical structure with B^- ions constituting the lattice points and A^+ ions occupying 25% of its tetrahedral holes. The molecular formula of the crystal is
(a) A_2B (b) AB_3
(c) AB_2 (d) A_2B_3
(e) A_2B_5

Kerala-CEE-2015

Ans. (c) : Let number of octahedral holes in the lattice = x
∴ Number of tetrahedral holes in the lattice = 2x
∴ Number of tetrahedral void = 2 × number of octahedral voids
Now, A^+ ions occupy 25% of tetrahedral holes. Hence, number of tetrahedral holes occupied in lattice

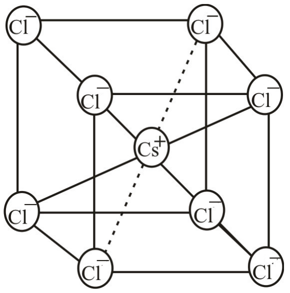
$$= 2x \times 25\%$$
$$= 2x \times 25 \times \frac{1}{100}$$
$$= \frac{2x}{4} = \frac{x}{2}$$

Since, number of octahedral holes = Number of lattice points.
∴ Number of octahedral holes = x
∴ Molecular formula of the crystal is
$A_{x/2}\,B_x$ or AB_2

114. The number of CsCl units per unit cell of it is
(a) 1 (b) 2
(c) 3 (d) 4

SRMJEEE – 2015

Ans. (a) : As we know CsCl has the body centred cubic structure in which one Cs^+ surrounded by 8 Cl^-.



Hence, number of CsCl units per unit cell is 1.

@apna_pdf

115. Potassium dichromate belongs to which crystal system?

(a) Tetragonal (b) Orthorhombic
(c) Triclinic (d) Hexagonal
(e) Monoclinic

Kerala-CEE-2014

Ans. (c) : Potassium dichromate belongs to triclinic crystal system , which is the most asymmetric crystal system. For this systems intercepts, $a \neq b \neq c$ and crystal angle $\alpha \neq \beta \neq \gamma \neq 90^o$.

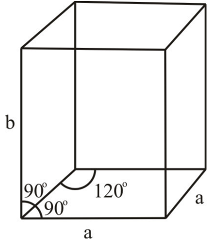
116. Which among the following solids crystallises as a face centred cube?

(a) Iron (b) Rubidium
(c) Uranium (d) Platinum

MHT CET-2014

Ans. (d) : Platinum solids crystallises as a face centred cubic while iron, rubidium and uranium are as body centred cubic crystal.

117. Ice crystallizes in a hexagonal lattice. At the low temperature, the lattice constants were a=4.53 $\overset{o}{A}$ and b=7.41 $\overset{o}{A}$ .How many H_2O molecules are contained in a unit cell? [d(ice)=0.92g/cm^3]



(a) 4 (b) 3
(c) 2 (d) 1

UPTU/UPSEE-2014

Ans. (a) : Given, $a = 4.53Å = 4.53 \times 10^{-8}$ cm

$b = 7.41Å = 7.41 \times 10^{-8}$ cm

Density (d) = 0.92 g cm^{-3}

$N_A = 6.023 \times 10^{23}$ mol^{-1}

Molar mass (M) = 18 g mol^{-1}

As we know that density (d) = $\frac{Z \times M}{VN_A}$

$$0.92 = \frac{Z \times 18}{(a^2b) \times 6.023 \times 10^{23}}$$

$$Z = \frac{0.92 \times (4.53 \times 10^{-8})^2 \times 7.41 \times 10^{-8} \times 6.023 \times 10^{23}}{18}$$

$Z = 4$

118. An ionic compound has a unit cell constituting of A ions at the corners of a cube and B ions on the centres of the faces of the cube. The empirical formula for the compound would be

(a) AB (b) A_2B
(c) AB_3 (d) A_3B

SRMJEEE – 2014

Ans. (c) : In one unit cell there are six faces present and each atom of face contribute with one another cubic unit cell. Similarly, corner atom contribute with 8 atom of another cubic unit cell.

$\therefore$ Number of A ions = $8 \times \frac{1}{8} = 1$

and number of B ions = $6 \times \frac{1}{2} = 3$

$\therefore$ Formula = AB_3

119. KF has NaCl-type structure. What is the distance between K^+ and F^- ions, the cell edge in cm is?

(a) 2 cm (b) $\frac{a}{2}$ cm
(c) 4a cm (d) $\frac{a}{4}$ cm

Assam CEE-2014

Ans. (b) : Since, for NaCl type unit cell , cations (K^+) ions are placed at edge center and anions (F^-) are placed at corner of the unit cell.

$\therefore$ Distance between K^+ and F^- = $\frac{1}{2} \times$ length of the edge (a).

120. What is the difference between the number of atoms per unit cell in face centerd cube and the number per unit cell in body centred cube?

(a) 2 (b) 1
(c) 4 (d) 6

GUJCET-2014

Ans. (a) : Number of atom in face centred cubic unit cell,

$$A_F = 8 \times \frac{1}{8} + 6 \times \frac{1}{2}$$
$$= 1 + 3$$
$$A_F = 4$$

Number of atoms in body centred cubic unit cell,

$$A_b = 8 \times \frac{1}{8} + 1 = 2$$

$\therefore$ Difference = $A_f - A_b = 4 - 2 = 2$

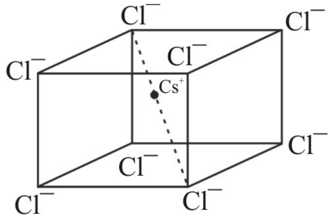
121. CsCl crystallises in body centered cubic lattice. If 'a' its edge length, then which of the following expressions is correct?

(a) $r_{Cs^+} + r_{Cl^-} = 3a$ (b) $r_{Cs^+} + r_{Cl^-} = \frac{3a}{2}$

(c) $r_{Cs^+} + r_{Cl^-} = \frac{\sqrt{3}}{2}a$ (d) $r_{Cs^+} + r_{Cl^-} = \sqrt{3a}$

[JEE Main 2014]

Ans. (c) :



In CsCl structure, Cs^+ ion is in contact with Cl^- ion at the nearest distance–

$$2r_{Cs^+} + 2r_{Cl^-} = \sqrt{3}\,a$$

@apna_pdf

$$2(r_{Cs^+}+r_{Cl^-})=\sqrt{3}\,a$$

$$r_{Cs^+}+r_{Cl^-}=\frac{\sqrt{3}}{2}a$$

122. Volume occupied by single CsCl ion pair in a crystal is 7.014 × 10^{-23} cm^3. The smallest Cs-Cs internuclear distance is equal to length of the side of the cube corresponding to volume of one CsCl ion pair. The smallest Cs to Cs internuclear distance is nearly

(a) 4.4 Å (b) 4.3 Å

(c) 4 Å (d) 4.5 Å

Karnataka-CET-2014

Ans. (c) : The volume of the unit cell is 7.014 ×10^{-23} cm^3.

According to the given condition

Edge length (a) = (volume of one CsCl ion pair)$^{1/3}$

$a = (7.014 \times 10^{-23} cm^3)^{1/3} = 4.124\times10^{-8}$

a = 4Å

123. The radius of an atom is 300 pm. If it crystallizes in a face-centered cubic lattice, the length of the edge of the unit cell is

(a) 488.5 pm (b) 848.5 pm

(c) 884.5 pm (d) 484.5 pm

COMEDK-2014

Ans. (b) : Given r = 300 pm

For fcc, $a = 2\sqrt{2}\ r$

a= $2\sqrt{2}\times300pm = 848.4pm$

124. The crystal lattice of electrovalent compound is composed of

(a) oppositely charged ions

(b) both molecules and ions

(c) molecules

(d) atoms.

J & K CET-(2014)

Ans. (a) : The regular arrangement of constituent of a crystalline solid in there dimensional space is called the crystal lattice or space lattice.

The crystal lattice of electrovalent compound composed of oppositely charged ions.

125. The existence of a substance in more than one solid modifications is known as

(a) Ismorphism (b) Polymorphism

(c) Amorphism (d) Allotropy

[AIIMS-2013]

Ans. (b) : The existence of a substance is more than one solid modifications is known as polymorphism. It is the ability of a solid material to exist in more than one state or crystal structure.

Polymorphism can potentially be found in any crystalline including polymers, minerals, and metals, and is related to allotropy, which refers to chemical elements.

126. CsBr crystallizes in a body-centred cubic unit lattice with an edge length of 4.287 $\overset{\circ}{A}$. How many molecules of CsBr will be present in the unit lattice?

(a) 1 (b) 2

(c) 3 (d) 4

AMU-2013

Ans. (a) : In CsBr unit cell structure Br^- ions are arranged in a simple cubic arrangement. In this arrangement the Br^- ions are present at all the corner of the cube. The Cs^+ ions occupy the cubic state i.e, Cs ions are present at the body centre of the cube. Number of Br^- ions = $8\times\frac{1}{8}$

= 1 ions per unit cell.

In Cs^+ ion in the body centre and its contribution per unit cell is 1.

Hence, there is one Br^- ion for each Cs^+ ion. There is one molecule of CsBr in the unit lattice.

127. Which of the following exists as covalent crystals in the solid state?

(a) Iodine (b) Silicon

(c) Sulphur (d) Phosphorus

[JEE Main 2013]

Ans. (b) : Silicon exists as a covalent crystal in solid state. It is network like structure, as seen in diamond.

128. KF has ccp structure. How many F^-ions and octahedral voids are there in this unit cell respectively?

(a) 4 and 4 (b) 4 and 8

(c) 8 and 4 (d) 6 and 6

JIPMER-2013

Ans. (a) : For KF, fcc structure, the anions occupy corners and face atom which contributes

$= 8\times\frac{1}{8} + 6\times\frac{1}{2}$

= 1 + 3

= 4

Since the charge must be balanced there must be 4 k^+ atoms that occupy octahedral voids.

So, F^- ions and octahedral voids are 4, 4.

129. The number of carbon atoms per unit cell of diamond unit cell is

(a) 6 (b) 1

(c) 4 (d) 8

(NEET-2013)

Ans. (d) : Diamond atoms are present in face – centred cubic (fcc) unit cell.

So, Total number of atoms in corner = $\frac{1}{8}\times8 = 1$

And total number of atoms in face centred = $\frac{1}{2}\times6 = 3$

Then, total atom at corner and face center = 1+ 3 = 4C. atom

Here carbon atoms occupies the corners face center and also half of the tetrahedral voids. The number of carbon atoms per unit cell =

$$8\times\frac{1}{8}+6\times\frac{1}{2}+8\times\frac{1}{2}=8$$

So, 8 atoms are presence in diamond unit cell.

130. Two ions A^+ and B^- have radii 104 and 200 pm respectively, in a cubic close packed crystal of compound AB. The co-ordination no. of A^+ is

(a) 4 (b) 8

(c) 6 (d) 3

COMEDK-2012

@apna_pdf

Ans. (c) : Given that,
Radius of A^+ = 104 pm
Radius of B^- = 200 pm

So, radius ratio= $\frac{r^+}{r^-} = \frac{104}{200} = 0.52$pm

It lies in the range of 0.414 to 0.732, then the coordination number is 6.

131. The crystal structure of solid Mn(II) oxide is
(a) NaCl structure
(b) Fe_2O_3 structure
(c) CaF_2 structure
(d) Na_2O structure

J & K CET-(2012)

Ans. (a) : The crystal structure of solid Mn(II) oxide is NaCl structure.
- Iron (III) oxide structure – Fe_2O_3.

132. Silver iodide is used for producing artificial rain because AgI
(a) is easy to synthesize
(b) has crystal structure similar to ice
(c) is insoluble in water
(d) is easy to spray at high altitude

Karnataka-CET-2012

Ans. (b) : Solid silver iodide is preferred as a nueteator for artificially stimulated rain because its crystal lattice parameters are close to those of ice, and for that reason are more effective than other salt in causing small ice crystals in clouds to melt.

133. The number of nearest neighbours around each particle in a face centred cubic unit cell is:
(a) 4
(b) 6
(c) 8
(d) 12

MPPET - 2012

Ans. (d) : In the face centred cubic lattice, the atoms are present at the corner of the cubic lattice as well as on the face centres. The nearest neighbours = 12

Cubic System	**No. of Neighbour atom**
Simple cubic unit cell (SC)	6
Body centred cubic unit cell (BCC)	8
Face centred cubic unit cell (FCC)	12
(Hexagonal centred cubic unit cell (HCP)	12

134. The radius ratio of a substance is 0.32. The coordination number of the substance is
(a) 8
(b) 3
(c) 6
(d) 4

COMEDK-2011

Ans. (d) : Given, radius ratio is 0.32 lies in the range of 0.225 to 0.414 . Thus the co-ordination number is 4.

135. Tetragonal crystal system has the following unit cell dimensions
(a) $a = b = c, \alpha = \beta = \gamma = 90°$
(b) $a = b \neq c, \alpha = \beta = \gamma = 90°$
(c) $a \neq b \neq c, \alpha = \beta = \gamma = 120°$
(d) $a = b \neq c, \alpha = \beta = 90°, \gamma = 120°$

VITEEE- 2011

Ans. (b) : The dimensions of the tetragonal crystal system are $a = b \neq c$ and $\alpha = \beta = \gamma = 90°$. Hence, two edge length are equal and all the angles are 90°.

136. The number of unit cells present in 39 g of potassium if it crystallizes as body centred cube is (N= Avogadro number, At. wt. of potassium= 39)
(a) $\frac{N}{4}$
(b) $\frac{N}{2}$
(c) $\frac{N}{3}$
(d) N

AP-EAMCET- (Engg.)-2011

Ans. (b) : Given that,
Potassium has BCC system.
$\therefore$ In BCC system 2 atoms are present in 1 unit cell.

Number of moles $= \frac{39}{39} = 1$ mol

Since, 1 mole of atoms = 6.022×10^{23} atoms = N

$\therefore$ N number of atoms are present in $\frac{N}{2}$ unit cells.

137. In zinc blende structure, the coordination number of the cation is
(a) 4
(b) 6
(c) 8
(d) 12

J & K CET-(2011)

Ans. (a) : Zinc blende (ZnS) has FCC structure. It is an ionic crystal having 4 : 4 coordination number.
S^{2-} form FCC lattice and Zn^{2+} has alternate tetrahedral voids. Hence, in zinc blende structure, the coordination number of cation is 4.

138. Assertion (A) White tin is an example of tetragonal system.
Reasoning (R) for a tetragonal system a=b=c and $\alpha = \beta = \gamma \neq 90^\circ$. The correct answer is
(a) (A) and (R) are true and (R) is the correct explanation of (A).
(b) Both (A) and (R) are true and (R) is not the correct explanation of (A).
(c) (A) is true but (R) is not true.
(d) (A) is not true but (R) is true.

AP-EAMCET- (Engg.) - 2010

Ans. (c) : White tin is an example of tetragonal system. For a tetragonal system, one side is not equal to other while all angles are equal i.e. $a = b \neq c$ and $\alpha = \beta = \gamma = 90°$.

139. A metal has bcc structure and the edge length of its unit cell is 3.04Å. The volume of the unit cell in cm^3 will be
(a) $1.6 \times 10^{-21} cm^3$
(b) $2.81 \times 10^{-23} cm^3$
(c) $6.02 \times 10^{-23} cm^3$
(d) $6.6 \times 10^{-24} cm^3$

BCECE-2010

Ans. (b) : Edge length 'a' = 3.04 Å
= 3.04×10^{-8} cm
Volume of unit cell (v) = a^3
= $(3.04 \times 10^{-8} cm)^3$
= $2.81 \times 10^{-23} cm^3$

@apna_pdf

140. If the radius of K^+ and F^- are 133 pm and 136 pm respectively, the distance between K^+ and F^- in KF is

(a) 269 pm (b) 134.5 pm
(c) 136 pm (d) 3 pm

JCECE - 2010

Ans. (a) : Distance between K^+ and F^- in KF

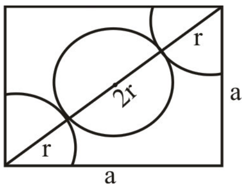
$$= r_{K^+} + r_{F^-} = 133 + 136 = 269 \text{ pm}$$

141. If a be the edge length of the unit cell and r be the radius of an atom then for FCC arrangement, the correct relation is

(a) $4a = \sqrt{3}\,r$ (b) $4r = \sqrt{3}\,a$
(c) $4r = \sqrt{2}\,a$ (d) $4r = \dfrac{a}{\sqrt{2}}$

JIPMER-2010

Ans. (c):



In the face diagonal, the length of the face diagonal will be equal to

$$\Rightarrow a^2 + a^2 = (r + 2r + r)^2$$
$$2a^2 = (4r)^2$$
$$\sqrt{2a^2} = 4r$$
$$\sqrt{2}\,a = 4r$$

142. Coordination numbers of Zn^{2+} and S^{2-} in the crystal structure of wurtzite are

(a) 4,4 (b) 6,6
(c) 8,4 (d) 8,8

[AIIMS-2010]

Ans. (a) : Coordination numbers of Zn^{2+} and S^{2-} in the crystal structure of wurtzite are 4,4. Sulphide ions occupies CCP while zinc ions occupy alternate tetrahedral voids. Number of formula units per unit cell is 4.

143. The radius of Na^+ is 95 pm and that of Cl^- ion is 181 pm. Hence, the coordination number of Na^+ will be

(a) 4
(b) 6
(c) 8
(d) unpredictable

VITEEE- 2010

Ans. (b) :

$$\text{Radius ratio} = \frac{\text{Radius of cation, } r^+}{\text{Radius of anion } r^-} = \frac{95}{181} = 0.525$$

As this value lies in between 0.414 – 0.732, thus, the coordination number of Na^+ ion will be 6.

144. The number of Na^+ ions filling all octahedral voids in NaCl structure is

(a) 9 (b) 12
(c) 13 (d) 14

CG PET- 2010

Ans. (c) : Since, there is one octahedral void at the body centre and 12 octahedral voids at the midpoint of axis in NaCl crystal, the total number of octahedral voids = 1 + 12

= 13

Thus , $13Na^+$ ion are present in the NaCl structure.

However, the number of effective octahedral voids in NaCl is 4.

145. Lithium forms body-centred cubic structure. The length of the side of its unit cell is 351 pm. Atomic radius of the lithium will be

(a) 75 pm (b) 300 pm
(c) 240 pm (d) 152 pm

[AIEEE 2010]

Ans. (d) : In the body centred cubic structure.

$$\text{Radius (r)} = \frac{\sqrt{3}}{4}a$$

Given that –

Edge length 'a' = 351 pm

So,

$$r = \frac{\sqrt{3}}{4} \times 351 \text{ pm}$$
$$r = \frac{1.732}{4} \times 351 \text{ pm}$$
$$r = 152 \text{ pm}$$

146. The edge length of a face centered cubic cell of an ionic substance is 508 pm. If the radius of the cation is 110 pm, the radius of the anion is

(a) 288 pm (b) 398 pm
(c) 618 pm (d) 144 pm

[AIEEE 2010]

Ans. (d) : For the ionic substance in face centred cubic arrangement.

Given that –

Radius of cation (r^+) = 110 pm

Edge length (a) = 508 pm

$\therefore \quad 2(r^+ + r^-) = \text{edge length}$

$\Rightarrow \quad 2(r^+ + r^-) = a$

$\Rightarrow \quad (110 + r^-) = \dfrac{a}{2} = \dfrac{508}{2}$

$\Rightarrow \quad 110 + r^- = 254$

$r^- = 254 - 110$

$r^- = 144$

147. The space lattice of graphite is

(a) cubic (b) tetragonal
(c) rhombic (d) hexagonal

[AIIMS-2009]

Ans. (d) : Graphite is composed of layers of carbon atoms that are arranged in 6-membered, hexagonal rings. These rings are attached to one another on their edges. Carbon atoms in these ring are in the sp^2 hybridized state.

148. Edge length of a cube is 400 pm, its body diagonal would be

(a) 566 pm (b) 600 pm
(c) 500 pm (d) 693 pm

JCECE - 2009

@apna_pdf

Ans. (d) : Given that –

edge length 'a' = 400 pm

The body diagonal = $\sqrt{3}$ a

$= \sqrt{3} \times 400$

$= 1.732 \times 400 = 693$ pm

149. In NaCl crystal each Cl^- ion is surrounded by

(a) $4Na^+$ ions (b) $6Na^+$ ions

(c) $1\ Na^+$ ion (d) $2\ Na^+$ ions

UPTU/UPSEE-2009

Ans. (b) : Sodium chloride (NaCl) crystal consists of Na^+ and Cl^- ions. Each Na^+ ion is surrounded by six Cl^- ions and each Cl^- ion is surrounded by six Na^+ ions. Thus, in sodium chloride, Na^+ as well as Cl^- ions have the coordination number of 6.

150. Arrangement of Sulphide ions in Zinc blende is.........

(a) FCC (b) BCC

(c) HCP (d) Simple cubic

GUJCET-2008

Ans. (a) : Sulphide ion in zinc blende are present at the corners as well as at the centre of each face of the cube. So, the arrangement of sulphide ion in zinc blend is FCC.

151. For AX ionic crystal to exist in BCC structure, the ratio of radii $\left(\frac{r_{cation}}{r_{anion}}\right)$ should be

(a) between 0.41 and 0.73

(b) greater than 0.73

(c) less than 0.41

(d) equal to 1.0

J & K CET-(2008)

Ans. (b) : In the body centred cubic (bcc) structure the ratios of radii $\left(\frac{r_{cation}}{r_{anion}}\right)$ lies in between 0.732 – 1.00.

Hence, The ratio or radii for bcc structure is greater than 0.73.

In the BCC structure cubic avoid present then cubic avoid radii ratio = 0.732 -1.0

152. An ionic compound is expected to have tetrahedral structure if r_+/r_- lies in the range of

(a) 0.414 to 0.732 (b) 0.225 to 0.414

(c) 0.155 to 0.225 (d) 0.732 to 1

KARNATAKA-CET, 2008

Ans. (b) :

Radius ratio (r_+ /r_-)	**Structure**
< 0.155	linear
0.155 – 0.225	planar triangular
0.225 – 0.414	tetrahedral
0.414 – 0.732	octahedral
0.732 – 1	bcc

153. A compound is formed by elements A and B. This crystallizes in the cubic structure where the A atoms are the at the corners of the cube and B atoms are at the body centres. The simplest formula of the compound is :

(a) AB (b) A_6B

(c) A_8B_4 (d) AB_6

KARNATAKA-CET, 2008

Ans. (a) : Since, A atoms are present at the corners of the cube,

Number of A atoms per unit cell = $8 \times \frac{1}{8} = 1$

Number of B atoms per unit cell = 1

($\because$ present at the body centre of the cube)

Hence, the formula of the compound = AB

154. KCl crystallises in the same type of lattice as does NaCl. Given that $r_{Na^+}/r_{Cl^-} = 0.55$ and $r_{k^+}/r_{Cl^-} = 0.74$. Calculate the ratio of the side of the unit cell for KCl to that of NaCl.

(a) 1.123 (b) 0.0891

(c) 1.414 (d) 0.414

(e) 1.732

Kerala-CEE-2008

Ans. (a): In the NaCl type structure, $r^+ + r^- = \frac{a}{2}$ where a is the edge length of the unit cell.

So,

$$= \frac{a_{KCl}}{a_{NaCl}} = \frac{r_{K^+} + r_{Cl^-}}{r_{Na^+} + r_{Cl^-}}$$

$$= \frac{\frac{r_{K^+}}{r_{Cl^-}} + 1}{\frac{r_{Na^+}}{r_{Cl^-}} + 1}$$

$$= \frac{0.74 + 1}{0.55 + 1} = \frac{1.74}{1.55}$$

$= 1.123$

155. The radius ratio in CsCl is 0.93. The expected lattice structure is

(a) tetrahedral (b) square planar

(c) octahedral (d) body-centred cubic

UPTU/UPSEE-2008

Ans. (d) : The ratio of the radius of the cation to the radius of the anion is called radius ratio. From this ratio the structure of lattice can be determined by using the following table.

r_c/r_a	**Arrangement**
0.155 – 0.225	Planar triangular
0.414 – 0.732	Octahedral
0.732 – 1.0	Body centred cubic
0.225 – 0.414	Tetrahedral

Here, the radius ratio of CsCl is 0.93 hence its lattice structure is body-centred cubic.

156. NH_4Cl crystallises in a body centred cubic lattice with edge length of unit cell equal to 387 pm. If the radius of the Cl^- ion is 181 pm, then radius for NH_4^+ ion is

(a) 154.1 pm (b) 92.6 pm

(c) 366.3 pm (d) none of these,

SRMJEEE – 2008

Ans. (a) : Given - crystal type = BCC

a = 387 pm

r_{Cl^-} = 181 pm

@apna_pdf

$r_{NH_4^+} = ?$

Now, from the relation of radius and edge length –

$$r = \frac{\sqrt{3}}{2}a$$

$$r = \frac{\sqrt{3}}{2} \times 387\,\text{pm}$$

$$r = 335.142\text{ pm}$$

$$\because \quad r_{NH_4^+} + r_{Cl^-} = 335.142\text{ pm}$$

$$r_{NH_4^+} = 335.142 - 181$$

$$r_{NH_4^+} = 154.1\text{ pm}$$

157. A cubic close packed (ccp) structure contains 'N' atoms. The tetrahedral and octahedral voids, respectively, will be

(a) N and N (b) 2N and 2N

(c) 2N and N (d) N and 2N

AMU – 2007

Ans. (c) **:** In cubic close packed (CCP) arrangement, there is two tetrahedral and one octahedral voids corresponding to each atoms, the tetrahedral and octahedral voids respectively will be 2N and N.

Number of tetrahedral voids per atom in lattice

$= N \times 2 = 2N$

Number of octahedral voids per atom in lattice

$= N \times 1 = N$

158. The crystalline structure of NaCl is

(a) hexagonal close packing

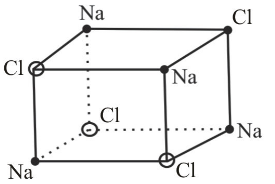
(b) face centered cubic

(c) square planar

(d) body centred cubic

J & K CET-(2007)

Ans. (b) :



Sodium Chloride (NaCl) has face centred cubic structure. It contains $4Na^+$ and $4Cl^-$ ions. Each Na^+ ion is surrounded by $8Cl^-$ ions and each Cl^- ion is also surrounded by $8Na^+$ ions.

159. The cubic unit cell of Al (molar mass 27 g mol^{-1}) has an edge length of 405 pm. Its density is 2.7g cm^{-3}. The cubic unit cell is

(a) face centred (b) body centred

(c) primitive (d) edge centred

(e) simple

Kerala-CEE-2007

Ans. (a) : Given that –

Molar mass (M) = 27 g mol^{-1}

Edge length (a) = 405 pm

$= 4.05 \times 10^{-10}$ cm

Density (d) = 2.7 g cm^{-3}

So, $$d = \frac{Z \times M}{a^3 \times Na}$$

$$Z = \frac{d \times a^3 \times Na}{M}$$

$$Z = \frac{2 \cdot 7 \times (405 \times 10^{-10})^3 \times 6.023 \times 10^{23}}{27}$$

$$Z = 4$$

The FCC (face centred cubic) unit cell contain 4 atom.

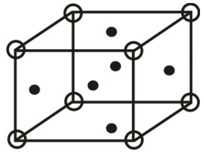
160. In a face centred cubic lattice, a unit cell is shared equally by how many unit cells?

(a) 4 (b) 2

(c) 6 (d) 8

CG PET -2007

Ans. (c) : In a face centred cubic (FCC) unit cell. Consist of 6 faces. So, it is equally shared by 6 unit cell.



161. AB is an ionic solid. The ionic radii of A$^+$ and B$^-$ are r_c and r_a respectively. Lattice energy of AB is proportional to

(a) $\frac{r_c}{r_a}$ (b) $(r_c + r_a)$

(c) $\frac{r_a}{r_c}$ (d) $\frac{1}{(r_c + r_a)}$

A.P.EAMCET-2006

Ans. (d) : Given that,

Ionic radii of $A^+ = r_c$

Ionic radii of $B^- = r_a$

Lattice energy $(U) \propto \frac{q_c q_a}{r_c + r_a}$

So, lattice energy of AB is $U_{AB} \propto \frac{1}{(r_c + r_a)}$

162. Sodium metal crystallizes at room temperature in a body centred cubic lattice with a cell edge a = 4.29 Å. The radius of sodium atom is:

(a) 1.40 (b) 2.65

(c) 1.85 (d) 2.15

AP-EAMCET (Medical), 2006

Ans. (c) : Given data :

$a = 4.29$Å

$r_{Na} = ?$

For BCC lattice, the relation between radius of atom and edge length can be written as-

$$r = \frac{\sqrt{3}}{4}a$$

or $$r = \frac{\sqrt{3}}{4} \times 4.29\text{Å}$$

$$r = 1.85\text{Å}$$

163. Assertion: Graphite is an example of tetragonal crystal system.

Reason: For a tetragonal system, $a = b \neq c, \& \alpha = \beta = 90^\circ, \gamma = 120^\circ$

@apna_pdf

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect the Reason is correct.

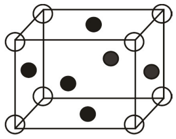
[AIIMS-2006]

Ans. (c) :
A :– Graphite is an example of hexagonal crystal system for which $\alpha = \beta = 90^o$ and $\gamma = 120^o$ and $a = b \neq c$. So, assertion is false.
R:– For tetragonal system, $a = b \neq c$ and $a = \beta = \gamma = 90$.
So, reason are incorrect.

164. The rank of a face centred cube unit cell is
(a) 1 (b) 2
(c) 4 (d) 6

AMU–2006

Ans. (c) : Face centered cubic with atoms at the corners as well as 6 face of the cube.

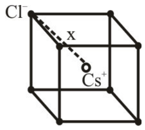


FCC Contribution $= 8\times\frac{1}{8}+\frac{1}{2}\times 6$
$= 1 + 3$
$= 4$

165. Interionic distance for CsCl crystal is
(a) a (b) $\frac{a}{2}$
(c) $\frac{\sqrt{3}}{2}a$ (d) $\frac{2a}{\sqrt{3}}$

CG PET -2006

Ans. (c) : The interionic distance for caesium chloride is between the Cs^+ cation present at the body center and Cl^- anion present at the corner which is equal to half the length of diagonal.



x = intreionic distance
body diagonal length $= \sqrt{3}a$
$x = \frac{\sqrt{3}a}{2}$

166. How many space lattices are obtained from the different crystal systems?
(a) 7 (b) 14
(c) 32 (d) 230

CG PET -2006

Ans. (b) : There are 7 type of crystal lattice while space lattice is 14 type are obtained from the different crystal system.

167. The radius ratio $\left[\frac{r^+}{r^-}\right]$ of an ionic solid $(A^+B^-)$is 0.69. What is the coordination number of B^-?
(a) 6 (b) 8
(c) 2 (d) 10

J & K CET-(2006)

Ans. (a) : Permitted coordination number for the ratio value 0.414 – 0.732 is 6.

Sr. No.	Limiting Value of radius ratio (r^+/r^-)	Coordination no. of cation	Structural arrangement
1	0 -0.155	2	Linear
2	0.155-0.225	3	Planner triangular
3	0.225 -0.414	4	Tetrahedral
4	0.414 - 0.732	6	Octahedral
5	0.732 - 1.00	8	Cubic

168. In CsCl type of structure co-ordination of Cs^+ and $Cl^-$are :
(a) 6,6 (b) 6,8
(c) 8,8 (d) 8,6

UPTU/UPSEE-2005

Ans. (c) : In CsCl, cesium ions forms the simple cubic arrangement and chloride (Cl^-) ion occupy the interstitial sites such that each cesium ion is surrounded by 8 chloride ions and each cesium ions surrounded by 8 cesium ion, hence the coordination is 8:8.

169. Structure of NaCl crystal is
(a) tetragonal (b) cubic
(c) orthorhombic (d) monoclinic

CG PET -2004

Ans. (b) : For the sodium chloride (NaCl) the chloride ions are arranged in a cubic structure (Called face centred cubic) and sodium ions occupy octahedral voids between them. Each Sodium ion is surrounded by 6 chloride ions.

170. Bravais lattices are of
(a) 8 types (b) 12 types
(c) 14 types (d) 9 types

CG PET -2004

Ans. (c) : A Bravais lattice is a mathematical construct, designed to describe the underlying periodicity of a crystal.
There are 14 types of Bravais lattice.

171. A solid is made of two elements X and Z. The atoms Z are in CCP arrangement while the atom X occupy all the tetrahedral sites. What is the formula of the compound?
(a) XZ (b) XZ_2
(c) X_2Z (d) X_2Z_3

UPTU/UPSEE-2004

@apna_pdf

Ans. (c) :
CCP arrangement has 4 atom. Atom Z are in CCP arrangement so total atom of Z = 4.
Tetrahedral sites are double of total number of atom present in the unit cell.
So,

Tetrahedral sites present = 2 × 4
= 8

X occupy tetrahedral sites, so total number of X present = 8
Formula of compound is $X_8 Z_4$ or X_2Z.

172. In which of the crystals of ionic compounds would you expect maximum distance between the centres of cations and anions?

(a) LiF (b) CsF
(c) CsI (d) LiI

J & K CET-(2003)

Ans. (c) : The ionic radii of Cs^+ is highest among the given cations and ionic radii of I^- is highest among the given anions. Therefore, the maximum distance between the centers of cations and ions occurs in CsI.

173. What is the coordination number of sodium Na_2O?

(a) 6 (b) 4
(c) 8 (d) 2

[AIIMS-2003]

Ans. (b) : The coordination number of Na in Na_2O is 4. Na^+ ion is surrounded by four oxide ions and O_2^- ion is surrounded by eight Na^+ ions.
Hence, the coordination number of Na in Na_2O is 4.

174. What is the coordination number of body centred cube?

(a) 8 (b) 6
(c) 4 (d) 12

UP CPMT-2003

Ans. (a) : The unit cell of body centred cube has one atom at each of the eight corners and one atom at the centre of body.
∵ the atom at centre is in contact with 8 other atoms
∴ the coordination number in bcc = 8

175. An AB_2 type structure is found in

(a) NaCl (b) CaF_2
(c) Al_2O_3 (d) N_2O

[AIIMS-2002]

Ans. (b) : If we break the AB_2 type structure then we get :

$AB_2 \rightleftharpoons A^{2+} + 2B^-$

Similarly, if we break CaF_2 then

$$CaF_2 \rightleftharpoons Ca^{2+} + 2F^-$$

∴ AB_2 type of structure is present in CaF_2.

176. To which of the crystal systems does TiO_2(titanium oxide) belongs?

(a) tetragonal (b) cubic
(c) hexagonal (d) monoclinic

J & K CET-(2001)

Ans. (a) : Tetragonal crystal lattice result from stretching a cubic lattice along becomes a rectangular prism with a square base and a height.
In tetragonal Bravais lattices related are

$$a = b \neq c \text{ and } \alpha = \beta = \gamma = 90°$$

titanium dioxide (body-centered tetragonal)
the titanium cations have a coordination number of 6 meaning they are surrounded by octahedron of 6 oxygen atoms. The oxygen anions have a co-ordination number of 3 resulting interregional planar coordination.

177. When Zn converts from melted state to its solid state, it has hcp structure, then find the number of nearest atoms.

(a) 6 (b) 8
(c) 12 (d) 4

(NEET-2001)

Ans. (c) : Zn is in hcp structure and has co–ordination number of 12.
It means the number of nearest neighbours is 12, six are in the plane, 3 above the plane and 3 below the plane.

178. What is the crystal structure of cesium chloride?

(a) Body centred cubic (b) Face centred cubic
(c) Tetrahedral (d) Octahedral

A.P.EAMCET-2000

Ans. (a) : In cesium chloride crystal lattice, the chloride ion (Cl^-) are present at each corner and Cs^+ are present at body centre cubic lattice. The crystal structure of CsCl is body centered cubic.

179. Each unit cell of NaCl consists of 6 chlorine atoms and

(a) 13 Na atoms (b) 14 Na atoms
(c) 8 Na atoms (d) 6 Na atoms

J & K CET-(2000)

Ans. (d) : Each unit cell of NaCl consist of 6 chlorine atoms and 6 sodium atom. For NaCl each Na^+ is surrounded by $6Cl^-$ ion at the corners of a regular octahedron and similarly each Cl^- ion is surrounded by Na^+ ion .

180. The range of radius ratio (cationic to anionic) for an octahedral arrangement of ions in an ionic solid is

(a) 0 – 0.155 (b) 0.155 – 0.225
(c) 0.225 – 0.414 (d) 0.414 – 0.732

J & K CET-(1998)

Ans. (d) : • If the radius ratio is less than 0.155, the coordination number is 2. The position of anions around cation will be linear.

- $\frac{r\oplus}{r-} = 0.155 - 0.225$ for triangular void
- $\frac{r+}{r-} = 0225 - 0.414$ for tetrahedral void
- $\frac{r+}{r-} = 0.414 - 0.732$ for octahedral void.

181. CsBr crystal has BCC structure. It has an edge length of 4.3 Å. The shortest interionic distance between Cs^+ and Br^- ions is

(a) 3.72 Å (b) 1.86 Å
(c) 7.44 Å (d) 4.3 Å

J & K CET-(1998)

@apna_pdf

Ans. (a) : Given that –
edge length 'a' = 4 ·3 Å
In body centred cubic (bcc) unit cell

$$4r = \sqrt{3}\,a$$

$$r = \frac{\sqrt{3}}{4}a$$

$$r\ \frac{\sqrt{3}}{4}\times 4.3\,\text{Å}$$

$$r = \frac{1.732\times 4.3}{4}\,\text{Å}$$

$$r = 1{\cdot}86\ \text{Å}$$

Now,
The shortest interionic distance
R = 2r
R = 2 ×1.86
R = 3.72 Å

182. In crystals of which one of the following ionic compounds would you expect maximum distance between centres of cations and anions?
(a) CsI
(b) CsF
(c) LiF
(d) LiI

(NEET-1998)

Ans. (a) : The ionic radii of Cs^+ is highest among the given cations and ionic radii of I^- is highest among the given anions, therefore the maximum distance between the centers of cations and anions occurs in CsI.

183. In CsCl structure, each Cs^+ ion is surrounded by
(a) 4 Cl^- ions
(b) 6 Cl^- ions
(c) 8 Cl^- ions
(d) 12 Cl^- ions

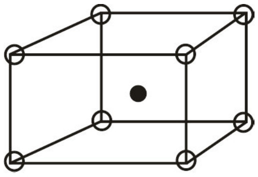
J & K CET-(1997)

Ans. (c) : In CsCl type structure, Cs^+ and Cl^- ions have 8:8 co–ordination; i.e. each Cs^+ is surrounded by 8 Cs^+ ion.

184. The intermetallic compound LiAg crystallizes in cubic lattice in which both lithium and silver have coordination number of eight. The crystal class is
(a) face-centred cube
(b) simple cube
(c) body-centred cube
(d) none of these.

(NEET-1997)

Ans. (c) : The intermetallic compound Li–Ag crystallizes in a cubic lattice in which both lithium and silver have a coordination number of 8. The crystal class is body – centred cubic. The coordination number of simple cubic, body – centred cubic, hexagonal closed packing and face – centred cubic are 6, 8, 12 and 12 respectively.
The structure of bcc.



185. Assertion: In crystal lattice, size of the cation is larger in a tetrahedral hole than in an octahedral hole.
Reason: The cations occupy more space than anions in crystal packing.
(a) If both Assertion and Reason are true and the Reason is a correct explanation of the Assertion
(b) If both Assertion and Reason are true but Reason is not a correct explanation of the Assertion
(c) If Assertion is true but the Reason is false
(d) If both Assertion and Reason are false

AIIMS-1996

Ans. (d): In crystal lattice tetrahedral void is smaller than the octahedral void because the concerned geometry. Anion are larger in size than cations so anions occupy more space.
It means assertion and reason both are incorrect so option (d) is correct.

186. The fcc crystal contains how many atoms in each unit cell?
(a) 6
(b) 8
(c) 4
(d) 5

(NEET-1996)

Ans. (c) : In face centred cubic unit cell. The atoms corner and face – centre. There are total eight (8) corner and each contribution is 1/8 and there are 6 face centre and each contribution is ½ .
So,

$$\text{Number of atom in fcc} = \frac{1}{8}\times 8 + \frac{1}{2}\times 6$$
$$= 1 + 3$$
$$= 4.$$

The total number of atoms in fcc unit cell is 4.

187. In the fluorite structure, the coordination number of Ca^{2+} ion is
(a) 4
(b) 6
(c) 8
(d) 3

(NEET-1993)

Ans. (c) : In fluorite structure each Ca^{2+} ion is surrounded by eight F ion . Thus , the coordination number of Ca^{2+} is eight, In fluorite structure each F^- ion is surrounded by four Ca^{2+} ion whereas each Ca^{2+} is surrounded by eight F^- ions, giving a body centred cubic arrangement thus the coordination number of Ca^{2+} and F^- are 8 and 4.

188. For orthorhombic system axial ratio are a≠b≠c and the axial angles are
(a) $\alpha = \beta = \gamma \neq 90°$
(b) $\alpha = \beta = \gamma = 90°$
(c) $\alpha = \gamma = 90°,\ \beta \neq 90°$
(d) $\alpha \neq \beta \neq \gamma \neq 90°$

NEET-(1991)

Ans. (b) : In the orthorhombic crystal system have axial ratios are $a \neq b \neq c$ and axial angles are $\alpha = \beta = \gamma = 90^0$.
It means all the edges lengths are unequal while all the axial angles are equal.

@apna_pdf

189. Iron crystallizes in several modifications. At about 911°C, the bcc 'α' form undergoes a trasition to fcc 'γ' form. If the distance between the two nearest neighbours is the same in the two forms at the transition temperature, the ratio of the density of iron in FCC form (ρ_2) to that of iron of BCC form (ρ_1) at the transition temperature

(a) $\frac{\rho_1}{\rho_2} = 0.918$ (b) $\frac{\rho_1}{\rho_2} = 0.718$

(c) $\frac{\rho_1}{\rho_2} = 0.518$ (d) $\frac{\rho_1}{\rho_2} = 0.318$

VITEEE-2017

Ans. (a) : Given that,

distance of BCC is (ρ_1)

distance of FCC is (ρ_2)

∴ Relation between edge length and radius

In BCC crystal structure,

$$4r = \sqrt{3}a$$

$$a = \frac{4r}{\sqrt{3}}$$

Therefore density $= \frac{Z \times M}{a^3}$

Where Z = no. of atom in unit cell

M = mass

$$\frac{\rho_1}{\rho_2} = \frac{2}{\left(\frac{4r}{\sqrt{3}}\right)^3} \times \frac{\left(\frac{4r}{\sqrt{2}}\right)^3}{4} = \frac{2}{4} \times \left(\frac{\sqrt{3}}{\sqrt{2}}\right)^3$$

$$\frac{\rho_1}{\rho_2} = 0.918$$

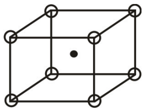
190. Number of atoms in the unit cells of Na (BCC type crystal) and Mg (FCC type crystal) are, respectively

(a) 4, 4 (b) 4, 2

(c) 2, 4 (d) 1, 1

JEE Main 2018

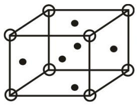
Ans. (c) : In BCC unit cell



Number of atoms in body centred cubic unit cell,

$$= 8 \times \frac{1}{8} + 1 = 2$$

In FCC unit cell



Number of atoms in FCC $= \frac{1}{8} \times 8 + \frac{1}{2} \times 6$

$= 1 + 3$

$= 4$

Therefore the correct option is (c).

3. Classification of Crystalline Solid

191. Which of the following is not correct for ionic crystals?

(a) They possess high melting point and boiling point

(b) All are electrolyte

(c) Exhibit the property of isomorphism

(d) Exhibit directional properties of the bond

Manipal-2019

Ans. (d) : Ionic crystal exhibit non-direction properties. of the bond.

192. Which of the following is a network crystalline solid?

(a) I_2 (b) AlN

(c) NaCl (d) Ice

Karnataka-CET-2019

Ans. (b) :

- I_2 is molecular crystalline solid.
- AlN is network crystalline solid.
- NaCl is crystalline solid.
- Ice is hexagonal crystalline solid.

193. Example of molecular solid is:

(a) $SO_2(s)$ (b) SiC

(c) C (graphite) (d) NaCl

[AIIMS-27 May, 2018(M)]

Ans. (a) : • Solid sulphur dioxide $SO_2(s)$ is a polar molecular solid. The comprised atoms or molecules are held together by stronger dipole – dipole interactions. They are soft and non – conductor of electricity.

- Silicon carbide (SiC) is covalent solid since the atoms of silicon are connected with carbon through covalent bonds.
- Graphite is covalent solid – strong covalent bonds are presents in between C atoms in graphite.
- NaCl (sodium chloride) is a ionic solid because they have cation (Na+) and anion (Cl^-).

194. Which of the following is a network solid?

(a) SO_2 (Solid)

(b) I_2

(c) Diamond

(d) H_2O (ice)

JCECE - 2013

Ans. (c) : Diamond is an example of network solid.

Any chemical compound in which covalent bond is present is known as network solid. The atoms in a continuous network extending throughout the material is called network solid or covalent network solid or atomic crystalline solids. Si, BN, SiO_2, Ge are other example of network solid.

@apna_pdf

195. Which one of the following is a covalent crystal?

(a) Rock salt (b) Ice

(c) Quartz (d) Dry ice

Karnataka-CET-2011

Ans. (c) : Covalent crystal are hard, frequently brittle materials such as diamond, silicon and silicon carbide. Molecular crystals are substances that have relative weak intermolecular binding.

In quartz, lattice points are made up of non-metal, and they are held by covalent bond. So, quartz is a covalent crystal.

196. Which of the following is a molecular crystal?

(a) Rock salt (b) Quartz

(c) Dry ice (d) Diamond

Karnataka-CET, 2010

Ans. (c) : Molecular crystals are substances that have relatively weak intermolecular binding, such as dry ice (solidified carbon dioxide), solid forms of the noble gases (e.g. Argon, Krypton and Xenon).

In dry ice (solid CO_2) constituents are molecules. The various molecules are held together through weak forces like dipole-dipole interaction, thus it is an molecular crystal.

197. Which of the following forms molecular solid?

(a) SO_2 (b) SiO_2

(c) SiC (d) Diamond

JIPMER-2004

Ans. (a) : In SO_2, molecules are bonded by weak van der Walls force. Hence, it is molecular solid.

198. A solid X melts slightly above 273 K and is a poor conductor of the heat and electricity. To which of the following categories does it belong?

(a) Ionic solid (b) Covalent solid

(c) Metallic solid (d) molecular solid

AMU–2001

Ans. (d) : Metals are good conductors of heat and electricity with variable melting points. Ionic solids are also good conductors of heat and electricity with very high melting point. Covalent solids are non-conductor of electricity and heat with very high melting points due to their strong bonding.

Molecular solids are poor conductors or heat and electricity and they have lower melting point than ionic solids.

199. In which crystal system, the length of each edge (edge length) is same?

(a) $BaSO_4$ (b) HgS

(c) $CaSO_4$ (d) ZnO

GUJCET-2017

Ans. (b) : $BaSO_4$ and $CaSO_4$ has a parallelepiped structure and ZnO has a hexagonal structure. So, in this molecules, the edge lengths are different whereas in HgS, it has a rhombohedral structure and same edge length. So, HgS (Mercury sulfide) is correct.

200. Cation and anion combines in a crystal to form following type of compound

(a) ionic (b) metallic

(c) covalent (d) dipole-dipole.

NEET-(2000)

Ans. (a) : Cation is a positively charged species and anion is a negatively charged species. We know that opposite charges always attract each other and this force of attraction is called the electrostatic force of attraction. It leads to the formation of ionic compound. An examples of ionic compounds is sodium chloride (NaCl) and copper sulphate ($CuSO_4$).

4. Packing Efficiency

201. Atoms of element X form hcp lattice and those of element Y occupy $\frac{2}{3}$ of its tetrahedral voids: The percentage of element X in the lattice is ________. (Nearest integer)

JEE Main-24.06.2022, Shift-I

Ans. (43) : Given,

Element X from hcp lattice element Y occupy $\frac{2}{3}$ of tetrahedral voids.

No. of atom X-atom 6

That means–

$$X = 6 \text{ [HCP lattice]}$$

$$Y = \frac{2}{3} \text{ X tetrahedral voids}$$

$$= \frac{2}{3} \times 12 = 8$$

$$\text{\% of element } X = \frac{\text{No.of X-atoms}}{\text{Total atom}} \times 100$$

$$= \frac{6}{14} \times 100 = 42.85$$

$$= 43\%$$

$$\text{\% of X in unit cell } = 42.857 \approx 43\%$$

202. Metal deficiency defect is shown by $Fe_{0.93}O$. In the crystal, some Fe^{2+} cations are missing and loss of positive charge is compensated by the presence of Fe^{3+} ions. The percentage of Fe^{3+} ions. The percentage of Fe^{2+} ions in the $Fe_{0.93}O$ crystals is_____. (Nearest integer)

JEE Main-27.06.2022, Shift-I

Ans. (84.94) : Metal deficiency defect is arises due to the absence of anions or the presence of extra cations at the interstitial sites

Here, Fe present in two oxidation state (+2) and (+3).

Number of $Fe^{2+} = x$

Number of $Fe^{3+} = 0.93 - x$

Then,

@apna_pdf

$$2x + 3(0.93 - x) = 2$$
$$2x + 0.93 \times 3 - 3x = 2$$
$$x = 0.79$$
$$\% \text{ of } Fe^{2+} = \frac{0.79}{0.93} \times 100$$
$$= 84.94\ \%$$

203. In a solid AB, A atoms are in ccp arrangement and B atoms occupy all the octahedral sites. If two atoms from the opposite faces are removed, then the resultant stoichiometry of the compound is A_xB_y. The value of x is——— [nearest integer]

JEE Main-26.06.2022, Shift-II

Ans. (3) : Given that,

Solid AB (ccp arrangement)

B atoms occupy octahedral voids

Stoichiometry of compound = A × By

$$A = \frac{1}{8} \times 8(\text{corner}) + \frac{1}{2} \times 4(\text{face center})$$
$$= 1 + 2 = 3$$

B = all octahedral voids = 4

Formula = A_3B_4

So, the value of x = 3

204. Total Volume of atoms present in a face-centred cubic unit cell of a metal is (r is atomic radius)

(a) $\frac{20}{3}\pi r^3$ (b) $\frac{24}{4}\pi r^3$

(c) $\frac{12}{3}\pi r^3$ (d) $\frac{16}{3}\pi r^3$

MHT-CET, 2016
BITSAT-2009
JIPMER-2008
BCECE-2008
JCECE-2007
[AIEEE 2006]

Ans. (d) : In a FCC lattice the number of atoms per unit cell = 4.

$$\text{Total volume of atoms} = \frac{4}{3}\pi r^3 \times 4$$
$$= \frac{16}{3}\pi r^3$$

205. The fraction of total volume occupied by the atoms present in a simple cube is

(a) $\frac{\pi}{3\sqrt{2}}$ (b) $\frac{\pi}{4\sqrt{2}}$

(c) $\frac{\pi}{4}$ (d) $\frac{\pi}{6}$

BITSAT-2011
NEET - 2007

Ans. (d) : Let the edge length of the cube be a and radius of atom be r.

Now, in simple cube, number of atoms present

$$= \frac{1}{8} \times 8 = 1$$

So, volume occupied = $1 \times \frac{4}{3}\pi r^3$

Now, in simple cube atoms at corner will touching each other.

$$\Rightarrow a = 2r \Rightarrow r = \frac{a}{2}$$

Volume of cube = a^3

So, fraction of total volume occupied

$$= \frac{\frac{4}{3}\pi r^3}{a^3}$$
$$= \frac{\frac{4}{3} \times \pi \times \left(\frac{a}{2}\right)^3}{a^3}$$
$$= \frac{4}{3} \times \pi \times \frac{1}{8}$$
$$= \frac{\pi}{6}$$

206. The fraction of the total volume occupied by the atoms in a simple cube is

(a) $\frac{\pi}{2}$ (b) $\frac{\pi}{4}$

(c) $\frac{\pi}{6}$ (d) $\frac{\pi}{8}$

TS EAMCET 05.08.2021, Shift-I

Ans. (c) : Let the edge length of the cube = a

and radius of atom = r

Now, in simple cube, number of atoms present = $\frac{1}{8} \times 8 = 1$

So, volume occupied = $1 \times \frac{4}{3}\pi r^3$

The relation between 'a' and 'r' in simple cubic –

$$a = 2r$$
$$\Rightarrow r = a/2$$

Volume of cube = a^3

So, fraction of total volume occupied $= \frac{\frac{4}{3}\pi r^3}{a^3}$

$$= \frac{\frac{4}{3} \times \pi \times \left(\frac{a}{2}\right)^3}{a^3} \Rightarrow \frac{4}{3} \times \pi \times \frac{1}{8} = \frac{\pi}{6}$$

@apna_pdf

207. **Ga (atomic mass 70 u) crystallizes in a hexagonal close packed structure. The total number of voids in 0.581 g of Ga is -------×20^{21}. (Round off to the Nearest Integer). [Given : $N_A = 6.023\times10^{23}$]**

JEE Main 16.03.2021, Shift-II

Ans. (15) : For one atom, there will be two tetrahedral voids and one octahedral voids. Therefore, total three voids present in HCP lattice structure.

$\therefore$ Total number of atoms of Ga = $\dfrac{\text{Mass}}{\text{Molar mass}}\times N_A$

$$= \frac{0.581}{70}\times6.023\times10^{23}$$
$$= 4.99\times10^{21}$$

$\therefore$ Total number of voids = 3×total number of atoms

$$= 3\times4.99\times10^{21}$$
$$= 14.97\times10^{21}$$
$$\approx 15\times10^{21}$$

208. **The ratio of packing density in FCC, BCC, simple cubic and HCP, respectively is**

(a) 0.7 : 0.92 : 1.0 : 1.0
(b) 1.0 : 0.7 : 0.92 : 1.0
(c) 1.0 : 0.92 : 0.7 : 1.0
(d) 0.92 : 0.5 : 1.0 :0.92

TS-EAMCET 09.08.2021, Shift-I

Ans. (c) : Packing fraction of FCC, BCC, SC and HCP are 74%, 68%, 52% and 74% respectively.

Ratio $= \dfrac{74}{100}:\dfrac{68}{100}:\dfrac{52}{100}:\dfrac{74}{100}$

= 74 : 68 : 52 : 74

Ratio = 1 : 0.92 : 0.70 : 1.0

209. **Ga (atomic mass 70 u) crystallises in a hexagonal close packed structure. The total number of voids in 0.581 g of Ga is ....×10^{21}. (Round off to the nearest integer).**

[JEE Main 2021, 16 March Shift-II]

Ans. (15) **:** In hexagonal closed packing structure :

Per atom, there will be one octahedral void (OV) and two tetrahedral void (TV).

Therefore total three void per atom are present in HCP Structure. Therefore total number of atoms of Ga will be-

$$= \frac{\text{Mass}}{\text{Molar mass}}\times N_A$$

$$= \frac{0.581}{70}\times6.023\times10^{23}$$

$\approx 5 \times 10^{21}$

Now, total voids = 3 × total atoms

$$= 3 \times 5 \times 10^{21}$$
$$= 15 \times 10^{21}$$

So, answer is 15.

210. **The vacant space in body centered cubic (bcc) lattice unit cell is about**

(a) 32% (b) 10%
(c) 23% (d) 46%

Assam CEE-2020

Ans. (a) : Packing fraction of BCC Unit Cell is 68%, therefore the vacant space in BCC Unit cell is 32%

211. **An element has a body centered cubic (bcc) structure with a cell edge of 288 pm. The atomic radius is**

(a) $\dfrac{\sqrt{3}}{4}\times288\text{pm}$ (b) $\dfrac{\sqrt{2}}{4}\times288\text{pm}$
(c) $\dfrac{4}{\sqrt{3}}\times288\text{pm}$ (d) $\dfrac{4}{\sqrt{2}}\times288\text{pm}$

(NEET-2020)

Ans. (a) : In the body centred cubic crystal.

$$\sqrt{3}\,a = 4r$$

Given - Edge length 'a' = 288 pm
r = Radius of atom

So, $r = \dfrac{\sqrt{3}}{4}\times288\,\text{pm}$

212. **Which of the following is correct order of packing efficiency?**

(a) HCP = FCC > BCC > SC
(b) SC > BCC > HCP = FCC
(c) BCC > SC > HCP < FCC
(d) FCC = HCP > SC > BCC

AIIMS 25 May 2019 (Morning)

Ans. (a): Packing efficiency of HCP = 74%
Packing efficiency of FCC or CCP is also = 74%
Packing efficiency of simple cubic = 52% and packing efficiency of body centred cubic
(BCC) = 68%
So, HCP = FCC > BCC > SC

213. **What is the packing efficiency of arrangement in a body centred unit cell.**

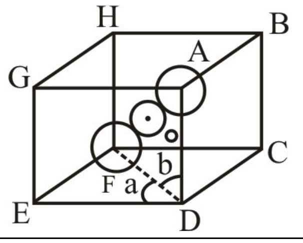
(a) 53.26% (b) 74.00%
(c) 68.00% (d) 64.00%

GUJCET-2019

Ans. (c) : Packing efficiency is defined as percentage of space occupied by constituent particles packet inside the lattice.

Consider edge length is 'a'

In bcc,



@apna_pdf

$AC = \sqrt{AB^2 + BC^2} = \sqrt{a^2 + a^2} = \sqrt{2}\,a$

$AC = FD$

and $FD = \sqrt{AD^2 + FD^2} = \sqrt{2a^2 + a^2} = \sqrt{2}\,a$

Thus $\sqrt{3}\,a = 4r$

$$a = \frac{4r}{\sqrt{3}}$$

Volume of the unit cell $a^3 = \left(\frac{4r}{\sqrt{3}}\right)^3 = \frac{64r^3}{3\sqrt{3}}$

Now, Number of spheres per unit cell

$$= \frac{1}{8} \times 8 + 1$$

$$= 1 + 1 = 2$$

Thus volume of two spheres $= 2 \times \frac{4}{3}\pi r^3$

$$= \frac{8}{3}\pi r^3$$

$$\therefore \text{Packing efficiency} = \frac{\frac{8}{3}\pi r^3}{\frac{64r^3}{3\sqrt{3}}}$$

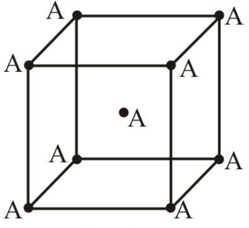
$$= \frac{8}{3}\pi r^3 \times \frac{3\sqrt{3}}{64r^3}$$

$$= \frac{\sqrt{3}\,\pi}{8}$$

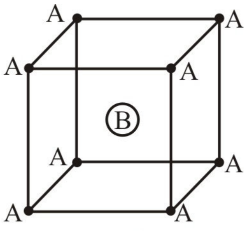
$$= 0.68$$

Thus , % Packing efficiency = 68%

214. Consider the bcc unit cells of solids 1 and 2 with the position of atoms as shown below. The radius of atom B is twice that of atom A. The unit cell edge length is 50% more in solid 2 than in 1. What is the approximate packing efficiency in solid 2?



Solid 1



Solid 2

(a) 65%
(b) 90%
(c) 75%
(d) 45%

[JEE Main 2019, 8 April Shift-II]

Ans. (b) : % packing efficiency

$$= \frac{\text{Volume occupied by atom}}{\text{Volume of unit cell}} \times 100$$

$$= \frac{\frac{4}{3}\pi r^3}{a^3} \times 100$$

Let radius of corner atom is r and radius of central atom is 2r.

So, $\sqrt{3}\,a = 2\,(2r) + 2r$

$\sqrt{3}\,a = 4r + 2r = 6r$

$$a = \frac{6}{\sqrt{3}}\,r$$

$$a = 2\sqrt{3}\,r$$

Now,

$$\%\text{ packing efficiency} = \frac{\frac{4}{3}\pi r^3 + \frac{4}{3}\pi (2)^3}{(2\sqrt{3}\,r)^3} \times 100$$

$$= \frac{\frac{4}{3}\pi (r^3 + 8r^3)}{8 \times 3\sqrt{3}\,r^3} \times 100$$

$$= \frac{4\pi \times 9r^3}{8 \times 8 \times 3\sqrt{3}\,r^3} \times 100$$

$$= 90.6\,\% \approx 90\,\%$$

215. Iron exhibits bcc structure at room temperature, Above 900°C, it transforms to fcc structure. The ratio of density of iron at room temperature to that at 900°C (assuming molar mass and atomic radii of iron remains constant with temperature) is

(a) $\frac{\sqrt{3}}{\sqrt{2}}$
(b) $\frac{4\sqrt{3}}{3\sqrt{2}}$
(c) $\frac{3\sqrt{3}}{4\sqrt{2}}$
(d) $\frac{1}{2}$

(NEET-2018)

Ans. (c) : We know that , $d = \frac{ZM}{a^3 \times N_A}$

For the bcc unit cell

$Z = 2$ and $a = \frac{4}{\sqrt{3}}\,r.$

So, density at room temperature (25°C) is–

$$d_{25^\circ C} = \frac{2M}{\left(\frac{4}{\sqrt{3}}r\right)^3 N_A} \qquad ....(1)$$

For FCC unit cell

$Z = 4$ and $a = \frac{4}{\sqrt{2}}\,r$

So, density at 900°C is–

$$d_{900^\circ C} = \frac{4M}{\left(\frac{4}{\sqrt{2}}r\right)^3 N_A} \qquad ....(2)$$

Dividing eq^n (1) with eq^n (2) we get –

@apna_pdf

$$\frac{d_{25^\circ C}}{d_{900^\circ C}} = \frac{\dfrac{2M}{\left(\dfrac{4}{\sqrt{3}}r\right)^3 N_A}}{\dfrac{4M}{\left(\dfrac{4}{\sqrt{2}}r\right)^3 N_A}} = \frac{1}{2}\times\left(\frac{\sqrt{3}}{\sqrt{2}}\right)^3 = \frac{3\sqrt{3}}{4\sqrt{2}}$$

216. A solid AB has NaCl structure. If the radius of cation A^+ is 170 pm, then the maximum possible radius of the anion B^- is

(a) 397.4 pm (b) 347.9 pm
(c) 210.9 pm (d) 410.6 pm

JIPMER-2017

Ans. (d) : In the NaCl type structure

$$\frac{r_{A^+}}{r_{B^-}} = 0.414 - 0.732$$

For maximum possible radius of B —

$$\frac{r_{A^+}}{r_{B^-}} = 0.414$$

$$\frac{170}{r_{B^-}} = 0.414$$

$$r_{B^-} = \frac{170}{0.414} = 410.6\,\text{pm}$$

217. The packing efficiency of simple cubic (sc), body centred cubic (bcc) and cubic close packing (ccp) lattices follow the order

(a) bcc < ccp < sc
(b) ccp < bcc < sc
(c) sc < ccp < bcc
(d) sc < bcc < ccp

TS-EAMCET-2016

Ans. (d) : For packing efficiency $= \dfrac{Z\times\frac{4}{3}\pi r^3}{a^3}\times 100$

Where, Z = Atom in lattice
r = Radius of atom
a = Edge length

For simple cubic packing efficiency = 52% (a = 2r)

For BCC packing efficiency = 68% ($4r = \sqrt{3}a$)

For FCC packing efficiency = 74% ($4r = \sqrt{2}a$)

So, the order is SC < BCC < FCC (CCP)

218. Which one of the following statements about packing in solids is incorrect?

(a) Coordination number in bcc mode of packing is 8.
(b) Coordination number in HCP mode of packing is 12
(c) Void space in CCP mode of packing 32%
(d) Void space in CCP mode of packing is 26%

[AIIMS-2016]

Ans. (c) : In the HCP arrangement of atoms occupies 74% of the available space and thus has 26% vacant space.

So, option (c) is incorrect.

219. The non stoichiometric compound $Fe_{0.94}O$ is formed when x % of Fe^{2+} ions are replaced by as many $\frac{2}{3}Fe^{3+}$ ions, x is

(a) 18 (b) 12
(c) 15 (d) 6

BITSAT-2016

Ans. (a) : x% of Fe^{2+} ions are replaced by as many $\frac{2}{3}Fe^{3+}$ ions.

The number of Fe^{3+} ions replacing x Fe^{2+} ion $= \dfrac{2x}{3}$

The vacancies of cations $= x - \dfrac{2x}{3} = \dfrac{3x-2x}{3}$

$= \dfrac{x}{3}$

But the non stiochiometric compound has formula $Fe_{0.94}O$

$$\frac{x}{3} = 1 - 0.94 = 0.06$$

x = 0.06 × 3 = 0.18 = 18%

220. If AgI crystallises in zinc blende structure with I ions at lattice points What fractions of tetrahedral voids occupies by Ag^+ ions?

(a) 25% (b) 50%
(c) 100% (d) 75%

[AIIMS-2014]

Ans. (b) : In AgI crystal, number of Ag^+ ion is equal to I^- ions. However, the number of tetrahedral voids are twice the number of atom forming the cubic lattice.

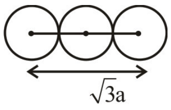
∴ Number of tetrahedral voids occupied by Ag^+ ion = 50%

221. CsBr has BCC structure with edge length 4.3 p.m. The shortest inter-ionic distance between Cs^+ and Br^- in p.m. is

(a) 7.44 (b) 3.72
(c) 4.3 (d) 1.86

Assam CEE-2014

Ans. (b) : Body diagonal



In BCC —

Inter ionic distance $= \dfrac{1}{2}$ of body diagonal

$= \dfrac{1}{2}\times\sqrt{3}a$

@apna_pdf

$$= \frac{1}{2} \times \sqrt{3} \times 4 \cdot 3$$
$$= 3 \cdot 72 \text{ Å}$$

222. If a is the length of the side of a cube, the distance between the body-centred atom and one corner atom in the cube will be

(a) $\frac{2}{\sqrt{3}}a$ (b) $\frac{4}{\sqrt{3}}a$
(c) $\frac{\sqrt{3}}{4}a$ (d) $\frac{\sqrt{3}}{2}a$

(NEET-2014)

Ans. (d) : We know that for bcc structure,

$$4r = \sqrt{3}\,a$$

Hence, $2r = \frac{\sqrt{3}}{2}a$

2r represents the distance between the body centered atom and one corner atom.

Thus, if 'a' represents the length of the side of a cube, the distance between the body-centered atom and one corner atom in the cube will be $\frac{\sqrt{3}}{2}a$.

223. Calculate the ionic radius of a Cs^+ ion, assuming that the cell edge length for CsCl is 0.4123 nm and that the ionic radius of a Cl^- ion is 0.181 nm.

(a) 0.176 nm (b) 0.231 nm
(c) 0.357 nm (d) 0.116 nm

UPTU/UPSEE-2014

Ans. (a) :

$$r_{cs} + r_{cl^-} = \frac{d_{body}}{2} = \frac{0.7141}{2}$$
$$= 0.3571 \text{ nm}$$
$$r_{cs^+} = 0.3571 - 0.181$$
$$= 0.176 \text{ nm}$$

224. A metal crystallises with a face-centred cubic lattice. The edge of the unit cell is 408pm. The diameter of the metal atom is

(a) 288pm (b) 408pm
(c) 144pm (d) 204pm

(NEET-2012)

Ans. (a) : In the face centered cubic unit cell —

$$r = \frac{a}{2\sqrt{2}}$$
$$a = 408 \text{ pm}$$
$$r = \frac{408}{2\sqrt{2}}$$
$$r = 144 \text{ pm}$$

Diameter = 2r = 2 × 144
= 288 pm

225. Gold has a face centred cubic lattice with and edge length of the unit cube of 407 pm. Assuming the closest packing, the diameter of the gold atom is

(a) 576.6 pm (b) 287.8 pm
(c) 352.5 pm (d) 704.9 pm

[AIIMS-2011]

Ans. (b) : Given that —
edge length 'a' = 407 pm.
For the FCC lattice,

$$4r = a\sqrt{2}$$
$$r = \frac{\sqrt{2}}{4}a$$

Where 2r = diameter

$$r = \frac{\sqrt{2} \times 407}{2}$$
$$r = \frac{1.414 \times 407}{4} \qquad \because (\sqrt{2} = 1.414)$$
$$r = 287 \cdot 8 \text{ pm}$$

226. Atom A possesses higher values of packing fraction than atom B. The relative stabilities

(a) A is more stable than B
(b) B is more stable than A
(c) A and B both are equally stable
(d) Stability does not depend on packing fraction

UP CPMT-2011

Ans. (b) : The atom which has lower value of packing fraction is stable. Hence, atom B is more stable than atom A.

The more negative the Packing fraction of an element the more stable should be the nucleus. On the other hand a positive packing fraction indicates that the nucleus should be less stable is that packing fraction is inversely proportional to the stability. So, the atom which has or lower value of packing fraction is stable.

227. Percentage of free space in cubic close packed structure and in body centred packed structure are respectively

(a) 30% and 26%
(b) 26% and 32%
(c) 32% and 48%
(d) 48% and 26%

[AIEEE 2010]

Ans. (b) : The percentage of the total space which is occupied by the particles in a certain packing is known as packing efficiency. In a closed packed structure the unit cell is FCC, that has particles on corners as well as the centre of all faces.

So, here Z = 4

Now, P.E. of CCP = 74%

So, vacant space = 100–74
= 26%

@apna_pdf

When body centered packed structure, unit cell is Z = 2

So, P.E. of BCC = 68%

So, the vacant space = 100 – 68

= 32%

228. A solid AB has the NaCl structure. If radius of cation A^+ is 120 pm, the maximum possible value of the radius of the anion B^- is

(a) 240 pm (b) 60 pm

(c) 49.6 pm (d) 290 pm

JIPMER-2010

Ans. (d): For the NaCl crystal.

$$\frac{\text{Radius of cation}}{\text{Radius of anion}} = 0.414 \text{ to } 0.732$$

$$\frac{r_{A^+}}{r_{B^-}} = 0\cdot414 \qquad \text{(for max. } B^- \text{ radius)}$$

$$r_{B^-} = \frac{r_{A^+}}{0.414} = \frac{120}{0.414} = 290\,\text{pm}$$

229. AB crystallizes in a body-centered cubic lattice with edge length 'a' equal to 387 pm. The distance between two oppositely charged ions in the lattice is

(a) 335pm (b) 250pm

(c) 200pm (d) 300pm

(NEET-2010)

Ans. (a) : The distance between them would be

$$2r = \sqrt{3} \times \frac{a}{2}$$

$$2r = 387 \times \frac{\sqrt{3}}{2} = 335 \text{ pm approx.}$$

This would be the distance between two opposite charges.

230. A solid metal has ccp or fcc structure. The relation of side of cube (a) and radius of atom (r) will be

(a) $a = 2r$ (b) $a = 2\sqrt{2}\ r$

(c) $a = \frac{4}{\sqrt{3}}r$ (d) $a = \sqrt{\frac{3}{2}}r$

CG PET -2009

Ans. (b) : For the ccp or fcc structure

$$4r = \sqrt{2}\,a$$

$$a = \frac{4r}{\sqrt{2}}$$

$$a = 2\sqrt{2}\,r$$

231. Lithium metal crystallises in a body-centred cubic crystal . If the length of the side of the unit cell of lithium is 351 pm, the atomic radius of lithium will be

(a) 151.8pm (b) 75.5pm

(c) 300.5pm (d) 0.8pm

(NEET-2009)

Ans. (a) : In the body centred-cubic crystal

$$4r = \sqrt{3}\,a$$

Given that —

edge length (a) = 351 pm

So, $$r = \frac{\sqrt{3}}{4} \times a$$

$$r = \frac{\sqrt{3}}{4} \times 351\,\text{pm}$$

$$r = \frac{1.732 \times 351}{4}\ \text{pm}$$

$$r = 151.8 \text{ pm}$$

232. Copper crystallises in a face-centred cubic lattice with a unit cell length of 361 pm. What is the radius of copper atom in pm?

(a) 157 (b) 181

(c) 108 (d) 128

(NEET-2009)

Ans. (d) : Copper crystallizes in a fcc lattice

$$4r = \sqrt{2}\,a$$

$$r = \frac{\sqrt{2}}{4}a$$

Give edge length 'a' = 361 pm

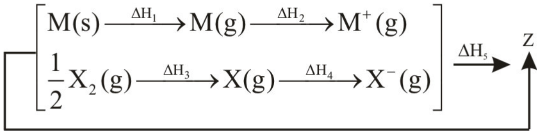
So, $$r = \frac{\sqrt{2}}{4} \times 361\,\text{pm}$$

$$r = \frac{1.414 \times 361}{4}\ \text{pm}$$

$$r = 127.61 \text{ pm}$$

$$r \simeq 128 \text{ pm}$$

233. Consider the Born-Haber cycle for the formation of an ionic compound given below and identify the compound (Z) formed.



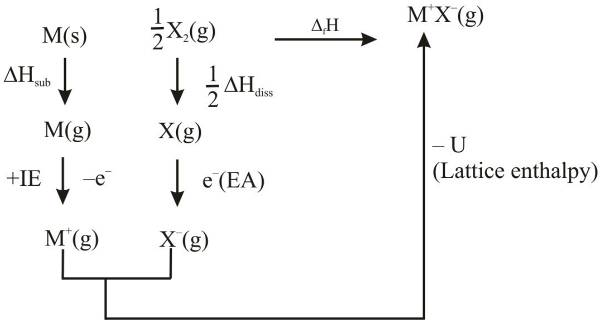
$M(s) \xrightarrow{\Delta H_1} M(g) \xrightarrow{\Delta H_2} M^+(g)$
$\frac{1}{2}X_2(g) \xrightarrow{\Delta H_3} X(g) \xrightarrow{\Delta H_4} X^-(g)$
ΔH_5
Z

(a) M^+X^- (b) $M^+X^-(s)$

(c) MX (d) $M^+X^-(g)$

Karnataka-CET, 2008

Ans. (a) : The Born-Haber cycle takes place as follows



Hence, Z is $M^+\ X^-(s)$

@apna_pdf

234. Which of the following statements is not correct?

(a) The number of carbon atoms in a unit cell of diamond is 8.

(b) The number of Bravais lattices in which a crystal can be categorized is 14.

(c) The fraction of the total volume occupied by the atoms in a primitive cell is 0.48.

(d) Molecular solids are generally volatile.

(NEET-2008)

Ans. (c) : • The diamond contain 4 lattice points per unit cell but contains B atom per unit cell. It means option (a) is correct.

• There are 14 possible Bravais lattices in 3D space in which crystal can be categorized. It means option (b) is also correct.

• The fraction of total volume occupied by the atoms in the primitive cell is 0.52 whereas the void space is 0.48. It means option (c) is incorrect.

• Molecular solid are soft and volatile and have low melting points. It means option (d) is also correct.

235. If a stands for the edge length of the cubic systems: simple cubic, body-centred cubic and face-centred cubic, then the ratio of radii of the spheres in these systems will be respectively

(a) $\frac{1}{2}a : \frac{\sqrt{3}}{2}a : \frac{\sqrt{2}}{2}a$ (b) $1a : \sqrt{3}a : \sqrt{2}a$

(c) $\frac{1}{2}a : \frac{\sqrt{3}}{4}a : \frac{1}{2\sqrt{2}}a$ (d) $\frac{1}{2}a : \sqrt{3}a : \frac{1}{\sqrt{2}}a$

(NEET-2008)

Ans. (c) : In a simple cubic unit cell —

$$2r = a$$

$$r = \frac{a}{2}$$

In a body centred cubic (bcc) unit cell —

$$4r = \sqrt{3}\,a$$

$$r = \frac{\sqrt{3}}{4}a$$

In face-centred cubic (fcc) unit cell —

$$4r = \sqrt{2}\,a$$

$$r \frac{\sqrt{2}}{2\times\sqrt{2}\times\sqrt{2}}a$$

$$r = \frac{1}{2\sqrt{2}}a$$

Now, ratio is $\frac{1}{2}a : \frac{\sqrt{3}}{4}a : \frac{1}{2\sqrt{2}}a$

236. A metallic crystal having BCC type stacking pattern, what percentage of volume of this lattice is empty space?

(a) 68% (b) 32%

(c) 26% (d) 74%

GUJCET-2007

Ans. (b) : In this type of structure, total number of atoms is 2 and their volume is $2\times\frac{4}{3}\pi r^3$.

• Volume of the cube, a^3 will be equal to $\left(\frac{4r}{\sqrt{3}}\right)^3$ or

$$a^3 = \left(\frac{4}{\sqrt{3}}r\right)^3$$

Therefore,

$$\text{Packing fraction} = \frac{Z\times\text{Volume of sphere}}{\text{Total volume}}$$

$$= \frac{2\times\frac{4}{3}\pi r^3}{a^3}$$

$$= \frac{2\times\frac{4}{3}\times\pi\times\left(\frac{a\sqrt{3}}{4}\right)^3}{a^3}$$

$$= 68\%$$

$$\text{empty space} = 100 - 68$$

$$= 32\%$$

237. The 8:8 type of packing is present in

(a) MgF_2 (b) CsCl

(c) KCl (d) NaCl

VITEEE- 2007

Ans. (b) : 8 : 8 type of packing is present in CsCl. In this structure each Cs^+ ion is surrounded by ions and each ions is also surrounded by 8 Cs^+ ions.

6 : 6 type of packing is present in NaCl and KCl.

238. For an ionic crystal of the general formula AX and coordination number is 6, the value of radius ratio will be

(a) greater than 0.73

(b) in between 0.73 and 0.41

(c) in between 0.41 and 0.22

(d) less than 0.22

CG PET -2006

Ans. (b) : Since the general formula is AX with coordination number 6, the crystal could be considered as NaCl. Thus, it is evident that the ratio lies between 0.414 and 0.732 because of its octahedral structure.

The value ranging between 0.732 to 0.414 is obtained by dividing the radius of positive ion by that of negative ion.

239. The ionic radii of Rb^+ and I^- are 1.46Å and 2.16Å. The most probable type of structure exhibited by it is

(a) Cs*Cl* type (b) ZnS type

(c) Na*Cl* type (d) CaF_2 type

UPTU/UPSEE-2004

@apna_pdf

Ans. (c) : Given that –

radius of cation (r^+) = 1.46 Å

radius of anion (r^-) = 2.16 Å

$$\frac{r^+}{r^-} = \frac{1.46}{2.16} = 0.676$$

Value in between 0.414 – 0.732

Hence, the structure of NaCl type.

240.The percentage of unoccupied volume in simple cubic cell is

(a) 52.40% (b) 32.00%

(c) 47.60% (d) 68.04%

MHT CET-02.05.2019, SHIFT-II

Ans. (c) : Volume occupied in simple cubic cell = 52.4

∴Volume remains unoccupied in simple cubic cell = 47.6 %.

241. What is number of tetrahedral voids per atom in a crystal lattice?

(a) 1 (b) 2

(c) 4 (d) 6

AMU–2003

Ans. (b) : $\frac{\text{Tetrahedral void}}{\text{Total number of atom}} = ?$

In unit cell –

Total number of atoms = n

Tetrahedral voids = 2n

Octahedral void = n

$$\frac{\text{Tetrahedral void}}{\text{Total number of atom}} = \frac{2n}{n} = 2$$

Number of Tetrahedral voids = 2 × number of atoms in the packing.

So, tetrahedral void is 2 per atom.

242. The pyknometric density of sodium chloride crystal is $2.165 \times 10^3 \text{kgm}^{-3}$ while its X-ray density is $2.178 \times 10^3 \text{kgm}^{-3}$ the fraction of unoccupied sites in sodium chloride crystal is

(a) 5.96 (b) 5.96×10^{-2}

(c) 5.96×10^{-1} (d) 5.96×10^{-3}

(NEET-2003)

Ans. (d) : Volume from pyknometric density = $\frac{M}{d}$

$$= \frac{M}{2.165 \times 10^3} \text{ m}^3 (\text{M in kg})$$

Molar Volume form X – ray density = $\frac{M}{d}$

$$= \frac{M}{2.178 \times 10^3} \text{ m}^3$$

$$\therefore \text{ Volume unoccupied} = \frac{M}{10^3}\left(\frac{1}{2.165} - \frac{1}{2.178}\right) \text{m}^3$$

$$= \frac{\left(\frac{0.013M \times 10^{-3}}{2.165 \times 2.178}\right)}{\left(\frac{M \times 10^{-3}}{2.165}\right)}$$

$= 5.96 \times 10^{-3}$

243. The edge length of face-centered unit cubic cells is 508 pm. If the radius of the cation is 110 pm, the radius of the anion is

(a) 144pm (b) 398pm

(c) 288pm (d) 618pm

(NEET-1998)

Ans. (a) : For FCC lattice (assuming cation in octahedral Void and anion in FCC)

a = 508 pm

$$(r^+ + r^-) = \frac{a}{2} = \frac{508}{2} = 254 \text{ pm}$$

$(r^+ + r^-) = 254$ pm

$r^- = 254 - r^- = 254 - 110 = 144$ pm

244. A metal has bcc structure and the edge length of its unit cell is 3.04Å. The volume of the unit cell in cm^3 will be

(a) $1.6 \times 10^{21} \text{ cm}^3$

(b) $2.81 \times 10^{-23} \text{ cm}^3$

(c) $6.02 \times 10^{-23} \text{ cm}^3$

(d) $6.6 \times 10^{-24} \text{ cm}^3$

VITEEE-2014

Ans. (b) : Given edge length of its unit cell of BCC is 3.04Å.

∴ Volume of unit cell (V) = a^3

$= (3.04 \times 10^{-8} \text{ cm})^3$

$= 2.81 \times 10^{-23} \text{ cm}^3$

245. The density of solid argon is 1.65 g per cc at –233°C. If the argon atom is assumed to be a sphere of radius 1.54×10^{-8} cm, what per cent of solid argon is apparently empty space? (Ar = 40)

(a) 16.5% (b) 38%

(c) 50% (d) 62%

AIPMT 1998

Ans. (d) : Given, radius of sphere = $1.54 \times 10^{-8} \text{ cm}^3$

Volume of one atom $= \frac{4}{3}\pi r^3$

$$= \frac{4}{3} \times 3.14 \times \left(1.54 \times 10^{-8}\right)^3$$

$$= 1.53 \times 10^{-23} \text{cm}^3$$

Volume of all atoms in 1.65 g Ar

$$= \frac{1.65}{40} \times 6.02 \times 10^{-23} \times 1.53 \times 10^{-23} = 0.380 \text{cm}^3$$

Volume of solid Ar containing in 1.65 gm = 1 cm^3

Empty space = 1 – 0.380 = 0.620

% of empty space = 62%

@apna_pdf

5. Defects in Crystal

246. Given below are two statements: one is labelled as Assertion (A) and the other is labelled as Reason (R).

Assertion (a) : It a particular point defect, an ionic solid is electrically neutral, even if few of its cations are missing from its unit cells.

Reason (R) :

In an ionic solid, Frenkel defect arises due to dislocation of cation from its lattice site to interstitial site, maintaining overall electrical neutrality.

In the light of the aboves statements, choose the most appropriate answer from the options given below

(a) (A) is not correct but (R) is correct
(b) Both (A) and (R) are correct and (R) is the correct explanation of (A)
(c) Both (A) and (R) are correct but (R) is not the correct explanation of (A)
(d) (A) is correct but (R) is not correct

NEET-17.07.2022

Ans. (c) : It is a particular point defect. Electrical neutrality is essential condition. In Frenkel defect, it is dislocation from lattice site to interstitial position.

247. The incorrect statement about the imperfections in solids is:

(a) Schottky defect decreases the density of the substance.
(b) Interstitial defect increases the density of the substance.
(c) Frenkel defect does not alter the density of the substance.
(d) Vacancy defect increases the density of the substance.

JEE Main-28.06.2022, Shift-I

Ans. (d) : When some of the lattice sites are vacant, the crystal is said to have vacancy defect. This results decrease in density of the substance. So, the option (d) is incorrect statement.

248. Which one of the following will show both frenkel and Schottky Defect?

(a) NaCl (b) AgBr
(c) CrCl (d) KCl

Assam CEE-2021
JEE Main-08.01.2020-Shift-II
JIPMER-2019
GUJCET-2019
J&K CET-2010

Ans. (b) : AgBr schottky defect is shown in AgBr because cations and anions both get out of the lattice Ag^+ is quite small which is why it occupies interstitial sites easily this is the Frenkel defect.

The Radius ratio of AgBr is also intermediate, thus AgBr satisfies the exhibit both type of defects.

249. What type of crystal defect is indicated in the diagram below?

Na^+	Cl^-	Na^+	Cl^-	Na^+	Cl^-
	Cl^-		Cl^-	Na^+	Na^+
Na^+	Cl^-		Cl^-	Na^+	Cl^-
	Cl^-	Na^+	Cl^-	Na^+	Na^+

(a) Frenkel defect
(b) Schottky defect
(c) Interstitial defect
(d) Frenkel and Schottky defects

BCECE-2010
AIEEE-2004

Ans. (b) : Schottky defect is indicated in the diagram as equal number of sodium cation and chloride anion are missing.

In frenkel defect a cation or anion leaves its regular site and occupies interstitial position.

250. Due to Frenkel defect, the density of ionic solids

(a) decreases (b) increases
(c) does not change (d) changes

BITSAT-2013
CGPET-2012

Ans. (c) : Due to the frenkel defect, the density of ionic solid does not change. This defect does not impact the density of the solid as it involves only the migration of the ions within the crystal, these preserving both the volume and mass. The volume and mass due to the Schottky defect, the density of ionic solids decreases.

251. The flame colors of metal ions are due to

(a) Schottky defect
(b) Frenkel defect
(c) metal excess defect
(d) metal deficiency defect

CG PET- 2011
Manipal-2016

Ans. (c) : The flame colours of metal. Ions are due to metal excess defect. Due to presence of metal excess defect, the crystals have free electrons that can be excited to higher energy levels. This results in absorption spectra.

Note:– In metal excess of metal ions are present.

252. Which one of the following has frenkel defect?

(a) Sodium chloride
(b) Graphite
(c) silver bromide
(d) Diamond

MHT-CET-02.05.2019, Shift-III
CG PET -2005

@apna_pdf

Ans. (c) : Frenkel defect is a defect which is created when an ion leaves its appropriate site in the lattice and occupies and interstitial site. A hole or vacancy is thus produced in the lattice. The cations and anions differ much in their sizes and the ions have low co-ordination numbers. Examples are Zns, AgBr, AgI, AgCl.

253. Which of the following defect is seen in FeO?

(a) Metal excess defect
(b) Metal deficiency defect
(c) Displacement defect
(d) Impurity defect

GUJCET-2016, 2015

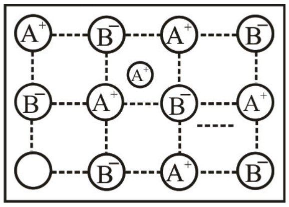
Ans. (b) : FeO shows metal deficiency defect. In crystal of FeO some Fe^{2+} cations are missing and the loss of positive charge is made up by the presence of required number of Fe^{3+} ions.

254. In a solid lattice, the cation has left a lattice site and is located at interstitial position, the lattice defect is

(a) interstitial defect
(b) vacancy defect
(c) Frenkel defect
(d) Schottky defect

JCECE-2012
J & K CET-(2005)

Ans. (c) :



Frenkel defect

In a solid lattice, the cation has left a lattice site and is located at interstitial position , the lattice defect is Frenkel defect. This defect is observed in compound having low coordination number and low radius ratio. It is also found in compounds having highly polarizing cation and an easily polarisable anion.

255. Schottky defect in a crystal is observed, when

(a) unequal number of cations and anions are missing from the lattice
(b) equal number of cations and anions are missing from the lattice
(c) an ion leaves it normal site and occupies and interstitial site
(d) density of the crystal is increased

Karnataka-CET-2016
AIPMT-1998

Ans. (b) : Schottky defect is observed when equal number of cations and anions are missing from the lattice. This defect changes the density as pair of ions are missing from the lattice.

256. The correct statement regarding defects in solids is

(a) Frenkel defect is a vacancy defect
(b) Schottky defect is a dislocation defect
(c) Trapping of an electron in the lattices leads to the formation of F-centre
(d) Schottky defect has no effect on density.

Kerala-CEE-29.08.2021
Karnataka CET-2021

Ans. (c) : The correct statement regarding defects in solids is trapping of an electron in the lattices leads to the formation of F-centre.

(1) Frenkel defect is a dislocation defect it arises due to a vacancy at cationic site the cations moves to another position between two layers and is surrounded by greater number of anions.

(2) Frenkel defect is a found in ZnS, AgBr, AgCl, AgI etc.

(3) Due to Schottky defects, the density of crystals decreases.

(4) Frenkel defect have no effect on the density of crystalline solids.

257. Find the correct statement about crystal defects,

(a) Schottky defect makes a crystal electrically charged.
(b) Frenkel defect alters the density of the crystal.
(c) Metal excess defect gives colour to the crystal.
(d) Metal deficiency defect can be found in the halides of alkali metals.

SRMJEEE – 2013, 2012

Ans. (c) : Schottky defect is basically a vacancy defects in ionic solids. In order to maintain electrical neutrality, the number of missing cations and anions are equal.

The Frenkel defect is shown by ionic solids. It does not change the density of the solid.

Metal deficiency defect can be found in transition metals which show variable valencies.

258. Identify the incorrect statement regarding crystals having Frenkel defect:

(a) Frenkel defects are observed where the difference in sizes of cations and anions is large.
(b) The density of crystals having Frenkel defect is less than that of a pure perfect crystal.
(c) An ionic crystal having Frenkel defect may also contain schottkey defect.
(d) Alkali halides don't usually have Frenkel defect.

AP EAPCET 25.08.2021, Shift-II

Ans. (b) : Frenkel defect observes the difference in size of cations and anions is large. An ionic crystal having Frenkel defect may also contain schottky defect and alkali halides don't usually have Frenkel defect are correct.

@apna_pdf

259. An excess of potassium ions makes KCl crystal appear violet or lilac in colour because ______

(a) of the presence of impurities
(b) some of the anionic and cationic sites are vacant
(c) some of the anionic vacancies are occupied by unpaired electron
(d) some of the cationic vacancies are occupied by unpaired electron

AP- EAPCET- 07-09-2021, Shift-I

Ans. (c) : When KCl crystals are heated. It leads the deposition of potassium ion on the surface of KCl. The Cl^- ions diffuse to the surface of crystal and loss electron by potassium atom to form K^+ ion released electron occupied anionic site which is known as F-centre and impart colour to the crystal.

260. KBr is doped with 10^{-5} mole percent of $SrBr_2$. The number of cationic vacancies in 1 g of KBr crystal is...........10^{14} (Round off to the nearest integer)
[Atomic mass : K = 39.1u, Br = 79.9u, N_A = 6.023 × 10^{23-}

[JEE Main 2021, 17 March Shift-II]

Ans. (5) : For every Sr^{2+} ion, 1 cationic vacancy is created.

Hence, number of Sr^{2+} ion = Number of cationic vacancies.

Since the mole percentage of $SrBr_2$ doped is 10^{-5} is to that of total moles of KBr.

Hence,

$$\text{Number of cationic vacancy} = \frac{10^{-5}}{100}\times\frac{1}{119}\times N_A$$

$$= \frac{1}{119}\times10^{-7}\times6.022\times10^{23}$$

$$= 5 \times 10^{-2}\ 10^{-7} \times 10^{23}$$

$$= 5 \times 10^{14}$$

$$= 5$$

261. Given below are two statements.
Statement-I Frenkel defects are vacancy as well as interstitial defects.
Statement-II Frenkel defect leads to colour in ionic solids due to presence of F-centres.
Choose the most appropriate answer for the statements from the options given below.

(a) Statement I is false but Statement II is true.
(b) Both statement I and Statement II are true.
(c) Statement I is true but statement II is false.
(d) Both Statement I and statement II are false.

[JEE Main 2021, 26 Aug Shift-I]

Ans. (c) : Frenkel defect is a type of defect is shown by ionic solids. the smaller in (usually cation) is dislocated from its normal site to an interstitial site.

It creates a vacancy defect at its original site and an interstitial defect at it new location.

F - centre is formed in metal excess defect, which is a non -stoichiometric defect.

262. The defect produced due to the presence of extra cations at interstitial sites is called____.

(a) metal excess defect
(b) Schottky defect
(c) metal deficiency defect
(d) Frenkel defect

AP EAMCET (Engg.) 17.09.2020, Shift-II

Ans. (a) : When a metal contains extra cations (metal ion) in the interstitial site of its lattice. We observe metal excess defect. It is a non-stoichiometric defect.

263. When $CaCl_2$ is added to AgCl crystal, the defect introduced is

(a) Frenkel defect only
(b) Schottky defect only
(c) No change
(d) Both Frenkel and Schottky defects

AP EAMCET (Engg.) 21.09.2020, Shift-I

Ans. (b) : When mixing AgCl and $CaCl_2$, each added ion of Ca^{2+} replaces Ag^+ as they have similar radii. Since, the charge of Ca and Ag is of +2 and +1 respectively, it leads to the formation of positive vacancies (Schottky defect).

It means that one mole of $CaCl_2$ provides one mole of Ag vacancies in crystal structure.

264. A metallic solid undergoes Frenkel defect. Its original mass, volume and density are M_0, V_0 and D_0 respectively. After Frenkel defect the mass, volume and density are M, V and D respectively. The variations of M, V and D after Frenkel defect are

(a) $M = M_0, V = V_0, D = D_0$
(b) $M < M_0, V < V_0, D < D_0$
(c) $M > M_0, V = V_0, D > D_0$
(d) $M = M_0, V < V_0, D > D_0$

AP EAMCET (Engg.) 21.09.2020, Shift-II

Ans. (a) : In Frenkel defect, atoms remain within the solid crystal. Only one vacancy is created. Density remains the same. Thus, $M = M_0$, $V = V_0$ and $D = D_0$.

265. A crystal is made up of metal ions M_1 and M_2 and oxide ions. Oxide ions form as ccp lattice structure. The cation M_1 occupies 50% of octahedral voids and the cation M_2 occupies 12.5% of tetrahedral voids of oxide lattice. The oxidation number of M_1 and M_2 are, respectively

(a) +2, +4
(b) +1, +3
(c) +3, +1
(d) +4, +2

[JEE Main 2020, 6 Sep Shift-II]

Ans. (a) : O^{2-} ions from ccp $\Rightarrow O_4$

$$M_1 = 50\%\ \text{Octahedral void} = \frac{50}{100}\times4=2$$

$$M_2 = 12.5\ \%\ \text{tetrahedral void} = \frac{12.5}{100}\times8=1$$

@apna_pdf

So formula is: $(M_1)_2 (M_2)_1 O_4$
Let change of M_1 and M_2 are + x and + y respectively. And O_4 has –8 charges. As crystal is neutral so metal must have + 8 charge in total.
$=2x + y = 8$ ——— (i)
From given option x = +2
y = +4

266. Schottky defect is shown by

(a) ionic substances in which the size of the cation is smaller than the of the anion
(b) ionic substances in which the cation are of almost similar sizes
(c) ionic substances in which the size of the cation is larger than of the anion
(d) non-stoichometric inorganic solids
(e) non-ionic substances

Kerala-CEE-2020

Ans. (b) : Schottky defect equal number of cationic and anionic vacancies are present. It is observed in cations and anions having similar size. The density of crystal decreases. It is observed in alkali halides (NaCl, CsCl) etc.

267. Which type of defect present in NaCl?

(a) Frenkel defect
(b) Schottky defect
(c) F-centre defect
(d) None of these

JIPMER-2019

Ans. (b) : Schottky defect is shown by ionic substance in which the cation and anion are of almost similar sizes. for example NaCl, KCl, CsCl and AgBr.

268. 1 mole of NaCl is doped with 10^{-5} mole of $SrCl_2$. The number of cationic vacancies in the crystal lattice will be

(a) 6.022×10^{18}
(b) 6.022×10^{15}
(c) 6.022×10^{23}
(d) 12.044×10^{20}

Karnataka-CET-2019

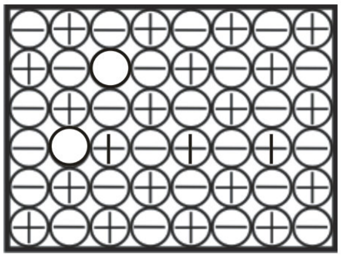
Ans. (a) : NaCl : 1 mole = 10^{-5} mole $SrCl_2$
1 mole NaCl doped with 10^{-5} mole $SrCl_2$ = Cation vacancies per mole of NaCl = 10^{-5} moles
1 mole = 6.022×10^{23} particle
$\therefore$ Cations vacancies = $6.022 \times 10^{23} \times 10^{-5}$
$= 6.022 \times 10^{18}$ per mole of NaCl

269. Which among the following statements is true about Schottky defect?

(a) In this defect cation and anion are lacking in stoichiometric proportion
(b) Formation of metal alloy is example of this defect
(c) In this cation or anion moves from regular site to place between lattice site
(d) In this regular cation is replaced by different cation

MHT CET-03.05.2019, SHIFT-I

Ans. (a) : The cation and anion are not in stoichiometric proportion in the schottky defect. In ionic solids, it's essentially a vacancy defect. The quantity of missing cations and anions must be equal to maintain electrical neutrality. The following illustration clearly depicts this follow–



270. Formula of nickel oxide with metal deficiency defect in its crystal is $Ni_{0.98}O$. The crystal contains Ni^{2+} and Ni^{3+} ion. The fraction of nickel existing as Ni^{2+} ions in the crystal is

(a) 0.96
(b) 0.04
(c) 0.50
(d) 0.3

(Odisha NEET-2019)

Ans. (a) : The formula is $Ni_{0.98}O$.
So, the ratio of Ni : O = 98 : 100
Thus, if there are 100 atom of oxygen then 98 atom of Ni.
Let x be the number of atoms of Ni^{2+}.
Number of atoms of $Ni^{3+} = 98 - x$
Charge on Ni = Charge on O.
Since oxygen has charge – 2
Therefore,
$2x + 3(98 - x) - 2 \times 100$
$2x + 294 - 3x - 200 = 0$
$x = 94$
Therefore,

$$\text{Fraction of } Ni^{2+} = \frac{\text{Atom of } Ni^{2+}}{\text{Tota number of atom}}$$

or $$\text{Fraction of } Ni^{2+} = \frac{94}{96} = 0.96$$

271. Assertion: Metal deficiency defect can be seen in FeO.
Reason : Li compound (LiCl) have violet colour due to F-center.

(a) In both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

[AIIMS-27 May, 2018(M)]

@apna_pdf

Ans. (b) : In the crystal of FeO, some Fe^{2+} ions are missing and the loss of positive charge is made up by the presence of the required number of Fe^{3+} ions. This however causes metal deficiency in the crystal.

272. Assertion: Conductivity of silicon increase by doping it with group -15 elements.

Reason: Doping means introduction of small amount of impurities like P, As or Bi into the pure crystal.

(a) In both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

[AIIMS-27 May, 2018(M)]

Ans. (b) : When a silicon crystal is doped with a group - 15 elements, such as P, As, Sb or Bi the structure of the crystal lattice is left unchanged but an occasional atom with five valence electrons occupies a site that would normally be occupied by a silicon atom. The foreign atom uses four of its electrons in covalent bonding but the remaining fifth electron becomes delocalized and thus free to contribute to electrical conductance.

273. Assertion: Schottky defects is produced in solids when equal number of cations and anions are lost from lattice sites. This defect is observed in ionic crystals formed by cations and anions of nearly equal size

Reason: We observe Schottky defect in crytals of KCl, NaCl.

(a) In both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

[AIIMS-26 May, 2018(E)]

Ans. (b) : Schottky defect is defect occurs. When oppositely charged ions leave their lattice site creating vacancies in such a way that electrical neutrality of crystal is maintained. It is generally seen in highly ionic compounds where a difference in size of cation and anion small.

So, an equal number of cations and anions vacancies are present in the crystals with Schottky Defect.

274. F- centre is

(a) anion vacancy occupied by unpaired electron.
(b) anion vacancy occupied by electron.
(c) cation vacancy occupeid by electron.
(d) anion present in interstitial site.

[AIIMS-26 May, 2018(M)]

Ans. (a) : The anionic sites occupied by unpaired electrons are called F- centers. Such defects also impart color to the crystals.

275. In which among the following solids, Schottky defect is not observed?

(a) ZnS (b) NaCl
(c) KCl (d) CsCl

MHT CET-2018

Ans. (a) : The Schottky defect is not observed in ZnS. The Schottky defect is observed in NaCl, KCl and CsCl. The Schottky defect is observed in solids in which cations and anions have almost equal size.

276. A type of defect observed in stoichiometric compounds in Schottky defect. Schottky defect occur mainly in ionic compounds where

(a) positive and negative ions are of different sizes
(b) positive and negative ions are of same sizes
(c) positive ions are small and negative ions are big
(d) positive ions are big and negative ions are small.

J & K CET-(2017)

Ans. (b) : Schottky defect occur mainly in ionic compound where positive and negative ions are of the same size. For example NaCl, KCl show this defect.

Frenkel defect occur mainly in ionic compound where positive and negative ions are of different size. for example, AgCl and Zns shown this defect.

277. The correct statement regarding defect in solids is

(a) Frenkel defect is usually favoured by a very small difference in the sizes of cations and anions
(b) Frenkel defect is a dislocation defect
(c) Trapping of proton in the lattice leads to the formation of F-centres
(d) Schottky defect has no effect on the physical properties of solids

Karnataka-CET-2017

Ans. (b) : Fenkel defect is favoured by a large difference is the size of cation and anion. When an ion is missing from its normal position and occupies an interstitial site between lattice points, Frenkel defect arises, hence it is dislocation defect.

The electron trapped in anion vacancies are referred to as F – centres.

@apna_pdf

Schottky defects arises when some atoms or ions are missing from their normal lattice points due to the presence of large number of vacancies in crystals, its density (i.e, physical property) is lowered.

278. Which is the incorrect statement ?

(a) Density decreases in case of crystals with Schottky defect.

(b) $NaCl_{(s)}$ is insulator, silicon is semiconductor, silver is conductor, quartz is piezoelectric crystal.

(c) Frenkel defect is favoured in those ionic compounds in which sizes of cation and anions are almost equal.

(d) $FeO_{0.98}$ has non-stoichiometric metal deficiency defect.

(NEET-2017)

Ans. (c,d) : Frenkel defect occurs in those ionic compounds in which size of cation and anion is largely different.

Non-stoichiometric defects due to metal deficiency is shown by Fe_xO where x = 0.93 to 0.96.

279. Which defect in any crystal lowers its density ?

(a) Schottky (b) Interstitial

(c) F-centre (d) Frenkel

UPTU/UPSEE-2016

Ans. (a): In schottky defect same number of cations and anion are missing from their lattice sites. This defect decreases the density of crystal.

280. Ionic solids with Schottky defect may contain in their structure

(a) cation vacancies only

(b) cation vacancies and interstitial cations

(c) equal number of cation and anion vacancies

(d) anion vacancies and interstitial anion

WB-JEE-2016

Ans. (c) : Schottky defect is found in ionic solids. But in ionic compound, we need to balance the electrical neutrality of the compound so an equal number of anions and cations will be missing from the compound.

- It reduces the density of the substance.
- In this , the size of cations and anions are of almost same.

281. Which of the following defects are present in AgBr and ZnS crystal systems?

(a) Frenkel and Schottky

(b) Schottky and Frenkel

(c) Frenkel and Frenkel

(d) Schottky and Schottky

AMU-2015

Ans. (b, c) : In case of Ag Br and ZnS, the cations Ag^+ and Zn^{2+} are small in size thus, some of these ions in the lattice shifts to the interstitial sites that arises Frenkel defect in these crystals.

AgBr shows both shottky and frenkel defects.

282. The correct statement regarding defects in crystalline solids is

(a) Frenkel defects decrease the density of crystalline solids

(b) Frenkel defect is a dislocation defect

(c) Frenkel defect is found in halides of alkaline metals

(d) Schottky defects have no effect on the density crystalline solids.

(NEET-2015)

Ans. (b) : (a) Frenkel defect have no effect on the density of crystalline solids.

(b) Frenkel defect is a dislocation defect.

It arises due to a vacancy at cationic site.

The cation moves to another position between the two layers and is surrounded by greater number of anions.

(c) Frenkel defect is a founded in ZnS, AgBr, AgI, AgCl etc.

(d) Due to schottky defect, the density of crystals decreases.

283. Schottky defect in crystals is observed when

(a) an ion leaves its normal site and occupies an interstitial site

(b) unequal number of cations and anions and missing from the crystal lattice

(c) equal number of cations and anions are missing from the crystal lattice

(d) there is large difference in size of positive and negative ions.

COMEDK 2014

Ans. (c) : In Schoottky defects in crystal is observed when equal number of cations and anions are missing from the crystal lattice.

284. When a cation leaves its normal position in the crystal and moves to some interstitial space, the defect in the crystal is known as

(a) Schottky defect

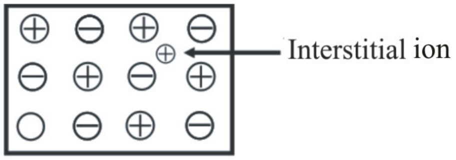
(b) F-centre

(c) Frenkel defect

(d) non-stoichiometric defect

J & K CET-(2013)

Ans. (c) : When a cation leaves its normal position in the crystal and moves to some interstitial space, the defect in the crystal is known as Frenkel defect.



Frenkel defect is also know as interstitial defect

285. Which kind of defects are introduced by doping?

(a) Dislocation defects

(b) Schottky defects

@apna_pdf

(c) Electronic defects
(d) Frenkel defects

JCECE - 2013

Ans. (c) : When electron rich or electron deficient impurity is added to a perfect crystal in introduces an electronic defect in them.

286. Which one of the following has Schottky defect?
(a) NaCl (b) AgCl
(c) FeS (d) ZnS

SRMJEEE – 2011

Ans. (a) : Schottky defect is shown by ionic substances in which the cation and anion are of almost similar sizes. Hence the correct option is A.

287. Assertion: Due to Frenkel defect, there is no effect on the density of the crystalline solid.
Reason : In Frenkel defect, no cation or anion leaves the crystal.
(a) In both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

[AIIMS-2011]

Ans. (a) : A Frenkel defect is a type of defect in crystalline solid where in an atom is displaced from its lattice position to an interstitial site, creating a vacancy at the original site and an interstitial defect at the new location within the same element without any changes in chemical properties.

No cation and anion are leaving the crystal. Only the cation is moving from one place to another place within the crystal. So the density of crystalline solid will not change.

288. Which is not correct about the Schottky defects?
(a) Both cations and anions are missing from their lattice sites without affecting the stoichimetry of the stoichiometry of the compound.
(b) Because of the presence of holes the lattice energy decreases.
(c) The presence of holes causes the density of the crystal to decrease.
(d) The defect increase the electrical conductivity of the solid due migration of the ions into holes.

[AIIMS-2011]

Ans. (b) : If in an ionic crystal of type $A^+ B^-$ an equal number of cation and anions are missing from their lattice sites so that electrical neutrality , as well as stoichiometry , is maintained then this defect is called a Schottky defect, The presence of holes causes the density of the crystal to decreases. It is a vacancy defect (due to missing ions) and also a stochiometric defect, as the number of cation and anions remains the same. the energy needed to form a Schottky defect is very less but the production of defect of Schottky is an endothermic process. Hence the lattice energy increases. The defect increases the electrical conductivity of the solid due to a migration of the ions into the holes.

289. Frenkel defect is generally observed in
(a) AgBr (b) AgI
(c) ZnS (d) All of the above

VITEEE- 2010

Ans. (d) : When the size of cation is much smaller than the anion then Frenkel defect is observed. Frenkel defect is exhibited in ionic compound in which the radius ratio is low. Hence, AgBr, AgI and ZnS all exhibit Frenkel defect.

290. Extrinsic semi-conduction is due to
(a) purity of crystal
(b) low temperature
(c) thermal defect
(d) impurity in crystal.

SRMJEEE – 2010

Ans. (d) : Extrinsic semiconductors are semiconductors that are doped by a specific impurity which is able to deeply modify its electrical properties, making it suitable for electronic applications.

291. In stoichiometric defect, the ratio of positive and negative ions as indicated by chemical formula of the compound
(a) decreases
(b) increases
(c) changes by a factor of 2
(d) remains same

UPTU/UPSEE-2010

Ans. (d) : Stoichiometric defect, the ratio of positive and negative ions (stoichiometric) and electrical neutrality of a solid is not disturbed. It is also known as intrinsic or thermodynamic defects.

292. Which defect causes decrease in the density of crystal?
(a) Frenkel (b) Schottky
(c) Interstitial (d) F - centre

UPTU/UPSEE-2010

Ans. (b) : Schottky defect is found in ionic solids. But in ionic compound, we need to balance the electrical neutrality of the compound so an equal number of anions and cations will be missing from the compound.

- It reduces the density of the substance.
- In this , the size of cations and anions are of almost same.

@apna_pdf

293. Assertion : No compound has both Schottky and Frenkel defects.
Reason : Both defects change the density of the solid.

(a) In both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

[AIIMS-2008]

Ans. (d) : AgBr have both Schottky and Frenkel defect. Only Schottky defect change the density of solid because anions or cations are missing and Frenkel defects have no change in density because they have same number of cations or anions only change the position of ions.

294. Schottky defects occurs mainly in electrovalent compounds where

(a) positive ions and negative ions are of different size
(b) positive ions and negative ions are of same size
(c) positive ions and small negative ions are big
(d) positive ions and big negative ions are small

VITEEE- 2008

Ans. (b) : When equal number of cations or anions are missing from their lattice sites than the defect is called Schottky defect. The defect is observe in highly ionic compound which have cation and anions of similar size e.g. NaCl, KCl etc.

295. With which one of the following elements Silicon should be doped so as to give p-type of semiconductor?

(a) Selenium
(b) Boron
(c) Germanium
(d) Arsenic

(NEET-2008)

Ans. (b) : P-type of semiconductor are obtained by doping sillcon or germanium with elements of group 13 like B, Al, Ga or silicon is doped with boron.

296. The structure of ionic compound with Schottky defects has

(a) same number of cationic and anionic vacancies
(b) anionic vacancy and interstitial anion
(c) cationic vacancies
(d) cationic vacancies and interstitial cation

CG PET -2007

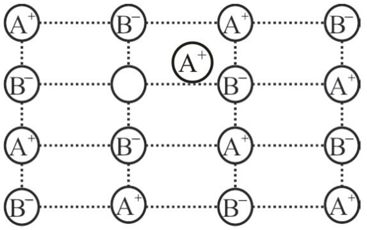
Ans. (a) : The structure of ionic compound with Schottky defects has same number of cationic and anionic vacancies.

297. An ion leaves its regular site occupy a position in the space between the lattice sites is called

(a) Frenkel defect
(b) Schottky defect
(c) Impurity defect
(d) Vacancy defect

VITEEE- 2007

Ans. (a) : In Frenkels defect an ion leaves its regular site and occupy a position in the space between the lattice sites.



298. Schottky defect is observed in the crystal of

(a) NaCl
(b) TiCl
(c) AgCl
(d) $MgCl_2$

AP - EAMCET (Medical) - 2007

Ans. (a) : Schottky defect is observed when equal number of cations and anions are missing from the Lattice. This defect observed in NaCl, KCl, AgBr.

299. If NaCl is doped with 10^{-4} mol % of $SrCl_2$, the concentration of cation vacancies will be ($N_A = 6.02\times10^{23}$ mol^{-1})

(a) 6.02×10^{16} mol^{-1}
(b) 6.02×10^{17} mol^{-1}
(c) 6.02×10^{14} mol^{-1}
(d) 6.02×10^{15} mol^{-1}

(NEET-2007)

Ans. (b) : Moles of $SrCl_2$ in 1 mole NaCl = $\frac{10^{-4}}{100} = 10^{-6}$ moles.

$\therefore$ One Sr^{+2} creates one cationic vacancies.

Concentration of the cationic vacancies produced by 10^{-6} moles of $SrCl_2$

$= 10^{-6} \times 6.023\times10^{23}$

$= 6.023\times10^{17}$ mol^{-1}.

300. Schottky defect in solids is due to

(a) a pair of cation and anion vacancies
(b) occupation of interstitial site by a pair of cation and anion
(c) occupation of interstitial site by a cation
(d) occupation of interstitial site by a anion

VITEEE- 2006

Ans. (a) : Schottky defects in solid is due to a pair of cation and anion vacancies. Equal number of cation and anion are missing which ensure electrical neutrality. Due to this defects the density of crystal decreases. Frenkel defects in solids is due to occupation of interstitial site by a cation or an anion. This defects does not affects the density of the crystal.

@apna_pdf

301. When electrons are trapped into the crystal in anion vacancy, the defect is known as:

(a) Schottky defect (b) Frenkel defect
(c) Stoichiometric defect (d) F-centres

JIPMER-2006

Ans. (d) : F-centres are the sites where anions are missing and instead electron are present. They are responsible for colour.

302. The appearance of colour in solid alkali metal halides is generally due to

(a) Interstitial positions (b) F-centres
(c) Schottky defect (d) Frenkel defect.

(NEET-2006)

Ans. (b) : The appearance of colour in solid alkali metal halides is generally due to F-centres.

303. Frenkel and Schottky defects are

(a) nucleus defects (b) non-crystal defects
(c) crystal defects (d) nuclear defects

JIPMER-2005

Ans. (c) : Frenkel and Schottky defect are called the crystal Defects.

304. Point defects are present in

(a) ionic solids (b) molecular solids
(c) amorphous solids (d) liquids

CG PET -2004

Ans. (a) : Point defects are where an atom is missing or is in an irregular place in the ionic solid lattice structure. Impurity atoms in a pure metal vacancies, and self interstitials are examples of point defects.

305. Density of a crystal remains unchanged as a result of:

(a) ionic defect (b) Schottky defect
(c) Frenkel defect (d) crystal defect
(e) point defect

Kerala-CEE-2004

Ans. (c) Density of crystal does not change in Frenkel defect as missing ions are present in the interstitial sites.

306. Which of the following statement is true?

(a) Some complex metal oxides behave as superconductor
(b) Zinc oxide can act as superconductor
(c) An impurity of tetravalent germanium in trivalent gallium creates electron deficiency
(d) A Frenkel defect is formed when an ion is displaced from its lattice site to and intersitial site

BCECE-2003

Ans. (d) : Frenkel defect is formed by displacement of ion from its lattice site to interstitial state.

307. Schottky defects defines imperfection in the lattice structure of

(a) Solid (b) Gas
(c) Liquid (d) Plasma

[AIIMS-2002]

Ans. (a) : A Schottky defect is a type of point defect in a solid crystal lattice.

308. Ionic solids, with Schottky defects, contain in their structure

(a) cation vacancies only
(b) cation vacancies and interstitial cations
(c) equal number of cation and anion vacancies
(d) anion vacancies and interstitial anions.

(NEET-1994)

Ans. (c) : Ionic solid with Schottky defect may contain in their structure, equal number of cation and anion vacancies,

In schottky defect, equal number of cation and anion are missing.

309. Schottky defect in crystals is observed when

(a) unequal number of cations and anions are missing from the lattice
(b) equal number of cations and anions are missing from the lattice
(c) an ion leaves its normal site and occupies an interstitial site
(d) density of the crystal is increased

Ans. (b) : It is schottky defect is observed when equal number of cations and anions are missing from the lattice site. This defect changes the density as a pair of ions are missing from the lattice.

6. Bragg's Equation

310. In Bragg's equation nλ = 2dsinθ, n represents :

(a) Number of moles
(b) The principal quantum number
(c) Avogadro's number
(d) Order of reflection

MPPET-2013

Ans. (d) : Bragg's equation,

$$\boxed{2d\sin\theta = n\lambda}$$

Where, n = order of reflection from solid
(n = 1, 2, 3, 4, etc.)
d = It is interplanar distance
θ = Angle between the wave vector of the incident plane wave
λ = Wavelength

311. X-rays of wavelength 1.14 Å in the first order reflection from a crystal, were reflected at an angle of 30°
The inter-planar distance in the crystal is (sin 30° = 0.5)

(a) 3.8 Å (b) 1.14 Å
(c) 0.342 Å (d) 2.28 Å

SRMJEEE – 2012

@apna_pdf

Ans. (b) : According to Bragg's law, 2d sinθ = n λ

Where, d = Interplanar distance

n = Order of reflection

λ = wave length.

$\therefore\ 2 \times d \times \sin 30° = 1 \times 1.14 \times 10^{-10} \Rightarrow d = 1.14\text{Å}$

312. The First order reflection (n = 1) from a crystal of the X-ray from a Copper anode tube (λ = 1.54 Å) occurs at an angle of 45º. What is the distance between the set of plane causing the diffraction?

(a) 0.1089 nm.

(b) 0.1089 m.

(c) 10.89 Å

(d) 1.089×10^{-9} m.

GUJCET-2011

Ans. (a): Given that

n = 1, λ = 1.54 Å, θ = 45º, d = ?

We know that Bragg's equation –

2d sinθ = nλ

$$d = \frac{n\lambda}{2\sin\theta} = \frac{1 \times 1.54\text{Å}}{2 \times \sin 45^\circ}$$

$$d = \frac{1.54\text{Å}}{2 \times 0.7071} = 1.089\text{Å}$$

or d = 0.1089 nm

313. For a crystal, the angle of diffraction (2θ) is 90° and the second order line has a d value of 2.28, Å the Wavelength (in Å) of X-rays used for Bragg's diffraction is

(a) 1.612

(b) 2.00

(c) 2.28

(d) 4.00

A.P.EAMCET-2008

Ans. (a) : Given that, $2\theta = 90^0$ or $\theta = 45^0$

d = 2.28Å , n = 2, λ = ?

We know that Bragg's equation-

$$\therefore \quad n\lambda = 2d\sin\theta$$

$$2 \times \lambda = 2 \times 2.28\text{Å} \times \sin 45^\circ$$

$$\lambda = \frac{2 \times 2.28\text{Å}}{2} \times \frac{1}{\sqrt{2}}$$

$$\lambda = 1.612\text{Å}$$

∴The wavelength of X - rays used for Bragg's diffraction is 1.612 Å.

314. The second order Bragg diffraction of X–rays with wavelength of 2.00Å from a set of parallel planes in a crystal occurs at 60°. The distance between the scattering planes in the crystal is

(a) 5.75 Å

(b) 2.00 Å

(c) 4.00 Å

(d) 2.30 Å

AMU – 2008

Ans. (d) : Bragg's law represent a relationship between the wavelength of the X-rays and the distance between the planes.

From the Bragg's equation–

nλ = 2d sinθ

$\therefore\ 2 \times 2 = 2 \times d \sin 60°$

$$\therefore\ 2d = \frac{4}{\sin 60^\circ}$$

$$\therefore\ 2d = \frac{4}{\sqrt{3}/2}$$

$$\therefore\ 2d = \frac{8}{\sqrt{3}}$$

$$\therefore\ d = \frac{8}{2\sqrt{3}} = \frac{4}{\sqrt{3}} = 2.30\text{Å}$$

315. The second order Bragg's diffraction of X-rays of wavelength 100 pm from a set of parallel lattice planes in a metal occurs at a grazing angle of 30°. The spacing between the successive scattering planes in the crystal is

(a) 50 pm

(b) 100 pm

(c) 150 pm

(d) 200 pm

SRMJEEE – 2007

Ans. (d) : Given that, n = 2

λ = 100 pm

θ = 30°

d = ?

Now, from Bragg's law :-

2dsinθ = nλ

$$\text{or} \quad d = \frac{n\lambda}{2\sin\theta}$$

$$d = \frac{2 \times 100\,\text{pm}}{2 \times \sin 30^\circ} = 200\,\text{pm}$$

316. The second order Bragg diffraction of X-rays with λ = 1.00Å from a set of parallel planes in a metal occurs at an angle 60°. The distance between the scattering planes in the crystal is

(a) 2.00 Å

(b) 1.00 Å

(c) 0.575 Å

(d) 1.15 Å

(NEET-1998)

Ans. (d) :

Given that –

Wavelength (λ) = 1.00 Å

Angle of diffraction (θ) = 60^0

Order of diffraction (n) = 2

According to Bragg’s equation

2d sinθ = nλ

$$d = \frac{n\lambda}{2\sin\theta}$$

$$d = \frac{2 \times 1\text{Å}}{2 \times \sin 60} \qquad \therefore\ \sin 60 = \frac{\sqrt{3}}{2}$$

$$d = \frac{2 \times 1\text{Å}}{2 \times \frac{\sqrt{3}}{2}}$$

@apna_pdf

$$d = \frac{2\times 1 Å}{\sqrt{3}} \qquad \therefore \sqrt{3} = 1.732$$

$$d = 1.15 Å$$

The distance between the scattering planes in the crystal is d = 1.15 Å.

317. Bragg's law is given by the which of the following equation?

(a) $n\lambda = 2\theta \sin\theta$ (b) $n\lambda = 2d \sin\theta$

(c) $2n\lambda = d \sin\theta$ (d) $n\frac{\theta}{2} = \frac{d}{2}\sin\theta$

VITEEE-2003

Ans. (b) : Bragg's Law, $n\lambda = 2d \sin\theta$

$$d_{hkl} = \frac{a}{\sqrt{h^2+k^2+l^2}}$$

Where λ = Wavelength of the x - ray

n = Positive integer

d = Distance between the lattice planes

θ = Incident angle

a = Lattice parameter

7. Density of Unit Cell

318. Copper crystallizes in fcc unit cell with cell edge length of 3.608 × 10^{-8} cm. The density of copper is 8.92 g cm^{-3}. Calculate the atomic mass of copper.

(a) 65 u (b) 63.1 u

(c) 31.55 u (d) 60 u

NEET-17.07.2022

Ans. (b) : Given that,

Z = 4 (FCC)

$d = 8.92 \text{ g cm}^{-3}$

$N_A = 6.023 \times 10^{23}$

$a = 3.608 \times 10^{-8}$ cm

$$d = \frac{Z\times M}{N_A \times \text{Volume}}$$

$$8.92 = \frac{4\times M}{6.02\times 10^{23}\times(3.608\times 10^{-8})^3}$$

$$8.92 = \frac{4\times M}{6.02\times 10^{23}\times 46.97\times 10^{-24}}$$

M = 63.05

319. The distance between Na^+ and Cl^- ions in solid NaCl of density 43.1 g cm^{-3} is_____ × 10^{-10} m. (Nearest Integer) (Given: $N_A = 6.02\times 10^{23}$ mol^{-1})

JEE Main-25.06.2022, Shift-I

Ans. (1) : Given,

Density of solid NaCl = 43.1 cm^{-3}

$N_A = 6.02 \times 10^{23}$ mol^{-1}

Z (effective number of atoms in unit cell) = 4

Molecular mass (M) = 58.5 gm.

We know that –

$$\text{Density} = \frac{Z\times M}{N_A \times \text{Volume}}$$

$$43.1 = \frac{4\times 58.5}{6.02\times 10^{23}\times[a]^3}$$

$$a^3 = \frac{4\times 58.5}{6.02\times 10^{23}\times 43.1}$$

$$= 9\times 10^{-24}$$

$$a = 2.08\times 10^{-8} \text{ cm}$$

$$d_{Na^+ + Cl^-} = \frac{a}{2} = 1\times 10^{-10} \text{m}$$

320. What is the percentage of free space in body. centred cubic unit cell?

(a) 32% (b) 20%

(c) 34% (d) 28%

NEET-2015, 2008

J & K CET-(2014)

JIPMER-2014

Ans. (a) : We know that,

$$\text{Packing fraction} = \frac{V_{sphere}}{\text{Volume of the unit cell}}\times 100$$

For BCC,

$$\text{Packing fraction} = \frac{2\times\frac{4}{3}\pi r^3}{\left(\frac{4r}{\sqrt{3}}\right)^3}\times 100$$

$$= \frac{\sqrt{3}\pi}{8}\times 100$$

= 68% (volume occupied)

Fraction of free space in BCC = 100 – 68 = 32%

321. The cubic unit cell of a metal (molar mass =63.55g mol^{-1}) has an edge length of 362 pm. Its density is 8.92gcm^{-3}. The type of unit cell is

(a) primitive (b) face-centred

(c) body centred (d) end centred

CG PET -2017

AP-EAMCET (Engg.)-2009

Ans. (b) : Density (d)=8.92 g cm^{-3}

Edge length (a)= 362×10^{-10} cm

M= 63.55 g mol^{-1}

$$d = \frac{Z\times M}{a^3\times N_A}$$

$$Z = \frac{8.92\times 6.023\times 10^{23}\times\left(362\times 10^{-10}\right)^3}{63.55}$$

Z=4

∴ The metal crystallizes in face centred cell.

@apna_pdf

322. A metal crystallizes in bcc lattice with unit cell edge length of 300 pm and density 6.15 gcm^{-3}. The molar mass of the metal is

(a) 50 gmol^{-1} (b) 60 gmol^{-1}
(c) 40 gmol^{-1} (d) 70 gmol^{-1}

Karnataka-CET-2021

Ans. (a) : We Know that –

$$\text{Density (d)} = \frac{Z \times M}{a^3 \times N_A}$$

Given that –

Edge length a = 300 pm

Density d = 6.15 gcm^{-3}

$N_A = 6.02 \times 10^{23}$

In bcc number of atom Z = 2

$$\text{So,} \quad M = \frac{d \times a^3 \times N_A}{Z}$$

$$M = \frac{6.15 \times (300 \times 10^{-10})^3 \times 6.02 \times 10^{23}}{2}$$

$M = 50$ gmol^{-1}

323. The unit cell of copper corresponds to a face centered cube of edge length 3.596 A with one copper atom at each lattice point. The calculated density of copper in kg/m^3 is......[Molar mass of Cu = 63.54 g ; Avogadro number = 6.022×10^{23}]

[JEE Main 2021, 25 Feb Shift-II]

Ans. (9077) : Given that,

Molar mass of Cu = 63.54g

$N_A = 6.022 \times 10^{23}$ mole^{-1}

a = 3.596 Å = 3.596×10^{-10} m

In FCC whit cell Z = 4

So,

$$d = \frac{Z \times M}{N_A \times a^3}$$

$$d = \frac{4 \times 63.54 \times 10^{-3}}{6.022 \times 10^{23} \times (3.596 \times 10^{-10})^3}$$

$$d = \frac{254.16}{6022 \times 10^{23} \times 46.50 \times 10^{-30}}$$

d = 9077 kg/m^3

324. A copper complex crystallising in a CCP lattice with a cell edge of 0.4518 nm has been revealed by employing X-ray diffraction studies. The density of copper complex is found to be 7.62 g cm^{-3}. The molar mass of copper complex is ......g mol^{-1}. (Nearest integer)
(Given : $N_A = 60.022 \times 10^{23}$ mol^{-1})

[JEE Main 2021, 22 July Shift-II]

Ans. (106) : Given that,

a = 0.4518 nm = 0.4518×10^{-7} cm

d = 7.62 gcm^{-3}

In CCP/FCC unit cell Z = 4

$N_A = 6.022 \times 10^{23}$mol^{-1}

$$\text{So,} \quad d = \frac{Z \times M}{a^3 \times N_A}$$

$$7.62 = \frac{4 \times M}{6.022 \times 10^{23} \times (0.4518 \times 10^{-7})^3}$$

M = 105.8 g/mol.

325. A metal crystaillses in BCC lattice with unit cell edge length of 300 pm and density 6.15 g cm^{-3}. The molar mass of the metal is

(a) 50 g mol^{-1} (b) 60 g mol^{-1}
(c) 40 g mol^{-1} (d) 70 g mol^{-1}

Kerala-CEE-29.08.2021

Ans. (a) : Given that –

Edge length (a) = 300 pm = 300 ×10^{-10} cm = 3 × 10^{-8} cm

Density (d) = 6.15 gcm^{-3}

Molar mass (M) = ?

Now, from the equation of density, we get –

$$d = \frac{Z \times M}{N_A \times a^3}$$

Where, d = density of the crystal

Z = 2 (Number of atom in BCC lattice)

M = Molecular mass

a = edge length

N_A = Avogadro number (6.023×10^{23})

$$\therefore M = \frac{\rho \times N_A \times a^3}{Z}$$

$$M = \frac{6.15 \times 6.023 \times 10^{23} \times 27 \times 10^{-24}}{2}$$

or M = 50 gmol^{-1}

326. A diatomic molecule X_2 has a body-centered cubic (bcc) structure with a cell edge of 300 pm. The density of the molecule is 6.17 g cm^{-3} . The number of molecules present in 200 g of X_2 is (Avogadro constant)
($N_A = 6 \times 10^{23}$ mol^{-1})

(a) 40N_A (b) 8N_A
(c) 4 N_A (d) 2 N_A

[JEE Main 2020, 5 Sep Shift-I]

Ans. (c) : Given,

Edge length (a) = 300 pm = 300 × 10^{-10} cm

Density (d) = 6.17 g cm^{-3}

For BCC, Z = 2

$$\text{Density } d = \frac{Z \times M}{a^3 \times N_A}$$

$$6.17 = \frac{2 \times M}{6.02 \times 10^{23} \times (300 \times 10^{-10})^3}$$

$$6.17 = \frac{2M}{6.02 \times 2.7}$$

2M = 6.17×6.02×2.7

@apna_pdf

$$M = \frac{6.17 \times 6.02 \times 2.7}{2}$$

$M = 50$ g/mol

$$\text{Number of moles} = \frac{\text{Mass}}{\text{Molar Mass}}$$

$$= \frac{200}{50}$$

= 4 mol.

Number of molecule = mole × N_A

$= 4 \times N_A$

327. An element with molar mass 2.7×10^{-2} kg mol^{-1} forms a cubic unit cell with edge length 405 pm. If its density is 2.7×10^3 kg m^{-3}, the radius of the element is approximately…….$\times 10^{-12}$ m (to the nearest integer).

[JEE Main 2020, 3 Sep Shift-I]

Ans. (143.21) : Given that,

$d = 2.7 \times 10^3$ $kgm^{-3} = 2.7$ g cm^{-3}

$a = 405$ pm $= 405 \times 10^{-10}$ cm

$m = 2.7 \times 10^{-2}$ kg $mol^{-1} = 27$g mol^{-1}

Volume $(a^3) = (405)^3 = (405 \times 10^{-10})^3$ cm^3

$N_A = 6.023 \times 10^{23}$ mol^{-1+}

$$\text{We know that, } d = \frac{ZM}{a^3 N_A}$$

$$Z = \frac{d \times a^3 \times N_A}{M}$$

$$= \frac{2.7 \times (405 \times 10^{-10})^3 \times 6.023 \times 10^{23}}{27} = 4$$

Hence, the nature of the cubic unit cell is CCP/FCC.

$$a = 2\sqrt{2}R \Rightarrow R = \frac{a}{2\sqrt{2}} = \frac{405 \times 10^{-10}}{2\sqrt{2}} = 143.21 \times 10^{-12}\,m$$

328. A metal crystallises in face centred cubic structure with metallic radius $\sqrt{2}\,\overset{o}{A}$. The volume of the unit cell (in m^3) is

(a) 4×10^{-10}
(b) 6.4×10^{-29}
(c) 4×10^{-9}
(d) 6.4×10^{-30}

Karnataka-CET-2020

Ans. (b) : Given that, $r = \sqrt{2}$ Å

$$\text{For FCC, atomic radius } (r) = \frac{\sqrt{2}a}{4}$$

$$\sqrt{2} \times 10^{-10} = \frac{\sqrt{2}a}{4}$$

$$\sqrt{2}a = 4 \times \sqrt{2} \times 10^{-10}$$

$$a = \frac{4 \times \sqrt{2} \times 10^{-10}}{\sqrt{2}}$$

$a = 4 \times 10^{-10}$ m

So, Volume of unit cell $(a^3) = (4 \times 10^{-10})^3$

$= 64 \times 10^{-30}$ m^3

$= 6.4 \times 10^{-29}$ m^3

329. The number of atoms in 2.4 g of body centred cubic crystal with edge length 200 pm is (density = 10g cm^{-3}, $N_A = 6 \times 10^{23}$ atoms/mol)

(a) 6×10^{22}
(b) 6×10^{20}
(c) 6×10^{23}
(d) 6×10^{19}

Karnataka-CET-2019

Ans. (a) : We know that,

$$\text{Density } d = \frac{Z \times M}{a^3 \times N_A}$$

Given that —

Density (d) = 10 g cm^{-3}

Edge length a= 200 pm

$N_A = 6 \times 10^{23}$ atoms/mol.

So

$$d = \frac{2 \times M}{(200)^3 \times 6 \times 10^{23}}$$

$$M = \frac{10 \times (200)^3 \times 10^{-30} \times 6 \times 10^{23}}{2}$$

M = 24

24 g contain → 6×10^{23}

2.4g contain → 6×10^{22} number of atoms

330. At 100ºC, copper (Cu) has FCC unit cell structure with cell edge length of x Å What is the approximate density of Cu (in g cm^{-3}) at this temperature?

[Atomic mass of Cu = 63.55u]

(a) $\frac{211}{x^3}$
(b) $\frac{205}{x^3}$
(c) $\frac{105}{x^3}$
(d) $\frac{422}{x^3}$

[JEE Main 2019, 9Jan Shift-II]

Ans. (d) : We know that –

$$\text{Density (d)} = \frac{Z \times M}{a^3 \times N_A}$$

In FCC unit cell, z = 4

So,

$$d = \frac{4 \times 63.55}{6.02 \times 10^{23} \times x^3 \times 10^{-24}}\,g/cm^3$$

[∴ 1 Å = 10^{-8} cm.]

$$d = \frac{63.55 \times 4 \times 10}{6.02 \times x^3}\,g/cm^3$$

$$d = \frac{422.26}{x^3}$$

$$d \simeq \frac{422}{x^3}$$

331. A solid having density of 9×10^3 kg m^{-3} forms face centred cubic crystals of edge length $200\sqrt{2}$ pm. What is the molar mass of the solid? (Avogadro constant = 6×10^{23} mol^{-1}, π = 3)

@apna_pdf

(a) 0.03050 kg mol^{-1}
(b) 0.4320 kg mol^{-1}
(c) 0.0432 kg mol^{-1}
(d) 0.0216 kg mol^{-1}

[JEE Main 2019, 11 Jan Shift-I]

Ans. (a) : Given that, $d = 9 \times 10^3$ kg m^{-3}

$a = 200\sqrt{2}$ pm $= 200\sqrt{2}\times10^{-12}$ m

$N_A = 6 \times 10^{23}$ mol^{-1}

We know the formula of density –

$$d = \frac{Z\times M}{a^3\times N_A}$$

For, FCC unit cell Z = 4

So, $$d = \frac{Z\times M}{a^3\times N_A}$$

$$9\times10^3 = \frac{4\times M}{(200\sqrt{2}\times10^{-12})^3\times6.0\times10^{23}}$$

$$4\times M = 9\times10^3\times(200\sqrt{2}\times10^{-12})^3\times6.0\times10^{23}$$

$$M = \frac{9\times10^3(200\sqrt{2}\times10^{-12})^3\times6.0\times10^{23}}{4}$$

M = 0.0305 kg.mol^{-1}

332. Each edge of a cubic unit cell is 400 pm long. If atomic mass of the element is 120 and its density is 6.25 g / cm^3, the crystal lattice is: (use $N_A = 6 \times 10^{23} mol^{-1}$)

(a) primitive
(b) body centered
(c) face centered
(d) end centered

BITSAT-2018

Ans. (b) : Given that, Unit cell length (a) = 400 pm $= 4\times10^{-8}$ cm

Molar mass (M) = 120 g mol^{-1}

Density (d) = 6.25 g cm^{-3}

$N_A = 6\times10^{23}$ mol^{-1}

$\therefore$ $$d = \frac{Z\cdot M}{N_A\times a^3}$$

or $$Z = \frac{d\times N_A\times a^3}{M}$$

$$Z = \frac{6\times10^{23}\times(4\times10^{-8})^3\times6.25}{120}$$

When, Z = 2 it means body centre cubic.

333. In a cubic lattice each edge length of the unit cell is 408.6 pm and density of the unit cell is 10.5×10^3 kgm^{-3} at weight 107. The crystal lattice is

(a) FCC (b) BCC
(c) CCP (d) Primitive

JCECE - 2018

Ans. (a) : Given that, a = 408.6 pm $= 4.086 \times 10^{-10}$ m

$d = 10.5 \times 10^3$ kg m^{-3}

$M = 107 = 1.07 \times 10^{-1}$ kg mol^{-1}

$N_A = 6.023\times10^{23}$ mol^{-1}

$$Z = \frac{d\times a^3\times N_A}{M}$$

$$= \frac{10.5\times10^3\times(4.086\times10^{-10})^3\times6.022\times10^{23}}{1.07\times10^{-1}}$$

Z = 4

It has FCC crystal lattice.

Note:–

Crystal lattice		**No. of atom**
SC	⟶	1
BCC	⟶	2
FCC	⟶	4
HCP	⟶	6

334. An atom forms face centred cubic crystal with density d = 8.92 g/ml and edge length a = 3.6 × 10^{-8} cm. The molecular mass of atoms in amu is

(a) 98 amu (b) 63 amu
(c) 32 amu (d) 93 amu

JIPMER-2018

Ans. (b) : Given that, Density (d) = 8.92 g/cm^3

Edge length (a) = 3.6×10^{-8} cm

Z = 4 (FCC)

The molecular mass of atom in a lattice can be calculated by using the formula.

$$d = \frac{Z\times M}{N_A\times a^3} \Rightarrow M = \frac{d\times N_A\times a^3}{Z}$$

$$M = \frac{8.92\times6.023\times10^{23}\times(3.6\times10^{-8})^3}{4}$$

M = 62.665g. mol^{-1} = 62.665 amu

335. An element has a body centered cubic structure with a unit cell edge length of 400 pm. Atomic mass of an element is 24 g mol^{-1}. What is the density of the element? ($N_A = 6 \times 10^{23}$ mol^{-1})

(a) 2.50 g cm^{-3}
(b) 1.80 g cm^{-3}
(c) 3.60 g cm^{-3}
(d) 1.25 g cm^{-3}

AP EAMCET-2017

Ans. (d): Given, for body centered cubic (Z) = 2

Edge length (a) = 400 pm
$= 400 \times 10^{-12}$ m
$= 400 \times 10^{-10}$ m

Atomic mass (M) = 24 g/mole

$\therefore$ density (d) $= \dfrac{Z\times M}{N_A a^3}$

@apna_pdf

$$= \frac{2\times 24\,g/mole}{6\times 10^{23}mol^{-1}\times(400\times 10^{-10})^3}$$

$$= \frac{48\times 10}{6\times 4\times 16}$$

$= 1.25\ gcm^{-3}$

336. Al (at. wt 27) crystallizes in the cubic system with a cell edge of 4.05 Å. Its density is 2.7 g per cm^3. Determine the unit cell type & calculate the radius of the Al atom.

(a) fcc, 2.432 Å (b) bcc, 2.432 Å

(c) bcc,1.432 Å (d) fcc,1.432 Å

BITSAT-2016

Ans. (d) : The density is given by the formula

$$\rho = \frac{Z\times M}{\text{Avogadro's no.}\times a^3}$$

$$2.7 g/cm^3 = \frac{Z\times 27\ g/mol}{6.02\times 10^{23}\times(4.05\times 10^{-8.}\ cm)^3}$$

$Z = 4$

The number of atom per unit cell Z = 4 Hence it is face centered cubic unit lattice.

Again, $4r = a\sqrt{2} = 4.05\text{Å}\times 1.414 = 5.727\text{Å}$

The radius of the Al atom = 1.442 Å,

Hence, the correct option is 'd'.

337. The density and edge length values for a crystalline element with FCC lattice are 10 g cm^{-3} and 400 pm, respectively. The number of unit cells in 32 g of this crystal is

(a) 8×10^{23} (b) 5×10^{22}

(c) 8×10^{22} (d) 5×10^{23}

J & K CET-(2016)

Ans. (b) : Given that,

Density of the unit cell = $10 g/cm^3$

Volume of the unit cell $(a^3)=(400\times 10^{-10})^3\ cm^3$

$= 64\times 10^{-24}\ cm^3$

So, Mass of unit cell = Volume × density

$= 64\times 10^{-24}\times 10$

$= 640\times 10^{-24}\ g$

Now, $640\times 10^{-24}\ g$ = 1 unit cell

$$\therefore \quad 32\ g = \frac{1}{640\times 10^{-24}}\times 32$$

$= 0.05\times 10^{24}$

$= 5\times 10^{22}$

338. An element crystallising in body centred cubic lattice has an edge length of 500 pm. If its density is 4gcm^{-3}, the atomic mass of the element (in g mol^{-1}) is (consider N_A= 6 × 10^{23})

(a) 100 (b) 250

(c) 125 (d) 150

(e) 50

Kerala-CEE-2016

Ans. (d) : Given that, edge length = 500pm

Density (d) = 4g cm^{-3}

$N_A = 6\times 10^{23}$

So, $$d = \frac{Z\times M}{a^3\times N_A}$$

For BCC, Z = 2

$$4 = \frac{2\times M}{(500\times 10^{-10})^3\times 6\times 10^{23}}$$

$$M = \frac{4\times(500\times 10^{-10})^3\times 6\times 10^{23}}{2}$$

$M = 150\ g\ mol^{-1}$

339. Lithium has a BCC structure. Its density is 530kg m^{-3} and its atomic mass is 6.94 g mol^{-1} calculated the edge length of a nnit cell of lithium metal.(N_A = 6.02 ×10^{23} mol^{-1})

(a) 527 pm (b) 264 pm

(c) 154 pm (d) 352 pm

(NEET-I-2016)

Ans. (d) : For BCC structure –

$d = 530\ kg\ m^{-3}$

Atomic mass = 6. 94gmol^{-1} = 6.94×10^{-3} kg mol^{-1}

$N_A = 6.02\times 10^{23}\ mol^{-1}$

For BCC, Z = 2

So, $$d = \frac{Z\times M}{N_A\times a^3}$$

$$530 = \frac{2\times 6.94\times 10^{-3}}{6.02\times 10^{23}\times a^3}$$

$$a^3 = \frac{2\times 694}{530\times 6.02\times 10^{28}}$$

$a^3 = 0.435\times 10^{-28} m$

$a = 3.52\times 10^{-10}\ m$

$a = 352\times 10^{-12}\ m = 352\ pm.$

340. Aluminium (atomic mass = 27) crystallises in a cubic system with edge length of 4Å, its density is 2.7 g cm^{-3}. The number of aluminium atoms present per unit cell is

(a) 5 (b) 6

(c) 4 (d) 2

(e) 3

Kerala-CEE-2015

Ans. (c) : Given that –

Density (d) = 2.7 g cm^{-3}

Mass (M) = 27 g/mol

We know that –

$$\text{Density (d)} = \frac{Z\times M}{a^3\times N_A}$$

Edge length (a) = 4Å = 4×10^{-8} cm

So, the number of aluminium atoms present per unit cell–

@apna_pdf

$$(Z) = \frac{d \times a^3 \times N_A}{M}$$

$$Z = \frac{2.7 \times (4 \times 10^{-8})^3 \times 6.022 \times 10^{23}}{27}$$

$Z = 3.85$

$Z \simeq 4$

341. For two isomorphous crystals A and B, the ratio of density of A to that of B is 1.6 while the ratio of the edge length of B to that of A is 2. If the molar mass of crystal B is 200g mol^{-1}, then that of crystal A is

(a) 240 g mol^{-1} (b) 120 g mol^{-1}
(c) 80 g mol^{-1} (d) 160 g mol^{-1}
(e) 40 g mol^{-1}

Kerala-CEE-2015

Ans. (e) : Density of crystal $d = \frac{Z \times M}{a^3 \times N_A}$

So, $d \propto \frac{M}{a^3}$

Its density and molar mass of isomorphous crystal (A) and d_A and M_A, density and molar mass of isomorphous crystal B are d_B and M_B respectively.

Then, $\frac{d_A}{d_B} = \frac{M_A}{M_B} \times \left(\frac{a_B}{a_A}\right)^3$

Given $M_B = 200$ g / mol

$\frac{d_A}{d_B} = 1.6, \quad \frac{a_B}{a_A} = 2$

$m_A = \frac{1.6 \times 200}{8} = 40$ g / mol.

342. Argon crystallizes in FCC arrangement and the density of solid and liquid Ar is 1.59 g/cm^3 and 1.42/cm^3, respectively. The percentage of empty space in liquid Ar is–

(a) 34.84% (b) 43.8%
(c) 23.4% (d) 21.6%

BCECE-2015

Ans. (a) : Let the volume of solid (Ar) = 100 mL

Mass of solid Ar = V × d
= 100 × 1.59 g/cm^3
= 159 g

Volume of liquid Ar $= \frac{\text{Mass}}{d} = \frac{159}{1.4} = 113.57$ mL

$\therefore$ Argon crystallizes in FCC type lattice, the packing fraction = 0.74.

So, the actual volume occupied by Ar
= Packing fraction × Volume of solid Ar
= 0.74 × 100
= 74 mL

$\therefore$ % empty in liquid Ar $= \frac{(113.57 - 74) \times 100}{113.57}$

$= \frac{(39.57) \times 100}{113.57}$

= 34.84%

343. Ferrous oxide has a cubic structure. The length of edge of the unit cell is 5 Å and the density of the oxide is 4.0 g cm^{-3}. Then the number of Fe^{2+} and O^{2-} ions present in each unit cell will be

(a) four Fe^{2+} and two O^{2-}
(b) four Fe^{2+} and four O^{2-}
(c) two Fe^{2+} and four O^{2-}
(d) two Fe^{2+} and two O^{2-}

JIPMER-2015

Ans. (b) : Given that, a= 5 Å = 5 × 10^{-8}cm

$\therefore \quad V = (5 \times 10^{-8})^3$ cm^3

Molecular Mass, M = 56 + 16 = 72g

$\therefore \quad d = \frac{Z \times M}{N_A \times a^3}$

$\therefore \quad Z = \frac{d \times N_A \times a^3}{M}$

$Z = \frac{4 \times 6.023 \times 10^{23} \times (5 \times 10^{-8})^3}{72}$

$= 4.16 \approx 4$

Four molecules of ferrous oxide (FeO) per unit cell, it means that Fe^{2+} and O^{2-} ions are present in each unit cell.

344. Suppose the mass of a single Ag-atom is m. Ag metal crystallizes in FCC lattice with unit cell of length a. The density of Ag metal in terms of a and m is

(a) $\frac{4m}{a^3}$ (b) $\frac{2m}{a^3}$
(c) $\frac{m}{a^3}$ (d) $\frac{m}{4a^3}$

WB-JEE-2015

Ans. (a) : Given that,
Mass of single Ag–atom is = m
Unit cell length = a
For FCC, z = 4
So, Mass of unit cell = 4m.
Volume of unit cell = a^3

Density (d) $= \frac{\text{Mass of unit cell}}{\text{Volume of unit cell}}$

$= \frac{\text{No. of atoms} \times \text{Mass of each atom}}{\text{Volume of the unit cell}}$

$= \frac{4m}{a^3}$

345. An elemental crystal has a density of 8570 kg / m^3. The packing efficiency is 0.68. The closest distance of approach between neighbouring atom is 2.86 Å. What is the mass of one atom approximately?

@apna_pdf

(a) 93 amu (b) 39 amu
(c) 63 amu (d) 29 amu

BITSAT-2014

Ans. (a) : Given that –
The packing efficiency = 0.68
It means the given crystal lattice is in BCC.
So, number of unit cell (Z) is 2 .
BCC closest distance = 2r & 4r = $a\sqrt{3}$

$$a = \frac{4r}{\sqrt{3}} = \frac{2\times 2.86}{\sqrt{3}} = 3.30 \times 10^{-10}\,\text{m}$$

$$d = \frac{ZM/1000}{N_A \times a^3} \Rightarrow 8570 = \frac{2\times M}{6.02\times 10^{23}\times(3.30\times10^{-10})^3\times10^3}$$

$$M = \frac{8570\times6.02\times10^{23}\times(3.30\times10^{-10})^3\times10^3}{2} = 92.7\,\text{g/mol}$$

$\therefore$ Mass of 1 atom = 92.7amu ≅ 93 amu.

346. A metal has a FCC lattice. The edge length of the unit cell is 404 pm. The density of the metal is 2.72g cm^{-3} the molar mass of the metal is (N_A Avogardo's constant = 6.02×10^{23}mol^{-1})

(a) 27g mol^{-1} (b) 20 g mol^{-1}
(c) 40 g mol^{-1} (d) 30 g mol^{-1}

(NEET-2013)

Ans. (a) : The edge length of unit cell = 404 pm
Density (d) = 2.72g cm^{-3}
$N_A = 6.022 \times 10^{23}$ mol^{-1}
For FCC, Z = 4

$$d = \frac{ZM}{a^3\times N_A}$$

$$M = \frac{d\times a^3\times N_A}{Z}$$

$$M = \frac{2.72\times(404\times10^{-10})^3\times6.02\times10^{23}}{4}$$

M = 27 g mol^{-1}

347. A crystalline solid substance has a density of 10 g/cm^3 and the length of the edge of the unit cell (FCC) is $2.0\,\overset{\circ}{A}$. How many number of atoms are present in 200 g of the solid?

(a) 2×10^{23} (b) 1×10^{26}
(c) 1×10^{25} (d) 5×10^{27}

AP- EAMCET(Medical) -2010

Ans. (c): 1Å = 100 pm
Z = No. of atoms in FCC = 4
2Å = 200 pm

$$M = \frac{d\times a^3\times N_A\times10^{-3}}{Z}$$

$$= \frac{10\times(200)^3\times6.02\times10^{23}\times10^{-3}}{4}$$

mol. wt. = 12.04

$$\text{No. of atoms in 200 gram} = \frac{6.02\times10^{23}\times200}{12.04}$$

$= 1.0 \times 10^{25}$

348. Assertion: Stability of a crystal is reflected in the magnitude of its melting point.
Reason: The stability of crystal depends upon the strength of the interparticle attractive force.

(a) Both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) Both Assertion and Reason are correct, but Reason is not the correct explanation for Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

[AIIMS-2009]

Ans. (a) : The stability of crystal depends upon the strength of the inter particle attractive force (force of attraction between the particle).
The melting point of a solids depends on the strength of the attractive force acting between constituent particles.
Since, the stability of a crystal gets reflected in magnitude of is melting point.

349. The cubic unit cell of a metal (molar mass = 63.55g mol^{-1}) has an edge length of 362 pm. Its density is 8.92g cm^{-3}. The type of unit cell is

(a) primitive
(b) face centred
(c) body centred
(d) end centred

VITEEE- 2009

Ans. (b) : Given, molar mass (M) = 63.55 g mol^{-1}
Edge length (a) = 362 pm = 362×10^{-10} cm
Density (d) = 8.92 g cm^{-3}
$N_A = 6.023\times10^{23}$ mol^{-1}

$$\text{Density, } d = \frac{MZ}{N_A a^3}$$

Where, Z = number of atoms in unit cell

$$\therefore Z = \frac{d\cdot N_A a^3}{M}$$

$$= \frac{8.92\times6.023\times10^{23}\times(362\times10^{-10})^3}{63.55}$$

= 4.0

Thus, metal has face centred unit cell.

350. CsBr crystallises in a body-centred cubic lattice. The unit cell length is 436.6 pm. Given that the atomic mass of Cs = 133 and that of Br = 80 amu and Avogardo number being 6.02×10^{23} mol^{-1}, the density of CsBr is

(a) 4.25 g/cm^3 (b) 42.5 g/cm^3
(c) 0.425 g/cm^3 (d) 8.25 g/cm^3

(NEET-2006)

@apna_pdf

Ans. (d) : CsBr crystallises in a BCC

Unit cell length (a) = 436.6 pm

$= 436.6 \times 10^{-10}$ cm

Molecular weight of CsBr = 133+80 = 213 g mol^{-1}

For BCC, Z = 2

So, $d = \frac{Z \times M}{a^3 \times N_A}$

$$= \frac{2 \times 213}{\left(436.6 \times 10^{-10}\right)^3 \times 6.022 \times 10^{23}}$$

$= 8.49 \times 10^{-7} \times 10^7$ g/cm^3

$= 8.50$ g/cm^3

351. An element (atomic mass 100g/mol) having bcc structure has unit cell edge 400 pm. The density of element is (no. of atoms in bcc, Z = 2)

(a) 2.144g/cm^3

(b) 7.289 g/cm^3

(c) 5.188 g/cm^3

(d) 10.376 g/cm^3

[AIIMS-2002]

Ans. (c) : Given that –

Edge length (a) = 400 pm = 400 × 10^{-10} cm

Number at atom (Z) = 2

Molar Mass (M) = 100 g mol^{-1}

We know that –

$$d = \frac{Z \times M}{a^3 \times N_A}$$

$$d = \frac{2 \times 100}{(400 \times 10^{-10})^3 \times 6.023 \times 10^{23}}$$

$$d = \frac{2 \times 10^2}{64 \times 10^{-24} \times 6.023 \times 10^{23}}$$

$d = 5.188$g/cm^3

352. An element (atomic mass = 100 g mol^{-1}) having BCC structure has unit cell edge 400 pm. The density of element is

(a) 7.289 g/cm^3

(b) 2.144 g/cm^3

(c) 10.376 g/cm^3

(d) 5.188 g/cm^3

(NEET-1996)

Ans. (d) : Given that, Cell edge (a) = 400 pm

= 400 × 10^{-10} cm

M = 100 g mol^{-1}

For BCC, z =2

So, $d = \frac{Z \times M}{a^3 \times N_A}$

$$d = \frac{2 \times 100}{\left(400 \times 10^{-10}\right)^3 \times 6.023 \times 10^{23}}$$

$d = 5.188$ g/cm^3

353. Among the following the incorrect statement is

(a) Density of crystals remains unaffected due to Frenkel defect.

(b) In BCC unit cell the void space is 32%

(c) Density of crystals decreases due to Schottky defect.

(d) Electrical conductivity of semiconductors and metals increases with increase in temperature.

AIEEE-2012

Ans. (d) : For semiconductor, conductivity increase with increase in temperature because when temp rise it electron leave the valance band and goes in the conduction band.

For metal- conductivity of metal decrease with rise in temperature because when temperature increase electron start oscillating in there mean position and collide with free electron which lead to increase in resistivity.

8. Closed Packed structure

354. If in a crystal lattice of a compound, each corner of a cube is enjoyed by Sodium, each edge of a cube has Oxygen and centre of cube is enjoyed by Tungsten (W), then ...... formula.

(a) Na_2WO_4 (b) $NaWO_3$

(c) Na_3WO_3 (d) Na_2WO_3

AMU-2012

SRM JEE-2012

GUJCET-2011

Ans. (b): In a crystal lattice of a compound, sodium atom are present at the corners of the cube, therefore,

Effective number of Na atom in unit cell $= 8 \times \frac{1}{8} = 1$

Tungusten atoms are present at the cube centers then no. of atom in unit cell = 1

Oxygen atom are present at edge = $\frac{1}{4} \times 12 = 3$

Effective number of Oxygen atom = 3

∴ The formula of the compound = $NaWO_3$.

355. The atoms of element 'Y' form hexagonal close packing and the atoms of element X occupies $^2\!/_3$ portion of the number of tetraherdral voids. Write the formula of the compound formed by X and Y.

(a) X_2Y_3 (b) X_2Y

(c) X_3Y_4 (d) X_4Y_3

GUJCET-2014

AP EAMCET (Medical) – 2013

[AIEEE 2008]

@apna_pdf

Ans. (d) : In HCP at corner = $\frac{1}{6}\times12 = 2$ atom

In HCP at face centre = $2\times\frac{1}{2} = 1$ atom

In HCP at centre = 3 atom

Total number of atoms in HCP = 2 + 1 + 3

= 6 atom

Total number of tetrahedral voids = 2 × number of atom forming lattice

= 2 × 6

= 12

So, number of atoms of X = $\frac{2}{3}\times12 = 8$

number of atoms of Y = 6

So, X : Y ⇒ X : Y

8 : 6 4 : 3

So, Formula is $X_4\,Y_3$

356. A solid compound formed by elements X and Y crystallises in a cubic structure in which the X atoms are at the corners of a cube and the Y atoms are at the face-centre. The formula of the compound is

(a) XY_3 (b) X_3Y

(c) XY (d) XY_2

CGPET-2007

(NEET-2004)

Ans. (a) :

Number of atoms at the corner of cube is X = $\frac{1}{8}\times8=1$

Number of atoms at face center is $Y=\frac{1}{2}\times6$

Y = 3

So, The formula of compound is $X\,Y_3$.

357. What is the number of octahedral void (s) per atom present in a cubic close-packed structure?

(a) 1 (b) 2

(c) 3 (d) 6

J & K CET-(2018)

NEET-2012

Ans. (a) : In cubic closed packing (CCP).

Number of atom = 4

Number of octahedral void = 4

Since number of octahedral void formed = number of atom in CCP.

∴ Number of octahedral voids per atom

$=\frac{4}{4}$

= 1 .

358. Atoms of element N form HCP lattice and those of the element M occupy 1/3rd of tetrahedral voids. What will be the formula of the compound formed by the elements M and N?

(a) M_4N_3 (b) M_3N_2

(c) M_2N_3 (d) M_3N

GUJCET-2022

[AIIMS-27 May, 2018(E)]

Ans. (c) : In HCP at corner = $12\times\frac{1}{6}$ = 2 atom

In HCP at face centre = $2\times\frac{1}{2}$ = 1 atom

In HCP at centre = 3 atom

Total number of atom in HCP = 2 + 1 + 3 = 6 atom

Total number of tetrahedral void = 2 × number of atom forming the lattice = 2 × 6

= 12

So, number of atom of M = $\frac{1}{3}\times12$

= 4

Number of atom of N = 6

So, M : N ⇒ M : N

4 : 6 2 : 3

So, formula is M_2N_3

359. Element 'B' forms CCP structure and 'A' occupies half of the octahedral voids, while oxygen atoms occupy all the tetrahedral voids. The structure of bimetallic oxide is:

(a) A_2BO_4 (b) AB_2O_4

(c) A_2B_2O (d) A_4B_2O

BITSAT-2021

JEE MAIN-2019-8 April Shift-I

Ans. (b) : Bimetallic oxide has CCP or FCC structure of unit cell. It has both octahedral voids and tetrahedral voids.

Atom B are present at corner and face centred of the unit cell.

So, the total number of atom in B = $8\times\frac{1}{8}+6\times\frac{1}{2}$

= 1 + 3

= 4

Number of octahedral voids = 4

A atoms present per unit cell = $\frac{1}{2}\times4$

= 2

Number of tetrahedral voids = 8

Oxygen atom present per unit cell = 8

∴ Formula = $A_2\,B_4\,O_8$ or AB_2O_4

360. Which set of characteristics of ZnS crystal is correct?

(a) Coordination number (4:4); ccp; Zn^{++}ion in the alternate tetrahedral voids.

(b) Coordination number (6:6); hcp; Zn^{++} ion in all tetrahedral voids.

@apna_pdf

(c) Coordination number (6:4); hcp; Zn^{++} ion in all octahedral voids

(d) Coordination number (4:4) ; ccp; Zn^{++} ion in all tetrahedral voids

[AIIMS-2015]
AMU – 2009

Ans. (a) : ZnS has Zinc blende type structure. The S^{2-} ions are present at the corner of the cube and at the centre of each face. Zinc ions occupy half of the tetrahedral state. Each zinc ion is surrounded by four sulphide ions which are disposed towards the corners of a regular tetrahedron.

Hence, CN = 4:4; CCP; Zn^{+2} ion is the alternate tetrahedral voids.

361. In a close-packed body-centred cubic lattice of potassium, the correct relation between the atomic radius (r) and the edge-length (a) of the cube is

(a) $r = \frac{a}{\sqrt{2}}$
(b) $r = \frac{a}{\sqrt{3}}$
(c) $r = \frac{\sqrt{3}}{2}a$
(d) $r = \frac{\sqrt{3}}{4}a$

WB-JEE-2017
J&K CET, 2015

Ans. (d) : For BCC,

- 'a' to 'r' relation,

$$\boxed{4r = \sqrt{3}\,a \Rightarrow r = \frac{\sqrt{3}}{4}a}$$

- Avg. no. of atoms = 2
- Co-ordination No. = 8
- Atomic packing fraction = 0.68

Ex:– Tungeston (w), Chromium (Cr), Vanadium (V), Molbydinum (Mo), Tantalum.

362. The number of octahedral voids per lattice site in a lattice is.......
(Rounded off to the nearest integer)

[JEE Main 2021, 26 Feb Shift-II]

Ans. (1) : Assuming FCC

No. of lattice sites = 6 face centre + 8 corner = 14

No. of octahedral Voids = 13

Ratio = 13/14 = 0.92857

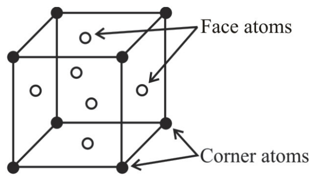
≈ 1 (nearest integer)

363. An alloy made up of A and B metals crystallizes in a lattice, where B atoms occupy the corners and A atoms occupy the face centers. The formula of the alloy

(a) AB_3
(b) A_3B
(c) A_2B_3
(d) A_3B_2

TS-EAMCET (Engg.), 06.08.2021

Ans. (b):



No. of A atoms (Z_A) = Total no. of atom at face $\times\frac{1}{2}$

$$= 6\times\frac{1}{2} = 3$$

No. of B atoms (Z_B) = Total no. of cornor $\times\frac{1}{8}$

$$= 8\times\frac{1}{8} = 1$$

Thus, the formula of an alloy = A_3B

364. Atoms of element X form hcp lattice and those of element Y occupy 75% of tetrahedral voids. What is the formula of the compound formed by elements X and Y?

(a) X_4Y_3
(b) X_3Y_4
(c) X_2Y_3
(d) X_3Y_2

GUJCET-2021

Ans. (c) : Given that, element 'X' forms hcp lattice so, the effective number of atoms in hcp lattice.

$$x = \frac{1}{6}\times12 + 2\times\frac{1}{2} + 3\times1$$

$$x = 6$$

Number of tetrahedral void = 2 × number of atom forming the lattice

$$= 2 \times 6$$
$$= 12$$

So, Number of atom Y = $\frac{3}{4}\times12 = 9$

Hence, the formula of compound is X_6Y_9 or X_2Y_3.

365. Right option for the number of tetrahedral and octahedral voids in hexagonal primitive unit cell are

(a) 12,6
(b) 8,4
(c) 6,12
(d) 2,1

(NEET-2021)

Ans. (a) :

Number of atom in hexagonal primitive unit cell = 6

Number of tetrahedral voids = 2 × Number of atoms per unit cell

= 2× 6

= 12

Number of octahedral void = Number of atoms per unit cell

= 6

So,

Option (a) (12, 6) is correct.

@apna_pdf

366. In Chrysoberyl, a compound containing Beryllium, Aluminium and oxygen, oxide ions from cubic close packed structure. Aluminium ions occupy $\frac{1^{th}}{4}$ of tetrahedral voids and Beryllium ions occupy $\frac{1^{th}}{4}$ of octahedral voids. The formula of the compound is

(a) $BeAlO_4$ (b) $BeAl_2O_4$
(c) Be_2AlO_2 (d) $BeAlO_2$

Kerala-CEE-29.08.2021

Ans. (b) : Total number of atom present in ccp structure = 4

∴ No. of tetrahedral voids in ccp = 8

No. of octahedral voids in ccp = 4

∴ Molecular formula = $Be_{\frac{1}{4}\times4}Al_{\frac{1}{4}\times8}O_4$

Thus, the molecular formula = $BeAl_2O_4$

367. A mixed oxide having cubic closed packed structure has 1/8 part of the tetrahedral holes occupied by x^{2+} ions and ½ part of the octahedral holes of y^{3+} ions. The formula of the compound is

Assam CEE-2021

Ans. XY_2O_4 :

Let, the number O^{2-} ions in the crystal = N

∴ No. of tetrahedral voids = 2N

No. of octahedral voids = N

∴ No. of X^{2+} ions = $\frac{1}{8}\times2N=\frac{N}{4}$

No. of Y^{3+} ions = $\frac{1}{2}\times N=\frac{N}{2}$

$X^{2+}:Y^{3+}:O^{2-}=\frac{N}{4}:\frac{N}{2}:N=1:2:4$

Hence, the formula of the compound is XY_2O_4.

368. A compound made up of atoms of Y (anions) forming a CCP arrangement, where the element X (cations) occupies octahedral voids, The formula of the compound is

(a) XY_2 (b) X_3Y_2
(c) X_2Y (d) XY

TS EAMCET 10.08.2021, Shift-I

Ans. (d) : Since, atoms of Y forms CCP which is analogous to FCC.

So effective no. of atoms of Y in lattice = 4

No. of octahedral voids = No. of atoms form CCP = 4

So, effective no. of atoms of X in the lattice = 4

Then X : Y = 4 : 4 or 1 : 1

So the formula of the compound is XY.

369. The number of voids in 1 mole of a compounds forming a HCP structure are

(a) 1.8×10^{24} (b) 3.6×10^{24}
(c) 6.0×10^{23} (d) 7.2×10^{24}

TS-EAMCET (Engg.), 05.08.2021 Shift-II

Ans. (a) : In hexagonal close packed structure, there is 6 atoms per unit cell.

∴ Number of octahedral voids = 6

∴ Number of tetrahedral voids = 2 × 6 = 12

Total number of voids = 6 + 12 = 18

∴ Total number of voids per atom = $\frac{18}{6}=3$

∴ In 1 mole compound the total number of voids = $3\times1\times6.023\times10^{23}=1.8\times10^{24}$

370. A compound made up of elements A and B (with a general formula A_xB_y), where B form a hcp lattice and A occupy $2/3^{rd}$ of the tetrahedral voids. The formula of the compound is

(a) A_2B_2 (b) A_3B_4
(c) A_4B_3 (d) A_3B_3

TS EAMCET 04.08.2021, Shift-I

Ans. (c) : Given that,

Atom B form hcp lattice.

So, effective no. of atoms in unit cell

$$=12\times\frac{1}{6}+2\times\frac{1}{2}+1\times3$$

$$=2+1+3=6$$

Atom A occupy $2/3^{rd}$ of the tetrahedral voids.

So, no. of tetrahedral void = 2 × no. of atoms forming the lattice

= 2 × 6 = 12

Since, no. of atoms of A = $\frac{2}{3}\times12=8$

Hence, the formula of the compound is A_8B_6 or A_4B_3.

371. In a mixed oxide of 'A' and 'B', 'A' occupies all the octahedral voids while 'B' occupies $(2/3)^{rd}$ the tetrahedral voids. The molecular formula of this oxide is ______.

(a) $A_3B_4O_3$ (b) $A_3B_2O_3$
(c) A_3BO_3 (d) AB_2O_3

AP-EAMCET 25-08-2021 Shift - I

Ans. (a) : Let the no. of atom in mixed oxide structure = N

∴ Number of octahedral void = N

and Number of tetrahedral void = 2N

∵ A contains all octahedral void = N

and B contains $2/3^{rd}$ tetrahedral void $=\frac{2}{3}\times2N=\frac{4}{3}N$

∴ Molecular formula = $A_NB_{4/3N}O_N=A_3B_4O_3$

372. A compound is formed by cation C and anion A. The anions form hexagonal close packed (hcp) lattic and the cations occupy 75% of octahedral voids. The formula of the compound is

(a) C_4A_3 (b) C_2A_3
(c) C_3A_2 (d) C_3A_4

(NEET-2019)

@apna_pdf

Ans. (d) : Anions (A) form hexagonal close packed (hcp) lattice , so

Number of anion (A) = 6

Number of octahedral void = Number of atoms in the closed packed structure = 6.

Cations (C) occupy 75% of octahedral void, so number of cations (C) = $6\times\frac{75}{100}$

$$= 6\times\frac{3}{4}=\frac{9}{2}$$

$\therefore$ The formula of compound = $C_{9/2}\,A_6$

$$= C_9\,A_{12} = C_3\,A_4.$$

373. A compound of formula A_2B_3 has the hcp lattice. Which atom forms the hcp lattice and what fraction of tetrahedral voids is occupied by the other atoms?

(a) hcp lattice-A, $\frac{2}{3}$ tetrahedral voids-B

(b) hcp lattice-A, $\frac{1}{3}$ tetrahedral voids-B

(c) hcp lattice-B, $\frac{1}{3}$ tetrahedral voids-A

(d) hcp lattice-B, $\frac{2}{3}$ tetrahedral voids-A

[JEE Main 2019, 10 Jan Shift-II]

Ans. (c) : Let B from hcp lattice

Number of B = 6

Tetrahedral void occupied = 2N

By atom

$$= 2\times 6$$
$$= 12$$

Number of atom in A = $\frac{1}{3}\times$ tetrahedral void

$$= \frac{1}{3}\times 12$$
$$= 4$$

Formula formed = A_4B_6 or A_2B_3

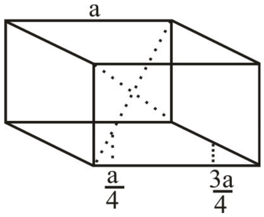
374. In FCC, distance between nearest tetrahedral voids is:

(a) $\frac{a}{2}$ (b) a

(c) $\sqrt{3}a/2$ (d) $\sqrt{3}a/4$

AIIMS 26 May 2019 (Evening)

Ans. (a):



Tetrahedral void = $\frac{3a}{4}-\frac{a}{4}$

$$= \frac{3a-a}{4}=\frac{2a}{4}$$
$$= \frac{a}{2}$$

375. General formula of solid in zinc blends structure is

(a) AB_2 (b) AB_3

(c) AB (d) A_2B

BITSAT-2019

Ans. (c) : Tetrahedral void present in alternate zinc blend.

$$= \frac{1}{2}\times 8 = 4$$

S^{2-} present in ccp = 4

$\therefore Zn_4S_4 = ZnS$ is AB type compound.

376. The number of tetrahedral voids present in 0.5 mol of HCP crystal structure is:

(a) 3.6×10^{23} (b) 9×10^{23}

(c) 3.6×10^{24} (d) 3×10^{22}

AIIMS 25 May 2019 (Morning)

Ans. (c): We know that,

In HCP, Z= 6

So, in tetrahedral voids = 2Z = 2 × 6 = 12

Tetrahedral void present in 0.5 mol = 12 × 0.5 mol

$$= 6\,N_A$$
$$= 6\times 6.02\times 10^{23}$$
$$= 3.6\times 10^{24}$$

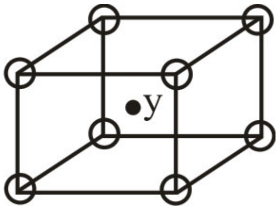
377. A compound formed by elements X and Y crystallises in the cubic structure, where X atoms are at the corners of a cube and Y atoms are at the centre of the body. The formula of the compounds is

(a) XY (b) XY_2

(c) S_2Y_3 (d) XY_3

WB-JEE-2018

Ans. (a) :



In the given compound; there must be 8 corners in cube. So, as the X atoms are at corners, so each of the X atom will contribute $\frac{1}{8}$ part toward a particular unit cell.

The number of X atom per unit cell = $\frac{1}{8}\times 8$

$$= 1$$

@apna_pdf

While the Y atoms at the centre of body
So, The number of y atom = 1
Hence, the formula of compound is XY.

378. In a crystalline solid, having formula XY_2O_4, oxide ions are arranged in cubic close packed lattice while, cations X are present in tetrahedral voids and cations Y are present in octahedral voids. The percentage of tetrahedral voids occupied by X is

(a) 12.5% (b) 25%
(c) 50% (d) 75%

JIPMER-2018

Ans. (a) : In a cubic close packed lattice of oxide ions, there would be two tetrahedral and one octahedral void per oxide ion.
Since, the formula shows the presence of 4 oxide ions, the number of tetrahedral void is eight and that of octahedral void is four out of the eight tetrahedral void, one is occupied by X.

$\therefore$ Percentage of tetrahedral voids occupied = $\frac{1}{8}\times 100$

= 12.5 %

379. In a compound, atoms of element Y form ccp lattice and those of element X occupy 2/3rd of tetrahedral voids. The formula of the compound will be

(a) X_4Y_3 (b) X_2Y_3
(c) X_2Y (d) X_3Y_4

VITEEE-2018

Ans. (a) : There are eight tetrahedral voids per unit cell of ccp structure.
Hence, From the given data

Number of X atoms in a unit cell = $8\times\frac{2}{3}=\frac{16}{3}$

Number of Y atoms in a unit cell = 4

$\therefore$ Formula of compound $=X_{\frac{16}{3}}Y_4$

Formula of compound $=X_4Y_3$

380. In a face centred cubic arrangement of A and B atoms in which 'A' atoms are at the corners of the unit cell and 'B' atoms are at the face centres. One of the 'A' atoms is missing from one corner in unit cell. The simplest formula of compounds is

(a) A_7B_8 (b) A_7B_3
(c) AB_3 (d) A_7B_{24}

Karnataka-CET-2017

Ans. (d) : In fcc there are total 8 corners and each contributed 1/8 to the unit cell.
One of the A atom is missing from one corner unit cell.

So there are 7 A atom with total contribution = $7\times\frac{1}{8}$

$=\frac{7}{8}$

B atoms are at the face centres. There are six face centres. Each contributes one half to the unit cell.

Total contribution = $6\times\frac{1}{2}=3$

A: B = $\frac{7}{8}:3$

A : B = 7: 24
The simplest formula of compound is A_7B_{24}.

381. The number of tetrahedral and octahedral voids in CCP unit cell are respectively

(a) 4, 8 (b) 8, 4
(c) 12, 6 (d) 6, 12

TS EAMCET-2017

Ans. (b) : Number of atom in CCP (cubic close packing) $=\frac{1}{8}\times 8+\frac{1}{2}\times 6$

= 1 + 3
= 4 (atoms)

$\therefore$ Number of tetrahedral voids = 2n = 2 × 4 = 8
Number of octahedral voids = n = 4
Hence the option (b) is correct.

382. A crystalline solid is made up of X and Y atoms, X atoms, possesses CCP structure and Y atoms are arranged in tetrahedral voids. If all the atoms situated on a diagonal of one side are removed, what will be the molecular formula of the crystalline solid?

(a) X_3Y_2 (b) X_4Y_3
(c) X_2Y_3 (d) X_3Y_4

GUJCET-2017

Ans. (d) :

X	Y
Corner + face centre	Tetrahedral voids
$\left(8\times\frac{1}{8}\right)+\left(6\times\frac{1}{2}\right)$	(8 × 1)
4	8

When atoms on diagonal of one side removed

X	Y
$4-\left(4\times\frac{1}{8}+1\times\frac{1}{2}\right)$	8 – 4 (1)
4 – 1	4
3	4

$\therefore$ Formula is X_3Y_4

383. If a compound is firmed by X, Y and Z atoms and Z is present on the corners, Y is present $\frac{1}{2}$ tetrahedral voids and X atom in $\frac{1}{2}$ octahedral voids, which of the following will be the molecular formula of the compound?

@apna_pdf

(a) X_2Y_4Z (b) XYZ_4
(c) XYZ (d) X_2ZY

UPTU/UPSEE-2016

Ans. (a): $x = \frac{1}{2}$ of octahedral void

$= \frac{1}{2} \times 4$

$= 2$

$Y = \frac{1}{2}$ of tetrahedral void

$= \frac{1}{2} \times 8$

$= 4$

Z = corners

$= \frac{1}{8} \times 8$

$= 1$

So, the molecular formula of compound is $X_2\,Y_4\,Z$

384. If in a cubic cell, atoms A present at all corners and atoms B at the center of each face. What will be the molecular formula of the compound, if all the atoms present on one body diagonal are replaced by atom C?

(a) $A_3B_{12}C$ (b) $AB_{12}C_3$
(c) ABC_3 (d) $A_3B_{12}C_4$

UPTU/UPSEE-2016

Ans. (a): Atoms are present at corners,

Atoms A per unit cell = $8 \times \frac{1}{8}$

If atoms present on one body diagonal are replaced by atom C, then atoms A per unit cell = $\frac{6}{8} = \frac{3}{4}$

Atoms B are at centre of each face = $6 \times \frac{1}{2} = 3$

Atoms C at corners, atoms. C per unit cell will be

$= 2 \times \frac{1}{8} = \frac{1}{4}$

So, the molecular formula of compound

$A_{\frac{3}{4}}\,B_3\,C_{\frac{1}{4}}$ or $A_3\,B_{12}\,C$

385. If oxide ions are arranged in hcp and the aluminium ions occupy two thirds of octahedral voids. What will be the formula of the compound?

(a) AlO_3 (b) Al_2O_3
(c) $(Al_2O_3)_2$ (d) Al_3O_4

JIPMER-2016

Ans. (b) : For hcp arrangement of oxide ion:
Number of octahedral void for each oxide ion = 1
Number of tetrahedral voids for each oxide ion = 2
Al^{3+} occupies only 2/3 of octahedral voids.

Thus, number of Al^{3+} for each oxide ion = $\frac{2}{3}$

Ratio of oxide ion: Aluminium ion ⇒ 3: 2

So,

Formula of compound is $Al_2\,O_3$.

386. In which of the following compound, cations occupy alternate tetrahedral voids in cubic closed packing (ccp)?

(a) ZnS (b) NaCl
(c) Na_2O (d) CaF_2

JCECE - 2016

Ans. (a) : ZnS has fcc (ccp) type structure, in which S^{2-} ions occupy corner and face centre positions, while Zn^{2+} ions are placed at alternate tetrahedral voids.

387. The number of tetrahedral and octahedral void per unit cell of cubic closed packed structure is

(a) 4, 8 (b) 4, 4
(c) 8, 4 (d) 8, 8

J & K CET-(2015)

Ans. (c) : In CCP or FCC structure number of lattice points (z) = 4

∴ Number of octahedral void = Number of lattice point.

∴ Number of octahedral void = 4

And,

Number of tetrahedral void = 2×number of octahedral void

= 2×4

= 8

388. Assertion : In close packing of spheres, a tetrahedral void is surrounded by four spheres whereas an octahedral void is surrounded six spheres.

Reason : A tetrahedral void has a tetrahedral shape whereas an octahedral void has an octahedral shape.

(a) In both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

[AIIMS-2015]

Ans. (c) : Tetrahedral void is so called because it is surrounded by four spheres tetrahedrally while octahedral void is so called because it is surrounded by six spheres Octahedrally.

389. Which of the following arrangements correctly represents hexagonal and cubic close packed structure respectively?

(a) ABAB……….and ACBACB………
(b) ABCABC……and ABAB………..

@apna_pdf

(c) Both have ABCABC…….arrangement
(d) Both have ABAB…… arrangement

JIPMER-2015

Ans. (a) : Hexagonal closed packing arrangement , ABAB……….

- Cubic close packed (CCB or FCC) arrangement, ACB ACB…………

390. An alloy of Cu, Ag, Au is found to have a simple cubic close packed lattice. If the Ag atoms occupy the face centres and Au is present at the body centre, the formula of the alloy will be

(a) Cu_4Ag_4Au
(b) $CuAg_3Au$
(c) CuAgCu
(d) Cu_4Ag_2Au

JCECE - 2015

Ans. (b) : The number of Cu in the unit cell

$(8 \times \frac{1}{8}) = 1$

The number of Ag in the unit cell

$= (6 \times \frac{1}{2}) = 3$

The number of Au in the unit cell = 1 (body center = 1)

The formula of the alloy = $Cu_4\ Ag_3Au$

391. If same type of atoms are packed in hexagonal close packing and cubic close packing separately, then

(a) density of hcp will be greater than ccp
(b) density of hcp will be smaller than ccp
(c) density of hcp will be equal to ccp
(d) density of hcp and ccp will depend upon the temperature of the system.

COMEDK-2015

Ans. (c) : The density of hcp (hexagonal closed packing) will be equal to ccp (cubic closed packing) because, the percentage of packing efficiency in both hcp and ccp is 74% and free space is 26%.

∴ If same atoms are packed in hcp and ccp separately then density becomes equal in both crystals.

392. How many octahedral void (s) are present per atom in a cubic close-packed structure?

(a) 3
(b) 4
(c) 1
(d) 2

J & K CET-(2014)

Ans. (c) Position of octahedral voids = Edge centre and body centre.

Number of octahedral voids per unit cell in cubic close packing

$$= N_e \times \frac{1}{4} + N_b \times 1$$

$$= 12 \times \frac{1}{4} + 1 \times 1 = 4$$

⇒ Number of octahedral voids = 4

The total number of octahedral voids per atom present in a cubic close-packed structure is one as $\frac{4}{4} = 1$

393. A crystalline solid has A^- ions at the corners and face centres whereas B^+ ions are at the body centre and edge centres of the unit cell. The simplest formula of the compound will be

(a) A_2B
(b) AB_2
(c) AB_3
(d) AB

COMEDK 2014

Ans. (d) : In crystalline A^- ions present at corners and face centers

So, number of A^- ions $= 8 \times \frac{1}{8} + 6 \times \frac{1}{2} = 4$

In crystalline B^+ ions present at body centre and edge centers.

So, number of B^+ ions $= 1 + 12 \times \frac{1}{4} = 4$

Hence, simplest formula of the compound is

$= (A^-)_4 (B^+)_4 = AB$

394. A compound of copper and gold crystallizes in a cubic lattice in which the copper atoms occupy the centres of each of the cube faces and the gold atoms occupy the lattice point. The formula of compound is

(a) Au_3Cu
(b) $AuCu_3$
(c) Au_2Cu_3
(d) Au_3Cu_2

AMU-2013

Ans. (b) : Gold occupies corner of the unit cell. There are 8 corner and contribution of each corner is $\frac{1}{8}$.

So, total number of atom in Au $= \frac{1}{8} \times 8 = 1$

Copper occupies faces of cube. There are 6 faces and contribution of each face is $\frac{1}{2}$.

So, total number of atoms in Cu $= \frac{1}{2} \times 6 = 3$

Hence, the formula compound is $AuCu_3$.

395. The number of octahedral and tetrahedral holes respectively present in a hexagonal close packed (hcp) crystal of 'X' atoms are

(a) X, 2X
(b) X, X
(c) 2X, X
(d) 2X, 2X

AP-EAMCET (Engg.) 2013

Ans. (a) :
Number of octahedral voids in HCP is X
number of tetrahedral voids in HCP is 2X
Hence, the no. of octahedral and tetrahedral holes is X, 2X respectively.

@apna_pdf

396. Structure of a mixed oxide is cubic close packed (ccp). The cubic unit cell of mixed oxide is composed of oxide ions. One fourth of the tetrahedral voids are occupied by divalent metal A and the octahedral voids are occupied by a monovalent metal B. The formula of the oxide is

(a) ABO_2 (b) A_2BO_2
(c) $A_2B_3O_4$ (d) AB_2O_2

(NEET-Mains-2012)

Ans. (d) : It is given that the structure of mixed oxide is cubic closed packed.

Therefore, Number of O_2^- ions according to ccp = 4

So,

Number of tetrahedral voids = 8
and octahedral voids = 4

A ions occupy $\frac{1}{4}$th of tetrahedral voids = 2

B ions occupy all octahedral voids = 4

So,

$$A : B : O = 2 : 4 : 4$$
$$= 1 : 2 : 2$$

Then the formula of the oxide is AB_2O_2.

397. A compound formed by elements A and B crystallizes in the cubic structure where A atoms are at the corners of a cube and B atoms are at the face centres. The formula of the compound is–

(a) A_2B_2 (b) AB_3
(c) AB (d) A_3B

BCECE-2012

Ans. (b) : A occupies corner of the unit cell. there are 8 corner and contribution of 8 corner is $\frac{1}{8}$.

So, The total number of atom in A = $\frac{1}{8} \times 8 = 1$

B occupies face of cube. There are 6 faces and contribution of each faces is 1/2.

So, the total number of atom in B = $\frac{1}{2} \times 6 = 3$

Hence, the formula of compound is AB_3.

398. In a face-centred cubic lattice, atom A occupies the corner positions and atoms B occupies the face centred positions. If one atom of B is missing from one of the face centred points, the formula of the compound is

(a) A_2B (b) AB_2
(c) A_2B_2 (d) A_2B_5

[AIEEE 2011]

Ans. (d) : In the FCC lattice, atom (A) occupies the corner positions. There are 8 corner and each corner contributed 1/8 to the unit cell.

So, Total number of atom in A = $\frac{1}{8} \times 8 = 1$

Atom (B) occupies the face centre positions. There are six (6) face centre position. One atom of B is missing from one of the face centre position. Thus, there are 5 face centre positions that are occupies. Each such position contributed one half (1/2) to the unit cell.

So,

The total number of atom in B

$$= 6 \times 1/2 - 1 \times 1/2 = \frac{5}{2}$$

$$\because \quad A : B = 1 : \frac{5}{2} = 2 : 5$$

The formula of the compound is $AB_{2.5}$ or A_2B_5

399. A compound of 'A' and 'B' crystallizes in a cubic lattice in which 'A' atoms occupy the lattice points at the corners of the cube. The 'B' atoms occupy the centre of each face of the cube. The probable empirical formula of the compound is

(a) AB_2 (b) A_2B
(c) AB (d) AB_3

KARNATAKA-CET, 2009

Ans. (d) : A occupies corners, thus number of A atoms per unit cell = $8 \times \frac{1}{8} = 1$

B occupies face centres, thus number of B atoms per unit cell = $6 \times \frac{1}{2} = 3$

∴ The empirical formula of the compound is AB_3.

400. The unit cell of a binary alloy composed of A and B metals, has a ccp structure with A atoms occupying the corners and B atoms occupying centres of each face of the cube. If during the crystallization of this alloy, in the unit cell two A atoms are missed, the overall composition per unit cell is

(a) AB_6 (b) AB_4
(c) AB_8 (d) A_6B_{24}

J & K CET-(2009)

Ans. (d) : Permitted co–ordination number for ccp is 8 but two A atoms are missing.

So, number of A occupying the corner = 8 – 2 = 6

∴ Contribution of A = $6 \times \frac{1}{8} = \frac{6}{8}$

Contribution of B = $6 \times \frac{1}{2} = 3$

So, composition per unit cell is–

$A_{\frac{6}{8}}B_3$ Or A_6B_{24}.

@apna_pdf

401. A solid compound contains X, Y and Z atoms in a cubic lattice with X atom occupying the corners. Y atoms in the body centered positions and Z atoms at the face center unit cell. What is the empirical formula of the compound?

(a) XY_2Z_3	(b) XYZ_3
(c) $X_2Y_2Z_3$	(d) X_8YZ_6
(e) XYZ	

Kerala-CEE-2008

Ans. (b): Number of atoms of X in a unit cell = $\frac{1}{8} \times 8 = 1$

Number of atoms of Y in unit cell = 1

Number of atoms of Z in unit cell = $\frac{1}{2} \times 6 = 3$

So, empirical formula of the compound = XYZ_3

402. The coordination number in HCP is

(a) 6	(b) 12
(c) 18	(d) 24

[AIIMS-2007]

Ans. (b) : Co-ordination number is the number of ions that immediately surround an ion of the opposite charge within a crystal lattice.

The coordination number in HCP and CCP is 12.

403. The Ca^{2+} and F^- are located in CaF_2 crystal, respectively at face centered cubic lattice points and in

(a) tetrahedral voids
(b) half of tetrahedral voids
(c) octahedral voids
(d) half of octahedral voids

[AIIMS-2006]

Ans. (a) : The Ca^{2+} and F^- are located in CaF_2 crystal respectively at face – centred cubic lattice points and in tetrahedral voids. The calcium fluoride structure is also called fluorite structure. It is 8 : 4 arrangement, the coordination number Ca^{2+} and F^- ions is 8 and 4 ions respectively.

404. If z is the number of atoms in the unit cell that represents the closest packing sequence ..... ABCABC......, the number of tetrahedral voids in the unit cell is equal to:

(a) z	(b) 2z
(c) z/2	(d) z/4

[AIIMS-2005]

Ans. (b) : Number of tetrahedral voids = 2×N
Where N = number of atoms per unit cell
Hence number of tetrahedral voids = 2×z (z = N)

405. A substance Ax, By crystallises in a face centred cubic lattice in which A atom occupies each corner of cube and atom B occupies the centres of each face of the cube. Identify the correct composition of the substance A_xB_y.

(a) AB_3
(b) A_4B_3
(c) A_3B
(d) Composition cannot be specified

J & K CET-(2004)

Ans. (a) : A_x B_y crystallizes in a face –centered cubic (FCC) lattice.

A atoms occupy each corner of the cube. So, the number of atoms of A is $8\times\frac{1}{8} = 1$.

B atoms occupy the center of each face of the cube, so the number of atoms of B is $6\times\frac{1}{2} = 3$

Hence, the formula of compound is AB_3

406. The coordination number of the ions is the CsCl crystal lattice is

(a) 4:4	(b) 8:8
(c) 6:6	(d) 4:8

A.P.EAMCET-1991

Ans. (b) : In the crystal of CsCl , Cs^+ ion is surrounded by $8Cl^-$ and Cl^- ion is surrounded by $8Cs^+$. So, the coordination number of CsCl is 8:8.

407. An alloy of copper, silver, and gold is found to have copper atom constituting the CCP lattice. If silver atom occupy the edge centres and gold atom is present at body centred, the alloy has a formula

(a) Cu_4Ag_2Au
(b) Cu_4Ag_4Au
(c) Cu_4Ag_3Au
(d) CuAgAu

VITEEE-2015

Ans. (c) : Copper present in CCP (or FCC) lattice

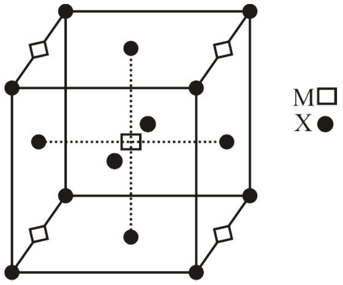
$$=\frac{1}{8}\times 8+6\times\frac{1}{2}=4$$

Silver atoms present in edged centred $=12\times\frac{1}{4}=3$

Gold atoms presents at body centred = 1

Hence, the formula is Cu_4Ag_3Au.

408. A compound M_pX_q has cubic close packing (CCP) arrangement of X. Its unit cell structure is shown below. The empirical formula of the compound is



@apna_pdf

(a) MX
(b) MX_2
(c) M_2X
(d) M_5X_{14}

AIEEE-2012

Ans. (b) : M is present in edge and centre.

So, No. of atoms in $M = 4\times\frac{1}{4}+1 = 2$

X is present in corner and face centered.

So, No. of atom in $X = 6\times\frac{1}{2}+8\times\frac{1}{8} = 4$

So, The formula is = $M_2X_4 = MX_2$.

9. Electrical Properties

409. What is impact on benzene in magnetic field?

(a) Strongly attract
(b) Weakly attract
(c) Strongly repel
(d) Weakly repel

[AIIMS-26 May, 2018(E)]

Ans. (d) : Benzene is diamagnetic substance. The impact of benzene on magnetic field so weakly repel.

410. p-type silicon is formed by adding a minute amount of an element with

(a) five valence electrons
(b) three valence electrons
(c) Six valence electrons
(d) four valence electrons.

COMEDK-2017

Ans. (b) : p-type silicon is formed by adding a minute amount of a trivalent element like boron or aluminum. It becomes a p-type silicon which means it remains electrically neutral but a vacancy for electron becomes available per boron atom. The three electrons of these elements form covalent bonds by neighbouring silicon atoms. This causes an electron vacancy in the crystal. Therefore, p-type silicon is formed with elements of three valence electrons.

411. Malleability and ductility of metals can be accounted due to

(a) the presence of electrostatic force
(b) the crystalline structure in metal
(c) the capacity of layers of metal ions to slide over the other
(d) the interaction of electrons with metal ions in the lattice

KARNATAKA-CET, 2008

Ans. (c) : Malleability and ductility metals can be accounted due to malleability and ductility depends on the hardness of metal.

The malleability and ductility of metals is due to this sliding capacity of the delocalised electrons.

412. If a pentavalent impurity is mixed in the crystal-lattice of germanium then the semiconductor formed will be

(a) p- type semiconductor
(b) n- type semiconductor
(c) (a) and (b) both
(d) None of the above

CG PET -2007

Ans. (b) : When an impurity atom with 5 valence electron (as arsenic) is introduced in a germanium crystal, it replaces one of the Germanium atoms four of the free valence electron of the impurity atom form covalent bond with each valence electron of four germanium atom and fifth valence electron becomes free to move in the crystal structure. These free electron acts as a charge carries such as an impure germanium crystal is called n-type semiconductor become in it charge carrier are negative (free electron).

413. If was mix a pentavalent impurity in a crystal lattice of germanium, what type of semiconductor formation will occur?

(a) n- type semiconductor
(b) P- type semiconductor
(c) Both (a) and (b)
(d) None of these

(NEET-1996)

Ans. (a) : Germanium crystal is called n–type semiconductor because in it change carriers are negative (free electron). When an impurity atom with 5 valence electron is introduced in a germanium crystal, it replaces one of the germanium atoms. Four of the five valence electrons of the impurity atom form covalent bond with each valence electron of four germanium atoms and fifth valence electron becomes free to move in the crystal structure. This free electron acts as a charge carrier.

414. On doping Ge metal with a little of In or Ga, one gets

(a) P- type semiconductor
(b) n- type semiconductor
(c) insulator
(d) rectifier.

(NEET-1993)

Ans. (a) : Doping of group 14 elements such as germanium with elements of group 13 gives size to P-type semi-conductors while doping using group 15 elements given p-type semi-conductors.
